$(\text{CH}_3)_2\text{C}_5\text{H}_9\text{NH}$.

Properties: B. p. (760 mm) 127.9°C; sp. gr. (20/20°C) 0.8199; refractive index 1.4383 (n_D 20); soluble in water at 20°C in all proportions.

Use: Intermediate.

dimethylpolysiloxanes. See siloxanes.**2,2-dimethylpropane.** See neopentane.**2,6-dimethylpyridine.** See lutidine.**2,7-dimethylquinoline** $(\text{CH}_3)_2\text{C}_9\text{H}_7\text{N}$.

Typical specifications: M. p. -40°C (approx.); distillation range 140-150°C (20 mm); soluble in benzene and diethyl ether.

Uses: Organic synthesis; suggested as dye intermediate.

dimethyl sebacate $[(\text{CH}_2)_4\text{COOCH}_3]_2$.

Plasticizer of ester type.

Properties: Liquid, water-white; sp. gr. 0.9896 (25/20°C); m. p. 24.5°C; flash point 145°C (293°F); b. p. approx. 294°C (760 mm); refractive index 1.4376 (20°C).

Grades: Technical.

Containers: 1-, 5- and 10-gal cans; tank cars.

Uses: Solvent or plasticizer for nitrocellulose, vinyl resins; intermediate.

Shipping regulations: None.*

dimethyl silicone. General term for a family of silicones of composition $[(\text{CH}_3)_2\text{SiO}]_x$, being the more volatile materials formed on hydrolysis of dimethyldichlorosilane.

Colorless oils with b. p. ranging from 134°C (760 mm) (for x = 3) to 188°C (20 mm) (for x = 9), and presumably even higher boiling members exist.

dimethyl sulfate (methyl sulfate) $(\text{CH}_3)_2\text{SO}_4$.

Properties: Colorless liquid; vapors are very poisonous! Soluble in alcohol and ether; very slightly soluble in water. Sp. gr. 1.3516; m. p. -26.8°C; b. p. 188°C (dec).

Derivation: By adding fuming sulfuric acid to methyl alcohol and distilling in vacuo.

Method of purification: Rectification.

Grades: Technical.

Containers: Returnable drums; tank cars.

Uses: Methylating agent for amines and phenols.

Danger: Extremely hazardous liquid and vapor. Causes severe burns. MCA warning label.

Shipping regulations: Corrosive liquid.

White label.*

dimethyl sulfide (methyl sulfide; methanethio-methane) $(\text{CH}_3)_2\text{S}$.

Properties: Colorless liquid; disagreeable odor. Soluble in alcohol and ether; insoluble in water. Sp. gr. 0.845 (20°C); m. p. -83°C; b. p. 37.5°C.

Derivation: (a) From kraft pulping black liquor, by heating it with inorganic sulfur compounds at high temperatures and pressures; (b) by interaction of a solution of potassium sulfide and methyl chloride in methanol.

Method of purification: Rectification.

Uses: Gas odorant; solvent for many inorganic substances; catalyst impregnator.

Shipping regulations: Flammable liquid.

Red label.*

dimethylsulfonyloxybutane. See nitrogen mustards.**dimethyl sulfoxide** (DMSO) $(\text{CH}_3)_2\text{SO}$.

Properties: Colorless liquid; b. p. 189°C; m. p. 18.45°C; sp. gr. 1.100 (20/20°C); specific heat 0.7; nearly odorless; slightly bitter taste; miscible with water.

Derivation: From dimethyl sulfide by a liquid phase oxidation process (a nitrogen oxide or nitric acid are reported to be used).

Containers: Drums; tank cars.

Uses: As a powerful solvent with low toxicity, for synthetic fibers, especially polyacrylonitrile fibers, industrial cleaners, pesticides, paint stripping; hydraulic fluids; treatment of wool felt.

dimethyl terephthalate (DMT) $\text{C}_6\text{H}_4(\text{COOCH}_3)_2$.

Properties: Colorless crystals; m. p. 140°C; sublimes above 300°C; insoluble in water; soluble in ether and hot alcohol.

Derivation: (a) Oxidation of para-xylene with nitric acid followed by esterification with methanol; (b) step-wise catalytic air oxidation of para-xylene with intermediate esterification of the para-toluic acid; (c) liquid phase oxidation of mixed xylenes followed by esterification.

Grade: Technical.

Uses: Polyester resins for film and fiber production.

dimethyl tetrachloroterephthalate. See dacthal.**N, N-dimethyl-N'-(alpha-thenyl)-N'-phenyl-ethylenediamine hydrochloride.** See methaphenylene hydrochloride.**N, N-dimethyl-N'-(3-thenyl)-N'-(2-pyridyl)-ethylenediamine hydrochloride.** See thenyldiamine hydrochloride.**O, O-dimethyl 2,2,2-trichloro-1-hydroxyethylphosphonate** ("Dipterex;" "Dylox;" "Neguvon") $(\text{CH}_3\text{O})_2\text{P}(\text{CHOHCCl}_3)\text{O}$. White

crystalline solid; m. p. 83-84°C; soluble in water. Used as an insecticide.

Caution! May be harmful if swallowed, inhaled or absorbed through the skin. Over-exposure will result in cholinesterase depression.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

(O, O-dimethyl O-(2, 4, 5 trichlorophenyl) phosphorothioate). See ronnel.

dimethyl tubocurarine chloride $C_{40}H_{48}Cl_2N_2O_6$.
Dimethyl ether of tubocurarine chloride.

Properties: White odorless, crystalline powder; when heated to 236°, decomposes with evolution of gas. Soluble in water and diluted sodium hydroxide; sparingly soluble in alcohol and diluted hydrochloric acid; very slightly soluble in chloroform; practically insoluble in benzene and ether.

Grade: N. N. D.

Use: Medicine.

dimethyl tubocurarine iodide $C_{40}H_{48}I_2N_2O_6$.

Dimethyl ether of d-tubocurarine iodide.

Properties: White to pale yellow, odorless, crystalline powder. When heated to about 257°, decomposes with evolution of gas. Slightly soluble in water, diluted hydrochloric acid and diluted sodium hydroxide; very slightly soluble in alcohol, benzene, chloroform, and ether.

Grade: N. F. XI.

Use: Medicine.

N, N'-dimethylurea (sym-dimethylurea, 1, 3-dimethylurea) $(CH_3NH)_2CO$.

Properties: Colorless prisms, sp. gr. 1.14; m. p. 106°C; b. p. 270°C; soluble in water and alcohol; insoluble in ether.

Typical specifications. Setting point 104°C (min); 0.05% amine; gray to white color; methylamine odor.

Use: Intermediate in synthesis of drugs.

1, 3-dimethylxanthine. See theophylline.

3, 7-dimethylxanthine. See theobromine.

dimolybdenum trioxide. See molybdenum sesquioxide.

dimyristyl amine (ditetradecylamine)

$(C_{14}H_{29})_2NH$. Solid; m. p. 52°C, sp. gr. 0.89. Almost insoluble in water. Used as an organic intermediate.

dimyristyl ether (ditetradecyl ether)

$(C_{14}H_{29})_2O$.

Properties: M. p. 38-40°C; b. p. 238-248°C (4 mm); sp. gr. 0.8127 (45/4°C).

Grade: 95% (min) purity.

Uses: Electrical insulators; water repellents lubricants in plastic molding; antistatic substances, chemical intermediates.

dimyristyl sulfide (ditetradecyl sulfide; di-myristyl thioether) $(C_{14}H_{29})_2S$.

Properties: Solid, m. p. 49-50°C; b. p., decomposes; sp. gr. 0.8258 (50/4°C).

Grades: 95% (min) purity.

Uses: Organic synthesis (formation of sulfonium compounds).

dimyristyl thioether. See dimyristyl sulfide.

N, N'-di-beta-2-naphthyl-meta-phenylene-diamine $C_{24}H_{16}(NHC_{10}H_7)_2$.

Properties: Colorless needles; m. p. 191°C, sparingly soluble in alcohol, insoluble in water and ether.

Derivation: By heating meta-phenylene-diamine with beta-naphthol and subsequent extraction with alcohol.

Method of purification: Crystallization.

Use: Organic synthesis.

N, N'-di-beta-naphthyl-para-phenylenediamine (DNPD) $C_{24}H_{16}(NHC_{10}H_7)_2$.

Typical specifications: Gray powder, set point 225°C (min); purity 98% (min); sp. gr. 1.20; insoluble in water; slightly soluble in acetone and chlorobenzene.

Grade: Pure.

Uses: Antioxidant; stabilizer; polymerization inhibitor; intermediate in organic synthesis.

dinitraniline. Same as dinitroaniline.

dinitraniline orange. A pigment made from dinitraniline and beta-naphthol. It is a reddish shade orange that has excellent light-fastness. This pigment has better resistance to bleeding in oils and solvents than the ortho-nitraniline type and it is used for awning paints. It is suitable for trim paints and enamels and it matches the federal shade known as "international orange." It has comparatively poor heat resistance and therefore is not generally employed in finishes that are to be baked.

dinitroaminophenol. See picramic acid.

2, 4-dinitroaniline (2, 4-dinitraniline)

$C_6H_3NH_2(NO_2)_2$.

Properties: Yellow crystals; slightly soluble in alcohol; insoluble in water. Sp. gr. 1.615, m. p. 187.5-188°C.

Derivation: By the nitration of para-nitroaniline with hot mixed acid.

Method of purification: Crystallization.

Grades: Technical; pure.

Containers: Fiber kegs; steel drums.

Use: Organic synthesis.

Shipping regulations: None.*

2, 4-dinitroanisole (2, 4-dinitrophenyl methyl ether) $CH_3OC_6H_3(NO_2)_2$. An effective ovicide.

Properties: Colorless to yellow monoclinic needles from water or alcohol; m. p. 88°C; sp. gr. 1.341 (20/4°C), sublimes; slightly soluble in hot water, soluble in alcohol and ether.

Use: Effective against moths, furniture and carpet beetles, cockroaches, and body lice.

dinitrobenzene (binitrobenzene) $C_6H_4(NO_2)_2$.

Meta, ortho and para isomers.

Properties: Yellow crystals; soluble in alcohol; slightly soluble in water. Sp. gr.: meta 1.546, ortho 1.565, para 1.6; m. p. meta 89.9°C, ortho 117.9°C, para 172-173°C; b. p. meta 302.8°C, ortho 319°C, para 299°C.

Derivation: By nitration of nitrobenzene with hot mixed acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: 5-, 25-, 50-, 100-lb drums.

Uses: Organic synthesis; dyes; camphor substitute in celluloid production.

Shipping regulations: Solid or liquid form, class B poison. Poison label.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

3,5-dinitrobenzoyl chloride $(\text{NO}_2)_2\text{C}_6\text{H}_3\text{COCl}$.

Properties: Needles; m. p. 66-68°C; b. p. 196°C (12 mm); decomposed by water and alcohol.

Use: Reagent.

2,4-dinitro-ortho-sec-butylphenol (2-sec-butyl-4,6-dinitrophenol; DNBP)

$\text{CH}_3(\text{C}_2\text{H}_5)\text{CH}(\text{C}_6\text{H}_2(\text{NO}_2)_2)\text{OH}$.

Properties: A reddish brown liquid, slightly soluble in water, soluble in alcohol and other organic solvents. Forms salts with metals and organic bases.

Uses: It is an excellent insecticide and ovicide, but due to its toxicity to plants must be used in the dormant growth season or as a salt form to reduce toxicity. It is also used as a herbicide for pre-emergence treatment.

Available commercially as the triethanolamine salt. See "DN-289."

dinitrochlorobenzene. See 1-chloro-2,4-dinitrobenzene.

dinitrochlorobenzol. See 1-chloro-2,4-dinitrobenzene.

4,6-dinitro-ortho-cresol (DNOC, 4,6-dinitro-2-methyl phenol) $\text{CH}_3\text{C}_6\text{H}_3(\text{NO}_2)_2\text{OH}$.

Properties: Yellow solid; m. p. 85.8°C; very slightly soluble in water.

Use: Dormant ovicidal spray for fruit trees (highly phytotoxic and cannot be used successfully on actively growing plants).

Danger! Poisonous by swallowing or skin contact. Absorbed through skin. MCA warning label.

2,4-dinitro-6-cyclohexylphenol. See dinitro-ortho-cyclohexylphenol.

dinitro-ortho-cyclohexylphenol (2,4-dinitro-6-cyclohexylphenol; DNOCHP)

$\text{C}_6\text{H}_{11}\text{C}_6\text{H}_2(\text{NO}_2)_2\text{OH}$. An insecticide which has partially replaced 4,6-dinitro-ortho-cresol.

Use: Control of mites on citrus fruits.

dinitrodibenzyldisulfonic acid

$(\text{CH}_2\text{C}_6\text{H}_4\text{SO}_3\text{HNO}_2)_2$.

Properties: Colorless plates or tablets, soluble in water, alcohol, and ether.

Derivation: By the oxidation of sodium para-nitrotoluene sulfonate with sodium hypochlorite in an excess of caustic soda.

3,5-dinitro-2,6-dimethyl-4-tert-butylacetophenone. See musk ketone.

2,4-dinitro-4-hydroxydiphenylamine

$(\text{NO}_2)_2\text{C}_6\text{H}_3\text{NHC}_6\text{H}_4\text{OH}$.

Properties: Yellow solid; m. p. 190°C; insoluble in water.

Derivation: Condensation of 2,4-dinitro-1-chlorobenzene and para-aminophenol.

2,6-dinitro-3-methoxy-4-tert-butyltoluene. See musk ambrette.

dinitronaphthalene $\text{C}_{10}\text{H}_6(\text{NO}_2)_2$. Isomers:

(a) 1,5-; (b) 1,8-.

Properties: (a) Yellowish-white needles, (b) yellowish-white, thick, crystalline tablets. M. p. (a) 217°C; (b) 172°C. (a) Sparingly soluble in pyridine;

(b) soluble in pyridine.

Derivation: By dissolving alpha-nitronaphthalene in sulfuric acid and adding nitric acid. The solution is heated to 80-90°C and cooled.

Method of purification: Crystallization.

Grades: Technical.

Containers: Wooden kegs; fiber drums.

Uses: Dyes, especially sulfur colors; intermediates.

Shipping regulations: None.*

2,4-dinitro-1-naphthol-7-sulfonic acid

(flavianic acid) $\text{C}_{10}\text{H}_6\text{O}_6\text{N}_2\text{S}$.

Properties: Yellow needles; m. p. 151°C; very soluble in water.

Uses: Intermediate; precipitant for organic bases; reagent for amino acids.

dinitrophenol $\text{C}_6\text{H}_3\text{OH}(\text{NO}_2)_2$. Commercial material is usually the mixture of 2,3-, 2,4-, and 2,6-isomers that are formed by action of sulfuric-nitric acid mixtures on phenol.

Properties: Yellow crystals. (2,3) sp. gr. 1.681; m. p. 144°C. (2,4) sp. gr. 1.683; m. p. 114-115°C. (2,6) m. p. 63°C. Soluble in alcohol and ether, also benzene and chloroform; slightly soluble in water (2,3 most soluble).

Derivation: (a) By heating phenol with dilute sulfuric acid, cooling the product, and then nitrating, keeping the temperature below 50°C. (b) By nitration with mixed acid with very careful temperature control.

Method of purification: Crystallization.

Grades: Technical.

Containers: Galvanized or stainless steel drums; fiber cans; barrels.

Uses: Dyes, especially sulfur colors; picric acid, picramic acid, conservation of lumber timbers and poles; starting point in the manufacture of the photographic developer diaminophenol hydrochloride.

Fire hazard: Dangerous. None when wet.

Shipping regulations: Solutions, poison, class B. Poison label.*

2,4-dinitrophenyl methyl ether. See 2,4-dinitroanisole.

2,4-dinitro-6-phenylphenol

$(\text{NO}_2)_2(\text{C}_6\text{H}_5)\text{C}_6\text{H}_2\text{OH}$.

Use: Agricultural insecticide; chemical synthesis.

2,4-dinitrosoresorcinol $\text{C}_6\text{H}_2(\text{OH})_2(\text{NO})_2\cdot\text{H}_2\text{O}$.

Properties: Light brown powder; m. p. 162-163°C. Decomposes, sometimes violently. Soluble in water and most organic solvents.

Grade: Technical (13.7% N).

Uses: Chelation of heavy metals; cross-linking agent.

Caution! Avoid contact with skin and breathing of dust.

Shipping regulations: Flammable solid. Yellow label.*

3,5-dinitrosalicylic acid

$\text{C}_6\text{H}_2(\text{OH})(\text{NO}_2)_2\text{COOH}$.

Properties: Yellow crystals; slightly soluble in water; soluble in alcohol and benzene; m. p. 174°C.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: Nitration of salicylic acid.
 Method of purification: Recrystallization.
 Grades: C. P.
 Containers: Glass bottles.
 Uses: Determination of glucose.
 Shipping regulations: None.*

dinitrostilbene disodium sulfonate

(4, 4'-dinitrostilbene-2, 2'-disulfonic acid, disodium salt)
 $\text{NaSO}_3(\text{NO}_2)\text{C}_6\text{H}_3\text{CH}:\text{CHC}_6\text{H}_3(\text{NO}_2)\text{NaSO}_3$.

Properties: Yellow crystals; very soluble in hot water; moderately soluble in cold water; slightly soluble in alcohol and ether. M. p., decomposes.
 Containers: Fiber kegs.

4, 4'-dinitrostilbene-2, 2'-disulfonic acid, disodium salt. See dinitrostilbene disodium sulfonate.**dinitrotoluene** (dinitrotoluol; DNT)

$\text{C}_6\text{H}_3\text{CH}_3(\text{NO}_2)_2$ (a) 2, 4-, (b) 3, 4-, (c) 3, 5-.
 Properties: Yellow crystals; soluble in alcohol and ether; insoluble in water. Sp. gr. (a) 1.3208, (b) 1.32, (c) 1.277; m. p. (a) 70.5°C, (b) 61°C, (c) 92.3°C.

Derivation: By nitration of nitrotoluene with hot nitrosulfuric acid.
 Method of purification: Crystallization.
 Grades: Technical.
 Containers: Fiber drums.
 Uses: Organic syntheses; toluidines; dyes, explosives.
 Fire hazard: Dangerous.*

dinitrotoluol. See dinitrotoluene.**2, 6-dinitro-3, 4, 5-trimethyl-tert-butylbenzene.** See "Musk Tibetene."**dinonyl adipate** (DNA). Ester of nonyl alcohol (trimethyl hexanols as major component, dimethyl heptanols as minor component, as well as small amounts of other isomers).

Properties: B. p. 201-210°C (1 mm); sp. gr. 0.926 (25°C); refractive index (n 20/D) 1.4523; viscosity 14.9 centistoke (100°F).
 Derivation: By heating adipic acid and nonyl alcohol in the presence of a trace of an acidic catalyst and removing the water of reaction as an azeotrope with a solvent such as toluene or xylene.

Use: Plasticizer where special low-temperature properties are desired.

dinonyl carbonate ($\text{C}_9\text{H}_{19}\text{OC}_2\text{O}_2$). Ester of nonyl alcohol; b. p. 135-140°C (0.3 mm); sp. gr. 0.894 (25°C); refractive index (n 20/D) 1.4427.**dinonyl ether** $\text{C}_9\text{H}_{19}\text{OC}_9\text{H}_{19}$.

Properties: B. p. 148-153°C (5 mm); sp. gr. 0.817 (25°C); refractive index (n 20/D) 1.4405. Dinonyl ether can be made from nonyl alcohol plus nonyl halide by the Williamson reaction.

dinonyl maleate $\text{C}_9\text{H}_{19}\text{OOCCH}:\text{CHCOOC}_9\text{H}_{19}$.

Ester of nonyl alcohol; b. p. 157-167°C (0.1 mm); sp. gr. 0.941 (25°C); refractive index (n 20/D) 1.4586; viscosity 6900 centistoke (-40°F), 17.47 centistoke (100°F), 3.50 centistoke (210°F).

dinonyl phenol ($\text{C}_9\text{H}_{19}\text{O}_2\text{C}_6\text{H}_3\text{OH}$).

Properties: Insoluble in water, soluble in common organic solvents.
 Use: Solvent.

dinonyl phthalate (DNP) $\text{C}_6\text{H}_4(\text{COOC}_9\text{H}_{19})_2$.
 Ester of nonyl alcohol.

Properties: B. p. 205-220°C (1 mm); sp. gr. 0.979 (25°C); refractive index (n 20/D) 1.4871; viscosity 55.3 centistoke (100°F); flash point 420°F.

Derivation: By heating phthalic acid and nonyl alcohol in the presence of a trace of an acid catalyst and removing the water of reaction as an azeotrope with a solvent such as xylene or toluene.

Use: General purpose low-volatile plasticizer for vinyl resins; pure grade as stationary liquid phase in chromatography.

"Dinopol MOP" Plasticizer. ⁵⁵ Brand name for mixed octyl phthalates, of the type of $\text{C}_8\text{H}_7(\text{COOR})_2$.

Properties: Almost colorless, oily liquid; insoluble or only slightly soluble in glycerol, glycols, and certain amines. Soluble in most organic liquids.

Typical specifications: Sp. gr. (20/20°C) 0.975 ± 0.003; f. p. -40°C; boiling range 232-267°C (4 mm); acidity, max. 0.01% as acetic acid; flash point 435°F; fire point 505°F; vapor pressure 0.01 mm (150°C), refractive index 1.482 (25°C); viscosity 45 cps (20°C), surface tension 31 dynes/cm (20°C); thermal expansion 0.00074 (10-40°C); wt/gal 8 lbs.

Containers: 1-, 5-gal cans; 55-gal drums; tank cars.

Uses: Primary plasticizer for most resins, imparting permanent flexibility, low-temperature flexibility, low water extraction, and heat stability.

DIOA. Abbreviation for diisooctyl adipate.**dioctadecylamine.** See distearylamine.**dioctadecyl ether.** See distearyl ether.**dioctadecyl sulfide.** See distearyl sulfide.**3, 3'-dioctadecyl thiodipropionate.** See distearyl thiodipropionate.**dioctyl adipate.** Now more correctly named di(2-ethylhexyl) adipate (q. v.).**dioctylamine.** See di-2-ethylhexylamine.**dioctylaminoethanol.** See di(2-ethylhexyl) aminoethanol.**dioctyl azelate.** See di(2-ethylhexyl) azelate.**dioctyl chlorophosphate** (dioctyl phosphorochloridate) ($\text{C}_8\text{H}_{17}\text{O}_2\text{P}(\text{O})\text{Cl}$).

Properties: Water-white liquid; sp. gr. 0.991 (25°C); refractive index 1.445 (n 25/D); decomposes on distillation; soluble in common inert organic solvents; insoluble in water.

Uses: Intermediate in organic synthesis.

di-n-octyl, n-decyl adipate (DNODA).

Properties: Clear oily liquid; color, APHA 50 max; sp. gr. 0.912-0.920 (25/25°C);

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- refractive index 1.443-1.447 (25°C).
Containers: 5- and 55-gal black iron drums; tank cars.
Uses: Low temperature plasticizer.
- di(n-octyl, n-decyl) phthalate (DNODP).**
Properties: Clear oily liquid; color APHA 50 max; odor slight; acidity (as phthalic acid) 0.01% max; sp. gr. 0.968-0.977 (25/25°C).
Containers: 5-, 55-gal drums; tank cars.
Uses: Plasticizer for polyvinyl chloride.
- dioctyl ether (C₈H₁₇)₂O.**
Properties: Liquid; m. p. -7°C; b. p. 291.7°C; sp. gr. 0.805 (17/4°C); refractive index 1.4329 (n_D 24/D).
Grades: 95% (min) purity.
Uses: Electrical insulator; water repellent, lubricant in plastic molding and processing, antistatic substance; chemical intermediate.
- dioctyl hexahydrophthalate.** See di(2-ethylhexyl) hexahydrophthalate.
- dioctyl isophthalate.** See di(2-ethylhexyl) isophthalate.
- dioctyl phosphite (dioctyl phosphonate) (C₈H₁₇O)₂P(O)H.**
Properties: Water-white liquid; b. p. 150-155°C (2-3 mm); sp. gr. 0.929 (25°C); refractive index 1.4418 (n_D 25/D); soluble in common organic solvents.
Containers: Carboys.
Uses: Solvent; antioxidant; intermediate.
- dioctyl phosphonate.** See dioctyl phosphite.
- dioctyl phosphoric acid.** See di(2-ethylhexyl) phosphoric acid.
- dioctyl phosphorochloridate.** See dioctyl chlorophosphate.
- dioctyl phthalate.** See di(2-ethylhexyl) phthalate.
- di(2-octyl) phthalate.** See dicapryl phthalate.
- dioctyl sebacate.** See di(2-ethylhexyl) sebacate.
- dioctyl sodium sulfosuccinate (di(2-ethylhexyl) sodium sulfosuccinate) C₂₀H₃₇NaO₇S.** An anionic surface-active agent.
Properties: White, wax-like, plastic solid with characteristic odor. Slowly soluble in water; freely soluble in alcohol and glycerin; very soluble in petroleum ether. Saponification value 240-253; stable in acid and neutral solutions; hydrolyzes in alkaline solutions.
Derivation: By esterification of maleic anhydride with 2-ethylhexyl alcohol followed by addition of sodium bisulfite.
Grade: N. F. XI.
Use: Medicine.
- dioctyl succinate.** See di(2-ethyl hexyl) succinate.
- dioctyl sulfide (dioctyl thioether) (C₈H₁₇)₂S.**
Properties: Liquid; m. p. 0.5°C; b. p. 180°C (10 mm), sp. gr. 0.8419 (17/17°C); refractive index 1.4606 (n_D 20/D).
Grades: 95% (min) purity.
Uses: Organic synthesis (formation of sulfonium compounds).
- dioctyl thioether.** See dioctyl sulfide.
- dioctyl thiopropionate.** See 3,3'-(2-ethylhexyl) thiodipropionate.
- diode.** A two-electrode device (usually assembled from a semiconductor material and connecting wiring, etc.), having an anode and a cathode and which has marked unidirectional characteristics, as far as the behavior of an electrical current is concerned.
- diode, crystal.** A diode consisting of a semiconductor such as germanium or silicon, as one electrode, and a fine wire whisker resting on the semiconductor as the other electrode. Used as a rectifier or detector of microwave frequencies.
- "Diodoquin."** ⁷⁰ Trademark for diiodohydroxyquin, U. S. P.
- "Diodrast."** ¹⁶² Trademark for iodopyracet.
- "Diol."** ⁵¹ Trademark for low carbon content and low pour point diesel engine lubricants for 2-stroke cycle, crankcase-scavenging engines and certain other diesels.
- diolefin.** See diene.
- DIOP.** Abbreviation for diisooctyl phthalate.
- diopside, fused CaMgSi₂O₆.** A synthetic diopside produced in the electric furnace and used as a refractory. Natural diopside is a mineral and is also sometimes used as a gem-stone.
- diorite.** A granitoid rock composed essentially of hornblende and feldspar. Quartz may be present in considerable amount, in which case the rock is called quartz diorite. Quarried for crushed rock in the District of Columbia, Virginia and many other states.
- DIOS.** Abbreviation for diisooctyl sebacate (q. v.).
- diosma.** See buchu.
- 1,4-dioxane (diethylene ether; 1,4-diethylene dioxide; diethylene oxide; dioxyethylene ether) OCH₂CH₂OCH₂CH₂.**
Properties: Flammable colorless liquid; faint pleasant ethereal odor, stable; miscible with water and most organic solvents. Vapor harmful.
Constants: B. p. 101.3°C; f. p. 11.8°C; sp. gr. 1.0356 (20/20°C); wt/gal 8.61 lbs (20°C); refractive index 1.4221 (20°C); surface tension 36.9 dynes/cm (25°C); vapor pressure 29.0 mm (20°C); viscosity 0.0131 poise (20°C); specific heat 0.420 cal/g (20°C); heat of fusion 33.8 cal/g; flash point 18°C (65°F) (ASTM open cup); latent heat of evaporation 98.6 cal/g at b. p.; heat of combustion 581 kg cal/mole; coefficient of expansion 0.00108 (20°C); electric conductivity < 2 x 10⁻⁸ recip. ohms

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

(25°C); miscible in all proportions with water.

Typical specifications: Acidity not more than 0.01% (as acetic); sp. gr. 1.030-1.038 (20/20°C); color water-white; odor mild, non-residual; f. p. not lower than 10°C; boiling range (760 mm) below 95°C none, above 103°C none; average wt/gal 8.61 lbs (20°C).

Derivation: (a) Ethylene glycol by treatment with acid; (b) from beta, beta-dichloroethyl ether by treatment with alkali.

Method of purification: Distillation.

Grades: Reagent; technical.

Containers: 1-, 5-gal cans; 55-gal (non-returnable) drums; tank cars.

Uses: Solvent for cellulose acetate and other derivatives, fats, greases, natural and synthetic resins, oil-soluble dyes, mineral oils, vegetable oils, blown and heat-bodied oils; lacquers; paints; varnishes, paint and varnish removers; plastics; wetting and dispersing agent in textile processing, dye baths, stain and printing compositions; cleaning and detergent preparations, cements; cosmetics; deodorants, fumigants; emulsions; glues; polishing compositions, shoe creams; stabilizer for chlorinated solvents.

Warning! Flammable. Vapor harmful, tends to form explosive peroxides, especially when anhydrous. MCA warning label.

Shipping regulations: Flammable liquid. Red label.*

2,3-para-dioxanedithiol-S, S-bis-(O, O-diethyl-phosphorodithioate $C_{12}H_{26}O_6P_2S_4$)

Properties: Tan liquid. M. p. -20°C.

Practically insoluble in water; partly soluble in hexane.

Use: Insecticide.

dioxolane $OCH_2CH_2OCH_2$.

Properties: Water-white liquid; soluble in water, stable under neutral or slightly alkaline conditions. Sp. gr. 1.065, b. p. 74°C; flash point 35°F, vapor pressure 70 mm (20°C), wt/gal 8.2 lbs (20°C).

Grades: Technical.

Use: Suitable as a low-boiling solvent and extractant for oils, fats, waxes, dyes, and cellulose derivatives.

Shipping regulations: Flammable liquid. Red label.*

dioxolanes. Cyclic acetals resulting from action of an aldehyde and a glycol. Thus ethylene glycol and formaldehyde give the simplest compound of this type, dioxolane.

dioxolone-2. See ethylene carbonate.

dioxopurine. See xanthine.

dioxyanthraquinones. See dihydroxyanthraquinones.

dioxybenzenes. See dihydroxybenzenes.

dioxyethylene ether. See 1,4-dioxane.

dioxyline phosphate ("Paveril" Phosphate) $C_{22}H_{25}NO_4 \cdot H_3PO_4$. 6,7-Dimethoxy-1-

(4'-ethoxy-3'-methoxy-benzyl)-3-methyl-isoquinoline phosphate.

Properties: White crystalline, odorless solid with a bitter taste; soluble in water; melts (with decomposition) 197-199°C.

Use: Medicine.

dioxynaphthalenes. See dihydroxynaphthalenes.

DIOZ. Abbreviation for diisooctyl azelate (q.v.).

DIPA. Abbreviation for diisopropanolamine (q.v.).

dipalmitylamine (dihexadecylamine)

$(C_{16}H_{33})_2NH$. Solid; m. p. 65°C; sp. gr. 0.83; almost insoluble in water. Used as a chemical intermediate.

"Di-Paralene." ³ Trademark for chlorcyclizine hydrochloride (q.v.).

dipentaerythritol $(CH_2OH)_3CCH_2OCH_2C(CH_2OH)_3$. Found in technical pentaerythritol.

Containers: Up to carload or truckload quantities.

Uses: Paints and coatings.

"Dipentek." ¹³⁸ Trade name for dipentaerythritol, technical.

Properties: An off-white, free-flowing powder. The molecule contains six primary hydroxyl groups, all of which are esterifiable.

Container: 50-lb multi-wall bags.

Uses: For high viscosity vehicles and fast drying alkyds.

dipentene (cinene, limonene, inactive, dl-parmentha-1,8-diene, cajuputene) $C_{10}H_{16}$.

Commercial form is high in dipentene content, but also contains other terpenes and related compounds in varying amounts.

Properties: Colorless liquid; pleasant, lemon-like odor, sp. gr. (15.5/15.5°C) 0.847; b. p. 175-176°C (760 mm); flash point (closed cup) 43°C; wt/gal 7.15 lbs (15.5°C). Miscible with alcohol; insoluble in water.

Typical specifications: Sp. gr. 0.859-0.862 (15°C); moisture content, trace; refractive index 1.472-1.477 (25°C); kauri-butanol solvency test 88; flash point (closed cup) 114°F; acidity none; color water-white, wt/gal 7.20 lbs; distillation range 170°-200°C.

Derivation: (a) From various ethereal oils, particularly Levant wormseed oil, (b) By close fractionation of wood turpentine.

(c) By-product in making synthetic camphor.

Grades: Steam distilled; destructively distilled.

Containers: 30-, 55-gal non-returnable galvanized drums; tank cars.

Uses: Solvent for oleoresinous products, rosin, ester gum, cumar and alkyd resins, waxes, metallic soap driers, rubber, etc.; rubber compounding and reclaiming of rubber; dispersing agent for oils, resins, resin-oil combinations, pigments and driers; paints, enamels, lacquers, and varnishes; general wetting and dispersing agent; printing inks; perfumes; substitute for turpentine and petroleum solvents in

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

floor waxes and furniture polishes;
manufacture of synthetic resins, poly-
terpenes, chemicals.

Fire hazard: Flammable.

Shipping regulations: None.*

dipentene dioxide (limonene dioxide) $C_{10}H_{16}O_2$.

Properties: Liquid; sp. gr. 1.0287 (20°C);
b. p. 242°C; f. p. -100°C, soluble in water.

Uses: Intermediate for plasticizers, epoxy
resins; pharmaceuticals.

dipenteneglycol. See terpin hydrate.

dipentene monoxide (limonene monoxide)

$C_{10}H_{16}O$.

Properties: Liquid; sp. gr. 0.929 (20°C).

Use: Organic intermediate; epoxy resins.

"Dipentene No. 122." ²⁶⁶ Trademark for
technical grade dipentene (dl-limonene);
colorless, mobile liquid; ASTM distillation
range, 5-95%, 175-181°C.

"Dipentene No. 213." ²⁶⁶ Trade name for a
mixture of monocyclic terpenes; color-
less, mobile liquid, ASTM distillation
range, 5-95%, 176-187°C.

"Dipentite." ³⁰⁶ Trademark for
 $C_6H_5OP(OCH_2)_2C(CH_2O)_2POC_6H_5$ (spiro).

Properties: White powder, b. p. 190°C
(0.1 mm).

Containers: 12-gal pails, 25 lbs net.

Use: Stabilizer for resins.

2,5-di(tert-pentyl)hydroquinone. See 2,5-
di(tert-amyloxy)hydroquinone.

diphemanil methyl sulfate (4-diphenylmethyl-
ene-1,1-dimethylpiperidinium methyl
sulfate)
 $(C_6H_5)_2C(C_6H_5)CH_2N(CH_3)_2CH_2CH_2 \cdot CH_3SO_4$.

Properties: White or near white, bitter
crystalline solid with faint characteristic
odor. M. p. 189-196°C. Very slightly
soluble in ether, slightly soluble in alco-
hol, chloroform, and water. Stable to
heat and light, somewhat hygroscopic;
pH (1% solution) 4.0-6.0.

Grade: N. F. XI.

Use: Medicine.

diphenadione (2-diphenylacetyl-1,3-indane-
dione) $C_{23}H_{16}O_3$.

Properties: Yellow, odorless crystals or
crystalline powder. Practically insoluble
in water, slightly soluble in acetone and
in alcohol, soluble in benzene, ether, and in
glacial acetic acid. Melting range: 144-
150°C.

Grade: N. F. XI.

Use: Medicine.

diphenatril. See diphenylacetoneitrile.

diphenhydramine hydrochloride (2-benzhy-
dryloxy)-N,N-dimethylethylamine hydro-
chloride; beta-dimethylaminoethyl benz-
hydryl ether hydrochloride)
 $(C_6H_5)_2CHOCH_2CH_2N(CH_3)_2 \cdot HCl$.

Properties: White, odorless, crystalline
powder. Darkens slowly on exposure to
light; m. p. 166-170°C. Solutions practi-
cally neutral to litmus paper. Freely

soluble in water, alcohol and chloroform;
slightly soluble in acetone; very slightly
soluble in benzene and ether.

Grades: U. S. P. XVI.

Use: Medicine.

diphenic acid (2,2'-biphenyldicarboxylic acid)
 $HOOC(C_6H_4)_2COOH$.

Properties: White needles; m. p. 228-229°C;
soluble in hot water.

Use: Synthesis of dyes, detergents, pharma-
ceuticals.

"Diphenolic Acid." ⁴²⁴ (DPA). Trademark
for 4,4-bis(4-hydroxyphenyl)pentanoic acid,
 $CH_3(C_6H_4OH)_2CCH_2CH_2COOH$.

Properties: White or light tan powder with
a slight phenolic odor; m. p. 170-173°C.
Soluble in hot water, alcohol and acetone;
insoluble in benzene and cold water.

Uses: Paint formulations; coatings and
finishes.

diphenyl (biphenyl) $C_6H_5C_6H_5$. Several crystal-
line forms are known.

Properties: White scales, pleasant odor.

Soluble in alcohol and ether; insoluble in

water. Sp. gr. approx 1, m. p. 70°C;

b. p. 255°C.

Derivation: (a) By slowly passing benzene
through a red hot iron tube. (b) By heating
bromobenzene and sodium, with subsequent
distillation.

Method of purification: Crystallization.

Grades: Technical.

Containers: Tins; steel drums; tank cars.

Uses: Organic synthesis; heat transfer agent,
fungicides; dyeing assistant for polyesters.

Shipping regulations: None.*

diphenylacetic acid $(C_6H_5)_2CHCOOH$.

Properties: Colorless, odorless crystals;

b. p. sublimes, m. p. 147.8-148.2°C;

soluble in hot water, alcohol, ether,
chloroform.

diphenylacetoneitrile (diphenatril) $(C_6H_5)_2CHCN$.

Properties: Yellow crystalline powder; m. p.
73-73.5°C; insoluble in water and very sol-
uble in alcohol.

Uses: Preparation of diphenylacetic acid,
para-diphenylethylamine and synthesis of
anti-spasmodics, as an herbicide.

diphenylacetylene. See tolan.

2-diphenylacetyl-1,3-indanedione. See diphen-
adione.

diphenylamine (DPA, phenylaniline) $(C_6H_5)_2NH$.

Properties: Colorless to grayish crystals.

Soluble in alcohol and ether; slightly solu-
ble in water. Sp. gr. 1.159; m. p. 52.85°C,
b. p. 302°C.

Derivation: By heating equal formula weights
of aniline and aniline hydrochloride in an
autoclave. The product is boiled with dilute
hydrochloric acid to remove the unaltered
aniline, and the residue is distilled.

Method of purification: Crystallization.

Grades: Technical; refined, flake and fused.

Containers: 350-lb barrels; fiber drums.

Uses: Antioxidant additives; stabilizers for
plastics, including solid rocket propellants;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

pesticides; explosives; dyes; pharmaceuticals.

Shipping regulations: None.*

diphenylaminechlorarsine. See phenarsazine chloride.

9,10-diphenylanthracene $C_{14}H_8(C_6H_5)_2$.

Properties: Crystals; m. p. 248-250°C; insoluble in water and alcohol; slightly soluble in toluene.

Grade: Purified.

Uses: As primary fluor or as wave length shifter in solution scintillators.

1,4-diphenylbenzene. See terphenyl.

diphenylbenzidine $C_6H_5NHC_6H_4C_6H_4NHC_6H_5$.

Properties: White powder. Insoluble in water; slightly soluble in alcohol and aromatic hydrocarbons. Sensitive to light. M. p. 242°C.

Derivation: Diphenylamine and fuming sulfuric acid.

Method of purification: Recrystallization.

Grades: C. P.; analytical.

Containers: Glass bottles.

Use: Determination of zinc and nitrites.

Shipping regulations: None.*

diphenylbromoarsine $(C_6H_5)_2AsBr$.

Properties: White crystals. Caution!

Very irritant! M. p. 54-56°C.

Derivation: (a) Hydrobromic acid and diphenylarsenious oxide are heated together for about 4 hours at 115-120°C; (b) by action of arsenic tribromide on triphenyl arsine at 300-350°C.

1,3-diphenyl-2-buten-1-one. See dyphnone.

diphenylcarbazine $(C_6H_5NHNH)_2CO$. Decomposes in light.

Properties: White crystals. Insoluble in water; soluble in alcohol and benzene.

M. p. 173°C.

Derivation: Phenylhydrazine and urea.

Method of purification: Recrystallization.

Grade: C. P.

Containers: Glass bottles.

Use: Determination of copper and other metals.

Shipping regulations: None.*

diphenylcarbinol. See benzhydrol.

diphenyl carbonate (carbonic acid, diphenyl ester) $(C_6H_5O)_2CO$.

Properties: White, crystalline solid. White needles from alcohol. Can be halogenated and nitrated in characteristic manner.

Readily undergoes hydrolysis and ammonolysis when treated respectively with inorganic bases, ammonia and amines. Soluble in acetone, hot alcohol, benzene, carbon tetrachloride, ether, glacial acetic acid and other organic solvents; insoluble in water. B. p. 302°C; m. p. 78°C; sp. gr. 1.1215 (87/4°C).

Grade: Technical.

Uses: Plasticizer and solvent; preparation of other carbonates.

diphenylchloroarsine $(C_6H_5)_2AsCl$.

Properties: Colorless crystals when pure.

The technical product is a dark-brown liquid, which slowly changes into a semi-solid, viscous mass. Decomposed by water (slowly). Insensitive to detonation. Caution! Very irritant! Soluble in carbon tetrachloride, chloropicrin, phenyldichloroarsine; practically insoluble in water. Constants: Sp. gr. 1.363 (40°C) (solid), or 1.358 (45°C) (liquid); b. p. 333°C (in CO_2 atmosphere); m. p. 41°C; vapor pressure 0.0005 mm (20°C); volatility 0.68 mg/cu m (20°C); latent ht of volatilization 56.6 cal; sp. heat 0.217 cal; coefficient of thermal expansion 0.00075.

Derivation: Benzene and arsenic trichloride are heated together in the presence of aluminum chloride.

Grade: Technical.

Use: Military poison gas.

Shipping regulations: Solid, poison, class C. Tear gas label.*

diphenylcyanoarsine $(C_6H_5)_2AsCN$.

Properties: Colorless prisms. Characteristic odor resembling that of a mixture of bitter almonds and garlic. Slowly decomposed by water. Easily decomposed by alkali solutions. Caution! Very irritant! Soluble in alcohol, benzene, ether; slightly soluble in water.

Constants: Sp. gr. 1.45 (20°C); b. p. 213°C (21 mm); m. p. (given variously) 31-35°C; vapor pressure 0.0002 mm (20°C), volatility 0.1-0.15 mg/cu m (20°C).

Derivation: Interaction of hydrocyanic acid and diphenylarsenious oxide.

diphenyl decyl phosphite $(C_6H_5O)_2POC_{10}H_{21}$.

Properties: Nearly water-white liquid; sp. gr. 1.023 (25/15.5°C); m. p. 18°C; refractive index 1.5160 (n 25/D).

Containers: 55-gal containers.

Uses: Chemical intermediate; stabilizer for polyvinyl and polyolefin resins.

diphenyldichlorosilane $(C_6H_5)_2SiCl_2$.

Properties: Colorless liquid; b. p. 305°C; m. p. -22°C; sp. gr. 1.19 (20°C); refractive index (n 25/D) 1.5773; flash point (Cleveland open cup) 288°F. Readily hydrolyzed by moisture, with the liberation of hydrochloric acid.

Derivation: (a) By the reaction of powdered silicon and chlorobenzene in the presence of copper powder as catalyst; (b) by the reaction of phenylmagnesium chloride with silicon tetrachloride.

Grade: Technical.

Use: Intermediate for silicone lubricants.

Shipping regulations: Corrosive liquid. White label.*

diphenyldi-n-dodecylsilane $(C_6H_5)_2Si(C_{12}H_{25})_2$.

Properties: Colorless oil.

Derivation: Reaction of didodecyldichlorosilane with phenyl lithium.

Use: High-temperature lubricant.

diphenyldiethoxysilane $(C_6H_5)_2Si(OC_2H_5)_2$.

Properties: Colorless liquid; b. p. (12 mm) 164°C.

Derivation: Reaction of diphenyldichlorosilane with ethanol.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

diphenyldiimide. See azobenzene.

2, 2-diphenyl-4-dimethylaminovaleronitrile $(C_6H_5)_2C(CN)CH_2CH(CH_3)N(CH_3)_2$. A granular, cream colored solid; m. p. 87°-92°C.
Precaution: Subject to Federal Narcotic Regulation.

diphenyleneimine. See carbazole.

alpha-diphenylenemethane. See fluorene.

diphenylenemethane oxide. See xanthene.

diphenylene oxide (dibenzofuran) $C_{12}H_8O$ (tricyclic).
Properties: Crystalline solid; m. p. 87°C, b. p. 288°C; insoluble in water; slightly soluble in alcohol, ether and benzene.
Derived from coal-tar.

1, 1-diphenylethane. See uns-diphenylethane.

1, 2-diphenylethane. See sym-diphenylethane.

uns-diphenylethane (1, 1-diphenylethane) $(C_6H_5)_2CHCH_3$.
Properties: Colorless liquid. Soluble in chloroform, ether, carbon disulfide.
B. p. 286°C; sp. gr. 1.004 (20°C), m. p. -21.5°C.

Derivation: By the action of acetaldehyde upon benzene in the presence of concentrated sulfuric acid.

Grade: Technical.

Uses: Solvent for nitrocellulose, organic synthesis.

sym-diphenylethane (bibenzyl; dibenzyl; 1, 2-diphenylethane) $C_6H_5CH_2CH_2C_6H_5$.
Properties: White, crystalline needles or small plates. Soluble in alcohol, chloroform, ether, carbon disulfide; insoluble in water. Sp. gr. 0.9782; b. p. 284°C; m. p. 52°C.

Derivation: (a) By treating benzyl chloride with metallic sodium. (b) By the action of benzyl chloride on benzylmagnesium chloride.

Grade: Technical.

Use: Organic synthesis.

diphenyl ether. See diphenyl oxide.

diphenylethylene. See stilbene.

N, N-diphenylethylenediamine (ethylene di-phenyldiamine) $C_6H_5NHCH_2CH_2NHC_6H_5$.
Properties: A cream-colored solid; sp. gr. 1.14; m. p. not definite, starts to soften at about 54°C while the main portion melts between 60-65°C, stable on storage; insoluble in water; soluble in acetone, ethylene dichloride, benzene, and gasoline, anti-oxidant.

Containers: 50-lb bags; 250-lb drums.

Use: As an antioxidant in rubber compounding.

Hazards: No health hazard when used in rubber or GR-S in amounts recommended.

diphenylguanidine (DPG; melaniline) $HN:C(NHC_6H_5)_2$. Isomeric symmetrical and unsymmetrical forms are known, the former being described here.
Properties: White crystalline powder;

sp. gr. 1.13; m. p. 147°C; decomposes above 170°C; soluble in ethyl alcohol, carbon tetrachloride, chloroform, hot benzene and toluene; slightly soluble in water to give an alkaline solution.

Derivation: Treatment of aniline with cyanogen chloride.

Method of purification: Recrystallization.

Grade: Technical.

Containers: Bags; drums.

Uses: Acceleration of rubber vulcanization; primary standard for acids.

Shipping regulations: None.*

diphenylguanidine phthalate.

Properties: White to gray powder; m. p. 178°C; sp. gr. 1.20.

Containers: 50-lb bags; 150-lb drums.

Use: Rubber accelerator.

1, 6-diphenylhexatriene

(DPH) $C_6H_5HC:CHCH:CHC_6H_5$. Used as wave length shifter in solution scintillation counting.

diphenylhydantoin $HNCONHCOC(C_6H_5)_2$.

Properties: White, odorless powder.

Practically insoluble in water; soluble in hot alcohol; slightly soluble in cold alcohol, chloroform, ether; m. p. 292-299°C, with decomposition.

Grade: U. S. P. XVI.

Use: Medicine.

diphenylhydantoin sodium (phenytoin, soluble)

$C_{15}H_{11}N_2O_2Na$. Sodium 5, 5-diphenylhydantoinate.

Properties: White, odorless powder; freely soluble in water; soluble in alcohol; practically insoluble in ether and in chloroform; somewhat hygroscopic, on exposure to air diphenylhydantoin is liberated.

Containers: Up to 100-lb drums.

Use: Medicine.

N, N'-diphenylhydrazine. See hydrazobenzene.

diphenylketone. See benzophenone.

diphenylmethane (benzylbenzene) $(C_6H_5)_2CH_2$.

Properties: Long colorless needles. Soluble in alcohol and ether; insoluble in water.

Sp. gr. 1.0056; m. p. 26.5°C; b. p. 264.7°C.

Derivation: By condensation of benzyl chloride and benzene in presence of aluminum chloride.

Method of purification: Crystallization.

Grade: Technical.

Containers: Iron barrels.

Uses: Organic synthesis; dyes; perfumery.

Shipping regulations: None.*

diphenylmethane diisocyanate

$OCNC_6H_4CH_2C_6H_4NCO$.

Derivation: para, para'-Diaminodiphenylmethane and phosgene.

Uses: Preparation of polyurethane resins; bonding rubber to rayon and nylon cord.

diphenylmethanol. See benzhydrol.

4-diphenylmethoxy-1-methylpiperidine hydrochloride. See diphenylpyraline hydrochloride.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

3-diphenylmethoxytropene methanesulfonate.

See benztropine methanesulfonate.

diphenylmethylchlorosilane $(C_6H_5)_2(CH_3)SiCl$.

Properties: Colorless liquid; b. p. 295°C.

Derivation: Grignard reaction of diphenyl-dichlorosilane with methylmagnesium chloride.

Uses: Intermediate; end stopper for silicone oils.

4-diphenylmethylene-1, 1-dimethylpiperidinium methyl sulfate. See diphemanil methyl sulfate.**1-diphenylmethyl-4-methylpiperazine hydrochloride.** See cyclizine hydrochloride.**diphenyl-naphthylenediamine** $C_{10}H_6(NHC_6H_5)_2$.

Properties: Silvery, crystalline plates.

Slightly soluble in alcohol, insoluble in water. M. p. 164°C.

Derivation: By heating 2, 7-dihydroxynaphthalene with aniline and aniline hydrochloride.

Method of purification: Crystallization.

Use: Organic synthesis.

diphenylnitrosamine. See N-nitrosodiphenylamine.**2, 5-diphenyloxazole** (DPO; PPO) $C_{15}H_{11}NO$.

Properties: Solid; m. p. 70-72°C.

Grade: Scintillation.

Containers: Glass bottles.

Uses: Scintillation counter, or as wave length shifter in liquid scintillators.

diphenyl oxide (phenyl ether, diphenyl ether) $(C_6H_5)_2O$.

Properties: Colorless crystals, geranium odor. Soluble in alcohol and ether; insoluble in water. Sp. gr. 1.072-1.075; m. p. 27°C; b. p. 259°C.

Derivation: By the reaction of bromobenzene and sodium phenate heated under pressure.

Method of purification: Crystallization.

Grade: Technical.

Containers: Glass bottles; aluminum containers; demijohns; drums.

Uses: Organic synthesis; perfumery, particularly for soaps; heat transfer medium.

Shipping regulations: None.*

N, N'-diphenyl-meta-phenylenediamine.

$C_6H_4(NHC_6H_5)_2$.

Properties: Flat crystalline needles. Soluble in hot alcohol; insoluble in water. M. p. 95°C.

Derivation: By heating resorcinol with aniline in presence of calcium chloride and zinc chloride at 210°C.

Method of purification: Crystallization.

Grade: Technical.

Containers: Wooden kegs; fiber drums.

Use: Organic synthesis.

Shipping regulations: None.*

N, N'-diphenyl-para-phenylenediamine

(DPPD) $(C_6H_5NH)_2C_6H_4$.

Typical specifications: Gray powder; sp. gr. 1.20; m. p. 136°C min, ash-trace; purity 92% (min). Insoluble in water; soluble in acetone, benzene, monochlorobenzene and isopropyl acetate.

Grade: Commercial.

Uses: Flex-resistant antioxidant in natural and synthetic rubbers; stabilizer; polymerization inhibitor. Also as intermediate in manufacture of dyes, drugs, plastics, and detergents.

diphenyl phthalate $C_6H_4(COOC_6H_5)_2$.

Properties: White powder; m. p. approx 80°C; sp. gr. 1.28 (20°C); flash point 435°F; b. p. 405°C; wt/gal 10.68 lbs; refractive index 1.572 (74°C).

Typical specifications: Appearance white powder; melt clear and very light yellow color; crystallizing point 69°C min; acidity as phthalic 0.20% (max); moisture 0.5% (max); soluble in ketones, esters, and chlorinated hydrocarbons; insoluble in water.

Grade: Technical.

Containers: 100-lb fiber containers.

Uses: Plasticizer; plasticizing compositions for ethylcellulose, nitrocellulose, and various synthetic resins.

diphenyl-4-piperidinemethanol hydrochloride.

See azacyclonol hydrochloride.

diphenyl-4-piperidylmethane $(C_6H_5)_2(C_5H_{10}N)CH$.

Properties: White to slightly off-white solid; difficultly soluble in water but readily soluble in dilute acids; moderately soluble in organic solvents such as alcohols, ketones, and aromatic hydrocarbons; f. p. 99.7°C min.

Use: Intermediate.

N, N'-diphenylpropylenediamine

$C_6H_5NHCH_2CH(CH_3)NHC_6H_5$.

Properties: A clear, deep reddish-brown, semi-viscous liquid; sp. gr. 1.07; stable in storage, insoluble in water; soluble in acetone, ethylene dichloride, benzene, and gasoline; readily disperses.

Containers: 450-lbs.

Uses: Antioxidant for latex compounds of all kinds.

Hazards: No health hazards when used in rubber in the amount recommended.

diphenylpyraline hydrochloride (4-diphenylmethoxy-1-methylpiperidine hydrochloride) $(C_6H_5)_2CHOC_5H_9NCH_3 \cdot HCl$.

Properties: Crystals; m. p. 206°C. Soluble in water, alcohol, isopropanol; insoluble in ether and benzene.

Use: Medicine.

diphenyl-4-pyridyl carbinol $(C_6H_5)_2(C_5H_4N)COH$.

Properties: White solid; very weak base; slightly soluble in such solvents as methanol, ether, acetone, benzene; soluble in hot glacial acetic acid, m. p. 236-241°C.

Use: Intermediate.

diphenyl-4-pyridyl methane $(C_6H_5)_2(C_5H_4N)CH$.

Properties: White to pale yellow crystalline solid; moderately soluble in common organic solvents; b. p. 234°C (20 mm); f. p. 123°C min.

Use: Intermediate.

diphenylsilanediol $(C_6H_5)_2Si(OH)_2$.

Properties: White solid; m. p. 130-150°.

Derived from hydrolysis of diphenyldichlorosilane. Used as a silicon chemical.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

para, para'-diphenylstilbene

Properties: Crystals; m. p. 308-310°C.

Uses: In purified form as fluor in plastic scintillators.

N, N'-diphenylthiourea. See thiocarbamilide.**diphenylurea (carbanilide)**

Properties: Colorless prisms. Soluble in alcohol and ether; very slightly soluble in water. Sp. gr. 1.239; m. p. 235°C; b. p. 260°C.

Derivation: From aniline and phenylcyanate.

Method of purification: Crystallization.

Grades: Technical; reagent.

Containers: Wooden kegs; fiber drums.

Use: Organic synthesis.

Shipping regulations: None.*

diphenyl ortho-xenyl phosphate

Properties: Sp. gr. 1.20 (20°C); refractive index 1.582-1.590 (60°C); boiling range 250-285°C (5 mm); flash point 225°C; insoluble in water.

Use: Plasticizer.

diphosgene. See trichloromethylchloroformate.**diphosphopyridine nucleotide.** See nicotinamide adenine dinucleotide.**dipicrylamine.** See hexanitrodiphenylamine.**dip oils.** See tar acids.

dipole. An assemblage of atoms or subatomic particles having equal electric charges of opposite sign separated by a finite distance, for instance the nucleus and orbital electron of a hydrogen atom, or the hydrogen and chlorine atoms of an HCl molecule.

dipole moment. In most molecules the atoms and their electrons and nuclei are so arranged that one part of the molecule has a positive electrical charge and other parts are therefore negatively charged with respect to the first mentioned part. The molecule therefore becomes a small magnet or dipole. When the molecule is subjected to changing electrical or magnetic fields, these interact with the dipole and the molecule is subjected to turning and twisting forces. The dipole moment (μ) is the distance in centimeters between the charges multiplied by the quantity of charge in electrostatic units.

dipotassium orthophosphate. See potassium phosphate, dibasic.**Dippel's oil.** See bone oil.**dipping acid.** See sulfuric acid.**dipropargyl (bipropargyl; 1,5-hexadiyne)**

Properties: Colorless liquid. Soluble in alcohol; insoluble in water; sp. gr. 0.805, b. p. 85°C; m. p. -6.0°C.

dipropenyl. See 2,4-hexadiene.**di-2-propenylamine.** See diallylamine.**di-n-propylamine (C_3H_7)₂NH.**

Properties: Sp. gr. 0.741 (20°C); boiling range 105-109°C; color water-white; odor amine; wt/gal 6.2 lbs.

Containers: 5-gal cans; 55-gal drums; tank cars.

Fire hazard: Flash point 45°F.

Shipping regulations: Flammable liquid. Red label.*

dipropylene. See 2,4-hexadiene.**dipropylene glycol ($\text{CH}_3\text{CHOHCH}_2$)₂O.**

Properties: Colorless, slightly viscous liquid. Soluble in toluene, water.

Constants: Sp. gr. 1.0252 (20/20°C); b. p. 231.8°C (760 mm); vapor pressure 0.01 mm (20°C); flash point 280°F; wt/gal 8.5 lbs (20°C); coefficient of expansion 0.00073 (20°C); viscosity 1.07 poise (20°C).

Typical specifications: Sp. gr. 1.034-1.039 (20/20°C); boiling range 215-240°C (760 mm); acidity not more than 0.01% (as acetic).

Grade: Technical.

Containers: 1-gal cans; 5-, 55-gal drums; tank cars.

Uses: Solvent for nitrocellulose, shellac; partial solvent for cellulose acetate; solvent mixtures; lacquers; coatings; printing inks.

dipropylene glycol dibenzoate

Properties: A light-colored liquid; sp. gr. 1.1271 (20/20°C); 9.4 lb/gal (20°C); b. p. 250°C (10 mm); vapor pressure 1.2 mm Hg (200°C); insoluble in water; viscosity 227 cps (20°C).

Use: Plasticizer.

dipropylene glycol monomethyl ether

Properties: Sp. gr. 0.950 (25/4°C); b. p. 189°C (760 mm), 74.5°C (10 mm); viscosity 3.5 cps (25°C); refractive index 1.419 (25°C); fire point 85°C; completely miscible with water, VM & P naphtha, acetone, ethanol, benzene, carbon tetrachloride, ether, methanol, monochlorobenzene and petroleum ether.

Containers: Drums; tank cars.

Uses: In many solvent applications; in hydraulic brake fluids.

Shipping regulations: None.*

dipropylene glycol monosalicylate (salicylic acid, dipropylene glycol monoester)

Properties: Light colored oil having faint characteristic fragrant odor; sp. gr. 1.16 (40°C); refractive index, about 1.52; soluble in alcohol; insoluble in water.

Uses: Ultraviolet light screening agents; protective coatings; plasticizers.

dipropylene triamine. See 3,3'-iminobispropylamine.**dipropyl ketone (butyryl; 4-heptanone)**

Properties: Stable, colorless liquid. Pleasant odor. Miscible with many of the organic solvents.

Constants: B. p. 143.7°C; m. p. -32.1°C;

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

sp. gr. 0.8162 (20/20°C); wt/gal 6.79 lbs (20°C); refractive index 1.4068 (20°C); surface tension 25.2 dynes/cm (25°C); viscosity 0.0074 poise (20°C); vapor pressure 5.2 mm Hg (20°C); flash point 49°C (120°F).

Grade: Technical.

Containers: 1- and 5-lb glass bottles; returnable steel drums.

Uses: Solvent for nitrocellulose, raw and blown oils, many natural and synthetic resins; lacquers; synthetic resin finishes.

Caution: Keep away from heat and open flame. Avoid breathing of vapor. Avoid contact with skin. MCA warning label.

Shipping regulations: None.*

dipropylmethane. See heptane.

dipropyl phthalate $C_6H_4(COOC_3H_7)_2$.

Properties: Sp. gr. 1.071 (25°C); refractive index 1.494 (25°C); b. p. 129-132°C (1 mm); solubility in water, 0.015% by weight.

Use: Plasticizer.

"**Dipsanil.**"²⁰⁶ Brand name for a textile waterproofing agent, consisting of an acid-stable aqueous emulsion of paraffin wax and aluminum acetate.

"**Dipterex.**"¹⁸¹ Trademark for O,O-dimethyl 2,2,2-trichloro-1-hydroxyethyl phosphonate.

dipteryx. See tonka.

alpha, alpha-dipyridyl $(C_5H_4N)_2$.

Properties: White crystals, m. p. 69-70°C; b. p. 272-273°C, slightly soluble in water; insoluble in alcohol, ether, benzene, chloroform, and petroleum ether.

Grade: Reagent.

Use: Reagent for iron determination.

2, 2'-dipyridylamine $(C_5H_4N)_2NH$.

Properties: Solid, f. p. 92.3°C (min), b. p. 222°C (50 mm); very slightly soluble in water.

Derivation: From 2-aminopyridine.

Use: Intermediate.

dipyridylethyl sulfide $[C_5H_4N(CH_2)_2]_2S$.

Properties: Sp. gr. 1.113 (25°C); refractive index 1.5841 (n_D 20/D), m. p. 1.5°C, soluble in water and all common organic solvents.

Grade: Technical (95% purity).

Uses: Synthesis of pharmaceuticals, dyes, rubber chemicals, flotation agents, insecticides, fungicides, plasticizers, textile assistants, herbicides, oil additives, rust preventives, and pickling inhibitors.

dipyron (1-phenyl-2,3-dimethyl-5-pyrazolone-4-methylaminosulfonate sodium)

$C_{12}H_{14}N_4O_4SNa \cdot H_2O$.

Properties: Almost white, water soluble, odorless, crystalline powder; faintly bitter taste; m. p. 172°C. Slightly soluble in ethyl alcohol; insoluble in ether and benzene.

Use: Medicine.

diquinine carbonate. See aristoquin.

direct dyes. Those soluble dyes that are taken up directly by fibers, presumably due to selective adsorption. Usually applied to cotton or union goods (cotton-wool mixtures). Dyeing assistants such as sodium chloride or sodium sulfate are used to obtain a higher concentration of dye on the fibers. These dyes are principally water-soluble sodium salts of sulfonic acids of azo dyes. Examples are Direct Blue 2B (C.I. 406), Direct Black EW (C.I. 581) and Direct Brown 3GO (C.I. 596).

diresorcinol (tetrahydroxydiphenyl)

$(OH)_2C_6H_3C_6H_3(OH)_2$.

Properties: White to slight yellowish crystalline powder. Soluble in hot water and alcohol. M. p. 310°C.

Derivation: By fusing resorcinol and phenol with caustic soda.

Method of purification: Crystallization.

Grade: Technical.

Containers: Wooden kegs; fiber drums.

Use: Organic synthesis.

Shipping regulations: None.*

diresorcinolphthalein. See fluorescein.

N, N'-disalicylidene-1, 2-diaminopropane

(N, N'-disalicylidene propylenediamine)

$HOC_6H_4CH:NCH_2CH(CH_3)N:CHC_6H_4OH$.

Used as a metal deactivator in motor fuels.

N, N'-disalicylidene propylenediamine. See

N, N'-disalicylidene-1, 2-diaminopropane.

"**Discaloy.**"³⁰⁸ Trademark for an austenitic iron-base alloy containing nickel, chromium and relatively small proportions of molybdenum, titanium, silicon, and manganese. This alloy is precipitation-hardening and was developed primarily to meet the need for improved gas turbine discs, one of the most critical components of jet engines. It has exceptionally high creep strength combined with good ductility, resistance to notch sensitivity, and excellent oxidation resistance in the temperature range of 1000°F to 1350°F - the range in which gas turbine discs operate.

discharging agents. Substances capable of destroying a dye or mordant present within the fibers of a fabric. There are various methods of utilizing this property so that it is possible to produce a colorless figure upon a colored ground or a colored figure upon a differently colored ground.

"**Discolite.**"¹⁵⁹ Trademark for sodium sulfoxylate formaldehyde, $NaHSO_2 \cdot CH_2O \cdot 2H_2O$.

White; available in powder, rice, pea, and chestnut sizes.

Uses: For discharge printing of textile fabrics.

disilanyl. See silanes.

disinfectants. Substances used on inanimate objects which destroy harmful microorganisms or inhibit their activity. They are not necessarily powerful enough to destroy spores. Some common disinfectants are phenol, cresol, guaiacol, thymol, mercurial or chlorinated phenols, various

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

coal-tar distillates, pine oil, formaldehyde, potassium permanganate, bleaching powder and the hypochlorites, hydrogen peroxide, and mercuric chloride. Their effectiveness is rated by the phenol coefficient test prescribed in U.S. Department of Agriculture Bulletin 198. See also antiseptics; sanitizers; phenol coefficient.

disintegration (radioactive or nuclear). A synonym for radioactive decay and for radioactivity. The transformation of one kind of nucleus into one or more different kinds of nuclei by bombardment with high energy particles such as neutrons, alpha particles, etc. is also known as disintegration. This process is called nuclear transformation.

disodium acetarsenate

$\text{NaOOCCH}_2\text{As}(\text{OH})\text{O}(\text{ONa}) \cdot 2\text{H}_2\text{O}$.

Properties: White, crystalline powder.

Soluble in water.

Derivation: By reacting sodium arsenite with sodium monochloroacetate.

2, 7-disodium dibromo-4-hydroxymercurifluorescein. See merbromin.

disodium dibutyl-ortho-phenylphenoldisulfonate.

Properties: Light brown paste; insoluble in solvents that are immiscible with water, soluble in alcohol, acetone, dibutyl tartrate, ethylene glycol.

Containers: 185-lb steel drums.

Uses: Wetting, penetrating and spreading agent used in kier-boiling; scouring and dyeing textiles; industrial cleaners; deodorant preparations; insecticidal formulations, metal cleaning, stabilizer and wetting agent in latex used to treat cord or other fabrics.

disodium dihydrogen ethylenediaminetetraacetate. See ethylenediaminetetraacetic acid, disodium salt.

disodium 1, 2-dihydroxybenzene-3, 5-disulfonate (4, 5-dihydroxy-meta-benzenedisulfonic acid disodium salt, sodium catechol disulfonate) $\text{C}_6\text{H}_2(\text{OH})_2(\text{SO}_3\text{Na})_2$.

Properties: Non-hygroscopic crystals.

Freely soluble in water; produces water-soluble, colored compounds with metal salts.

Use: Colorimetric reagent for iron, manganese, titanium, molybdenum.

disodium ethylenebisdithiocarbamate. See nabam.

disodium ethylenediaminetetraacetate. See ethylenediaminetetraacetic acid, disodium salt.

disodium methyl arsonate (DMA; methanearsonic acid, disodium salt) $\text{CH}_3\text{AsO}(\text{ONa})_2$, sometimes with $6\text{H}_2\text{O}$.

Properties: Colorless crystalline solid, hygroscopic; m. p. $> 355^\circ\text{C}$, soluble in water and methanol.

Derivation: Reaction of methyl chloride with sodium arsenate.

Grades: 55-65% powder concentrate; 31.5% blend.

Containers: 50-, 100-lb fiber drums.

Uses: Pharmaceuticals; herbicide (crabgrass killer).

Caution: Avoid contact with skin or prolonged breathing of dust.

disodium orthophosphate. See sodium phosphate, dibasic.

disodium phenyl phosphate. See phenyl dihydrogen phosphate, disodium salt.

disodium phosphate. See sodium phosphate, dibasic.

disodium pyrophosphate. See sodium pyrophosphate, acid.

disodium sulfamylphenylazo-7-acetamido-1-hydroxynaphthalene-3, 6-disulfonate.

See azosulfamide.

disodium [sulfonylbis-(para-phenyleneimino)] dimethanesulfonate. See sulfoxone sodium.

"Dispersall."¹⁵⁹ Trade name for ethylene oxide condensate.

Properties: Colorless, neutral, somewhat viscous liquid. Miscible with water in all proportions.

Uses: Dispersing agent; retardant and leveling assistant in the vat dyeing of cellulosic materials.

dispersing agents. Any materials added to a suspending medium to promote and maintain the separation of the individual, extremely fine particles of solids or liquids which are usually of colloidal size. Typical applications of dispersing agents include their use in the grinding of pigments for fine enamels and dispersing of certain water-insoluble dyes to secure uniform dyeing. The term is often used interchangeably with emulsifying agent or emulsifier (q.v.).

Dispersing Oil 10.¹⁷⁵ Brand name for a coal-tar oil distillate.

Properties: Clear, yellow-red liquid; sp. gr. 1.020-1.045 (15.5/15.5°C); distillation range, 220-300°C.

Containers: 55-gal steel drums.

Uses: A rubber softener, plasticizer, and reclaiming oil used similarly to "Bardol" B where light color is not a factor.

dispersion. A system of minute particles (solid, liquid, or gaseous) distinct and separate from one another and suspended in a liquid, gaseous, or solid medium. Usually applied as descriptive of colloidal particles (diameter 1-100 millimicrons) suspended in a suitable medium. Examples of dispersions: smog, homogenized milk, gels.

"Dispersite."²⁴⁶ Trademark for water dispersions of natural, synthetic, and reclaimed rubbers and resins.

Uses: Adhesives for textiles, paper, shoes, leather, tapes; coatings for metal, paper, fabrics, carpets; protective (strippable) for saturating paper, felt, book covers, tape, jute pads; for dipping tire cords. Can be applied by spraying, spreading, impregnation, saturation.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Dispersives Standard" 011, 012, 013. ¹⁰⁸

Brand name for a series of dry, powdered, lignin-type dispersing agents.

Containers: 50-lb bags.

Uses: Prevent scale and sludge in steam boiler and preboiler equipment.

"Disperso." ¹⁰⁴ Trademark for a wettable grade of zinc, calcium and other metallic stearates. Used where easy dispersion in water is desired.**"Dispersol."** ²⁰⁶ Brand name of proprietary line of dispersed insoluble azo dyestuffs for application in dyeing and printing of acetate rayon.

displacement series. See electromotive series.

dissociation. The change of one substance into two or more new substances, usually under such circumstances that at least partial recombination occurs to form the original substance.

dissociation pressure. The pressure exerted by the gaseous product or products of decomposition of a liquid or solid substance. Usually refers to the equilibrium value of this pressure, but in some cases a non-equilibrium value may be implied.

dissolved oxygen (D. O.). One of the most important indicators of the condition of a water supply for biological, chemical and sanitary investigations. Adequate dissolved oxygen is necessary for the life of fish and other aquatic organisms and is an indicator of corrosivity of water; photo-synthetic activity, septicity, etc. This measure is also a part of the biochemical oxygen demand (B. O. D.) evaluation.

distearylamine (dioctadecylamine) (C₁₈H₃₇)₂NH.
Properties: Solid; sp. gr. 0.85; m. p. 69°C.
Almost insoluble in water.
Use: Chemical intermediate.

distearyl ether (dioctadecyl ether) (C₁₈H₃₇)₂O.
Properties: Solid, m. p. 58-60°C, b. p., decomposes.
Grade: 95% (min.) purity.
Uses: Electrical insulators; water repellents; lubricants in plastic molding and processing, antistatic substance; chemical intermediates.

distearyl sulfide (dioctadecyl sulfide; distearyl thioether) (C₁₈H₃₇)₂S.
Properties: Solid; m. p. 68-69°C; b. p., decomposes, sp. gr. 0.8148 (70/4°C).
Grades: 95% (min.) purity.
Uses: Organic synthesis (formation of sulfonium compounds).

distearyl thiodipropionate (3,3'-dioctadecyl thiodipropionate; thiodipropionic acid, distearyl ester) (C₁₈H₃₇OOCCH₂CH₂)₂S.
Properties: M. p. 55°C. Insoluble in water; very soluble in benzene and olefin polymers. Extremely resistant to heat and hydrolysis.
Toxicity: Low.
Uses: Anti-oxidant; additive; plasticizer and softening agent.

distearyl thioether. See distearyl sulfide.

disthene. See cyanite.

distillation. The process of separation consisting of vaporizing a liquid and collecting the vapor, which is usually condensed to a liquid. Pure substances may be distilled, but the process is almost always used to achieve separation of liquid mixtures because of the difference in composition between the liquid and the vapor formed from it. See destructive distillation, batch distillation, extractive distillation, rectification, dephlegmation, flash distillation, simple distillation, reflux, fractional distillation, azeotropic distillation, vacuum distillation, and molecular distillation.

1,3-disulfamyl-4,5-dichlorobenzene. See dichlorophenamide.

disulfiram. See tetraethylthiuram disulfide.

3,5-disulfobenzoic acid C₆H₃(HSO₃)₂COOH.
Properties: White powder. Soluble in water.
Grade: C. P.
Uses: Intermediate for detergents, dyes and pharmaceuticals.

disulfuric acid. See sulfuric acid, fuming.

disulfuryl chloride. See pyrosulfuryl chloride.

"Disulphine." ²⁰⁶ Brand name of proprietary line of level dyeing acid dyestuffs for wool. They are also used for the dyeing of silk.

"Di-Syston." ¹⁸¹ Trademark for O,O-diethyl S-2-(ethylthio)ethyl phosphorodithioate (q. v.).

dita bark. See alstonia.

ditaine (echitamine) C₂₂H₂₈N₂O₄·4H₂O.
Properties: White, thick, glistening, crystalline alkaloid, poisonous! Soluble in water, alcohol, ether, and chloroform.
M. p. 206°C.
Derivation: By extraction from the bark of *Alstonia scholaris*.
Method of purification: Crystallization.
Grades: Technical.
Containers: Glass bottles.
Use: Medicine.
Shipping regulations: None.*

ditetradecylamine. See dimyristyl amine.

ditetradecyl ether. See dimyristyl ether.

ditetradecyl sulfide. See dimyristyl sulfide.

ditetrahydro-2-furfurylamine
Constants: B. p. 150-155°C (30 mm).
Derivation: By hydrogenating di-2-furfurylamine in ethyl alcohol.

"Dithane." ²³ Trademark for agricultural fungicides based on salts of ethylene bis-thiocarbamate. Supplied in zinc, manganese, and sodium forms as wettable powder or liquid concentrate.
Use: Control of fungus and mite diseases on plants.

1,4-dithiane (diethylene disulfide)
SCH2CH2SCH2CH2

- Properties:** White crystals. Volatile in steam. Soluble in alcohol, ether; slightly soluble in water.
- Constants:** B. p. 115.6°C (60 mm); m. p. 112°C.
- Derivation:** Interaction of dichloroethyl sulfide with sodium or potassium sulfide.
- Use:** Organic synthesis.
- dithiane methiodide** $C_4H_8S_2 \cdot CH_3I$.
Properties: Crystalline substance. Soluble in hot water; slightly soluble in alcohol; insoluble in ether. M. p. 174°C.
- Derivation:** Interaction of dichloroethyl sulfide and methyl iodide.
- dithiazanine** $C_{23}H_{23}IN_2S_2$. 3, 3'-Diethylthiadip-carbocyanine iodide.
Properties: A blue cyanine dye; decomposes 248°C; slightly soluble in alcohol and methanol.
- Grade:** N. N. D.
- Use:** Medicine, photography.
- beta, beta'-dithiobisalanine.** See cystine.
- dithiocarbamic acid** (aminodithioformic acid) NH_2CS_2H .
Properties: Colorless needles, soluble in alcohol.
- Uses:** The metal salts of the acid are important as rubber accelerators, as are the thiuram disulfide derivatives. See thiuram, selenium diethyldithiocarbamate, zinc dibutyldithiocarbamate, zinc diethyldithiocarbamate, ziram. Also used as seed disinfectants.
- 2, 2'-dithiodibenzoic acid** (dithiosalicylic acid) $(C_6H_4COOH)_2S_2$.
Properties: Tan to gray powder, m. p. ~80°C (min.).
- Containers:** Drums.
- Use:** Intermediate for pharmaceuticals.
- 1, 2-dithioglycerol.** See 2, 3-dimercaptopropanol.
- dithione** $C_{17}H_{21}O_5PS$. 7-Hydroxy-3, 4-tetramethylenecoumarin O, O-diethylthiophosphate.
Properties: Crystals, m. p. 88.0-88.5°C. Practically insoluble in water; limited solubility in organic solvents.
- Use:** Insecticide.
- 6, 8-dithiooctanoic acid.** See dl-alpha-lipoic acid.
- dithiooxamide** (rubeanic acid) $SC(NH_2)C(NH_2)_2S$.
Properties: Stable orange-red powder; decomposes at 140°C; insoluble in water, soluble in acetone and chloroform. Forms highly colored stable complexes with many metal ions, can form a series of N, N'-derivatives.
- Uses:** Suggested for pigments, herbicides, metal deactivators; intermediates; plastics.
- dithiosalicylic acid.** See 2, 2'-dithiodibenzoic acid.
- dithymol diiodide.** See thymol iodide.
- N, N-di-ortho-tolyethylenediamine** $CH_3C_6H_4NHCH_2CH_2NHC_6H_4CH_3$.
Properties: Light brown to purple granular solid; sp. gr. 1.13; m. p. not definite, starts to soften at about 57°C with the main portion melting between 60-66°C; stable in storage; insoluble in water; soluble in acetone, ethylene dichloride, benzene and gasoline.
- Containers:** 50-lb bags; 250-lb drums.
- Uses:** Antioxidant for both natural and synthetic light colored rubber goods.
- Hazards:** No health hazard when used in rubber in the amounts recommended.
- di-ortho-tolylguanidine** (DOTG) $(CH_3C_6H_4NH)_2CNH$.
Properties: White powder, non-hygroscopic; non-toxic. Very slightly soluble in water; soluble in warm alcohol, from which it crystallizes on cooling. Sp. gr. 1.10; m. p. 179°C.
- Derivation:** Desulfurization of di-ortho-tolylthiourea with a lead compound in the presence of ammonia.
- Containers:** Drums (100-lbs net).
- Use:** To accelerate and improve vulcanization of natural and synthetic rubber compounds.
- Shipping regulations:** None.*
- 2, 7-di-para-tolyl-naphthylenediamine** $C_{10}H_6(NHC_6H_4CH_3)_2$.
Properties: Fine needles. Sparingly soluble in alcohol; insoluble in water. M. p. 237°C.
- Derivation:** By heating 2, 7-dihydroxynaphthalene with para-toluidine and para-toluidine hydrochloride.
- Method of purification:** Crystallization.
- 1, 3-di-para-tolylphenylenediamine** $C_6H_4(NHC_6H_4CH_3)_2$.
Properties: Long needles. Soluble in alcohol and ether; insoluble in water. M. p. 137°C.
- Derivation:** By heating resorcinol and para-toluidine in presence of zinc chloride.
- Method of purification:** Crystallization.
- di-ortho-tolylthiourea** (DOTT) $SC(NHC_6H_4CH_3)_2$.
Properties: Colorless, crystalline leaflets, pungent odor; not hygroscopic. Soluble in alcohol, ether and benzene; insoluble in water. M. p. 144-148°C.
- Derivation:** By the interaction of ortho-toluidine and carbon disulfide.
- Containers:** Drums.
- Use:** Metal pickling inhibitor.
- di-para-tolylthiourea** $SC(NHC_6H_4CH_3)_2$.
Properties: White powder. Soluble in ether; slightly soluble in alcohol.
- Derivation:** From para-toluidine.
- Method of purification:** May be recrystallized from the above solvents.
- ditridecyl phthalate** (DTDP) $C_{26}H_{44}(COOC_{13}H_{27})_2$.
Properties: Sp. gr. 0.950 (25/25°C); b. p. 285 at 3.5 mm Hg; pour point 35°F; viscosity 190 cps (25°C).
- Use:** Plasticizer.
- ditridecyl thiodipropionate** (3, 3'-tetramethylnonyl thiodipropionate; thiodipropionic acid,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ditridecyl ester) $(C_{13}H_{27}OOCCH_2CH_2)_2S$.
 Properties: Sp. gr. (25°C) 0.932. Insoluble in water; soluble in most organic solvents.
 Uses: Stabilizer; plasticizer and softening agent for plastics; lubricant additive.

diuron. See 3-(3,4-dichlorophenyl)-1,1-dimethylurea.

divale. See belladonna.

divanadyl tetrachloride. See vanadyl chloride.

divi divi.

Derivation: The fruit of a West Indian tree *Caesalpinia copiaria*. Forms very thin pods about 3 inches in length.

Grades: Technical (pods, extract).

Containers: Pods: 100-, 200-lb and various size burlap bags, extract: 450- to 500-lb barrels.

Use: Tanning industry.

Shipping regulations: None. *

divine stone. See copper, aluminated.

divinyl acetylene $H_2C:CHC:CCH:CH_2$. Trimer of acetylene, formed by passing it into a hydrochloric acid solution containing metallic catalysts.

divinyl B. See butadiene.

divinylbenzene (DVB, vinylstyrene)

$C_6H_4(CH:CH_2)_2$, existing as ortho-, meta- and para-isomers. The commercial form contains the 3 isomeric forms together with ethylvinylbenzene and diethylbenzene.

Properties: (pure meta-isomer) Water-white liquid easily polymerized. B. p. 199.5°C; f. p. -66.90°C; sp. gr. 0.9289 (20°C); viscosity 1.09 centipoise (20°C); refractive index (n 20/D) 1.5772.

Divinylbenzene, 55%

Typical properties: Pale straw-colored liquid; f. p. -87°C; b. p. 195°C, sp. gr. 0.918 (25/25°C), insoluble in water; soluble in methanol and ether.

Grades: 50-60%; 20-25%.

Containers: Drums; tank cars.

Uses: Polymerization monomer for special synthetic rubbers, drying oils, ion-exchange resins, casting resins and other polymers.

Caution: Highly reactive compound. Polymerization, once started, may proceed with violence.

Shipping regulations: None. *

divinyl ether. See vinyl ether.

divinyl oxide. See vinyl ether.

3,9-divinylspirobi-meta-dioxane (3,9-divinyl-2,4,8,10-tetraoxaspirodecane.)
 $[CH_2:CHCH(OCH_2)_2]_2C$.

Properties: Liquid; m. p. 42°C; 120°C (2 mm); sp. gr. 1.251 (20/20°C); slightly soluble in water.

Uses: Intermediate and monomer.

divinyl sulfide $(CH_2:CH)_2S$.

Properties: Mobile liquid. Characteristic odor. Polymerizes readily. Sp. gr. 0.9174 (15°C); b. p. 85-86°C.

Derivation: Interaction of dichlorodiethyl

sulfide and an alcoholic solution of potassium hydroxide.

Grades: Technical.

divinyl sulfone $CH_2:CHSO_2CH:CH_2$.

Properties: Liquid; sp. gr. 1.1788 (20/20°C); b. p. 234°C; f. p. -26°C; soluble in water; flash point 255°F.

Uses: As a monomer to make a series of polymers with diols, urea, and malonic esters; shrinkage control agent (textiles).

3,9-divinyl-2,4,8,10-tetraoxaspirodecane.

See 3,9-divinylspirobi-meta-dioxane.

di-ortho-xenyl phenyl phosphate

$(C_6H_5C_6H_4O)_2(C_6H_5O)PO$.

Properties: Sp. gr. 1.20 (60°C); refractive index 1.603-5 (60°C); boiling range 285-330°C (5 mm); flash point 250°C; insoluble in water.

Use: Plasticizer.

"Dixie," ¹¹⁰ Brand name for a line of dustless or uncompressed carbon black; used as a coloring agent for ink, paint, etc., and as a reinforcing agent for rubber.

Containers: Paper bags, cartons, bag units and bulk.

Closely related products include:

"Dixie BB": Medium color channel black for paints, plastics.

"Dixie EP": Ordinary grade channel black for news inks.

"Dixie R": Ordinary grade channel black.

"Dixie Perfecto": High color channel black for high gloss enamels and lacquers.

"Dixie 5": General purpose channel black for inks, paints.

"Dixie 15": Long flow channel black for lithographic ink, carbon paper.

"Dixie 20, 35, 40, 50, 60, 70, and 85":
 Furnace type blacks; classified respectively

as SRF, GPF, HMF, FEF, HAF, ISAF and SAF, used principally in rubber.

"Dixie Clay," ⁶⁹ Trademark for a hard clay proprietary product, a kaolin.

Properties: White to cream; sp. gr. 2.62 ± .03; fineness (through 325 mesh) 99.8%.

Uses: Filler for rubber.

"Dixsol," ³¹⁹ Ammoniating solutions available in two general types, ammonia-ammonium nitrate solutions and ammonia-ammonium nitrate-urea solutions.

djenkolic acid $CH_2[SCH_2CH(NH_2)COOH]_2$. An amino acid isolated from the djenkol bean.

Properties: Rosettes of needles; slightly soluble in cold water; readily soluble in aqueous solutions of acids or alkalis; decomposes gradually 300-350°C.

Use: Biochemical research.

DKP. Abbreviation for dipotassium phosphate. See potassium phosphate, dibasic.

D-L. Abbreviation for dachlaurin.

DM. See phenarsazine chloride.

DMA. Abbreviation for dimethylamine or disodium methyl arsonate.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

DMAC. Abbreviation for dimethylacetamide (q. v.).

DMC.

1. Abbreviation for dichlorophenyl methyl carbinol. See di(para-chlorophenyl) ethanol.
2. Abbreviation for beta-dimethylaminoethyl chloride hydrochloride.

DMDT. Abbreviation for dimethoxydiphenyl-trichloroethane. See methoxychlor.

DMF. Abbreviation for dimethyl formamide.

DMF Antistall Additive. ²⁸ Dimethyl formamide, used to prevent engine stalling during cool humid weather conditions.

DMH. Abbreviation for dimethyl hydantoin.

DMIC. Abbreviation for beta-dimethylamino-isopropyl chloride hydrochloride.

DMMPC. Abbreviation for gamma-dimethyl-amino-beta-methylpropyl chloride hydrochloride.

"DMP," ²³ Trademark for dimethylamino-methyl-substituted phenols.

Use: Chemical intermediates, curing agents for epoxy resins, anti-oxidants.

DMPC. Abbreviation for gamma-dimethyl-aminopropyl chloride hydrochloride.

DMS. See dimethyl sulfide.

DMSO. Abbreviation for dimethyl sulfoxide.

"DMT," ²⁶⁶ Brand name for dimethyl terephthalate (q. v.).

DMU. See dimethylurea.

"DN-75," ²³³ Trademark for liquid agricultural fungicide containing dinitro-ortho-cyclohexylphenol (q. v.) for the control of psoriasis.

"DN-111," ²³³ Brand name for a proprietary insecticide and miticide containing a salt of dinitro-ortho-cyclohexylphenol as active ingredient and used for controlling red spider and certain other mites on fruit and nut trees.

"DN-289," ²³³ Brand name for a proprietary insecticide and fungicide containing a salt of dinitro-sec-butylphenol and used as a dormant spray against certain insects and fungus diseases attacking fruit trees, also as a miticide and pesticide.

DNA. Abbreviation for deoxyribonucleic acid; also for dinonyl adipate.

DNBP. Abbreviation for dinitro-ortho-sec-butylphenol.

"DN-Dry Mix," ²³³ Brand name for a proprietary dormant fungicide and miticide. No. 1 contains dinitro-ortho-cyclohexylphenol as active ingredient. No. 2 contains dinitro-ortho-cresol.

"DN-Dust," ²³³ Brand name for a series of miticidal dusts containing dinitro-ortho-cyclohexylphenol and salts thereof, and

used for controlling red spiders and certain other mites.

"D" Nickel. ²⁸³ Trademark for a wrought alloy containing approximately 4.5 per cent manganese. Used in the manufacture of spark plugs because of its improved resistance to attack by sulfur compounds at elevated temperatures; also for electronic components such as grid wires.

DNOC. Abbreviation for 4,6-dinitro-ortho-cresol.

DNOCHP. Abbreviation for dinitro-ortho-cyclohexylphenol.

DNODA. Abbreviation for di(n-octyl, n-decyl) adipate.

DNODP. Abbreviation for di(n-octyl, n-decyl) phthalate.

"DN-Oil," ²³³ Trademark for solution of dinitrophenols in oil used as agricultural sprays.

DNP. Abbreviation for dinonyl phthalate.

DNPD. Abbreviation for N,N'-di-beta-naphthyl-para-phenylenediamine.

"DN-Sulfur Dust," ²³³ Proprietary insecticidal dust mixture containing 2,4-dinitro-6-cyclohexylphenol and sulfur as active ingredients. Available in two forms: Regular and No. 10.

DNT. Abbreviation for dimittrotoluene.

D. O. Abbreviation for dissolved oxygen; see also biochemical oxygen demand (B. O. D.) and oxygen consumed (C. O. D.).

DOA. Abbreviation for dioctyl adipate. See the more exact name, di(2-ethylhexyl) adipate.

Dobbin's reagent. A reagent used as a test for caustic alkalis in soap.

Preparation: Mercuric chloride solution is added to potassium iodide solution until a permanent precipitate is obtained. The solution is filtered and 1 gram of ammonium chloride added. Dilute sodium hydroxide is then added until a precipitate is formed. The solution is filtered and made up to one liter.

D. O. C. Abbreviation for dichromate oxygen consumed. See oxygen consumed.

DOCA. Abbreviation for deoxycorticosterone acetate.

docosanoic acid. See behenic acid.

n-docosane C₂₂H₄₆

Properties: Solid; m. p. 45.7°C; b. p. 230°C (15 mm); sp. gr. 0.778 (45/4°C); refractive index 1.4400 (n_D 45/D).

Grades: 95% (min) purity.

Uses: Organic synthesis; calibration; temperature-sensing devices.

• **1-docosanol.** See behenyl alcohol.

cis-13-docosenoic acid. See erucic acid.

doctor solution. See doctor treatment.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ditridecyl ester) ($C_{13}H_{27}OOCCH_2CH_2)_2S$.
 Properties: Sp. gr. (25°C) 0.932. Insoluble in water; soluble in most organic solvents.
 Uses: Stabilizer; plasticizer and softening agent for plastics; lubricant additive.

diuron. See 3-(3,4-dichlorophenyl)-1,1-dimethylurea.

divale. See belladonna.

divanadyl tetrachloride. See vanadyl chloride.

divi divi.

Derivation: The fruit of a West Indian tree *Caesalpinia copiaria*. Forms very thin pods about 3 inches in length.

Grades: Technical (pods; extract).

Containers: Pods: 100-, 200-lb and various size burlap bags; extract: 450- to 500-lb barrels.

Use: Tanning industry.

Shipping regulations: None.*

divine stone. See copper, aluminated.

divinyl acetylene $H_2C:CHC:CCH:CH_2$. Trimer of acetylene, formed by passing it into a hydrochloric acid solution containing metallic catalysts.

divinyl B. See butadiene.

divinylbenzene (DVB, vinylstyrene)

$C_6H_4(CH:CH_2)_2$, existing as ortho-, meta- and para-isomers. The commercial form contains the 3 isomeric forms together with ethylvinylbenzene and diethylbenzene.

Properties: (pure meta-isomer) Water-white liquid easily polymerized. B. p. 199.5°C; f. p. -66.90°C; sp. gr. 0.9289 (20°C); viscosity 1.09 centipoise (20°C); refractive index (n 20/D) 1.5772.

Divinylbenzene, 55%

Typical properties: Pale straw-colored liquid; f. p. -87°C; b. p. 195°C; sp. gr. 0.918 (25/25°C); insoluble in water; soluble in methanol and ether.

Grades: 50-60%, 20-25%.

Containers: Drums; tank cars.

Uses: Polymerization monomer for special synthetic rubbers, drying oils, ion-exchange resins, casting resins and other polymers.

Caution: Highly reactive compound. Polymerization, once started, may proceed with violence.

Shipping regulations: None.*

divinyl ether. See vinyl ether.

divinyl oxide. See vinyl ether.

3,9-divinylspirobi-meta-dioxane (3,9-divinyl-2,4,8,10-tetraoxaspirodecane.)
 $[CH_2:CHCH(OCH_2)_2]_2C$.

Properties: Liquid; m. p. 42°C; 120°C (2 mm); sp. gr. 1.251 (20/20°C); slightly soluble in water.

Uses: Intermediate and monomer.

divinyl sulfide $(CH_2:CH)_2S$.

Properties: Mobile liquid. Characteristic odor. Polymerizes readily. Sp. gr. 0.9174 (15°C); b. p. 85-86°C.

Derivation: Interaction of dichlorodiethyl

sulfide and an alcoholic solution of potassium hydroxide.

Grades: Technical.

divinyl sulfone $CH_2:CHSO_2CH:CH_2$.

Properties: Liquid; sp. gr. 1.1788 (20/20°C); b. p. 234°C, f. p. -26°C; soluble in water; flash point 255°F.

Uses: As a monomer to make a series of polymers with diols, urea, and malonic esters; shrinkage control agent (textiles).

3,9-divinyl-2,4,8,10-tetraoxaspirodecane.

See 3,9-divinylspirobi-meta-dioxane.

di-ortho-xenyl phenyl phosphate

$(C_6H_5C_6H_4O)_2(C_6H_5O)PO$.

Properties: Sp. gr. 1.20 (60°C); refractive index 1.603-5 (60°C); boiling range 285-330°C (5 mm); flash point 250°C; insoluble in water.

Use: Plasticizer.

"Dixie." ¹¹⁰ Brand name for a line of dustless or uncompressed carbon black; used as a coloring agent for ink, paint, etc., and as a reinforcing agent for rubber.

Containers: Paper bags, cartons, bag units and bulk.

Closely related products include:

"Dixie BB": Medium color channel black for paints, plastics.

"Dixie EP": Ordinary grade channel black for news inks.

"Dixie R": Ordinary grade channel black.

"Dixie Perfecto": High color channel black for high gloss enamels and lacquers.

"Dixie 5": General purpose channel black for inks, paints.

"Dixie 15": Long flow channel black for lithographic ink, carbon paper.

"Dixie 20, 35, 40, 50, 60, 70, and 85": Furnace type blacks; classified respectively as SRF, GPF, HMF, FEF, HAF, ISAF and SAF, used principally in rubber.

"Dixie Clay." ⁶⁹ Trademark for a hard clay proprietary product, a kaolin.

Properties: White to cream; sp. gr. 2.62 ± .03; fineness (through 325 mesh) 99.8%.

Uses: Filler for rubber.

"Dixsol." ³¹⁹ Ammoniating solutions available in two general types, ammonia-ammonium nitrate solutions and ammonia-ammonium nitrate-urea solutions.

djenkolic acid $CH_2[SCH_2CH(NH_2)COOH]_2$. An amino acid isolated from the djenkol bean.

Properties: Rosettes of needles; slightly soluble in cold water; readily soluble in aqueous solutions of acids or alkalis; decomposes gradually 300-350°C.

Use: Biochemical research.

DKP. Abbreviation for dipotassium phosphate. See potassium phosphate, dibasic.

D-L. Abbreviation for dachlaurin.

DM. See phenarsazine chloride.

DMA. Abbreviation for dimethylamine or disodium methyl arsonate.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

DMAC. Abbreviation for dimethylacetamide (q. v.).

DMC.

1. Abbreviation for dichlorophenyl methyl carbinol. See di(para-chlorophenyl) ethanol.
2. Abbreviation for beta-dimethylaminoethyl chloride hydrochloride.

DMDT. Abbreviation for dimethoxydiphenyltrichloroethane. See methoxychlor.

DMF. Abbreviation for dimethyl formamide.

DMF Antistall Additive. ²⁸ Dimethyl formamide, used to prevent engine stalling during cool humid weather conditions.

DMH. Abbreviation for dimethyl hydantoin.

DMIC. Abbreviation for beta-dimethylaminoisopropyl chloride hydrochloride.

DMMPC. Abbreviation for gamma-dimethylamino-beta-methylpropyl chloride hydrochloride.

"DMP." ²³ Trademark for dimethylamino-methyl-substituted phenols.

Use: Chemical intermediates, curing agents for epoxy resins, anti-oxidants.

DMPC. Abbreviation for gamma-dimethylaminopropyl chloride hydrochloride.

DMS. See dimethyl sulfide.

DMSO. Abbreviation for dimethyl sulfoxide.

"DMT." ²⁶⁶ Brand name for dimethyl terephthalate (q. v.).

DMU. See dimethylurea.

"DN-75." ²³³ Trademark for liquid agricultural fungicide containing dinitro-orthocyclohexylphenol (q. v.) for the control of psoriasis.

"DN-111." ²³³ Brand name for a proprietary insecticide and miticide containing a salt of dinitro-ortho-cyclohexylphenol as active ingredient and used for controlling red spider and certain other mites on fruit and nut trees.

"DN-289." ²³³ Brand name for a proprietary insecticide and fungicide containing a salt of dinitro-sec-butylphenol and used as a dormant spray against certain insects and fungus diseases attacking fruit trees; also as a miticide and pesticide.

DNA. Abbreviation for deoxyribonucleic acid; also for dinonyl adipate.

DNBP. Abbreviation for dinitro-ortho-sec-butylphenol.

"DN-Dry Mix." ²³³ Brand name for a proprietary dormant fungicide and miticide. No. 1 contains dinitro-ortho-cyclohexylphenol as active ingredient. No. 2 contains dinitro-ortho-cresol.

"DN-Dust." ²³³ Brand name for a series of miticidal dusts containing dinitro-orthocyclohexylphenol and salts thereof, and

used for controlling red spiders and certain other mites.

"D" Nickel. ²⁸³ Trademark for a wrought alloy containing approximately 4.5 per cent manganese. Used in the manufacture of spark plugs because of its improved resistance to attack by sulfur compounds at elevated temperatures; also for electronic components such as grid wires.

DNOC. Abbreviation for 4,6-dinitro-ortho-cresol.

DNOCHP. Abbreviation for dinitro-orthocyclohexylphenol.

DNODA. Abbreviation for di(n-octyl, n-decyl) adipate.

DNODP. Abbreviation for di(n-octyl, n-decyl) phthalate.

"DN-Oil." ²³³ Trademark for solution of dinitrophenols in oil used as agricultural sprays.

DNP. Abbreviation for dinonyl phthalate.

DNPD. Abbreviation for N,N'-di-beta-naphthyl-para-phenylenediamine.

"DN-Sulfur Dust." ²³³ Proprietary insecticidal dust mixture containing 2,4-dinitro-6-cyclohexylphenol and sulfur as active ingredients. Available in two forms: Regular and No. 10.

DNT. Abbreviation for dinitrotoluene.

D. O. Abbreviation for dissolved oxygen; see also biochemical oxygen demand (B. O. D.) and oxygen consumed (C. O. D.).

DOA. Abbreviation for dioctyl adipate. See the more exact name, di(2-ethylhexyl) adipate.

Dobbin's reagent. A reagent used as a test for caustic alkalis in soap.

Preparation: Mercuric chloride solution is added to potassium iodide solution until a permanent precipitate is obtained. The solution is filtered and 1 gram of ammonium chloride added. Dilute sodium hydroxide is then added until a precipitate is formed. The solution is filtered and made up to one liter.

D. O. C. Abbreviation for dichromate oxygen consumed. See oxygen consumed.

DOCA. Abbreviation for deoxycorticosterone acetate.

docosanoic acid. See behenic acid.

n-docosane C₂₂H₄₆.

Properties: Solid; m. p. 45.7°C; b. p. 230°C (15 mm); sp. gr. 0.778 (45/4°C), refractive index 1.4400 (n_D 45/D).

Grades: 95% (min) purity.

Uses: Organic synthesis; calibration; temperature-sensing devices.

1-docosanol. See behenyl alcohol.

cis-13-docosenoic acid. See erucic acid.

doctor solution. See doctor treatment.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- doctor treatment.** A method of improving or "sweetening" the odor of stocks of gasoline, petroleum solvents, or kerosine. A doctor solution consisting of sodium plumbite, Na_2PbO_2 , is made by dissolving litharge in caustic soda solution, and the feed to be sweetened is passed through the doctor solution. The action of the sodium plumbite and the lead sulfide formed from it, in conjunction with free sulfur (either naturally present in the feed, or added) converts the disagreeable mercaptans to the pleasanter disulfides.
- dodecafluoro-1-heptanol.** See fluoroalcohols.
- dodecanal.** See lauryl aldehyde.
- n-dodecane** (bihexyl, dihexyl) $\text{CH}_3(\text{CH}_2)_{10}\text{CH}_3$.
Properties: Colorless liquid; sp. gr. 0.7504 (20/4°C); f. p. -10°C; b. p. 217°C; refractive index 1.4221 (20/D); flash point 71°C. Soluble in alcohol, acetone, ether; insoluble in water.
Grades: 95, 99%.
Containers: 1-, 5-, and 10-gal cans; drums.
Uses: Solvent; organic synthesis.
- dodecanoic acid.** See lauric acid.
- n-dodecanol.** See lauryl alcohol.
- dodecanoyl peroxide.** See lauroyl peroxide.
- dodecene** $\text{C}_{12}\text{H}_{24}$. Many possible isomers.
See 1-dodecene and tetrapropylene.
- 1-dodecene** (alpha-dodecylene)
 $\text{H}_2\text{CCH}(\text{CH}_2)_9\text{CH}_3$.
Properties: Colorless liquid; sp. gr. 0.7600 (20/4°C); m. p. -33.6°C; b. p. 213°C; refractive index (n 20/D) 1.4327; soluble in alcohol, acetone, ether, petroleum, coal tar solvents; insoluble in water.
Containers: 1-, 5-, 10-gal cans.
Uses: Flavors; perfumes; medicine; oils, dyes; resins.
- dodecene oxide** $\text{CH}_3(\text{CH}_2)_9\text{CHCH}_2\text{O}$. A liquid; sp. gr. 0.836 (25°C), used as an organic intermediate.
- dodecenylsuccinic acid**
 $\text{HOOCCH}(\text{C}_{12}\text{H}_{23})\text{CH}_2\text{COOH}$.
Properties: Extremely viscous liquid; practically insoluble in water; completely soluble in oil.
Uses: Synthesis; corrosion inhibitor in oils; waterproofing.
- dodecenylsuccinic anhydride**
 $\text{C}_{12}\text{H}_{23}\text{CHCOOOCCH}_2$. The normal and at least two branched chain dodecenyls are known commercially. The properties which follow are those of a branched chain compound.
Properties: Light yellow, clear, viscous oil; b. p. 180-182°C (5 mm); sp. gr. (25°C) 1.002; flash point 178°C (Cleveland open cup); viscosity (20°C) 400 centipoises, (70°C) 15.5 centipoises.
Containers: Drums.
Uses: Manufacture of alkyd and epoxy and other resins, anticorrosion agents, plasticizers, wetting agents for bituminous compounds, and vulcanizable products.
- dodecyl acetate** (acetate C-12; lauryl acetate) $\text{C}_{12}\text{H}_{25}\text{OOCCH}_3$.
Properties: Colorless liquid with a light fruity odor, sp. gr. 0.860-0.862; refractive index 1.430-1.433; b. p. 150.5-151.5°C; soluble in 3 volumes of 80% alcohol.
Derivation: By heating barium laurate and barium formate together in vacuo and reducing the crude lauryl aldehyde with zinc dust in the presence of glacial acetic acid.
Grades: Technical.
Containers: 1-, 5-, 10-gal cans.
Use: Perfumery.
- n-dodecyl alcohol.** See lauryl alcohol.
- dodecyl aldehyde.** See lauryl aldehyde.
- dodecylaniline** $\text{C}_{12}\text{H}_{25}\text{C}_6\text{H}_4\text{NH}_2$. (Probably the para-isomer).
Properties: Sp. gr. (25/25) 0.907-0.912; b. p. 340-350°C. Oil-soluble aromatic amine. Insoluble in water; soluble in most organic solvents.
Use: Intermediate.
- dodecylbenzene** (alkane, detergent alkylate).
A commercial blend of isomeric, predominantly monoalkyl benzenes. The side chains are saturated, averaging twelve carbon atoms.
Derivation: Alkylation of benzene with isomeric dodecenes, obtained usually by polymerization of propylene. See tetrapropylene.
Grades: Technical.
Containers: 55-gal drums; tank cars.
Uses: Detergents of the alkyl aryl sulfonate type.
- dodecylbenzenesulfonic acid** (DDBSA) $\text{C}_{12}\text{H}_{25}\text{C}_6\text{H}_4\text{SO}_3\text{H}$. A liquid available in tank car and tank truck lots, used in making detergents.
- n-dodecyl bromide.** See lauryl bromide.
- dodecyl dimethyl(2-phenoxyethyl) ammonium bromide.** See domphen bromide.
- alpha-dodecylene.** See 1-dodecene.
- N-dodecylguanidine acetate.** See dodine.
- n-dodecyl mercaptan** $\text{C}_{12}\text{H}_{25}\text{SH}$. Many isomers of dodecyl mercaptan are possible and a variety of these occur in the technical material known as tert-dodecyl mercaptan or lauryl mercaptan or simply dodecyl mercaptan. See lauryl mercaptan.
Properties of n-isomer: Colorless liquid, boiling point 143°C; refractive index 1.4589; soluble in ether and alcohol, insoluble in water.
- tert-dodecyl mercaptan.** See lauryl mercaptan.
- dodecylphenol** $\text{C}_{12}\text{H}_{25}\text{C}_6\text{H}_4\text{OH}$. A mixture of isomers.
Typical properties: Light straw; sp. gr. 0.93 (20/20°C); flash point 250°F; boiling range 310-335°F; phenolic odor; soluble in

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

- organic solvents; insoluble in water.
Containers: Drums; tank cars.
Uses: Solvent; intermediate for surface-active agents; oil additives; resins; fungicides; bactericides; dyes; pharmaceuticals; adhesives; rubber chemicals.
- dodecyltrichlorosilane** $C_{12}H_{25}SiCl_3$.
Properties: Colorless to yellow liquid; b. p. $288^\circ C$; sp. gr. 1.026 (25/ $25^\circ C$); refractive index (n 25/D) 1.4521. Readily hydrolyzed by moisture, with the liberation of hydrochloric acid.
Derivation: By Grignard reaction of silicon tetrachloride and dodecylmagnesium chloride.
Grades: Technical.
Containers: 1/2-, 1-, 8-lb bottles; 80-lb drums.
Use: Intermediate for silicones.
Shipping regulations: Corrosive liquid. White label. *
- dodecyltrimethylammonium chloride** $C_{12}H_{25}N(CH_3)_3Cl$.
Properties: White; surface tension, 0.1% in water, 33 dynes/cm. ($25^\circ C$); soluble in water and alcohol.
Uses: Germicides; moldicides; fungicides; textile fiber softeners; cationic emulsifiers; flotation reagents.
- dodine** (N-dodecylguanidine acetate) $C_{12}H_{25}NC(NH_2)_2 \cdot CH_3COOH$. Used as a fungicide.
- dogbane**. See apocynum.
- dog button**. See nux vomica.
- dog-fish oil**. See shark liver oil.
- dog-tooth spar**. See calcite.
- dolomite**. A mineral, and also a sedimentary rock composed mainly of the mineral.
Dolomite mineral. $CaMg(CO_3)_2$. A carbonate of calcium and magnesium. Color gray, pink, white, and various other colors; vitreous luster; sp. gr. 2.85, hardness 3.5-4; good cleavage in three directions; similar to calcite, but less soluble in acids (reacts with acid when powdered or with hot acid).
Dolomite rock. A rock similar to limestone, but composed principally of dolomite rather than calcite. Usually some calcite is present, along with argillaceous matter, iron and manganese carbonates, and quartz. Types intermediate between dolomite and limestone are common and are called dolomitic limestone or magnesian limestone.
Uses: Refractory for furnaces; manufacture of magnesium compounds, and magnesium metal; as building material; in fertilizers; stock feeds; paper making; ceramics; mineral wool.
- dolomite, fused**. A mixture of cubic crystals of calcium and magnesium oxides, fused in the electric furnace.
- dolomitic limestone**. See limestone; also dolomite.
- dolomol**. See magnesium stearate.
- "Dolophine" Hydrochloride**. ¹⁰⁰ Trademark for methadone hydrochloride.
- "Doloxide"**. ¹³⁹ Trademark for a calcined dolomite, powdered; 91% through 200 mesh; used in chemical processes where a high magnesium burned lime is required.
- dolphin oil**. See porpoise oil.
- domiphen bromide** (dodecylmethyl(2-phenoxyethyl)ammonium bromide) $C_6H_5OC_2H_4N(C_{12}H_{25})(CH_3)_2Br$. A quaternary ammonium salt.
Properties: Crystals; m. p. $112^\circ C$. Soluble in water and organic solvents.
Use: Medicine.
- donaxine**. See gramine.
- Donovan's solution**. Solution of arsenous and mercuric iodides.
- "Donut Pyro."** ¹⁷² Trade name for a grade of sodium acid pyrophosphate ($Na_2H_2P_2O_7$) possessing a controlled rate of reaction.
Derivation: Dehydration of monobasic sodium phosphate.
Uses: Leavening agent for doughnuts; for producing doughnuts in an automatic doughnut machine.
- DOP**. Abbreviation for dioctyl phthalate. See the more exact name, di(2-ethylhexyl) phthalate.
- dopes**. Sizing formulations consisting of solutions of nitrocellulose, cellulose acetate, or other cellulose derivatives. They are applied to crepe yarn to set the twist and assist creping, to airplane fabrics to make them taut, to balloon fabrics to make them less permeable to gases, and to leather to form a high-gloss finish.
- "Doriden."** ³⁰⁵ Trademark for glutethimide, N. N. D.
Use: Medicine.
- "Dormison."** ³²¹ Brand name for methylparafynol.
- Dorr strong-acid process**. A process for making weak phosphoric acid by treating calcined phosphate rock with sulfuric acid (94%). The phosphoric acid produced is 35% P_2O_5 and is suitable for the manufacture of phosphate fertilizers.
- "Dortan."** ⁵¹ Trademark for light-colored, sulfurized cutting oils which permit work visibility. Grades available include both fatty oil compounded and extreme-pressure types.
- dose (radiation)**. The amount of radiation delivered to a specified area or to the body of an individual. The permissible dose is the quantity of radiation which may be received by an individual over a given period with no detectable harmful effects. For x- or gamma ray exposure the permissible dose is 0.3 roentgen per week, measured in air. All persons working with radioactive materials are

expected to wear or carry some device for detecting or measuring the radiation received by them.

DOTG. Abbreviation for di-ortho-tolylguanidine.

dotriacontane (dicetyl) $\text{CH}_3(\text{CH}_2)_{30}\text{CH}_3$ or $\text{C}_{32}\text{H}_{66}$.

Properties: Crystals, sp. gr. 0.823, b. p. 310°C ; m. p. 70°C .

Use: Research.

DOTT. Abbreviation for di-ortho-tolylthiourea (q. v.).

double bond. A type of union or structure in molecules of organic compounds, in which a pair of valence bonds joins a pair of carbon or other atoms, as in ethylene ($\text{H}_2\text{C}=\text{CH}_2$, or $\text{H}_2\text{C}:\text{CH}_2$).

"Double-Duty Sour." ²⁴⁴ A proprietary product consisting of boric acid, fluorine compounds and blue dye.

Properties: White powder; water soluble; neutralizing value, 24.0 oz sodium bicarbonate per lb.

Containers: 60-lb, 140-lb, 260-lb plywood drums.

Uses: Laundry sour and blue combination.

double nickel salt. See nickel ammonium sulfate.

double salts. See complex compound.

"Doubl" Rosin. ⁷⁹ Trade name of an "FF" grade limed wood rosin.

Constants: M. p. (capillary tube) 70°C ; m. p. (ball & ring) 93°C ; acid number 109, color "FF", 2.9% lime.

Containers: Non-returnable 18 gauge black-iron drums of about 500-lbs gross wt. Tare 14-16 lbs.

Uses: Battery wax; box toes; dry cleaning compounds; dry core binders; matches, pipe bending, printing ink; rock wool, roofing cement, shoe bottom fillers, smoking molds, waterproofing varnish-paper.

douglas-fir oil. See pine-needle oils.

"Dowanol." ²³³ Trademark applied to a series of alkyl and aryl mono ethers of ethylene glycol, propylene glycol, and various polyglycols, useful as solvents, plasticizers, hydraulic fluids, etc.

"Dowcarb." ²³³ Trademark for calcium carbonate slurry for use in the paper industry.

"Dowclene." ²³³ Trademark applied to a blended synthetic industrial solvent.

"Dow Corning 3, 4 and 5 Compounds." ¹⁴⁹

Trade names for soft film silicone dielectric compounds for aircraft ignition systems, disconnect junctions, and for industrial electrical equipment. Nonmelting, water repellent and having low freezing points, they remain serviceable over wide temperature spans; retain dielectric properties in high humidity.

"Dow Corning 36 Emulsion." ¹⁴⁹ Trade name for water dilutable mold lubricant for

rubber and plastics. Effective at concentrations from 1 part emulsion to 35-200 parts water; does not decompose to form carbonaceous deposits; keeps mold maintenance to a minimum. Extremely fine particle size contributes to stability of the emulsion in storage and pumping, and to the better surface finish of molded products.

Uses: In molding tires, mechanical rubber goods, heels and soles, floor tiles, and hose.

"Dow Corning 200 Fluids." ¹⁴⁹ Trade name for a variety of polydimethyl siloxanes having the general formula $(\text{CH}_3)_2\text{Si}[\text{Si}(\text{O}(\text{CH}_3)_2)_n\text{OSi}(\text{CH}_3)_3]$. With the value of n ranging from 0 to 2,000, these silicone fluids are available in a range of viscosity grades, from 0.65 to over 1,000,000 centistokes.

Properties: Clear, water-white liquids; low freezing points, high flash points; low volatility, resistance to breakdown due to repeated shear; and relatively flat viscosity-temperature slopes. Insoluble in water, incompatible with most organic polymers, heat-stable and oxidation resistant.

Uses: As damping media; dielectric fluids, release agents; lubricants for rubber or plastics and certain metal combinations; polishing agents, cosmetic bases; anti-floating additives for paints; water repellents for glass and ceramics.

"Dow Corning 550 and 710 Fluids." ¹⁴⁹ Trade names for phenyl polysiloxane fluids which are characterized by unusual heat stability, resistance to oxidation and gumming, low volatility and high flash points.

Uses: As lubricants for clocks, oven timers and instruments; as heat transfer media, as liquid dielectrics.

"Dow Corning 33, 41 and 44 Greases." ¹⁴⁹

Trade names for silicone greases serviceable from -100 to 450°F . Characterized by remarkable heat stability, resistance to oxidation and gumming, and serviceability over wide temperature span.

Uses: To lubricate motor and conveyor bearings; paper coating and flat glass drawing machines, timers; plastic gears, textile dryers and slashers, and as antiseize for hold down bolts and injection nozzles.

"Dow Corning Mold Release Fluid." ¹⁴⁹ Trade

name for heat-stable, 100% silicone oil used as a mold-release agent in molding rubber and plastics. Practically inert and non-volatile with a flash point in the range of 600°F . Insoluble in water, incompatible with most organic materials. Generally used as a 0.5 to 2% solution in chlorinated solvents, methyl ethyl ketone, naphtha, or white gasoline. Especially effective in the bead and parting-line release of heavy duty tires, deep-draw molding of plastics, and as a casing spray for green tires.

"Dow Corning Pan Glaze." ¹⁴⁹ Trade name for a resinous silicone coating developed to replace pan grease in the baking of

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

bread, buns, rolls, and other low sugar content bakery products. Properly applied, it provides easy release for 100 or more bakes.

"Dow Corning 802, 803, 804, 805, 806, and 840 Resins."¹⁴⁹ Trade names for silicone resins used in formulating heat-stable finishes and maintenance paints. Other available resins include silicone and modified silicones for bake-on and air-dry finishes, designed for service at temperatures to 1000°F, in corrosive atmospheres, or in severe weathering.

"Dow Corning 2103, 2104, 2105, 2106 Resins."¹⁴⁹ Trade names for silicone laminating resins used to bond glass cloth in the production of heat-stable, structural, and electrical insulating parts and components. Each resin is a Class H electrical insulating material rated for hottest spot temperatures of 180°C.

Uses: "Dow Corning 2103 and 2105 Resins" are designed for high pressure laminating techniques; "2104 and 2106 Resins," for low pressure laminating. Each is supplied as a solvent solution at a viscosity suitable for impregnating.

"Dow Corning 935, 994, 996 and 997 Varnishes."¹⁴⁹ Trade names for silicone electrical insulating varnishes, rated to withstand Class H hottest spot temperature service of 180°C. All are resistant to oxidation, and retain dielectric properties in high temperature service. All are supplied as solvent solutions at a viscosity most suitable for intended application. 935 and 994 Varnishes are designed for cloth coating and for bonding mica or inert mineral fillers. 996 and 997 Varnishes are dipping or impregnating materials for electrical equipment.

Dowell process. Process for increasing the production of oil wells by treatment with inhibited hydrochloric acid. The hydrochloric acid enlarges the drainage channels.

"Dowetch."²³³ Trademark for magnesium photoengraving sheet, plate, and photoengraving chemicals.

"Dowex."²³³ Trademark name for a series of synthetic ion-exchange resins made from styrene-divinylbenzene copolymers.

"Dowfax."²³³ Trademark for a series of surface-active agents.

"Dowfax" 2A1: dodecyldiphenyl oxide disulfonic acid, sodium salt.

Uses: Liquid detergents; kier boiling of cotton; mercerizing cotton; oil well acidizing; water flood operations; sulfite; sulfate and semi-chemical processes in paper manufacturing.

"Dowfax" 9N9: nonyl phenol-ethylene oxide condensate having 9-10 moles of ethylene oxide.

Uses: Metal cleaning; formulation of household detergents; industrial cleaners, maintenance cleaners, agricultural toxicants; petroleum refining; manufacture of textiles, latex paints, paper and leather.

"Dowflake."²³³ Brand name for calcium chloride, 77-80%, in a special flake form.

"Dowfume."²³³ Trademark for a series of proprietary products used as fumigants, pesticides and insecticides.

"Dowicide."²³³ Trademark applied to a series of phenolic compounds useful as disinfectants, fungicides, algicides and preservatives. Available in two types; water-soluble and oil-soluble.

"Dowlap."²³³ Trademark for lamprey control products containing a chlorinated phenol as the active ingredient.

"Dowmetal."²³³ Trademark applied to a series of magnesium alloys containing more than 85% of magnesium and characterized by their extreme lightness. Other properties such as strength, toughness, thermal conductivity, etc., vary according to the particular alloy. Available in all the usual fabricated forms, including sand castings, permanent mold castings, die castings, forgings, extruded shapes, plate, sheet and strip.

Downs cell. An electrolytic cell for the production of metallic sodium and chlorine from fused salt. The cell consists of a steel vessel lined with refractory and insulating brick. The anode is a graphite block projecting upward from the bottom of the cell and surrounded by a cylindrical steel or copper anode. A dome and collector ring above the electrodes keep the products separate. Specially purified and dried sodium chloride is used as the electrolyte and the sodium metal produced is 99.9% pure.

"Dowpac."²³³ Trademark for a thermoplastic wetted walltype tower packing used in the aerobic biological oxidation of liquid wastes and in cooling towers.

"Dow-Per."²³³ Trademark for perchloroethylene (q. v.), in a special drycleaning grade.

"Dowpon."²³³ Trade name for a grass-killer, based on dalapon.

"Dowsol."²³³ Trademark for alkyl phosphates for use in metal extraction.

"Dowtherm 209."²³³ Trademark for an inhibited glycol ether that azeotropes with water. The azeotropic solution containing 47% water gives freeze protection to -45°F and has an azeotropic b. p. 209°F.
Use: Ebullient cooled engines.

"Dowtherm" A.²³³ Trademark for a eutectic mixture of diphenyl and diphenyl oxide.
Properties: Colorless, non-corrosive liquid which is stable up to 725°F; sp. gr. 1.060 (25/25°C); b. p. 258°C; f. p. 12°C; specific heat 0.63 Btu/lb/°F at b. p.; soluble in all proportions in alcohol, carbon tetrachloride, and ether (25°C); insoluble in water.
Containers: 5-, 10-, 55-gal drums; 42, 84 and 475-lbs net.
Uses: As a heat-transfer medium.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Dowtherm C." ²³³ Trademark for an isometric terphenyl mixture; m. p. 150°C; b. p. 340-390°C.

Uses: Heat transfer agent; moderator coolant in "organic moderated" nuclear reactors (it does not become radioactive).

"Dowtherm E." ²³³ Trademark for treated ortho-dichlorobenzene specially stabilized for heat transfer purposes in the range 300-500°F.

Properties: Clear, colorless liquid; sp. gr. 1.181 (212°F); b. p. 352°F; specific heat 0.31 Btu/lb/°F at b. p.; heat of vaporization, 118.9 Btu/lb at b. p.

Containers: 55-gal drums.

"Dowtherm SR-1." ²³³ Trademark for a specially inhibited ethylene glycol solution designed for low temperature operations; approximately -10 to +160°F.

doxylamine succinate $C_{17}H_{22}N_2O \cdot C_4H_6O_4$.
2-[alpha-(2-Dimethylaminoethoxy)-alpha-methylbenzyl]pyridine succinate;
 $CH_3C(C_6H_5)(C_6H_4NOCH_2CH_2N(CH_3)_2)C_4H_6O_4$.

Properties: Cream to white powder with characteristic odor M. p. 100-104°C
Very soluble in water, freely soluble in alcohol and chloroform, slightly soluble in ether and benzene; pH (1% solution) 4.9-5.1.

Grade: U. S. P. XVI.

Use: Medicine.

DOZ. Abbreviation for dioctyl azelate. See the more exact name, di(2-ethylhexyl) azelate.

DP. Abbreviation for dry point, used when a range of boiling temperatures is given. See also IBP.

DPA. Abbreviation for diphenylamine, also for "Diphenolic Acid."

DPG. Abbreviation for diphenylguanidine (q. v.).

DPH. Abbreviation for 1,6-diphenylhexatriene (q. v.).

DPN. Abbreviation for diphosphopyridine dinucleotide. See nicotinamide adenine dinucleotide.

DPO. Abbreviation for 2,5-diphenyloxazole (q. v.).

DPPD. Abbreviation for N,N'-diphenyl-para-phenylenediamine.

"DPS." ³⁴² Trademark for bacitracin methylene disalicylate.

"D. P. Solution." ⁵⁸ Trade name for a lacquer additive.

Properties: Pale straw-colored liquid; 8.2 lb/gal; 40% solution in equal parts of ethyl alcohol and acetone.

Containers: 5-, 55-gal drums.

Uses: Anticorrosion agent in lacquers and cotton solutions; light and heat stabilization of vinyl resins.

Dragendorff's solution: A solution of bismuth-potassium iodide used in analysis (testing

for alkaloids). Caution! Keep away from light and keep well stoppered!

dragon's blood.

Properties: Deep red, amorphous lumps; m. p. 120°C. Soluble in alcohol, ether, and volatile and fixed oils. Insoluble in water.

Chief known constituents: Dracoalban, dracoresene, draconine, and esters.

Derivation: The resin from the surface of the fruit of several species of *Daemonorops*; habitat: East Indies, Malay, Sumatra and Borneo.

Grades: According to source.

Containers: Tins; boxes.

Uses: Pigment; coloring plasters; lacquers; tooth-powders; coloring marble and stoneware; tanning extract, furniture polishes, colored papers, coloring toilet preparations, process engraving and lithography, pharmaceuticals; varnishes, paints.

Shipping regulations: None.*

"Drakeol." ²⁵ Brand name for a series of proprietary, white mineral oils. Colorless, odorless and tasteless, they meet requirements in the appropriate U. S. P. XVI "Heavy Liquid Petrolatum" and "Light Liquid Petrolatum" classifications.

"Dramamine." ⁷⁰ Trademark for U. S. P. dimenhydrinate.

"Drawcote." ²⁰⁴ Trademark for a class of compounds used as dry film lubricants in the cold working of metals. Commercially available in 300-lb fiber drums and wood barrels.

"Draw-ex." ⁵¹ Trademark for a group of drawing compounds suitable for hot and cold metal working. Oil-soluble and water-soluble grades are available, some being pigmented.

"DRC-14" Atlantic Reforming Catalyst. ²⁴¹ Trademark for a platinum-on-silica-alumina-base catforming catalyst. For reforming of petroleum naphtha.

"Dresinate." ²⁶⁶ Trademark for salts (soaps), or rosins and modified rosins, used as emulsifiers, detergents and dispersants in soluble oils, cleaning compounds and other compositions.

"Dresinol." ²⁶⁶ Trademark for a series 40-45% solid dispersions in sodium hydroxide and ammonium hydroxide of modified rosins and special resin acids. They are compatible with animal glue, starch, dextrin, proteins, natural and synthetic rubber latices, polyvinyl acetate, polyvinyl chloride, and water dispersions of phenolic- and urea-formaldehyde-type resins. They are used with these materials to improve the wetting and penetration of, and adhesion to, polar surfaces. In specific cases improvements are also noted in bonding strength, speed in the development of tack, and other properties.

"Driacin." ⁴¹⁶ Trademark for an ash-free organic salt of a hydrophobic, film-forming corrosion inhibitor.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Oily liquid; sp. gr. (60/60°F) 0.868; density, 7.2 lbs/gal; pour point, 45°F; flash point (Pensky-Martin), 120°F; viscosity (kinematic) 231 cs at 100°F, (universal) 1071 sec; insoluble in water; surface-active.

Uses: Sludge-dispersant additive for extending the storage life of cracked fuel oil and preventing filter or burner tip clogging; ingredient in rust-preventive formulations such as slushing oils.

"Dri-Clor." ²⁰⁴ Trademark for a powdered laundry bleach containing not less than 38% available chlorine.

"Dricoid." ³²² A trademark for a series of algin-emulsifier compositions.

Properties: Light tan or cream colored algin-emulsifier compositions in dry powder form with about 12% moisture; soluble in water, milk, cream, and ice cream products.

Grades: Refined.

Containers: 10-, 50-, 100-, 300-lb drums.

Uses: A stabilizer-emulsifier composition for ice cream and pressurized whipped cream.

Shipping regulations: None.*

"Dri-Die." ³¹¹ Trademark for a thermally attrited hydrogel which produces an unshrunk amorphous silica particle (aerogel). The active ingredients are 95.3% amorphous silica gel (SiO₂, 90%) and 4.7% ammonium fluorosilicate. The material kills insects on contact through physical dehydration coupled with physical-chemical action.

"Drierite." ³⁴⁵ Proprietary product. A special form of anhydrous calcium sulfate having a highly porous granular structure and a high affinity for water. Absorbs water vapor both by hydration and capillary action.

Desiccating efficiency: Residual moisture in a gas amounts to 0.005 milligram per liter or 0.31 pound per million cubic feet at atmospheric pressure and 30°C. Corresponding vapor pressure of first hydrate, 0.005 mm.

Properties: Neutral, stable, constant in volume, inert except toward water. Insoluble in organic liquids, non-deliquescent, non-disintegrating, non-poisonous, non-corrosive. Color: white. Weight of granule forms: 60-62 lbs/cu ft.

Grades: Regular "Drierite," Indicating "Drierite" (turns blue to red in use) "Ducal Drierite" (for drying air and gases.)

Uses: All laboratory and industrial drying of solids, liquids, gases.

driers. Chemical additives used to accelerate the drying period of paints, varnishes, printing inks and the like by catalyzing the oxidation of drying oils or synthetic resin varnishes, such as alkyds, which dry by air curing. The usual driers are salts of metals with a valence of two or greater and unsaturated organic acids. The approximate order of effectiveness of

the more common metals is cobalt, manganese, cerium, lead, chromium, iron, nickel, uranium and zinc. These are usually prepared as the linoleates, naphthenates and resinate of the metals. Paste driers are commonly the metal salts as acetates, borates, or oxalates dispersed in a drying oil.

"Dri-Film." ²⁴⁵ Trademark for a group of silicone resins designed to impart durable moisture and weather resistance to surfaces to which it is applied. Various types of the material are applied as a liquid and form a protective film over surfaces which protects from humidity, corrosive chemical atmospheres and dust.

Uses: Dri-Film 88 is used as a protective coating for electric motors, transformers, field coils, etc.; Dri-Film 144, a masonry water repellent; Dri-Film 432, used to impart durable water repellency and other properties including water-borne spot and stain resistance, improved hand and drape, increased flex abrasion resistance, and improved tear strength and wrinkle recovery.

drilling mud (oil well drilling mud). Mud used in drilling oil wells. It is sent down through the drilling pipe under high pressure and returns up through the annular space between the walls of the hole and the pipe. The mud helps control gas, oil and water pressures and helps maintain the walls of the hole. Its basic components are clay and water, but other materials are added to modify its properties. Some common additives are barite or celestite, to increase the specific weight, sodium tannate, to control the viscosity, lime or other caustic to increase the pH, gelatinized starches to prevent loss of water, and cellophane flakes to add bulk. Special clays such as bentonite are also used.

drilling-mud weighting materials. Class name given to materials which are added to drilling mud to control gas, oil, water, or formation pressures and to aid in maintaining the walls of the open hole.

See also bentonite.

"Drinalfa." ⁴¹² Trademark for methamphetamine hydrochloride (q. v.).

"Drinox." ⁴⁰¹ Trade name for liquid insecticide seed treatment containing aldrin (30%).

Containers: 6-, 30-, 54-gal drums.

Use: As a seed treatment for small grains, sorghum, cotton, corn for protection against soil insects such as seed corn maggots, wireworms, etc.

Warning: Hazardous by skin contact, inhalation or swallowing. Keep away from heat and open fire; flash point above 115°F.

"Drinox H-34." ⁴⁰¹ Trademark for liquid insecticide seed treatment containing heptachlor (24.5%).

Containers: 160 fl. oz. and 6-, 30-, 54-gal containers.

Use: As a seed treatment for small grains,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

sorghum and corn for protection against soil insects such as seed corn maggots, wireworms, etc.

Warning: Hazardous by skin contact, inhalation or swallowing. Keep away from heat and open fires.

"Dri-N-Tite." ²⁰⁵ Cut-back asphaltic liquids for reimpregnating and coating built-up roofing systems.

"Driocel." ⁹⁹ Trademark for a solid, granular desiccant used for the commercial scale drying of process liquids and gases. Manufactured from a selected grade of natural bauxite, reduced to the required particle size specification, and thermally activated to its maximum absorbing activity. Mesh grades 4/8, 4/10, 8/14.

Typical analysis (volatile free basis):
 Al_2O_3 81.5%; SiO_2 10.0%; TiO_2 3.5%;
 Fe_2O_3 3.0%; insolubles; 2.0%; volatile material; 6%.

Containers: 400-lb (net) steel drums.

"Driocel" S. ⁹⁹ Trademark for a drying (dehydrating) medium for light liquid hydrocarbons. Developed specifically to overcome souring of light hydrocarbon liquids, such as LPG products in the final drying stage. Mesh grades 4/8, 8/14; tamped bulk density 55-57 lbs/cu ft.

Containers: 400-lb (net) steel drums.

"Dri-Pax." ²⁴¹ Brand name for the small gram-size bags containing 1, 2, 3, and 5 grams of "Protek-Sorb" silica gel.

"Drisdol." ¹⁶² Trademark for crystalline vitamin D₂.

"Dri-Sol." ³¹⁹ Trademark for a series of ammoniating solutions which are essentially anhydrous solutions of ammonia and ammonium nitrate. These solutions contain only 0.5% water.

Use: Fertilizer manufacture.

"Drisoy." ⁶⁴ Trademark for a line of chemically treated soybean oils, for use as a general replacement of linseed oil.

"Dritomic." ⁵⁰ Trademark for wettable sulfur used as fungicide on fruit and ornamentals.

"Dri-Tri." ³³⁴ Trademark for sodium phosphate, tribasic, Na_3PO_4 .

Properties: White granules; soluble in hot water; pH (1% soln), 11.4; will cake heavily if exposed to moisture.

Grades: Technical; food processing.

Containers: 100-lb multiwall paper bags.

Uses: Detergents; dishwashing; water softening; all types of industrial and household cleaning.

"Driwall." ⁴⁴⁸ Trade name for transparent coatings (silicone); prevents water penetrating exterior walls of brick, stone, masonry.

drocarbil ($\text{C}_{16}\text{H}_{23}\text{AsN}_2\text{O}_7$). The acetarsone salt of arecoline.

Properties: Nearly white or slightly yellowish, odorless powder; freely soluble in water.

Grades: N. F. XI.

Use: Medicine.

drop black. A bone black or similar form of carbon which has been cast into tear or drop form by mixing with water and glue to give a paste-like mass.

drop chalk. See chalk, prepared.

drug and cosmetic dyes. See D & C dyes.

"Druid." ⁵¹ Trademark for heavy-bodied, dark green oils for journal bearing lubrication, where oil loss and wastage are too great to permit use of better oil.

drumstick. See cassia fistula.

dry battery. See dry cell.

dry-bone. See smithsonite.

dry cell (dry battery). An electrolytic cell (q. v.) in which the liquid electrolyte is soaked up in an absorbent powder to form a moist paste which functions satisfactorily in generating the electric current, but avoids the inconvenience of a liquid. Flash-light batteries are dry cells. Ammonium chloride is frequently used as the electrolyte.

dry chemical. Term applied to material for fire extinguishing systems; powdered chemical containing sodium bicarbonate with small percentages of added ingredients to render it free-flowing and water repellent. Used as a fire extinguisher on fires in electric equipment, oils, greases, gasoline, paints and flammable gases.

"Drycon." ¹⁷³ Trademark for a concentrated resin base material for restoring sizing to dry cleaned garments.

"Dry-Flo." ⁵³ Trademark for starch ester derivative containing hydrophobic groups. Especially free-flowing in dry state. Cannot be wetted with water, yet when moistened with a water-miscible solvent, it can be gelatinized and used to produce films with water repellent properties.

Uses: Dusting powder; no-offset spray for printing.

"Dryfol." ²²¹ Trademark for a line of copolymer fish oils.

dry ice (carbon dioxide snow) CO_2 . Solidified carbon dioxide.

Properties: White snow; sp. gr. 1.56 (-79°C); m. p. -78.5°C ; sublimes; wt/cu ft 94-97.5 lb.

Derivation: High purity carbon dioxide gas is compressed and cooled to liquefaction, then expanded to vapor and snow in presses that compress the snow into cakes.

Containers: Blocks approximately 10" x 10" x 11" are wrapped in paper. Large shipments are made in heavily insulated refrigerator cars or trucks. Small shipments are made in specially insulated corrugated cardboard cartons or other special containers.

Uses: Refrigerant; carbonated beverages; producing inert atmospheres for mechanical and chemical applications; immobilization

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

for humane animal killing; machine tool coolant; grinding and tumbling aid; fire extinguishing medium; source of carbon dioxide for chemical reactions; preservative for fresh meat; cooling medium for treating metals; hardening of foundry molds and cores; shielding gas for welding.

Warning! Extremely cold. Causes severe burns. Liberates heavy gas which may cause suffocation. MCA warning label. Shipping regulations: Nonflammable gas. Green label. *

drying oils. Oily, organic liquids which, when applied as a thin film, readily absorb oxygen from the air and "dry" to form a relatively tough, elastic substance. They are usually natural products such as linseed, tung, perilla, soybean, fish, and dehydrated castor oils but drying oils are also prepared by combination of the natural oils or their fatty acids with various synthetic resins (see alkyd resin and epoxy resin). The drying ability is due to the presence of unsaturated fatty acids, especially linoleic and linolenic acids, usually in the form of glycerides. The degree of unsaturation of an oil, and hence its drying ability, is expressed by its iodine number (ability to absorb iodine). The drying oils have the greatest capacity for iodine and the non-drying oils the least.

Uses: As binders in paints and varnishes.

"**Drymet.**" ⁴²⁸ Trademark for sodium metasilicate, anhydrous (q. v.).

"**Dryolene (VM & P).**" ²⁰⁰ Trademark for a petroleum solvent prepared by straight-run overhead distillation.

Properties: Water-white; boiling range 205-287°F; sp. gr. 0.747 (60°F), flash point (Tag closed cup) 25°F; wt/gal 6.22 lbs (60°F).

Caution! Flammable; keep lights and fire away.

Uses: By paint and rubber cement manufacturers where fast setting and relatively slow final drying are preferred.

Shipping regulations: Flammable liquid. Red label. *

"**Dryorth.**" ⁴²⁸ Trademark for anhydrous sodium orthosilicate.

"**Dryseq.**" ⁴²⁸ Trademark for sodium sesquiosilicate, anhydrous.

"**DS-207.**" ³⁰⁴ Trademark for dibasic lead stearate, $2\text{PbO} \cdot \text{Pb}(\text{C}_{17}\text{H}_{35}\text{COO})_2$, vinyl stabilizer.

Properties: Soft white unctuous powder, sp. gr. 2.02, refractive index 1.60.

Containers: Fiberboard drums containing 40 and 225 lbs.

Uses: Used as a stabilizer-lubricant for vinyl resins. Does not melt at processing temperatures.

D salt (2-naphthylamine-1,5-disulfonic acid, sodium salt) $\text{NH}_2\text{C}_{10}\text{H}_7(\text{SO}_3\text{Na})_2$. Used to darken the mass tone of Lithol Reds.

DSP. Abbreviation for disodium phosphate. See sodium phosphate, dibasic.

DTDP. Abbreviation for ditridecyl phthalate (q. v.).

"**Duart.**" ³³³ Clear varnishes and pigmented enamels formulated with China wood oil and adapted to produce wrinkle finishes.

"**Duatok.**" ⁵⁷ Trademark for sulfathiazole.

dubbin. See dubbing.

dubbing (dubbin). A mixture of cod oil and tallow used in the leather industry.

Dubb's asphalt. See sulfurized asphalts.

"**Duclean**" No. 1. ²⁸ Trademark for inhibited sulfuric acid, technical 60° Bé. sulfuric acid containing an acid pickling inhibitor. Properties: Clear, reddish-brown liquid; miscible with water; sp. gr. 1.706; f. p. below -10.8°C.

Containers: 185-lb glass carboys; 700-lb drums; tank cars, tank trucks.

Uses: In pickling iron and steel; for descaling and cleaning of steel and other metals under conditions where it is desirable to inhibit the acid corrosion of steel and other ferrous metals.

"**Duclean**" No. 2. ²⁸ Trademark for hydrochloric acid solution inhibited; technical. Properties: Clear, water-white liquid with pungent odor; miscible with water; sp. gr. 1.142; f. p. below -40°C.

Containers: 125-lb glass carboys; tank cars; tank trucks.

Uses: In pickling iron and steel; for removing deposits, including hard water scale, hydrated iron and rust from evaporators, condensers, water distributing lines, water well screens, etc., where it is important to inhibit acid corrosion of steel and other ferrous metals.

"**Duco.**" ²⁸ Trademark for a series of lacquers, enamels, undercoaters, sealers, rubbing and polishing compounds, household cement, paste wax for autos and furniture, and other compositions used by the automotive and furniture trades.

Dühring's rule. Relates the vapor pressures of similar substances at different temperatures. A straight or nearly straight line results if the temperatures at which a liquid exerts a particular pressure is plotted on a graph against the temperature at which some similar reference liquid exerts the same vapor pressure. Water is most frequently used as a reference liquid since its vapor pressure at various temperatures is well known.

"**Dulac.**" ³³³ Trade name for lacquers and lacquer-enamels with a clear cellulose base which are used for various coating and finishing requirements.

dulcamara (bittersweet). Dried stem of climbing shrub *Solanum dulcamara*. Habitat: Europe; North America.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

dulcin (para-phenetolecarbamide; sucrol)
 $\text{H}_2\text{NOCNHC}_6\text{H}_4\text{OC}_2\text{H}_5$. This substance should not be confused with dulcitol (q. v.) which is sometimes called dulcin.

Properties: White, needle crystals or powder with taste about two hundred times as sweet as sugar. M. p. 173-174°C; soluble in alcohol and ether; moderately soluble in hot water.

Derivation: From para-aminophenol.

Uses: Substitute for sugar; improves flavor of castor and cod-liver oils.

Shipping regulations: None.*

dulcite. See dulcitol.

dulcitol (dulcite; melampyrin; dulcin; dulcose, euonymin) $\text{C}_6\text{H}_8(\text{OH})_6$. A sugar.

Properties: White, crystalline powder; slightly sweet taste. Soluble in hot water, slightly soluble in cold water; very slightly soluble in alcohol. Sp. gr. 1.466; m. p. 188.5°C.

Derivation: By hydrogenation of lactose; occurs naturally in *Melampyrum nemorosum*.

Grades: Technical; reagent.

Containers: Glass bottles; fiber containers.

Uses: Bacteriology; medicine.

Shipping regulations: None.*

dulcose. See dulcitol.

"Dullatone." ³²⁸ Trademark for a series of delustering agents for textile fabrics, based largely on titanium pigments.

"Dullatone" 60. Cationic dispersion of titanium dioxide and other pigments.

"Dullatone" CA. Similar to above.

"Dullatone" CS. Self-precipitating insoluble inorganic salts.

"Dullatone" DG. Titanium dioxide dispersion in a cationic medium. A dark duller for use on blacks or navies without any frosting effects.

Dulong and Petit's law. The atomic heat capacity (atomic weight times specific heat) of elementary substances is a constant whose average value at room temperature is 6.2. A few elements, notably boron, carbon, and silicon, obey the law only at high temperatures.

"Dulux." ²⁸ Trademark for a wide range of products for surface coating.

"Dulux" Foam Resin. ²⁸ Trademark for polyester resin for use with isocyanates to produce flexible polyurethane foams.

dumortierite. Perhaps $8\text{Al}_2\text{O}_3 \cdot 6\text{SiO}_2 \cdot \text{B}_2\text{O}_3 \cdot \text{H}_2\text{O}$. A natural basic aluminum silicate. Bright, smalt-blue to greenish-blue in color.

Vitreous luster. Sp. gr. 3.26-3.36; hardness 7.

Occurrence: United States (New York, Arizona, Nevada); France; Silesia; Norway.

Uses: Extensively used in spark-plug porcelain; special refractories.

"Dunkit." ³³ Trade name for an immersion type stripping compound composed of cresylic and chlorinated compounds. Packaged in 55-gal drums. Used for

removing organic coatings and carbon deposits in pipe lines, tanks, or on equipment. Non-flammable, but prolonged breathing and skin contact are hazardous.

dunnione. Probable formula $\text{C}_{15}\text{H}_{14}\text{O}_3$. An ortho-quinone.

Properties: Orange-red needles; m. p. 90°C; optical rotation +310°.

Derivation: A natural coloring matter of the naphthalene group found as a deposit on the leaves and flowers of *Streptocarpus dunnii*.

Uses: Paints; textiles.

"Duobel." ²⁸ Trademark for high-velocity permissible explosives furnished in seven grades based upon velocity and cartridge count; poor water resistance.

Use: For mining coal where lump coal is not a factor.

"Duol." ²⁸ Trademark for resinated forms of red azo pigments.

Uses: In printing inks, paint, and plastics.

"Duomeens." ¹⁵ These are N-alkyltrimethylene diamines. The alkyl group is derived from coconut, soya, and tallow fatty acids. Insoluble in water; soluble in organic solvents.

Containers: 55-gal openhead drums and tank cars.

Uses: Pigment dispersion; color flushing; pigment coatings; germicides; water proofing in textiles, wetting agents; extrusion lubricants; anti-static agents; lubricant improvers, water treatment.

Duo-Sol process. A commercial process for refining lubricating oils by extraction with a solvent consisting of liquid propane and a cresol base.

"Duponol." ²⁸ Trademark for a line of surface active agents of the alcohol sulfate type. These have detergent emulsifying, dispersing, and wetting properties, and are used in the textile, paper, leather, cosmetic, shampoo, and electroplating industries.

"Duponol" 80. Sodium salt of technical octyl alcohol sulfate. Light yellow liquid. Wetting and penetrating agent effective in the presence of high concentrations of electrolytes.

"Duponol" C. White powder. Meets requirements of U. S. P. XIV for sodium lauryl sulfate. Used as emulsifying and dispersing agent for cosmetic, dental, and medical preparations.

"Duponol" D Paste. Sodium salt of unsaturated long chain alcohol sulfate. Yellow paste, used for scouring, emulsifying, dispersing and wetting agent and detergent.

"Duponol" EP. Alkylolamine salt of saturated long chain alcohol sulfate. Light yellow viscous liquid.

Use: As a detergent, wetting, dispersing and emulsifying agent having solubility, color stability, and foaming properties, particularly suited for shampoos.

"Duponol" G. Amine salt of saturated long chain alcohol sulfate. Oil-soluble light yellow paste.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Use: Powerful emulsifying agent for oils and solvents.
- "Duponol" L-144-WDG. Sodium salt of a modified unsaturated long chain alcohol sulfate. Reddish-brown liquid.
- Use: Emulsifying in dry cleaning and fungicidal sprays.
- "Duponol" LS Paste. Sodium salt of unsaturated long chain alcohol sulfate. Light yellow fluid paste.
- Use: Scouring and emulsifying agent in leather and textile industries.
- "Duponol" ME Dry Powder. Sodium salt of technical lauryl alcohol sulfate containing minimum electrolyte. White powder.
- Use: As emulsifying and dispersing agent in metal cleaning, electroplating, textile and leather processing.
- "Duponol" OS. "Duponol" G plus long chain unsaturated alcohol. Clear yellow oil-soluble liquid.
- Use: Very effective emulsifying agent for preparing oil-in-water emulsions.
- "Duponol" QC. Sodium salt of technical lauryl alcohol sulfate. Fluid liquid. Carefully controlled and standardized to provide a raw material for shampoos which allows manufacture from a single product of types which vary from clear liquids to pastes.
- "Duponol" SN. Sodium salt of saturated long chain alcohol sulfate. Clear light yellow liquid.
- Use: As a detergent, wetting, dispersing and emulsifying agent with high foaming power designed for use in shampoos and hand cleaners.
- "Duponol" ST. Alkylolamine salt of saturated long chain alcohol sulfate. Light yellow liquid.
- Use: Preparation of liquid shampoos.
- "Duponol" WA Dry Flakes. Sodium salt of technical lauryl alcohol sulfate. Light yellow flakes. Dry form of "Duponol" WA Paste.
- "Duponol" WA Paste. Sodium salt of technical lauryl alcohol sulfate. Viscous white paste.
- Use: As a detergent, wetting, dispersing and emulsifying agent in cosmetics, metal, leather, building materials, paper, pigment, and cleaning compound industries, and in shampoos.
- "Duponol" WAQ. Sodium salt of technical lauryl alcohol sulfate. Fluid white paste.
- Use: More fluid form of "Duponol" WA Paste designed primarily for shampoos.
- "Duponol" WAQE. Sodium salt of technical lauryl alcohol sulfate. Fluid liquid.
- Use: Carefully controlled and standardized for use as emulsifying agent in emulsion polymerization industry.
- "Duponol" WAT. Alkylolamine salt of long chain alcohol sulfate. Clear yellow viscous liquid.
- Use: As a detergent, wetting, dispersing and emulsifying agent of high solubility and good foaming, particularly suitable for shampoos.
- "Duponol" WS. "Duponol" G plus long chain saturated alcohol. Light cream-colored waxy solid.
- Use: A wax-soluble emulsifying agent for preparing water-in-oil emulsions.
- "Duponol" XL. Modified long chain alcohol sulfate. Clear light yellow liquid.
- Use: Shampoo base for high quality clear liquid shampoos.
- "Duracillin." ¹⁰⁰ Trademark for procaine penicillin G, U. S. P.
- "Durad." ³³³ Synthetic resin varnishes, enamels, and undercoats having phenolic and alkyd synthetic-resin bases.
- durain.** One of the types of physical structure found in coal (see also clarain, fusain, and vitrain). Durain occurs as solid bands of varying thickness having a finely granular structure. It has a dull luster and a black to lead gray color. See also splint coal.
- "Duralon." ³²⁶ A furane thermosetting resin used in industrial and chemical applications. Available in various compounds suitable for casting, trowelling, molding, impregnating, and coating.
- Uses: For industrial parts requiring resistance to acids, alkalies, and solvents.
- duralumin.** An aluminum alloy. It contains 4% copper, 0.5% magnesium, 0.25-1.0% manganese, and small amounts of iron and silicon. Resistant to corrosion by acids and sea water.
- Uses: Aircraft parts, railroad cars, boats, machinery, etc.
- "Duramold C." ³² A water-hardening, cold hobbing die steel. Annealed to 90 Brinell, max. Composition: 0.06 C, 0.15 Mn, 0.10 Si.
- "Duramul." ³³³ Trade name for emulsion type undercoats and finishes.
- "Duranickel." ²⁸ Trademark for a wrought, age-hardenable alloy containing approximately 94% of nickel. Has greater strength and hardness and the high resistance to corrosion which is characteristic of nickel.
- "Duranite." ⁴⁴⁸ Trade name of synthetic resin enamels for coating metal products.
- "Duranol." ²⁰⁶ Brand name of proprietary line of dispersed insoluble dyestuffs derived from anthraquinone for application in dyeing and printing of acetate rayon.
- "Duraplex." ²³ Trademark for drying and non-drying oil-modified alkyd resins derived from phthalic anhydride, polyhydric alcohols, and vegetable oils. Air drying, baking, and non-drying grades, in solvent solution or viscous 100% resins. Produce tough, glossy, light-colored coatings with excellent durability.
- Use: Primers, lacquers, and enamels; metal decorating; automotive coatings; furniture finishes; architectural enamels; inks.
- "Duraset." ²⁴⁸ Trademark for a series of products based on N-meta-tolyl phthalamide

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

acid, $\text{CH}_3\text{C}_6\text{H}_4\text{CONHC}_6\text{H}_4\text{COOH}$.

Properties: M. p. 149-151°C (dec); non-volatile; hydrolyzes rapidly in acid or alkaline media; only slightly soluble in water and benzene; soluble in acetone; soluble in ethyl, methyl, and isopropyl alcohols but decomposes rapidly.

Grades: 20W, a wettable powder.

Use: Flower and fruit setting hormone for research purposes.

Warning: Avoid inhalation and contamination of foodstuffs. Hazards, if any, not yet fully investigated.

"Durco." ⁴⁷ A series of cast alloys which includes:

"Durco" D-10, a nickel base alloy containing 65% nickel, 23% chromium, 3.5% copper, 2% molybdenum and 1% manganese. It offers good resistance to acetic, sulfuric and phosphoric acids and basic solutions.

"Durco" 18-8-S, a stainless steel containing besides iron, 18-20% chromium, 8-10% nickel and 0.07% carbon (max). It offers good resistance to acetic, nitric and fatty acids and basic salts.

"Durco" 18-8-S-Mo, a stainless steel containing besides iron, 18-20% chromium, 8-10% nickel, 2-3% molybdenum and 0.07% carbon (max). It offers good resistance to phosphoric acid, hot acetic and fatty acids, sulfite liquors and sulfur dioxide.

"Durco" D-12, a chromic steel containing besides iron, 11.5-14% chromium, 1% (max) nickel and 0.15% carbon (max).

"Durcon." ⁴⁷ A series of cast epoxy formulations for use in corrosion resisting equipment such as pumps, valves, fans, and others. This series of plastic materials is inert to hydrochloric acid, sulfuric acid to 80%, dilute nitric acid, alkalis and most organic acids and solvents. These materials are suitable for use to comparatively high temperatures.

durene (durol; sym-1, 2, 4, 5-tetramethylbenzene) $\text{C}_6\text{H}_2(\text{CH}_3)_4$.

Properties: Colorless crystals; camphor-like odor. Soluble in alcohol, ether, and benzene; insoluble in water. Sublimes and is volatile with steam. Sp. gr. 0.838, m. p. 79-81°C; b. p. 189-191°C.

Derivation: By heating ortho-xylene and methyl chloride in presence of aluminum chloride. Occurs in coal tar.

Method of purification: Crystallization.

Grades: Technical.

Containers: Tins.

Use: Organic syntheses; plasticizers; polymers; fibers.

Shipping regulations: None. *

"Durez." ⁶² Trademark for a line of phenol-formaldehyde resins and molding compounds, and also including diallyl phthalate resins.

Properties: Specific gravities of molded objects range from 1.25 to 1.85 depending on filler and molding conditions; dielectric strengths up to 600 v/mil; tensile strengths 4000-7000 psi; flexural strengths 8000-

12000 psi; impact 0.13 to 17.0 ft lb/in.

(ASTM); moisture absorption 0.15 to 1.5% on 48 hours immersion (ASTM). Some of these properties require special grades as follows:

Grades:

Non-bleeding (for caps and closures of containers holding alcohol and other solvents, and for applications requiring sterilization up to 275°F).

Heat-resistant (containing mineral fillers) for service in the 300-500°F range (iron and utensil handles, toasters, coffee makers).

Impact resistant for gears, power transmission parts, bushings, castor wheels, tool parts, pulleys, instrument cases, machine housings.

Electrical and electronic grades, available in both phenolic and diallyl phthalate types. Used in ignition parts, resistor casings, coil forms, tube bases, distributor caps, commutator parts, circuit breakers.

Special purpose grades for resistance to water, soaps, detergents, corrosion, specific chemicals.

Bonding and impregnating resins such as for brake linings, abrasive wheels, mortars, laminated sheets and tubes. Coating resins for varnishes, enamels, inks, floor dressings.

"Durheat." ³³³ Trade name for clear cellulose-base lacquers, enamels, and varnishes which will withstand temperatures up to 250-300°F. Used largely on metals.

"Durichlor." ⁴⁷ A ferrous cast alloy containing besides iron, 14.5% silicon, 0.85% carbon, 0.65% manganese, and 3.0% molybdenum. It offers the same high resistance to the conditions noted under "Duriron" and in addition gives excellent resistance to hot and cold hydrochloric acid and is superior to "Duriron" for most corrosive chloride salts. Not recommended for hydroxide, sulfites, and acidified ferric and cupric chlorides.

"Durimet-20." ⁴⁷ A ferrous alloy in cast and wrought forms containing in addition to iron the following percentages of other elements: 29% nickel, 20% chromium, 3.5% copper (min), 2% molybdenum and 0.07% carbon (max). It offers good resistance to most sulfuric acid concentrations at 80°C and up to 10% at boiling, all concentrations of hot and cold acetic, fatty, mixed, phosphoric, sulfurous and nitric acids, solvents, sodium and ammonium hydroxides and many other salts, acids, and alkalis.

"Durindone." ²⁰⁶ Brand name of proprietary line of indigoid vat dyestuffs.

"Duriron." ⁴⁷ A ferrous cast alloy containing besides iron, 14.5% silicon, 0.85% carbon and 0.65% manganese. It offers excellent resistance to all concentrations of hot and cold sulfuric, nitric, phosphoric and acetic acids, hypochlorite bleach solutions, chloroacetic acid and most metal-plating

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

solutions. It is also resistant to all concentrations of cold hydrochloric acid and to dilute hydrochloric acid at moderate temperatures. It also shows good resistance to most other acids and salts except hydrofluoric acid, sulfurous acid, sulfites and highly oxidized metallic chlorides. It does not provide satisfactory resistance to most strongly basic solutions.

"Durisite," ³²⁶ A type of "Duralon" furane thermosetting resin.

"Duristone," ³²⁶ A type of "Duralon" furane thermosetting resin.

"Durite," ⁶⁵ Trademark for a series of phenol-formaldehyde resins used in the manufacture of grinding wheels, brake linings, clutch facings, lamp-basing cements.

"Duro," ⁴⁴⁶ Trade name for an acid-proof brick made from materials of very low flux content. When fired stable minerals are formed which are insoluble in various acids and corrosive acidic solutions and resist alkaline solutions. Insoluble in mineral acids, except hydrofluoric.

Uses: Domes and dished bottoms of cylindrical tanks; capping tile, separators for electrolytic tanks, girders and supports for acid tower packing.

"Durobrite," ²⁸ Trademark for cyanide zinc plating brightening agents. Amber liquids.

"Durofix," ¹⁸⁸ Brand name for a proprietary product. A combined odorant and fixing agent.

Properties: Various odors available; faint amber color, will not discolor when exposed to air or sunlight or when incorporated in soaps; miscible with all essential oils, aromatic chemicals, and mixtures of same.

Uses: Soaps, bath salts, perfumes; toilet goods.

durol. See durene.

"Durol," ²⁴³ Trademark for milling blacks for wool and nylon.

dusting clays. Any finely divided pulverized clay that can serve as a diluent, carrier, or extender in the preparation of insecticide dusts, and which aids in adhesion of the insecticide to foliage.

dust-laying media. Calcium chloride, tars, liquid asphalt, heavy asphalt oils, solutions of petroleum asphalt in gas oils, crude oils, and emulsions of oils and water have all been used for road-dust laying.

Dutch liquid. See ethylene dichloride.

Dutch metal. A cheap imitation of gold leaf made of an alloy of copper and zinc.

Dutch oil. See ethylene dichloride.

Dutch pink. A yellow lake derived by absorbing quercitron, a yellow dye, on calcium carbonate or some similar inert material. Used as an artist's pigment, as wall paper coloring and to tone Brunswick Green.

Sometimes referred to as Dutch yellow, English pink, or Italian pink.

Dutch process. Process for making white lead. Perforated lead disks are placed over, but not in contact with, 3% acetic acid (vinegar) and surrounded with tan-bark. The system is closed off for 100 days while the acid vapors, moisture, and CO₂ from the fermenting tanbark act on the lead to produce white lead (lead carbonate, basic). The white lead is broken away from unreacted lead, ground, floated in water and dried to give about 70% carbonate and 30% hydroxide.

Dutch yellow. Yellow dyestuff prepared from tetraazotized benzidine, salicylic acid, and sodium bisulfite. Used to obtain brownish-yellow shades on wool. The term has also been used synonymously with Dutch pink.

DVB. Abbreviation for divinylbenzene.

dwarf pine needle oil. See pine needle oil, *Pinus mugo* variety.

Dy. Symbol for dysprosium.

"Dyal," ¹⁴¹ Trade name for a series of resins and resin solutions of the alkyd type.

"Dyasist," ³⁰⁰ Trademark for dyeing assistants for use on synthetic fibers.

"Dyasist" 230: For dyeing 100% "Orlon" with cationic dyes.

"Dyasist" 281: Leveling agent for dyeing nylon tricot and other nylon filament fabrics, to eliminate or minimize Barré marks.

"Dybar," ²⁸ Trademark for pellets containing 25% fenuron for control of oak, birch, locust, maple, pine, poplar and elm on fence rows, drainage ditches, utility and railroad rights-of-way, and spot treatment for control of bindweed.

Containers: 10-lb canisters; 50-lb bags.

dyclonine (4'-butoxy-3-piperidinopropiophenone hydrochloride) C₁₈H₂₇NO₂·HCl.

Properties: Crystals; m. p. 175-176°C; soluble in water, alcohol, acetone. Phenol coefficient 3.6.

Grade: N. N. D.

Use: Medicine.

dyeing assistants. Any materials added to a dye bath to promote or control dyeing. The action of assistants differs with the classes of dyes, but in most cases they aid in level deposition of the dye, either by delaying its absorption, increasing its solubility, or assisting the dye solution to penetrate the material.

dye intermediates. See intermediate.

dye retarding agents. Materials added to dye baths to prevent, by decreasing absorption of the dyes, the rapid exhaustion of the bath.

dyer's alkanet. See alkanna.

dyer's saffron. See carthamus.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

dyes. A dye is usually a colored organic compound or mixture, that can be applied to and give color to a second substance such as cloth, paper, plastic or leather, in a reasonably permanent fashion. Dyes characterized by satisfactory permanence in spite of exposure to light, air, and normal handling are referred to as "fast" dyes; others are "fugitive." Most dyes of commercial importance are synthesized from the aromatic hydrocarbons and related materials. Dyes are most frequently used to confer color on fabrics, but there are also a great number of other applications, including the following: paints and related materials; oil and gasoline; anti-freeze mixtures or compounds; foodstuffs and fruit; inks and paper; rubber, resins, plastics; carbon paper and typewriter ribbons; soap, nail polish, cosmetics; polishes, waxes, and candles. See also pigments. Dyes are classified according to chemical composition, and also according to the way in which they behave during application. Vat, sulfur, direct, acid and azoic dyes have been used in greatest volume. Increases in usage have occurred for mordant, solvent, dispersed, basic, food, drug, cosmetic dyes and for fluorescent brighteners. The most important chemical types are the azo, anthraquinone, sulfur, indigoid and stilbene dyes. The chemical classes of coloring matters and their arrangement according to chemical structures have been designated numerically according to the "Colour Index" (1957 revision) as follows:

Chemical Class	Colour Index
Nitroso	No. 10000-10299
Nitro	10300-10999
Monazo	11000-19999
Disazo	20000-29999
Trisazo	30000-34999
Polyazo	35000-36999
Azoic	37000-39999
Stilbene	40000-40999
Diphenylmethane	41000-41999
Triaryl methane	42000-44999
Xanthene	45000-45999
Acridine	46000-46999
Quinoline	47000-47999
Methine	48000-48999
Thiazole	49000-49399
Indamine	49400-49699
Indophenol	49700-49999
Azine	50000-50999
Oxazine	51000-51999
Thiazine	52000-52999
Sulfur	53000-54999
Lactone	55000-55999
Aminoketone	56000-56999
Hydroxyketone	57000-57999
Anthraquinone	58000-72999
Indigoid	73000-73999
Phthalocyanine	74000-74999
Natural	75000-75999

dyes, disperse. These dyes fall mainly into three clearly defined chemical classes: (a) nitroarylamine, (b) azo and (c) anthra-

quinone, and almost all contain amino or substituted amino groups but no solubilizing sulfonic acid groups. They are water-insoluble dyes introduced as a dispersion or colloidal suspension in water and are absorbed by the fiber after which they may remain untreated or be aftertreated (diazo-tized) to produce the final color. Their use is primarily for cellulose acetate and nylon, polyester and other synthetic fibers and for thermoplastics.

dyes, leather. Natural dyes and pigments were originally and often still are used for dyeing leather. However, most types of synthetic dyestuffs were found to have an affinity for leather; particular basic and acid dyes for vegetable-tanned leather and direct and acid dyes for chrome-tanned leather.

dyes, natural. This group comprises all dyes obtained from animal or vegetable matter with little or no chemical processing. They are mainly mordant dyes but include some vat dyes, solvent dyes and others. Some illustrations are curcuma, saffron, carmine, litmus, indigo, chlorophyll, walnut extract. Since they are natural extracts, they are not expected to be chemically pure. The use is varied, including dyeing of natural fabrics, as artist's colors, spirit or water base inks, coloring of paper, as indicator colors.

"Dykast." ³³³ Trade name for lacquer enamels used especially on zinc and aluminum die castings.

"Dylan." ¹¹ Trademark for soft polyethylene plastics having a low-polish, waxy appearance. Used for squeeze bottles, film packaging, other applications where flexibility is required. See also "Super Dylan."

"Dylene." ¹¹ Trademark for a light, rigid polystyrene used as a thermoplastic molding material. Available in a full range of colors and in both medium and high impact resistant types.

"Dylex." ¹¹ Trademark for styrene-butadiene latices.

Properties: Stable, milky white latices with high solids content; fine particle size; low viscosity; high mechanical stability; good electrolyte and acid stability.

Grades: Styrene-butadiene ratios from 50-50 to 90-10.

Uses: Paper and textile coatings; films.

"Dylite." ¹¹ Trademark for a free-flowing expandable polystyrene. Foam density controlled by application of heat. Used for low temperature thermal insulations, light weight core material in sandwich constructions, buoyant members, toys, novelties, and electronics.

"Dylox." ¹⁸¹ A selective insecticide containing O, O-dimethyl 2, 2, 2-trichloro-1-hydroxyethylphosphosphate (q. v.).

"Dymal." ¹⁴¹ Trade name for resins of the maleic anhydride or fumaric acid alkyl type.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"**Dymerex.**" ²⁶⁶ Trademark for a light-colored, hard, thermoplastic resin; dimerized resin acids; softening point 152°C; acid number 143; color M; density 1.069 at 20°C.

"**Dymetracin.**" ³⁴² Trademark for sodium bacitracin methylene disalicylate.

"**Dynahue.**" ²⁰⁴ Trademark for a complete laundry detergent designed for use on washable colored cottons.

dynamite. An industrial explosive which is detonated by blasting caps. The principal explosive ingredient is nitroglycerin or specially sensitized ammonium nitrate. Diethyleneglycol dinitrate, which is also explosive, is often added as a freezing point depressant. A dope such as wood pulp, and an antacid, as calcium carbonate, are also essential. See also blasting agents; blasting gelatin.

Shipping regulations: High explosive, Class A. High explosive label.*

"**Dynawet.**" ²³³ Trademark for emulsifier and wetting agent for use in herbicides, fungicides, insecticides, etc.

"**Dyne.**" ²⁸⁴ Trademark for a detergent-germicide recommended for dairy farm sanitation. Contains nonionic-iodine complexes. Claimed to be non toxic, non irritating, non staining when used as directed.

"**Dynel.**" ²¹⁴ Proprietary name for copolymer of vinyl chloride and acrylonitrile used as a textile fiber.

Properties: Irregular ribbon-shaped cross section filaments. Light cream color, easily dyed. Fire resistant and insect resistant. Unaffected by strong detergents and soaps and wide variety of inorganic acids, bases, and salts. Unaffected by hydrocarbons, dry cleaning solvents, and most other organic solvents. Acetone, cyclohexanone, and dimethyl formamide are solvents in varying degrees. Sp.gr. 1.30 (25°C); softening range 300-325°F.

Grades: Fiber sizes of 2, 3, 6, 12, and 24 denier and in staple lengths from 1 1/2 to 6 inches. Also available as 135,000 total denier tow.

Containers: Corrugated cartons, baled with steel tape containing 100 and 500 pounds net. Tow packed in cartons containing 150 pounds net.

Use: Textile fiber for use in pile, knitted and woven fabrics for apparel and industrial goods.

"**Dyphene.**" ¹⁴¹ Trade name for pure phenolic resins characterized by extreme hardness, excellent chemical resistance and fast drying properties.

"**Dyphenite.**" ¹⁴¹ Trade name for rosin-modified phenolic resins.

"**Dyphos.**" ³⁰⁴ Trademark for dibasic lead phosphite (2PbO·PbHPO₃·1/2H₂O) vinyl stabilizer.

Properties: Fine white acicular crystals; sp. gr. 6.94; refractive index 2.25.

Containers: Fiberboard drums containing 40 and 300 pounds.

Uses: Heat, light and weathering stabilizer for vinyl and other chlorinated resins in paints and plastics. Special "XL" grade available for vinyl electrical insulation.

Caution! "Dyphos" should be stored in closed containers, away from open flame, and at temperatures not to exceed 400°F. Avoid exposure to sparks or static electricity by grounding equipment and using wooden scoops.

dyphylline [7-(2,3-dihydroxypropyl)theophylline]
C₁₀H₁₄N₄O₄.

Properties: Crystals; extremely bitter taste; m. p. 158°C; freely soluble in water; soluble in alcohol and chloroform.

Grade: N. N. D.

Use: Medicine.

dypnone (phenyl alpha-methylstyryl ketone; 1,3-diphenyl-2-buten-1-one)

C₆H₅COCHC(CH₃)C₆H₅. Stable, light colored liquid with a mild fruity odor.

Properties: B. p. (50 mm) 246°C, sp. gr. 1.093 (20/20°C); f. p., sets to a glass below -30°C, almost insoluble in water; flash point 350°F.

Uses: Softening agent, plasticizer, and perfume base. High absorption of ultraviolet light, low water solubility, low evaporation rate, and good solvent action make it suitable for use in coatings that must be stable to light.

"**Dyrene.**" ¹⁸¹ Trademark for 2,4-dichloro-6-ortho-chloroaniline-s-triazine (q. v.).

dyscrasite. Ag₃Sb. A natural antimonide of silver. Color and streak silver-white; luster metallic, usually tarnished. Sp. gr. 9.74; hardness 3.5-4.

Occurrence: Germany; France; Canada.

Use: Ore of silver.

dysprosia. See dysprosium oxide.

dysprosium Dy. Rare earth element or lanthanide having atomic number 66.

Properties: Lustrous metal; m. p. 1465-1505°C; b. p. 2300° (approx). Reacts slowly with water; soluble in dilute acids.

Derivation: Reduction of the fluoride with calcium.

Source: See rare earth minerals.

Grades: High purity lumps or ingots.

See also rare earth metals.

dysprosium nitrate Dy(NO₃)₃·5H₂O.

Properties: Yellow crystals; m. p. 88.6°C (in its water of crystallization). Soluble in water.

Derivation: Treatment of oxides, carbonates or hydroxide with nitric acid.

Grades: Up to 99.9% pure.

Containers: Glass bottles; fiber drums.

Shipping regulations: Oxidizing material.

Yellow label.*

dysprosium oxide (dysprosia) Dy₂O₃.

Properties: White substance; many times more magnetic than ferric oxide; slightly hygroscopic, absorbing moisture and

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

carbon dioxide from the air. Sp. gr. 7.81 (27/4°C). Soluble in acids and alcohol.

See also rare earths.

Derivation: Ignition of hydroxides and oxyacids (carbonates, oxalates, sulfates, etc.).

Containers: Glass bottles; fiber drums.

dysprosium salts. Salts available commercially other than those listed here are the chloride, $\text{DyCl}_3 \cdot x\text{H}_2\text{O}$; fluoride, $\text{DyF}_3 \cdot 2\text{H}_2\text{O}$; arsenide, antimonide and phosphide. The last three are used as high purity binary semiconductors.

dysprosium sulfate $\text{Dy}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$.

Properties: Brilliant yellow crystals, stable at 110°C and completely dehydrated at 360°C. Soluble in water.

Derivation: Dissolving the hydroxide, carbonate or oxide in dilute sulfuric acid.

Use: For atomic weight determination.

"Dythal." ³⁰⁴ Trademark for dibasic lead phthalate vinyl stabilizer.

Properties: Fluffy white crystalline powder; sp. gr. 4.6; refractive index 1.99.

Containers: Fiberboard drums containing 40 and 250 lbs.

Uses: Heat and light stabilizer for general vinyl use. Excellent for high temperature vinyl insulation and opaque film and sheeting. Special "XL" grade available for vinyl electrical insulation.

"Dytol." ²³ Trademark for aliphatic primary alcohols derived from natural fats and oils.

Uses: Additives for cosmetic creams, polymerization regulators for elastomers and plastics, detergents and viscosity index improvers for lubricating oils, finishing and softening agents for textiles, preparation of quaternary ammonium compounds, surfactants, water evaporation control and anti-foam.

"Dytrol." ⁵⁸ Trademark for clear oily liquid resin plasticizer used as paint brush preservative, reconditioner; paint remover. Non-volatile; non-flammable; non-toxic, pleasant odor. Miscible with most common solvents, thinners and oils; softens paints, lacquers, varnishes; sp. gr. 1.088-1.091 (25/25°C), refractive index 1.507-1.510 (25°C), moisture content 0.1% maximum.

Containers: 5- and 55-gal drums.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

E

E. A symbol first suggested for einsteinium. See actinide elements.

"E-2," ⁵⁸ Trademark for ammonium nitrate fertilizer pellets, min. nitrogen content 33.5%, moisture 0.3%. No organic coating. Shipping regulations: See ammonium nitrate. Consult manufacturer.

"E 1059," ¹⁸¹ See O,O-diethyl O(and S)-2-(ethylthio)ethyl phosphorothioates.

eagle vine. See condurango.

EAK. Abbreviation for ethyl amyl ketone.

earth. Originally a naturally occurring metal oxide, somewhat impure or diluted. Most frequently used for oxides of iron and other metals of similar chemical activity and occurrence. Many of these oxides are used as pigments (see earth, red; earths, green, iron oxide reds). The word earth is also used to describe classes of metal oxides, as, alkaline earths, rare earths. It is most frequently used in combination with another descriptive term as in the preceding examples, and is seldom used alone.

earth flax. See asbestos.

earth, infusorial. See diatomite.

earth-nut. See peanut.

earth-nut cake. See peanut cake.

earth oil. See petroleum.

earth pitch. See asphalt.

earth, red. A fine red pigment consisting essentially of red iron oxide. See also iron oxide reds.

earths, green (terre verte). Collective name for various pale bluish-green earths formed by disintegration of minerals, principally those of the hornblende type, and used as pigments. They are somewhat deficient in body and intensity of hue, and are now largely replaced by manufactured pigments.

earth wax. See ceresin wax.

East Indian copaiba balsam. See gurjun balsam.

East Indian copaiba balsam oil. See gurjun balsam oil.

East Indian geranium oil. See palmarosa oil.

eau de cologne. An alcoholic solution of a number of essential oils among which are bergamot, lemon, lime, lavender,

rosemary, and neroli in varying amounts. Sold commercially as a perfume, toilet water, etc.

eau de javelle. See javelle water.

eau de Labarraque. See sodium hypochlorite; Labarraque's solution.

"EB-5," ²³³ Trademark for fumigant containing approximately 5% ethylene bromide (q. v.). Concentrations other than 5% are indicated by appropriate number.

ebm. See electron beam melted.

ebonite. Black, hard, vulcanized rubber used for valves, faucets, pipes, electric equipment, fountain pens, toilet articles, handles, etc., made from the cheaper grades of rubber, or from latex.

"Ebonol," ¹⁴² Trade name for various blackening processes including "Ebonol S" for blackening of steel, "Ebonol C" for blackening of copper and copper base alloys, and "Ebonol Z" for blackening of zinc. Materials are supplied in all cases as powders that are added to water at various temperatures to accomplish blackening.

ecgonidine. See anhydroecgonine.

echinacea (cone flower; black sampson; purple cone flower). Root of *Brauneria pallida* and *B. augustifolia*.

Habitat: North America.

Grade: Technical.

Containers: Bags; barrels.

Use: Medicine.

echitamine. See ditaine.

Eclipse. See benzopurpurin.

Eclipse Red. See benzopurpurin.

"Ecolid," ³⁰⁵ Trademark for chlorisondamine chloride N. N. D.

Use: Medicine.

economic poison. See pesticide.

"Econo-Sour," ²⁴⁴ A proprietary product consisting chiefly of fluorine compounds.

Properties: White powder; sparingly soluble in water; neutralizing value, 28.6 oz sodium bicarbonate per lb.

Containers: 150-lb and 300-lb fiber drums.

Uses: Laundry sour where economy is desired.

Shipping regulations: None.*

"Eco Spar," ³³³ Trade name for clear spar varnishes and enamels for use on exteriors.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ectylurea (2-ethyl-cis-crotonylurea)

Properties: Crystalline solid; m. p. 198°C; slightly soluble in organic solvents.

Grade: N. N. D.

Use: Medicine.

edathamil calcium disodium. See calcium disodium EDTA.

EDB. Abbreviation for ethylene dibromide (q.v.).

"**E-D-Bee.**"⁸⁵ Trade name for a concentrated fumigant for dormant treatment of bee hives and combs to control wax worms of bee-moths; contains ethylene dibromide.

Edeleanu process. A solvent extraction process using liquid sulfur dioxide for the removal of undesirable aromatics from heavy lubrication oils.

edestin. A vegetable globulin which can be obtained from hemp seed and certain other seeds.

Properties: White or light-brown crystals, soluble in water and dilute acids.

Use: Analytical determination of pepsin.

edible oils. Vegetable or animal oils, containing not over 0.1% of free fatty acid, used for food purposes (cooking, salad-dressing and manufacture of oleomargarine or other butter substitutes, such as butter oils, deodorized oils, margarine oils, salad oils).

"**Edicol.**"²⁰⁶ Brand name for a line of dye-stuffs used in coloring edible products, and specially prepared to conform to the food laws of the United Kingdom and other countries.

edrophonium chloride (dimethylethyl-(3-hydroxyphenyl)ammonium chloride)

Properties: White, odorless, crystalline powder; m. p. 167-170°C (dec). Very soluble in water; freely soluble in alcohol, practically insoluble in ether. pH (1% solution) 4.0-5.0.

Grade: U. S. P. XVI.

Use: Medicine.

EDTA. Abbreviation for ethylenediamine-tetraacetic acid.

e.g. Abbreviation of "for example."

egg oil. See egg yolk.

egg yolk (egg oil). See also albumin, egg.

Properties: Yellow semi-solid mass; sp. gr. 0.95; m. p. 22°C.

Derivation: From the eggs of hens, ducks, and geese. The yolks are separated from the whites and the yolks are then mixed with common salt; sometimes a small amount of borax is added as a preservative.

Grades: Technical, edible.

Containers: Wooden barrels; fiber drums.

Uses: Leather dressing; tanning; baking; dairy products; pharmaceuticals (ointments, emulsions, drug preparations); soap; perfumery.

eglantine. Name applied to isobutyl benzoate.

eglestonite. A natural mercury oxide-chloride, $\text{Hg}_4\text{Cl}_2\text{O}$. Found in Texas.

Egyptian asphalt. A glance pitch (q. v.) found in the Arabian desert between the Nile and the Red sea. It has sp. gr. 1.10 (77°F), contains over 99% non-mineral content, is soluble in carbon disulfide and has a fusing point of 285°F (B & R).

Shipping regulations: None.*

Egyptianized clay. A clay to which tannin has been added in order to make it more plastic.

Egyptian privet. See henna.

Ehrlich 606. See arsphenamine.

Ei. A symbol used for einsteinium, but not sanctioned by the IUPAC.

eicosafuoro-1-undecanol. See fluoroalcohols.

eicosane $\text{C}_{20}\text{H}_{42}$. Most technical eicosane is a mixture of predominantly straight chain hydrocarbons averaging 20 carbon atoms to the molecule.

Properties (pure n-eicosane): White crystalline solid, f. p. 36.7°C, b. p. 205°C (15 mm), refractive index 1.4348 (n_D 20/D); sp. gr. 0.778 (at melting point). Insoluble in water; soluble in ether. Can be readily chlorinated.

Specifications (technical eicosane): Melting range 35-36.5°C, boiling range (10 mm) 10% 383°F, 90% 410°F.

Grades: Pure normal (99+%), technical.

Uses: Cosmetics, lubricants, plasticizers; flameproofing fabrics.

eicosanoic acid. See arachidic acid.

1-eicosanol. See arachidyl alcohol.

eikonogen (1-amino-2-naphthol-6-sulfonic acid, sodium salt) $\text{NH}_2\text{C}_{10}\text{H}_5(\text{OH})\text{SO}_3\text{Na} \cdot 2\frac{1}{2}\text{H}_2\text{O}$.

Properties: White powder which reduces silver salts. Soluble in water; insoluble in alcohol and ether.

Derivation: By the interaction of sodium carbonate and amino-2-naphthol-6-sulfonic acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Photographic developer.

Shipping regulations: None.*

einsteinium (element 99) Es. A synthetic radioactive element with atomic number 99 first discovered in the debris from the 1952 hydrogen bomb explosion. Einsteinium has since been prepared in a cyclotron by bombarding uranium with accelerated nitrogen ions, in a nuclear reactor by irradiating plutonium or californium with neutrons, and by other nuclear reactions. The element is named for Albert Einstein. It has chemical properties similar to those of the rare earth holmium. Isotopes are known with mass numbers ranging from 246-253.

See also actinide elements.

ELA Elastomer Lubricating Agent.²⁸ Mixture of phosphate esters.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Pale yellow liquid.

Containers: Drums (425 lbs, net).

Use: As a lubricant for unvulcanized natural and synthetic rubber compositions.

elaidic acid (trans-9-octadecenoic acid)

$\text{CH}_3[\text{CH}_2]_7\text{CH}=\text{CH}[\text{CH}_2]_7\text{COOH}$. The trans form of an unsaturated fatty acid of which the cis-form is oleic acid.

Properties: White solid; sp. gr. 0.8505 (79/4°C); m. p. 43.7°C; b. p. 288°C (100 mm); 234°C (15 mm); refractive index 1.4358 (79°C). Insoluble in water; soluble in alcohol, ether, benzene and chloroform.

Derivation: Synthetic product, from oleic acid by elaidinization.

Grade: Purified, 99+ %.

Uses: In medical research and as reference standard in chromatography.

elaidinization. Originally, the reaction by which oleic acid is converted into elaidic acid but now used in the more general sense to indicate the conversion of any unsaturated fatty acid or related compound from the geometric cis to the corresponding trans form. Nitrous acid and selenium compounds are commonly used as catalysts for this reaction. The resulting trans acids are more stable to oxidative effects.

"Elaine." ²⁴² Trade name for a brand of oleic acids.

"Elastex" 20-A Plasticizer. ¹⁷⁵ Trademark for diisodecyl adipate, a plasticizer providing vinyl formulations with low-temperature performance.

Containers: 55-gal steel drums; tank trucks; tank cars.

"Elastex" 60-A Plasticizer. ¹⁷⁵ Trademark for dioctyl adipate (q. v.), a plasticizer commonly used with general purpose plasticizers in processing polyvinyl and other synthetic resin compounds.

Containers: 55-gal steel drums; tank trucks, tank cars.

"Elastex" 50-B Plasticizer. ¹⁷⁵ Trademark for butyl cyclohexyl phthalate (q. v.), used for processing natural and synthetic polymers and elastomers; also in nitrocellulose lacquers.

Containers: 55-gal steel drums; tank trucks, tank cars.

"Elastex" DCHP Plasticizer. ¹⁷⁵ Trademark for dicyclohexyl phthalate (q. v.), used as a plasticizer in processing vinyls because of its excellent compatibility at elevated temperatures; also widely used in the formulation of heat-sealing paper coatings.

Grades: Cast solid; granular; or lump.
Containers: Cast, 55-gal destructible steel drums; granular or lump, fiber drums (250 lb net).

"Elastex" 10-P Plasticizer. ¹⁷⁵ Trademark for diisooctyl phthalate (DIOP) (q. v.), a general purpose plasticizer for vinyl resins and synthetic rubbers.

Containers: 55-gal steel drums; tank trucks, tank cars.

"Elastex" 18-P Plasticizer. ¹⁷⁵ Trademark for isooctyl isodecyl phthalate (q. v.), a plasticizer characterized by good retention of physical properties after heat-aging.
Containers: 55-gal steel drums; tank trucks; tank cars.

"Elastex" 28-P Plasticizer. ¹⁷⁵ Trademark for dioctyl phthalate (DOP; di-2-ethylhexyl phthalate) (q. v.), a general purpose plasticizer used especially for vinyl resins and synthetic rubbers.

Containers: 55-gal steel drums; tank trucks; tank cars.

"Elastex" 40-P Plasticizer. ¹⁷⁵ Trademark for butyl isodecyl phthalate (q. v.), a secondary plasticizer for PVC and PVC-PVAc copolymer resins; also used in the formulation of plastisols and organosols.

Containers: 55-gal steel drums; tank trucks; tank cars.

"Elastex" 48-P Plasticizer. ¹⁷⁵ Trademark for butyl octyl phthalate, a primary plasticizer for vinyl resins.

Containers: 55-gal steel drums; tank trucks; tank cars.

"Elastex" 82-P Plasticizer. ¹⁷⁵ Trademark for n-octyl n-decyl phthalate, a primary plasticizer for vinyl film, sheeting, hose, and wire and cable insulation.

Containers: 55-gal steel drums; tank trucks; tank cars.

"Elastex" 90-P Plasticizer. ¹⁷⁵ Trademark for diisodecyl phthalate (DIDP) (q. v.), a low volatility plasticizer used to upgrade aging characteristics and also to stabilize viscosity of plastisols.

Containers: 55-gal steel drums; tank trucks; tank cars.

elastic glue. See glue.

elastin. An albuminoid which occurs in elastic tissue.

Properties: Yellow fibrous mass; insoluble in water, in dilute acids, alkalis and salt solutions, and in alcohol. Is partially digested by pepsin solution and wholly by trypsin.

elastomer. A synthetic polymer with rubber-like characteristics, but not necessarily in such a degree as to make the material practically useful. Examples of commercial products are butyl rubber, polyurethane rubber, and silicone rubber.

"Elastopar." ⁵⁸ Trademark for N-methyl-N,4-dinitrosoaniline (33%) plus "Whitetex" Clay (66%). Light colored, free flowing 30 mesh powder used for chemically modifying butyl rubber to give improved resilience; increased modulus; lower hardness; increased abrasion resistance, better low temperature flexibility, increased electrical resistance; reduced cold-flow and Mooney Viscosity.

elaterin $\text{C}_{20}\text{H}_{38}\text{O}_5$.

Properties: White, crystalline powder. Soluble in chloroform; slightly soluble in

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

alcohol, benzene, and ether. M. p. 216°C.
Derivation: From the juice of Echalium elaterium.

Method of purification: Crystallization.

Grade: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

elaterite (mineral caoutchouc). A variety of asphaltic pyrobitumen (q. v.).

elayl. *See ethylene.

"**Elbelan**,"²³² Brand name for a series of neutral-dyeing pre-metallized dyestuffs of outstanding fastness properties.

"**Elchem**" 1393.²⁸ Brand name for an addition agent, a grayish-white powder containing potassium cyanide and selenium; slightly hygroscopic, water-soluble, stable. Poisonous.

Containers: 25- and 100-lb fiber drums.

Uses: As brightening agent in cyanide copper plating baths.

"**Elchem**" 1396.²⁸ Brand name for an addition agent, a dark amber liquid; mildly alkaline. Use: Brightener and antipitting agent for cyanide copper plating baths.

"**Elchem**" 1442.²⁸ Brand name for an addition agent, a mildly alkaline solution containing potassium cyanide and selenium. Poisonous. Containers: 40-lb pails; 450-lb drums. Uses: As a brightening agent and leveling agent in cyanide copper plating baths.

electrical oils. See insulating oils.

electric furnace refractories. See cermets.

electric steels. Steels which have been made in an electric furnace.

electrochemical equivalent. The number of grams of an element or group of elements liberated by the passage of one coulomb of electricity (one ampere for one second).

electrochemistry. Branch of chemistry which deals with the chemical change produced by an electric current and with the production of electricity from the energy released in a chemical reaction. Applications are in the ordinary dry cell, in lead plate storage batteries, electroplating, purification of copper, production of aluminum, fuel cells, and in corrosion of metals.

electrocortin. See aldosterone.

electrode, hydrogen. Platinum surface coated with platinum black, immersed in a solution and bathed with a stream of pure hydrogen gas. The potential developed depends on the equilibrium between the hydrogen gas and the hydrogen ions in solution. Used as the standard reference electrode.

electrodeposition. The precipitation of a material at an electrode as the result of the passage of an electric current through a solution or suspension of the material, e.g., copper from copper sulfate solution; rubber from latex.

electroforming. The reproduction of an object or pattern by electrodeposition. A mold of the object to be reproduced is made in a soft metal or in wax (by impression). The non-conductor mold surface is made conducting by coating with graphite. Some suitable metal is then deposited electrolytically on the mold surface. This mold is then (in most cases) a negative of the object to be produced. Most extensive use is in the phonograph record industry.

electroluminescence. The emission of light as a consequence of electrical discharges in gases. Typical examples are neon lights, mercury vapor lamps and lightning.

electrolysis. Decomposition by means of an electric current; the compound is split into positive and negative ions which migrate to and collect at the negative and positive electrodes.

electrolyte. A substance which dissociates into ions when in solution or a fused state and which will then conduct an electric current. Common examples are sodium chloride and sulfuric acid.

electrolyte acid. See battery acid.

electrolytic cell. A combination of a liquid or semi-liquid electrolyte (solution of a salt, acid, or base) and two solids (the electrodes) which generates an electric current when the electrodes are connected by an external wire. Flashlight batteries (see dry cell), storage batteries (q. v.), and fuel cells (q. v.) are special types of electrolytic cells. When electricity is generated in such a cell chemical changes occur at the electrodes so that either or both the electrodes and the electrolyte are gradually consumed. The term cell or electrolytic cell is also loosely applied to somewhat similar arrangements in which an electric current from an external generator is passed through the cell, in order to cause chemical changes, as in the electrolysis of sodium hydroxide solution to produce hydrogen and oxygen gases.

"**Electromanganese**,"²⁵⁰ Trademark for an electrolytic manganese metal of high purity (99.9% min) used in the production of steel, aluminum and other metals and alloys.

electromotive series (displacement series; activity series). An arrangement of the metals in the order of their tendency to react with water and acids, so that each metal displaces from solution those below it in the series and is displaced by those above it. The arrangement of the more common metals is: potassium, sodium, magnesium, aluminum, zinc, iron, tin, lead, hydrogen, copper, mercury, silver, platinum, gold.

electron. A negatively charged particle with mass approximately 1/1860th that of the lightest atom (the hydrogen atom). Ordinary hydrogen atoms are composed of a

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

single electron and a central nucleus consisting of a positively charged proton particle, the charge being equal to that on the electron but opposite in sign. Other atoms have two or more electrons and more complex nuclei. An electric current consists of a stream of electrons more or less freed from their association with a particular atom. Electrons sometimes behave like waves of energy instead of discrete particles. See also fundamental particle.

electron beam melted (ebm). Used of steels and alloys, which are melted in electron beam furnaces, a process competitive with vacuum arc melting.

Electronic Palladium. ²⁸ Palladium metal with fluxes and vehicles for application on green ceramic bases that are fired at extreme temperatures and permit multiple laminations of electroded ceramic sheets used for capacitor manufacturer.

Containers: 1- to 32- oz jars.

Electronic Platinum. ²⁸ Similar to Electronic Palladium.

electron volt (ev). A unit of energy which is defined as the energy acquired by any charged particle carrying a unit electric charge when it falls through a potential of one volt. It is equivalent to 1.60×10^{-12} ergs. One mev is equal to one million electron volts. One kev is equal to one thousand electron volts. One bev is one billion electron volts.

electrophoresis. The phenomenon of migration of suspended or colloidal particles in a liquid due to the effect of an e. m. f. or potential difference across immersed electrodes. Just as in ordinary electrolysis, the migration is toward electrodes of electric charge opposite to that of the particles. Most solids, being negatively charged, migrate to the anode, the exception being basic dyes, hydroxide sols, and colloids which have adsorbed positive ions, all of which are positively charged and migrate to the cathode. Migrated particles lose their charge at the electrode, and generally agglomerate around it. A small current is used to avoid agitation caused by eddy currents of electrolysis or by evolution of gas bubbles.

Electrophoresis is important in the study of proteins because the molecules of such materials act like colloidal particles and their charge is positive or negative according to whether the surrounding solution is acidic or basic. Thus, the acidity of the solution can be used to control the direction in which a protein moves upon electrophoresis.

electroplating. The deposition of a layer of metal (usually thin) on a base metal or conducting surface by electrolysis, i. e., the action of an electric current.

Electropolishing Solution. ²⁸ A clear, dark amber corrosive liquid; glycolic acid-sulfuric acid formulation; acid content 85%.

Freezing point below 32°F; nonflammable and nonexplosive; miscible with water.

Containers: 162-lb. carboys.

Uses: In electropolishing stainless steel.

electrowinning. Recovery of metals from ores by electrochemical processes.

"Electrunite." ²⁵¹ Trademark for steel pipe and tubing, including both stainless and carbon steels.

element (elementary substance). A substance or kind of matter all of whose atoms are alike in the sense that they all have the same number of positive charges on the nucleus. The atoms however may have different masses, and in this case the element may have two or more isotopes. In a more conventional sense an element is a substance which can not be decomposed into or synthesized from other substances by ordinary chemical methods.

element 61. See promethium.

element 99. Now known as einsteinium. See also actinide elements.

element 100. Now known as fermium. See also actinide elements.

element 101. Now known as mendelevium. See also actinide elements.

element 102. Now known as nobelium (q. v.). See also actinide elements.

element 103. Tentatively named lawrencium (q. v.). See also actinide elements.

elementary particle. See fundamental particle.

elementary substance. See element.

elemi gum (canarium).

Derivation: A yellowish to brown resin from certain trees, Canarium commune in the Philippine Islands, Canarium maritanum in Mauritius and Amyris elemifera in Mexico and Brazil.

Soluble in alcohol, benzene, and turpentine.

Grades: Technical.

Containers: Bags.

Uses: Varnishes; lacquers; perfume fixative; ointments.

Shipping regulations: None.*

elemi oil.

Properties: An almost colorless, liquid oil; agreeable aromatic odor and taste. Soluble in alcohol, ether, chloroform, and carbon disulfide.

Chief known constituents: Limonene and phellandrene.

Constants: Sp. gr. 0.870-0.910.

Derivation: Distilled from the gum of the Manila elemi tree Canarium luzonicum.

Method of purification: Rectification.

Grades: Technical.

Containers: Tins; glass bottles.

• Uses: Medicine, perfumes.

• Shipping regulations: None.*

eleuthera bark. See cascarilla.

"Elf" Blacks. ²⁷⁵ Trade name for a series of standard color channel carbon blacks for

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

use in all types of printing inks and as a coloring agent in paints and plastics.

Available as:

"Elf" O. Specially treated for longer flow and low oil absorption.

"Elf" 1, 2 and 3. Darkest of the blacks in the Elf series.

"Elf" 4. Midway in color and strength in the Elf series.

"Elf" 5, 6, 7, 8. Largest particle size, lowest oil absorption and lowest strength of the Elf series.

"Elftex." ²⁷⁵ Trade name for a series of standard color furnace carbon blacks for use in inks and paints. Available as:

"Elftex" 5. Medium oil absorption.

"Elftex" 8. Lower oil absorption.

"Elipten." ³⁰⁵ Trademark for amino-glutethimide N. N. D.

Use: Medicine.

"Elite Fast." ²³² Brand name for a series of neutral dyeing acid dyestuffs of excellent fastness to washing.

elixir of vitriol. See sulfuric acid, aromatic.

elixirs. Aromatic, sweetened, alcoholic liquids containing small quantities of active medicinal substances.

"Elkosin." ³⁰⁵ Trademark for sulfisomidine, N. N. D.

Use: Medicine.

ellagic acid. $C_{14}H_6O_8$. Found in galls.

Properties: Yellowish powder, odorless, tasteless. Soluble in alkaline solutions; insoluble in acid or neutral solutions.

Use: Medicine.

elm. See ulmus.

Elmer's. ⁶⁵ Generic name applied to a series of products which include:

Elmer's Glue-All - fast-setting general-purpose, liquid polyvinyl acetate adhesive.

Elmer's Contact Cement - solvent-based cement for dry assemblage of plywood-phenolic laminates (Formica, Pionite) to wood or metal.

Elmer's Waterproof Glue - two-component resorcin-formaldehyde glue for use where water-proof or maximum durability wood bonds are required. Resists acids, alkalis, solvents, mildew, bacteria, cold or boiling water.

Uses: Boats, toys, outdoor furniture, sports equipment, etc.

"Eloma." ⁵¹ Trademark for transparent pipe coatings available in several grades for mill application.

"Elorine" Chloride. ¹⁰⁰ Trademark for tricyclamol methochloride.

"Elprene." ⁴¹ Trade name for a synthetic-rubber coating of the neoprene type used as a general maintenance coating.

"El-Sixty." ⁵⁸ Trademark for 1,3-bis-(2-benzothiazolyl-mercaptomethyl)urea (q.v.).

eluteria bark. See cascarilla.

elutriation. A process of washing, decantation and settling which separates a suspension of a finely divided solid into parts according to their weight. It is especially useful for very fine particles below the usual screen sizes and is used for pigments, clay dressing, and ore flotation.

"Elvacet." ²⁸ Trademark for thermoplastic, adhesive, and film-forming solutions and emulsions of polyvinyl acetate homo- and copolymers.

Polyvinyl Acetate Emulsion. Viscous, milk-white water dispersions which can be diluted with water. Available in various grades

Containers: 45-lb pails; 500-lb drums; 9,000 to 37,000-lb tank trucks; 37,000-lb and 75,000-lb tank cars.

Uses: Paint vehicles; adhesive base materials; binders; pigments and cement; textile finishes and sizes; paper coatings for grease-proofing and heat-sealing.

Polyvinyl Acetate Solution. Colorless, odorless resin available as a 60% solution in methanol.

Containers: 10- and 25-lb cartons; 50-lb multiwall bags; 100-lb drums.

Uses: Adhesive and binder; vehicle for metallic pigments; protective coatings on metal; heat-seal applications; grease-proofing; stiffening and permanent sizing.

"Elvanol." ²⁸ Trademark for polyvinyl alcohol.

Properties: White to creamy-white powder; odorless; water-soluble synthetic resin.

Grades: Eight grades covering various degrees of hydrolysis in three viscosities (high, medium, low). Solutions are stable over long periods of time.

Containers: Cartons; multiwall bags; drums.

Uses: Sizes for textiles and papers; base for water-resistant laminating adhesives; adhesives and binders; molded products; emulsion stabilizer and thickener; photo-sensitive films.

"Elvasize." ²⁸ Trade name for a two-step process for sizing paperboard. Borax solution, applied to the board in a pre-treatment, reacts with polyvinyl alcohol on the surface of the board to form a rigid, 3-dimensional gel, preventing excessive penetration of the size.

"Elvax." ²⁸ Trademark for a series of high molecular weight vinyl resins. Wax-compatible, amorphous copolymers; translucent, white, 1/8" diameter, free-flowing pellets. Two basic varieties - one for hot-melt adhesive and coating formulation, the other for toughening waxes. Viscosities (at 30°C, 0.25% in toluene) 0.77 cp. and 0.85 cp., respectively. Readily soluble in waxes, various low molecular weight resins and rosin esters; insoluble in aqueous mixtures and most polar solvents; density at 30°C 0.95; extensibility 700% at break.

Containers: 50-lb bags.

Uses: As a wax additive, improves

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

toughness, reduces flaking, improves heat-seal bond strength. "Elvax"-wax coatings used for sheet-waxed carton-board which retains low moisture vapor transmission, even after creasing. In laminating formulations for paper-to-paper and paper-to-cellophane, polyethylene, polystyrene, "Mylar" polyester film, or other plastic films, and to metal foils; as a base for hot-melt adhesives; as a low dielectric component in potting compounds.

emanon Em. A name at one time proposed for the element radon (q. v.).

emboilite Ag(Cl,Br). A natural chloride and bromide of silver. See cerargyrite and bromyrite.

embrittlement. A loss of toughness in a metal due to its becoming brittle. The causes are varied and frequently unknown. Embrittlement can lead to cracking and failure of the metal under stress.

"**Emcol.**" ¹⁰⁴ Brand name for a line of emulsifiers, germicides and detergents.

Emcol 61: Fatty acid amide for hair conditioning.

Emcol E-11: Alkyl benzyl triethyl ammonium chloride, 50% aqueous liquid, straw-colored. Used as germicide, textile assistant, sanitizing agent, deodorant.

Emcol E607: N(acetyl colamino formylmethyl) pyridinium chloride (from lauric acid), white crystals; quaternary ammonium detergent germicide.

Emcol 4150: Fatty amide sulfonate (35% aqueous solution). Foaming agent, detergent, floating agent.

Emcol E607S: Stearoyl homolog of Emcol E607 used in hair rinses.

Emcol H Series: Agricultural pesticide emulsifiers and industrial solvent emulsion systems.

Emcol K-8300: Emulsifier-stabilizer for rubber latices and adhesives.

Emcol MST: Glycerol mono- and distearate; non-self-emulsifying; edible.

Emcol P1059: Amine dodecyl benzene sulfonate.

Emcol RDC-D: Diethylene glycol laurate, self-emulsifying.

Emcol RHT: Glycerol mono- and distearate, self-emulsifying. Used in medicine.

Emcol 5100 Series: Alkanol fatty acid condensates. Used as nonionic detergents, thickeners, cleaners, foam stabilizers, and emulsifiers.

emerald. See beryl.

emerald green. A pigment consisting of copper acetoarsenite (q. v.).

emerald, Oriental. See corundum.

"**Emerox.**" ²⁴² Trademark for azelaic acid.

"**Emersol.**" ²⁴² Trademark for a line of oleic acids, stearic acids, and special liquid vegetable fatty acids. The later are specifically for alkyl resins.

emery. See corundum.

"**Emery.**" ²⁴² A line of distilled animal and vegetable fatty acids and oleic and stearic acid esters.

emetin. See emetine.

emetine (emetin) C₂₉H₄₀O₄N₂. An alkaloid from ipecac.

Properties: White powder; m. p. 74°C; very bitter taste; darkens on exposure to light; poisonous! Soluble in alcohol and ether; slightly soluble in water.

Derivation: By extraction and crystallization from root of *Cephalis ipecacuanha*, or synthetically.

Use: Medicine.

Shipping regulations: None.*

emetine hydrochloride C₂₉H₄₀O₄N₂·2HCl.

Properties: Odorless white crystalline powder; affected by light; m. p. 235-255°C; soluble in water and alcohol.

Grade: U. S. P. XVI.

Use: Medicine.

emf. Abbreviation for electromotive force.

"**Emfac.**" ²⁴² Trademark for pelargonic acid.

"**Emlon.**" ¹⁹⁴ Trademark applied to a series of resins for protective coatings and adhesives.

emodin (frangula emodin; frangulic acid)

C₁₄H₈O₂(OH)₃CH₃. 1,3,8-Trihydroxy-6-methylanthraquinone. Found, either free or combined with a sugar in a glucoside, in *Rhamnus*, *rhubarb*, and *rumex*. A synthetic product is also available. Orange crystals; m. p. 256°C; soluble in alcohol; insoluble in water. Used in medicine.

"**Emolein.**" ²⁴² Trademark for a line of diesters for use in compounding synthetic lubricant fluids and greases.

emperor green. See copper acetoarsenite.

empirical formula. See formula, chemical.

"**Empol.**" ²⁴² Trademark for a polymerized fatty acid, a C₃₆ dibasic acid made by the dimerization of polyunsaturated fatty acids. Very viscous liquid, acid value 180; saponification value 185; combining weight 305. Used in surface coatings, esters, lubricating greases, corrosion inhibitors, polyamides, polyurethane foams.

"**Emralon**" ³¹⁰. ⁴⁶ Trademark for a colloidal dispersion of polytetrafluoroethylene (PTFE) particles in a solution of phenolic resin.

Properties: 2 package liquid system; 50% PTFE, 50% resin, bakes for 1 hour at 300°F; flash point 46°F, friction coefficient 0.05-0.07.

Uses: As a clean, baked dry film where low coefficient of friction is needed under conditions of low load and low speed; small machine parts, rubber O-rings.

"**Emralon**" ³²⁰. ⁴⁶ Trademark for a colloidal dispersion of polytetrafluoroethylene (PTFE) particles in a solution of a cellulosic resin.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: 2 package liquid system; 50% PTFE, 50% resin; air dry at room temperature; flash point 40°F; friction coefficient 0.05-0.07.

Uses: As a clean, air dry film type lubricant; very low friction coating of good release properties; small machine parts, wood parts, paper, cloth.

"**Emtall**," ³⁴² Trade name for a line of fractionated tall fatty acids and distilled tall oils.

EMTS. Abbreviation for ethyl mercury para-toluene-sulfonanilide.

"**Emulphogene AM-870**," ³⁰⁷ Trademark for a nonionic surfactant, tallow alcohol-ethylene oxide reaction product; 100% active.

Properties: Soft wax; sp. gr. 1.04-1.05; soluble in water, acetone, alcohol, aromatic hydrocarbons and chlorinated hydrocarbons, insoluble in mineral oil and aliphatic hydrocarbons; stable to acid, alkali and metallic ions.

Uses: Emulsifier with good stability over a wide pH and temperature range; emulsifier for incorporation into natural and synthetic rubber latices to improve mechanical and chemical stability. In textile processing, used for acid degreasing of wool and to promote level dyeing. In the leather industry, emulsifying agent for mineral and raw neatsfoot oils; wetting agent for dry crusted leather; emulsifier in shoe waxes and polishes, surfactant for de-inking paper stock, dispersing and peptizing agent for pigments, clays, etc.

"**Emulphor**," ³⁰⁷ Trademark for a series of nonionic emulsifying agents and dispersants.

"**Emulphor EL-620**," Polyoxyethylated vegetable oil; 100% active.

Properties: Clear, yellow liquid, sp. gr. 1.04-1.05; soluble in water, hydrocarbon solvents; stable to metallic ions, alkalies and mild acids.

Uses: Emulsifying agent for oils, solvents and waxes; emulsifier for insecticide and herbicide formulations; emulsion stabilizer for polyester resins and polyvinyl acetate emulsion paints; in leather processing, used for degreasing, as a dyeing assistant and in fat liquor formulations; in paper processing, emulsifying and dispersing agent in manufacture of urethane foams and amino plastics.

"**Emulphor EL-719**," Polyoxyethylated vegetable oil; 96% min. activity.

Properties: Liquid; sp. gr. 1.06-1.07. Soluble in water.

Uses: Emulsifier for animal and vegetable fats; dispersing agent for pigments; promotes level dyeing in paper processing; degreasing, emulsifier and lubricant in leather processing; emulsion stabilizer for polyvinyl-acetate-emulsion paint; anti-static agent and lubricant for synthetic fibers.

"**Emulphor ON-870**," Polyoxyethylated fatty alcohol; 100% active.

Properties: Wax; density 1.03-1.04.

Uses: Emulsifier for mineral oils, fatty acids and waxes; stabilizer for natural or synthetic rubber latex emulsion; dyeing assistant and acid-degreasing agent for textiles; dispersant and degreasing agent in leather processing; emulsifier for aqueous dispersions of polyethylene.

"**Emulphor VN-430**," Polyoxyethylated fatty acid; 100% active.

Properties: Liquid; sp. gr. 0.90-1.00.

Uses: Emulsifier for mineral oils and liquid fatty acids; emulsifier for pesticides and cutting oils; used in paper, leather and textile processing; emulsifier in cosmetic industry.

"**Emulsarin**," ³⁴² Trademark for blend of gums used for the preparation of pharmaceutical emulsions.

emulsifiable oil. See soluble oil.

emulsifier. See emulsion.

"**Emulsifier STH**," ³⁰⁷ Brand name for a corrosion inhibitor, sodium salt of an N(alkylsulfonyl)glycine; 88% active (min).

Properties: Dark brown, viscous liquid; density 1.00-1.05; stable to alkali; soluble in water, carbon tetrachloride, ethylene glycol, kerosene, mineral oil, and xylene.

Uses: Rust and galvanic corrosion inhibitor in polyvinyl chloride films; prevents corrosion in containers of some grades of carbon tetrachloride; provides good galvanic corrosion and rust protection of light metals, such as aluminum and magnesium.

emulsin (synaptase, amygdalase, beta-glucosidase). An enzyme catalyzing the production of glucose from beta-glucosides.

Properties: White powder; odorless and tasteless; capable of hydrolyzing glucosides such as amygdalin to glucose and the other component substances. Soluble in water; insoluble in ether and alcohol.

Source: Sweet almonds.

Derivation: By extracting an emulsion of almonds with ether, filtering the clear solution and precipitating the emulsin with alcohol.

Shipping regulations: None.*

emulsion. A substantially permanent heterogeneous liquid mixture of two or more liquids which do not normally dissolve in each other but which are held in suspension, one in the other, by mechanical agitation, or more frequently, by small amounts of additional substances known as emulsifiers. These modify the surface tension of the droplets to keep them from coalescing. Typical emulsions are milk, mayonnaise, and such pharmaceutical preparations as cod-liver oil emulsion or liquid petrolatum emulsion.

Typical emulsifiers are egg yolk, casein, and certain other proteins; soap; gums such as acacia, sea weed extracts, water-soluble cellulose derivatives; lignin, bentonite, and surface-active agents such as the

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

quaternary ammonium compounds, sulfonated oils, and polyhydric alcohol esters and ethers. Specific kinds of soaps include those from tallow, grease, fish oil, rosin acids. These are widely used in synthetic rubber manufacture. Mahogany soaps, i. e., the sodium salts of sulfonic acids from petroleum refining sludge, are used in synthetic resin production, as are sorbitan oleates and laurates, and polyoxyethylene esters. Stearic acid esters of glycerin, ethylene oxide, sorbitol, and glycols, and also lecithin, are used in food products.

Ammonium and amine fatty acid soaps are used in waxes and polishes. Various ones of these and others are widely used in stabilizing the emulsions of cutting oils, pharmaceuticals, drycleaning solvents, and mixtures used in the textile and leather industry.

emulsion paint. A paint, the vehicle of which is an emulsion of binder in water. The binder may be oil, oleoresinous varnish, resin, or other emulsifiable binder. (ASTM definition, ASTM D16-52). Latex is a common binder.

"Emulsol," ²⁴⁴ Trademark for a series of raw fish oils emulsified with soap. Containers: Material packed in non-returnable steel drums averaging 400-425 lbs net. Uses: In the leather industry.

en. An abbreviation for ethylenediamine as used in formulas for coordination compounds. An example is the cobalt complex $\text{Co}[\text{en}]_3(\text{NO}_3)_3$. See also dien; pn, py.

enamel.

1. A type of oil-base paint containing binders that form a film by oxidation or polymerization on exposure to air and having an outstanding ability to level off brush marks, etc., and form an especially smooth film. Enamels are usually intended for use as top coats and contain relatively less pigment than paint formulations for priming or surfacing. The term enamel is also applied to insulating varnishes for electrical equipment.
2. A hard, smooth ceramic coating on a metal, for purposes of decoration or corrosion resistance. Porcelain or other ceramic materials are applied to the surface as a pasty mixture and the metal object is heated to high temperature to melt the coating and thus form a continuous film.

enamel-brick clay. Similar to clays used for manufacture of buff face brick. See brick clay.

enamel clay. Ball clays which are capable of floating non-plastic enamel slips so that they will spray and dip more evenly. Enamel clays usually contain some alkali and must be as low as possible in carbon.

enamel oxides. Calcined oxide mixtures with varied compositions, used for coloring sheet steel, cast iron, or aluminum

vitreous enamels.

Containers: 10-, 25-, 100-, 300- and 500-lb packages.

enamel, porcelain. See enamel; also Porcelain Enamels for Aluminum.

enanthic acid. See n-heptanoic acid.

"Enarax," ²⁹⁹ Trademark for a combination drug containing hydroxyzine hydrochloride and oxyphencyclimine hydrochloride.

enargite Cu_3AsS_4 . A natural copper arsenic sulfide, found in metallic veins. May contain some antimony.

Properties: Color grayish-black to iron-black; streak grayish black, luster metallic; sp. gr. 4.45; hardness 3.

Occurrence: Montana, Utah, Colorado; Peru; Yugoslavia.

Use: Ore of copper and arsenic.

encapsulation. In general, any process in which a material or its individual pieces or particles are coated or covered with, imbedded in, or packaged in a plastic film, or sheath, or foam, or some similar containing arrangement. The meaning of the term includes processes in which a foam-forming resin is used to completely fill the spaces between an assembly of electrical and/or other components and their housings so these are completely imbedded in and supported by the foamed resin. The objective is to protect insulation, prevent movement and vibration of the several components and also to prevent resonance and other acoustical difficulties. See also potting, microencapsulation.

endllichite. Mineral similar to vanadinite (q. v.) excepting that the vanadium is replaced by arsenic.

endo-. A prefix used in chemical names to indicate an inner position, specifically (a) in a ring rather than in a side chain, or (b) attached as a bridge within a ring. See also exo-.

endophenolphthalein. See diacetyldihydroxyphenylisatin.

"Endor," ²⁸ Trademark for a rubber peptizing agent containing activated zinc salt of pentachlorothiophenol $(\text{C}_6\text{Cl}_5\text{S})_2\text{Zn}$, and 80% inert filler. Grayish green powder; sp. gr. 2.39.

Use: A peptizing agent for plasticizing natural rubber and all types of SBR (styrene butadiene rubber).

Containers: 100-lb drums.

endothermic. A process or change that takes place with absorption of heat.

"Endox," ¹⁴² Trade name for alkaline rust-removal and descaling products supplied in powder form. These products are added to water and the solutions are used both electrolytically and non-electrolytically for removal of rust and other oxides on iron and steel.

endoxan. See cyclophosphamide.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

end point. In chemical analysis, the point during a titration at which a marked color change is observed, indicating that no more titrating solution is to be added.

endrin ($C_{12}H_{10}OCl_6$). The assigned common name for an insecticide 1, 2, 3, 4, 10, 10-hexachloro-6, 7-epoxy-1, 4, 4a, 5, 6, 7, 8, 8a-octahydro-1, 4-endo-endo-5, 8-dimethanonaphthalene. A stereoisomer of dieldrin which is the endo-exo isomer. See also aldrin.

Properties: White crystalline compound; m. p. approx. 200°C; insoluble in water, methanol. Moderately soluble in other common organic solvents. Compatible with non-acidic fertilizers, herbicides, fungicides and insecticides. Formulated as emulsifiable concentrates, wettable powders or dusts. Characteristics similar to dieldrin and aldrin. Not affected by alkalis; reacts with concentrated mineral acids, and is decomposed by acid catalysts.

MCA warning labels (formulations 2.5% and over): Danger! Poisonous by skin contact, inhalation or swallowing; rapidly absorbed by skin. (Formulations less than 2.5%): Warning! Hazardous by skin contact, inhalation or swallowing.

Shipping regulations: Liquid formulations containing 15% or more endrin and dry formulations of over 25%: Class B Poison. Poison label. *

"Enduro," ²⁵¹ Trademark for a line of stainless and heat resisting steels. Available in the following groups and types:

Low Nickel Group (200 Series)

Types 201-202: Chromium 17, nickel 4, magnesium 6 and chromium 18, nickel 5, magnesium 8 respectively. Low nickel-content alternates for the 200 Series, having virtually the same properties as the 300 Series types.

Chromium-Nickel Group (300 Series)

Type 301: Chromium 16-18, nickel 6-8, carbon 0.08-0.20; used for applications requiring ductility and strength, such as railway cars, truck bodies, etc.

Type 302: Chromium 17-19, nickel 8-10, carbon > 0.08-0.20; especially suited to resist atmospheric corrosion and corrosive reagents; for dairy and chemical plant equipment; food and meat-processing machinery; high strength, light-weight structural members; and for resistance to oxidation at elevated temperatures.

Type 302B: Type 302 with 2-3 silicon; for resistance to oxidation in temperatures up to 1700°F; for annealing boxes, furnace parts, etc.

Type 303: A free-machining variation of Type 302 through addition of 0.07 (min) selenium; machinability very good for chromium-nickel type—about 70% that of screw stock. Corrosion resistance same or little less than Type 302.

Type 304: Similar to Type 302 except carbon is kept to 0.08 max. which permits its use in welded equipment subject to severe

corrosion.

Type 305: A special modification of Type 302 to develop greater softness and less work-hardening; better adapted to successive drawing and spinning operations with less annealing than Type 302.

Type 309: Chromium 22-24, nickel 12-15; for resistance to oxidation up to 2000°F; fabricates, machines, and welds readily. High strength and creep at elevated temperatures. Not recommended for high sulfur conditions at high temperatures.

Type 309S: A variation of Type 309 with carbon 0.08 (max.); for applications involving welding and corrosion resistance to eliminate carbide precipitation.

Type 310: Chromium 24-26, nickel 19-22, silicon 2 (max.); for maximum heat resistance. Best strength and creep at high temperatures, but may be attacked if sulfur is present in gases. Resistant to carburizing.

Type 316: A variation of Type 304 plus 2-3 molybdenum; resistant to acids encountered in paper and pulp processes, woolen dyeing and in chemical and pharmaceutical industries; recommended for severe corrosive conditions; good fabricating and welding properties.

Type 317: A modification of Type 316 with higher alloy content for applications requiring somewhat higher corrosion resistance than Type 316.

Type 321: A variation of Type 304 to which titanium has been added for eliminating intergranular corrosion at high temperatures, used for airplane collector rings, exhaust manifolds, and other high-temperature requirements.

Type 347: A variation of Type 304 plus columbium for applications similar to those for which Type 321 is recommended, but affording somewhat better corrosion resistance than titanium.

Straight-Chromium Group (400 Series)

Type 403: Chromium 11.5-13, carbon 0.15 (max.); used for applications where corrosion resistance and physical strength are needed at medium high temperatures.

Type 410: Chromium 11.5-13.5, carbon 0.15 (max.); responds readily to heat treatment and is recommended where strength, toughness, and hardness are required; for pump shafts, valve seats, and stems, nuts and bolts, etc.

Type 414: A modification of Type 410 with addition of 1.25-2.5 nickel for somewhat better physical properties.

Type 416: Free-machining grade of Type 410 analysis. Machines nearly as well as Bessemer screw stock. Fairly resistant to the atmosphere, organic and fruit acids, etc. Can be hardened by heat treatment up to about 400 Brinell. Considerably more care and control required in forging operations than with Type 410.

Type 420: A straight chromium, high-carbon grade for heat treating for high hardness applications.

Type 420F: A high-carbon variation of

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Type 416 having better mechanical properties.

Type 430: Chromium 14-18, carbon 0.12 (max); good corrosion resistance and heat resistance to 1500°F; general corrosion resistance, fabricating and welding properties inferior to Type 302; for bicycle fenders, oil-burner parts, etc.

Type 430F: A free machining modification of Type 430 with machinability about 85-90% of Bessemer screw stock.

Type 440: A variation of Type 430 with somewhat better mechanical properties.

Type 443: Chromium 18-23; high heat-resisting properties; good resistance to scaling, but strength and creep lower than chromium-nickel types; for furnace parts, etc.

Type 446: Chromium 23-27; heat resistance to 1900°F; not affected by sulfur gases; strength and creep at high temperatures not as good as the chromium-nickel steels.

Types 501 and 502: Chromium 4-6 with several carbon ranges to 0.25 and with or without addition of molybdenum or columbium, titanium, aluminum, and tungsten; additions of columbium, titanium, or aluminum practically eliminate air hardening on welding, corrosion and heat resistance considerably superior to that of carbon steels, and with fair strength at high temperature; for oil-refinery and furnace parts.

"Enduron." Trademark for methyclothiazide (q. v.).

"Energex." ²⁰⁴ Trademark for a liquid detergent and emulsifying agent for dispersing moisture in dry cleaning solvents.

energy. Energy is defined as the capacity for doing work. Energy is work or anything that may be changed into work. Energy appears in various forms such as kinetic energy, potential energy, heat energy, electrical energy, chemical energy, and nuclear energy. The unit of energy is the erg which is a force of one dyne acting through one centimeter.

Kinetic energy is energy due to motion, and its numerical value in any case is one-half the mass of the body or particle that is moving multiplied by the square of the velocity, $E = 1/2 mv^2$. Kinetic energy is always relative since the velocity of one body is always measured with respect to some point which itself may be moving.

Potential energy arises from the position of a body with respect to another body, and is equal to the work required to achieve this difference in position.

Heat energy is evidenced by the temperature of a body, and is due to molecular motion. Electrical energy arises from a difference in charge, and it along with chemical and nuclear energy are special forms of potential energy.

See also nuclear energy.

enfleurage. Method of extracting odoriferous components of flowers by means of fats or

mixtures of fat and tallow, the process being carried out at room temperature to avoid decomposition of the desired perfumes. The latter are separated from the fat by washing with alcohol.

engine distillate. A petroleum distillate similar to naphtha but often of higher distillation range.

English bean. See tonka.

English laurel. See cherry laurel leaves.

English red. See iron oxide reds.

English vermillion. A precipitated mercury sulfide pigment, the color of which is a very light, bright vermillion shade. It is an opaque, non-bleeding red having a very low oil absorption and in paints and enamels it tends to darken on exposure to light. Because of its high cost, its use is quite restricted.

engraver's acid. See nitric acid.

"Engravoclor." ⁵⁶ Brand name for ferric chloride solution specially prepared for photo-engraving process. Contains 43% ferric chloride. Sold only in 155-lb carboys.

"Enjay Butyl HT Series Rubber." ²⁹ Brand name for isobutylene rubber containing chlorine. A new synthetic rubber where both chlorine and unsaturation are present in such a way that each may be utilized in vulcanization. The amount of each is small; however, they are sufficient to provide fast cure rates with conventional and new types of vulcanization systems. With its versatility of cure, it is found to be compatible with most other elastomers, such as butyl rubber, natural rubber, SBR, and neoprene. The outstanding property of this new polymer is its ability to resist heat up to 400°F. Other desirable properties are new compression set, good compression flexing, low permeability to gases, good tear strength, and good resistance to chemicals, oxidation and ozone.

"Enjay Butyl Latex." ²⁹ Brand name for isobutylene type rubber in aqueous emulsion. The outstanding characteristics inherent in butyl are now available for application in the field of rubber latex. Superior gloss, brightness, softness and long lasting flexibility for paper coating, textile finishing and emulsion paints formulation are some of the attributes which butyl latex can bring to a wide variety of products. Butyl latex can be readily compounded with pigments, fillers, thickeners, and tackifiers, and is compatible with a wide range of resin and elastomer emulsions. This high-solids, odorless, water emulsion has freeze-thaw, mechanical and chemical stability.

"Enjay Butyl Rubber." ²⁹ Brand name for isobutylene type rubber. A copolymer of isobutylene with a small proportion of isoprene to give a controlled, low degree of unsaturation. Processing is similar to that

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

of natural rubber except that no premastication is required. Outstanding properties include: low permeability to gases; excellent resistance to ozone, weathering, heat, chemicals, tear and abrasion; and outstanding electrical properties. Used in inner tubes, curing bags and bladders, wire and cable insulation, molded goods for automobiles, industrial tank lining, hose and belting, adhesives, caulking and sealing compounds. Other desirable properties are low compression set, good compression flexing, and excellent color retention.

"Ennjay." ⁵¹ Trademark of several special grades of asphalt.

"Enovid." ⁷⁰ Trademark for brand of norethynodrel with ethynylestradiol 3-methyl ether; 17 alpha-ethynyl-17-hydroxy-5(10)-estren-3-one with ethynyl-estradiol 3-methyl ether.

Use: Medicine.

"Enstrip." ¹⁴² Brand name of various solutions designed for stripping selectively one metal from another. All "Enstrips" with exception of "Enstrip L-88" are supplied as powders that are added to water for use.

"Enstrip S": For dissolving nickel, copper, zinc, cadmium and silver from steel.

"Enstrip 165S": For dissolving nickel from copper base alloys.

"Enstrip TL": For selective dissolving of tin and lead from steel and copper base alloys.

"Enstrip 103": For electrolytic dissolving of nickel, copper and other metals from steel.

"Enstrip L-88": A liquid for dissolving chromium, nickel and copper from the zinc base die castings.

"Entek." ¹⁴² Trade name for various organic compounds which are added in small amounts to rinse water to promote stain-free drying and produce a protective film which prevents subsequent tarnishing and corrosion of metals. Used after plating, pickling, cleaning or other wet processing of metals.

"Enth-Acid." ¹⁴² Trade name for a blend of acid salts, activators and surfactants which can be used as a replacement for liquid acids. Used for acid dipping of iron, steel, brass, copper, or zinc die castings prior to plating.

"Enthol." ¹⁴² Trademark for phosphoric acid-solvent mixtures designed for degreasing and oxide removal for such metals as steel, aluminum, and zinc. Materials are supplied in the liquid form.

"Enthonite." ¹⁴² Trademark for a polyvinyl plastisol coating used for coating metals, primarily for imparting resistance to acid, alkaline, and electroplating solutions. Material contains 100% solids and is applied by dipping.

"Enthox." ¹⁴² Trademark for salts that are added to water for producing chromate coatings on zinc and cadmium to withstand 100 or more hours in 20% salt spray.

"Entodon." ¹⁴² Trademark for propiodal.

entrainer. An additive for liquid mixtures that are difficult to separate by ordinary distillation. The entrainer usually forms an azeotrope with one of the components of the mixture and thereby aids in the separation of such a compound from the remainder of the mixture.

entrainment. The mist or fog of droplets of liquid carried off by the vapor of a boiling liquid, or more frequently from a liquid through which bubbles of gas or vapor are passing rapidly.

Ent. Soc. Abbreviation for Entomological Society of America.

enzymes. Definite chemical substances, protein in nature, which are formed in the living cells of plants and animals and which are necessary catalysts for the chemical reactions of biological processes. Enzymes are usually very specific in their catalytic behavior in that a given enzyme is effective for only one particular reaction. Enzymes are often classified by the kind of substance (substrate) that is consumed in the reactions that are catalyzed. For example, the term protease refers to enzymes that catalyze reactions that convert proteins to other substances. Carbohydrase (for carbohydrates) and lipase (for fats or glycerides) are corresponding terms. The manner of activity is also a basis for classification of all enzymes into four categories: (1) hydrolase, enzymes which catalyze the removal of water; (2) oxidase or dehydrogenase, which catalyze the transfer of electrons; (3) transferase, which cause a transference of a radical from one molecule to another; and (4) desmolase, which catalyze a split or form a C-C bond without group transfer. (It will be noted that enzymes named recently have the suffix -ase.) Corollary to the presence of enzymes are other substances, which have been termed coenzymes and antienzymes (q. v.).

Properties: Enzymes generally form colloidal suspensions in water and are insoluble in fat solvents. The range of molecular weights has been determined as between 20,000 and 483,000. The optimum temperature for enzyme activity occurs between 35° and 55°C. Inactivity occurs at 80°C, and enzymes are destroyed at 100°C. However, enzyme activity has been shown to be retained in seeds for over 100 years. The reaction velocity is governed by the quantity of enzyme present, the temperature, the pH of the media, the presence of certain metal ions and the accumulation of reaction products.

Uses: Enzymes cause hydrolysis (decompose fats, convert aldehydes into a mixture of acid and alcohol, invert sugars, digest

*See "I. C. C. Shipping Regulations," page xiii.

Reference number: refer to name of manufacturer. See "List of Manufacturers," page v.

proteins); coagulate (clot blood, curdle milk); oxidize (convert alcohol into acetic acid). Most reactions activated by enzymes are reversible. Some common enzymes are: amylase, lipase, maltase, papain, ptyalin, pepsin, trypsin, urease, invertase, rennin, oxidase. For information on these see the specific enzymes.

eosin (eosine; bromeosin; tetrabromofluorescein) $C_{20}H_6Br_4O_5$.

Properties: Red, crystalline powder; soluble in alcohol and acetic acid; insoluble in water; the potassium and sodium salts are soluble in water.

Derivation: By the bromination of fluorescein.

Grades: Technical; pure.

Containers: Barrels; boxes; fiber drums.

Uses: Dyeing silk, cotton and wool; making red writing ink; coloring motor fuel.

Shipping regulations: None.*

eosin, soluble. See eosin, yellowish.

eosin, yellowish (eosin, soluble, eosin YS).

Sodium or potassium salt of eosin; C. I. No. 768. $C_{20}H_6O_5Br_4Na_2$ or $C_{20}H_6O_5Br_4K_2$.

Properties: Brown to red crystals, yellow-red fluorescence in dilute aqueous solution, yellow-green fluorescence in dilute alcoholic solutions; soluble in water and alcohol.

Derivation: Prepared from brominated fluorescein.

Uses: Coloring ink, fabric, straw, paper, as a stain in microscopy, in preparing pink lakes, and in medicine.

eosin YS. See eosin, yellowish.

eosine. See eosin.

EP additives. See extreme pressure additives.

EPC black. Abbreviation for easy processing channel black. See channel black.

ephedrine (1-phenyl-2-methylaminopropanol, alpha-hydroxy-beta-methylaminopropylbenzene) $C_9H_{13}CH(OH)CH(NHCH_3)CH_3$.

Optically active (levorotatory) form. See racephedrine for the inactive mixture of isomers.

Properties: White to colorless granules, pieces or crystals, unctuous to touch; hygroscopic, keep cool and protect from moisture; gradually decomposes on exposure to light. Soluble in water, alcohol, ether, chloroform, and oils. M. p. 33-40°C, b. p. 255°C.

Derivation: Isolation from stems or leaves of Ephedra, especially Ma Huang (China and India).

Method of purification: Recrystallization.

Grades: Technical, N. F. XI.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

dl-ephedrine. See racephedrine.

ephedrine hydrochloride (1-phenyl-2-methylaminopropanol hydrochloride) $C_{10}H_{15}NO \cdot HCl$. Optically active (levoro-

tatory) form. See racephedrine hydrochloride for the inactive mixture of isomers.

Properties: White, odorless powder or crystals. Soluble in water and alcohol; insoluble in ether. Affected by light. M. p. 217-220°C; specific rotation (1 in 20) between -33° and -33.5°.

Grade: N. F. XI.

Containers: Drums.

Use: Medicine (same as ephedrine).

Shipping regulations: None.*

ephedrine sulfate (1-phenyl-2-methylaminopropanol sulfate) $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$. Optically active (levorotatory) form. See racephedrine sulfate for the inactive mixture of isomers.

Properties: White, odorless powder or crystals. Soluble in water and alcohol. Affected by light. M. p. 245°C (with decomposition); specific rotation (1 in 20) -30° to -32°.

Derivation: By action of sulfuric acid on ephedrine.

Grades: U. S. P. XVI.

Containers: Glass bottles; drums.

Use: Medicine.

Shipping regulations: None.*

ephenamine (1-N-methyl-1,2-diphenyl-2-hydroxyethylamine hydrochloride) $C_6H_5CH(OH)CH(C_6H_5)NHCH_3 \cdot HCl$.

Use: To form a crystalline salt of penicillin G.

ephetonin. See racephedrine hydrochloride.

"Ephynal" Acetate. ¹⁹⁰ Trademark for a brand of dl-alpha-tocopheryl acetate (q. v.).

epl.

1. A prefix denoting a bridge or intramolecular connection.

2. An abbreviation for epichlorohydrin.

"Epic." ⁵¹ Trademark for light yellow, liquid greases for textile mills and packaging machinery requiring a fluid lubricant that must not spatter and must "stay put." "Epic" lubricants have better oiliness and film strength than straight mineral oils.

epicaric acid (epicaric acid; 3-(2-hydroxy-1-naphthylmethyl)salicylic acid)

$C_6H_3(CH)(COOH)(CH_2C_{10}H_7OH)$.

Properties: White to reddish powder; less toxic than naphthol. Soluble in alcohol, ether, and soaps; difficultly soluble in water. M. p. 199°C (with decomposition).

Preparation: From alpha-naphthol and ortho-creosotic acid.

Use: Medicine.

Shipping regulations: None.*

epichlorohydrin (chloropropylene oxide; epl) CH_2OCHCH_2Cl .

Properties: Highly volatile, unstable, narcotic liquid. Chloroform-like odor; miscible with most organic solvents; immiscible with water, petroleum hydrocarbons.

Constants: Sp. gr. 1.1761 (20/20°C); b. p. 115.2°C; wt/gal 9.78 lbs; coefficient of expansion 0.00102 (20°C); vapor pressure

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

12.5 mm (20°C); f. p. -58.1°C; viscosity 1.12 cps (20°C); refractive index (n_D²⁵) 1.4358.

Grades: Technical.

Containers: Drums; tank cars.

Uses: Solvent for cellulose esters and ethers, gums, and resins; lacquers, paints, varnishes, coatings.

Shipping regulations: Poison, Class B. Poison label.*

epichlorohydrin resins. See epoxy resins.

epidosite. A rock consisting of epidote and quartz and sometimes containing gold. Banded epidosites are sometimes used for ornamental stones.

epidote Ca₂(Al, Fe)₃(SiO₄)₃(OH). The principal member of a group of minerals for which the general formula is R^{II}₂R^{III}₃(SiO₄)₃(OH) with R^{II} = Ca, Mn, Ce, and R^{III} = Al, Fe, Mn.

Properties: Color pistachio-green, yellow-green, greenish black to black; one good cleavage; sp. gr. 3.4, hardness 6-7.

Occurrence: Connecticut, California, New York, Colorado; Europe, Alaska.

Use: Sometimes as a gemstone.

See also epidosite, zoisite, allanite.

epinephrine (1-methylaminoethanolcatechol; 3,4-dihydroxy-α-(methylaminomethylbenzyl alcohol) C₆H₃(OH)₂CHOHCH₂NHCH₃. A hormone of the adrenal glands.

Properties: Light brown or nearly white, odorless crystalline powder; affected by light; m. p. 211-212°C, specific rotation (25°C) -50° to -53.5°, sparingly soluble in water; insoluble in alcohol, chloroform, ether, acetone, oils. Readily soluble in aqueous solutions of mineral acids, sodium hydroxide and potassium hydroxide.

Derivation: From the adrenal glands of sheep and cattle or synthetically from pyrocatechol.

Grades: U. S. P. XVI.

Containers: Glass bottles.

Uses: Medicine; shaving preparations.

epinephrine bitartrate C₉H₁₃NO₃·C₄H₆O₆.

Properties: White or gray, odorless, crystalline powder. Affected by light and air.

Solutions are acid (pH about 3.5) to litmus. M. p. 147-152°C. Soluble in water; slightly soluble in alcohol, almost insoluble in chloroform and ether.

Grade: U. S. P. XVI.

Use: Medicine.

"Epiphen." ⁶⁵ Trademark for an epoxy resin in liquid form. "Epiphen" ER-823 is used in adhesives for rubber, steel, aluminum or glass. Catalyst is supplied for specific end uses.

EPN (O-ethyl-O-para-nitrophenyl benzene-thionophosphonate)

C₆H₄P(C₂H₅O)(S)OC₆H₄NO₂. The abbreviated name is commonly used and has been accepted as a generic name by the Ent. Soc.

Properties: Pure compound: light yellow crystals; m. p. 36°C; sp. gr. 1.5978 (30°C).

Slightly soluble in water; freely soluble in most organic solvents. Decomposes in alkaline solutions.

Grades: Wettable powders and dusts.

Uses: As a pesticide.

Caution! Toxic! Is a cholinesterase inhibitor.

"EPN 300." ²⁸ Insecticide containing 25% ethyl para-nitro-phenylthionobenzene phosphonate. Uses: As a contact insecticide in agriculture to control certain mites, scales, and other insects. Also for use by qualified agencies for control of certain mosquito larvae.

"Epolene." ²⁵⁶ Trademark for a series of low-molecular-weight polyethylene resins. Available in both emulsifiable and non-emulsifiable types.

Properties: Rice-sized pellets; Ring and Ball softening point from 100°C to 114°C; Brookfield viscosity 340 cps to 16,000 cps (120°C). Color, Gardner scale, max. 2.

Containers: Paper bags (50 lbs net).

Uses: Floor polishes, textile finishes; rubber processing; paper coatings; inks; and as a modifying resin for use with plastic-grade polyethylene.

"Epon Curing Agent." ¹²⁵ Trademark for curing agents C-111, D, U, Z, T, T-1, H₁, and H₂. By the addition of these curing agents, EPON resins can be hardened to form clear tough polymers with high physical strength, excellent chemical resistance, and good electrical properties.

"Eponite" 100. ¹²⁵ Trademark for a water-dispersible liquid epoxy resin.

Properties: Colorless to pale yellow liquid; viscosity 90-150 cps (25°C); pH neutral; weight per gallon 10.2 lbs, slight characteristic odor.

Containers: 55-gal 18 gauge steel full removable head drum equipped with 2-inch, 3/4 inch Visegrip plated plugs in top head.

Uses: To impart durable crease resistance, shrinkage control embossing, glazing and minimum care effects on cotton, rayon and blended fabrics, especially where resistance to damage by chlorine is a requirement. Also used in combination with hydrolyzed or partially hydrolyzed polyvinyl acetate, starches, gums, cellulose ethers, selected resins or other chemical finishing agents to impart hand, stiffness, softness, dye-fixing or other fabric properties.

Caution! May polymerize rapidly, even violently, in presence of strong acids, strong bases and certain metallic salts. Store in closed, clean containers in cool place. Prevent all contact with skin or eyes.

"Epon" Resins. ¹²⁵ Trademark for condensation products of epichlorohydrin and bisphenol-A having excellent adhesion, strength, chemical resistance and electrical properties when formulated into protective coatings, adhesives and structural plastics.

Grades and Uses: The solid "Epon" resins (1001, 1002, 1004, 1007 and 1009) are used primarily in solvent-applied coatings; "Epon" 1001 and 1002 are used in amine-cured

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

maintenance paints; "Epon" 1004 (after esterification with fatty acids) in air dried varnishes and enamels or blended with urea or melamine resins in baked films, and "Epon" 1007 and 1009 (unesterified) in chemically resistant baked finishes in combination with urea and phenolic resins. "Epon" resin films combine excellent hardness, durability and flexibility.

The lower molecular weight resins ("Epon" 815, 820, 826, 828, 830 and 836 and 1001) have been widely used in adhesives, castings, laminates, potting compounds and high solids or solvent free coatings. They have extremely low shrinkage which makes them uniquely suitable to structural applications.

"Eporal." ⁴¹⁸ (Sulfonyldianiline).

Properties: Practically odorless, free-flowing yellowish powder; soluble in acetone, methanol, methyl ethyl ketone; insoluble in water.

Grade: Technical.

Containers: 10-lb tins; 100-lb drums.

Uses: As epoxy hardening agent.

Caution! Handle with care.

"Epoxol 7-4." ¹⁵² Trade name for a high purity epoxidized soybean oil.

Properties: Oxirane oxygen, 7.0% min, iodine value, 2 max, Gardner color, 1 max, Gardner viscosity (25/25°C) 3.4-3.7 poises; acid no. 0.2 max; sp. gr. (25/25°C) 0.990-0.995.

Uses: As a stabilizing plasticizer for vinyl and other resins, or for polymerization alone or copolymerization with various other resins.

Containers: 5-, 55-gal drums; tank trucks or tank cars.

epoxy-. A prefix in organic nomenclature denoting an oxygen atom joined to each of two atoms which are already united in some other way, as -C-O-C- .

3,4-epoxycyclohexane carbonitrile $\text{O}(\text{C}_6\text{H}_9)\text{CN}$.

Properties: Liquid; sp. gr. 1.0929 (20/20°C), b. p. 244.5°C, f. p. -33°C, soluble in water.

Uses: Intermediate; stabilizer.

2,3-epoxy-2-ethylhexanol

$\text{C}_3\text{H}_7\text{CHOC}(\text{C}_2\text{H}_5)\text{CH}_2\text{OH}$.

Properties: Liquid; sp. gr. 0.9517 (20/20°C), b. p., decomposes; f. p. -65°C; slightly soluble in water.

Uses: Stabilizer; intermediate.

2,3-epoxy-1-propanol. See glycidol.

epoxy resins. The commercially available materials of this class are usually derived from bisphenol A and epichlorohydrin. Before curing they are viscous liquids or clear, brittle solids melting up to 155°C with molecular weights from 400 to 8000. Chemical nature is indicated by the formula, $\text{H}_2\text{C}(\text{OCHCH}_2\text{O}(\text{RCHOHCH}_2\text{O})_n\text{ROCH}_2\text{CHOCH}_2$ where R is $\text{C}_6\text{H}_4\text{C}(\text{CH}_3)_2\text{C}_6\text{H}_4$. Variations from this basic composition are produced by the ratio of the reactants, the conditions

of reaction, and by the catalyst or agent and conditions used for final curing. Curing involves further reaction of the epoxy and hydroxy groups to cause chain growth and crosslinking. This is often accomplished by reaction with boron trifluoride amine catalysts or with polyamines, dibasic acid anhydrides or with phenolic or urea resins. Also, the epoxy and hydroxy groups may be esterified with unsaturated or saturated monobasic acids and curing then occurs as with alkyd resins. Heat may or may not be required for curing, depending on the various factors of composition, resin formation conditions, and curing agents used.

The epoxy resins are used for surface coatings, as adhesives and for laminating to produce plastic tanks, pipe, and aircraft parts, for casting plastic metal-forming tools and dies and for potting and encapsulation of electrical parts. There are also uses as plastic putty, solders and trowelling mixes. Epoxies show superior adhesion to metals and glass, and have limited shrinkage during cure.

Bisphenol A may be replaced by other diphenols, glycols or glycerine, but the resulting resins are of limited utility. The term epoxy plastic is also sometimes used for other types of high molecular weight compounds that contain the epoxy group, or are derived from such compounds. Thus "Carbowax" is sometimes designated as an epoxy.

EPR. Abbreviation for ethylene propylene rubber.

epsilon acid. See 1-naphthylamine-3,8-disulfonic acid.

"Epskol." ⁶⁴ Trademark for a modified linseed oil used as a replacement for China wood oil in varnishes and enamels.

epsomite $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$. A natural hydrated magnesium sulfate found in salt deposits with gypsum, halite, etc. Also produced commercially by recrystallization. The name is sometimes incorrectly used to refer to the dissolved material in brines. See also kieserite and magnesium sulfate.

Properties: Colorless to white; luster vitreous to earthy, taste very bitter; sp. gr. 1.68, hardness 2-2.5.

Occurrence: Germany; Michigan, Wyoming, Utah, Washington.

Use: Raw material for commercial Epsom salts; used in the textile industry, tanning; fertilizer; paints and soaps; and medicine.

Epsom salts. See magnesium sulfate.

EPTC (ethyl N,N-di-n-propylthiocarbamate) $\text{C}_2\text{H}_5\text{COSN}(\text{C}_3\text{H}_7)_2$. Used as a pre-emergence herbicide. Available in liquid and granular formulations.

equivalent weight. The equivalent weight of an element is the weight that will combine with or react with or can replace one atomic weight of hydrogen or one-half atomic

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

weight of oxygen. The equivalent weight of an acid is the weight that contains one atomic weight of acidic hydrogen, i. e., the hydrogen that reacts during neutralization of acid with base. The equivalent weight of a base or hydroxide is the weight that will react with an equivalent weight of acid. Equivalent weights of other substances are defined in a similar manner, all these definitions being variants of the first sentence of this statement.

Er. Symbol for erbium.

"Erasol." ²³² Brand name for a series of sulfoxylate reducing agents for use in the textile and paper industries.

"Eratrope." ²³² Brand name for a series of discharge agents for removing vat dyes from cellulosic material.

"Eraydo." ¹³⁵ A zinc-base alloy designed for use as a non-magnetic metal of higher annealing temperature and greater strength than commercial rolled zinc. Available in two types:

Type I. Pure zinc base with 0.7% to 1.25% copper. It is resistant to ordinary atmospheric conditions but is not stainless as it darkens in color upon exposure. It will not resist sea water and acid conditions. Used in operations requiring forming and drawing.

Type II. Pure zinc base with 0.7% to 1.25% copper and 0.01% magnesium. It is resistant to ordinary atmospheric conditions but is not stainless as it darkens in color upon exposure. It will not resist sea water and acid conditions. Used where greater hardness and rigidity are desired in flat plates requiring little, if any, bending, forming, or drawing.

Forms: Sheet and ribbon.

erbia. See erbium oxide.

erbium Er. Element with atomic number 68; one of the rare-earth elements of the yttrium subgroup.

Properties: Solid with metallic luster; insoluble in water, soluble in acids; salts are pink to red; sp. gr. 9.16 (15°C); m. p. 1400-1500°C; b. p. 2600°C (approx).

Derivation: Reduction of the fluoride with calcium.

Source: See rare earth minerals.

Grade: Lumps; ingots of high purity.

Uses: Nuclear control; special alloys.

erbium nitrate $\text{Er}(\text{NO}_3)_3 \cdot 5\text{H}_2\text{O}$.

Properties: Large reddish crystals, soluble in water, alcohol, ether, and acetone.

Derivation: Treatment of oxides, carbonates or hydroxides with nitric acid.

Grade: 99.9%.

Containers: Bottles; fiber drums.

Shipping regulations: Oxidizing material. Yellow label. *

erbium oxalate $\text{Er}_2(\text{C}_2\text{O}_4)_3 \cdot 10\text{H}_2\text{O}$.

Properties: Reddish microcrystalline powder, decomposes at 575°C. Very insoluble in water.

Use: Oxalates of the rare-earth metals are used to separate the latter from common metals.

erbium oxide (erbia) Er_2O_3 .

Properties: Pink powder which readily absorbs moisture and carbon dioxide from the atmosphere. Sp. gr. 8.64; specific heat 0.065; infusible; insoluble in water; slightly soluble in mineral acids.

Derivation: By heating the oxalate or other oxy-acid salts.

Grades: 98-99%.

Containers: Bottles; fiber drums.

Uses: Phosphor activator; infrared-absorbing glass.

See also rare earths.

erbium salts. Besides those listed here, erbium chloride, $\text{ErCl}_3 \cdot x\text{H}_2\text{O}$, and erbium fluoride, $\text{ErF}_3 \cdot 2\text{H}_2\text{O}$, are also available commercially.

erbium sulfate $\text{Er}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$.

Properties: Pink monoclinic crystals; soluble in water; sp. gr. (given variously) about 3; dehydrated at 400°C.

Derivation: Dissolving hydroxides, carbonates, or oxides in dilute sulfuric acid.

Grades: 99.9%.

Containers: Bottles; fiber drums.

Use: To determine atomic weight of the rare-earth element.

Erdmann's reagent. A reagent used in testing for alkaloids. Made by the addition of concentrated sulfuric acid to a small quantity of dilute nitric acid.

ergocalciferol (vitamin D₂). See vitamin D.

ergonovine $\text{C}_{19}\text{H}_{23}\text{N}_3\text{O}_2$. An alkaloid of importance in obstetrics.

Properties: Crystals with m. p. 162°C; freely soluble in lower alcohols, ethyl acetate, and acetone, slightly soluble in chloroform, more soluble in water than the other principal ergot alkaloids.

Derivation: From certain ergots; synthesized from lysergic acid and 2-amino-1-propanol.

Use: Medicine (as maleate salt).

ergonovine maleate $\text{C}_{19}\text{H}_{23}\text{N}_3\text{O}_2 \cdot \text{C}_4\text{H}_4\text{O}_4$.

Properties: White or faintly yellow microcrystalline powder, odorless; affected by light; soluble in water and alcohol; insoluble in ether and chloroform.

Grade: U. S. P. XVI.

Use: Medicine.

ergosterol, (provitamin D₂) $\text{C}_{28}\text{H}_{44}\text{O}$. A plant sterol widely distributed in nature.

Properties: Colorless crystals; m. p. 166°C (with 1 1/2 H₂O); b. p. 250°C (0.01 mm); sp. gr. 1.04, specific rotation -135° (in chloroform); insoluble in water; soluble in alcohol, benzene, ether. Affected by light and air and turns yellow.

Derivation: Synthesized by yeast from simple sugars, obtained from fungus ergot.

Use: Medicine; when irradiated with ultraviolet light, it has vitamin D activity.

ergot (secale cornutum; rye ergot). A fungus growth, *Claviceps purpurea*, on rye.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

- Habitat:** Europe; cultivated in Spain and Russia.
Grades: Spanish; Russian; N. F. XI.
Containers: Bags of variable size; tin-lined drums.
Uses: Medicine; source of many important alkaloids.
Shipping regulations: None.*
- ergotamine** $C_{33}H_{35}N_5O_5$. An alkaloid obtained from certain ergots found in central Europe.
Properties: Hygroscopic crystals; affected by air, light, and heat; m. p. 212-214°C (dec). Freely soluble in chloroform; slightly soluble in benzene, acetone, and alcohol; almost insoluble in water and petroleum ether.
Use: Medicine (also used as tartrate salt).
- ergotamine tartrate** $(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$.
Properties: Colorless crystals or white crystalline powder; m. p. 177-184°C with decomposition; slightly soluble in water and alcohol.
Grades: U. S. P. XVI.
Use: Medicine.
- ergotinine** $C_{33}H_{39}O_5N_5$.
Properties: White crystalline alkaloid; poisonous! Soluble in alcohol and ether; insoluble in water. M. p. 205°C.
Derivation: By extraction of sclerotium of ergot *Claviceps purpurea* and crystallization.
Method of purification: Recrystallization.
Grades: Technical.
Containers: Glass bottles. (Protect from light.)
Use: Medicine.
Shipping regulations: None.*
- "Ergotrate" Maleate.** ¹⁰⁰ Trademark for ergonovine maleate, U. S. P.
- erigeron oil** (fleabane oil, horseweed oil; butterweed oil).
Properties: Pale, yellow, limpid liquid, darkening and thickening with age and exposure; peculiar aromatic, persistent odor; aromatic, slightly pungent taste. Soluble in an equal vol. of 90% alcohol, but sometimes remains turbid after additions of several volumes of the solvent, also soluble in ether, chloroform, and carbon disulfide.
Chief known constituents: d-Limonene; terpineol; esters.
Constants: Sp. gr. 0.8565-0.868 (15°C); b. p. 175-180°C; optical rotation +52 to +83°; acid value 0; ester value 39 to 108, after acetylation 67 to 108.
Derivation: Distilled from the fresh, flowering herb of *Erigeron canadensis*.
Method of purification: Rectification.
Grades: Technical.
Containers: Glass bottles; cans.
Shipping regulations: None.*
- eriodictyon** (yerba santa).
Properties: Brownish fragments of leaves; slight, aromatic odor.
Derivation: Dried leaves of *Eriodictyon* californicum.
Habitat: California.
Grades: Technical; N. F. XI.
Containers: Boxes; fiber drums; bales.
Use: Medicine.
- Erlanger blue.** A name applied loosely to any of a number of the varieties of iron blue pigments. See iron blues.
- "Ertrane."** ³⁰⁹ Trademark for a surface active agent as additive for Portland and masonry cements to impart plasticity and air entraining properties thereto.
- erucamide** (erucyl amide) $C_{21}H_{41}CONH_2$.
Properties: Solid; sp. gr. 0.888; m. p. 75-80°C; iodine value 80-85; soluble in isopropanol; slightly soluble in alcohol and acetone.
Purity: 90% amide and 80% C_{22} .
Uses: Foam stabilizer; solvent for waxes and resins; emulsions.
- erucic acid** (cis-13-docosenoic acid) $C_{22}H_{42}O_2$. A C_{22} fatty acid with one double bond. A homolog of oleic acid with four more carbons.
Properties: M. p. 33-34°C; b. p. 264°C (15 mm); iodine value 75.
Derivation: Fats and oils of mustard and rape seed.
Containers: 400-lb drums.
Uses: Preparation of dibasic acids and other chemicals.
- erucyl alcohol** $C_{22}H_{43}OH$. A C_{22} fatty alcohol having one double bond. It is a white, soft solid, almost odorless. Sp. gr. 0.8486; cloud point 81°F; boiling range 334-376°C; iodine value 82; flash point 395°F; soluble in alcohol and most organic solvents.
Impurities: Oleyl and linoleyl alcohols.
Derivation: Sodium reduction of erucic acid.
Uses: Lubricants; surfactants, petrochemicals; plastics; textiles, rubber.
- erucyl amide.** See erucamide.
- "Erusticator."** ²⁰⁴ Trademark for a rust remover which dissolves rust rapidly from fabrics.
- "Erusto."** ²⁰⁴ Trademark for a series of laundry and dry-cleaning products.
- "Erusto-Cetic."** ²⁰⁴ Trademark for a sour for wet cleaning. Fabric-safe; sets colors.
- "Erustocide."** ²⁰⁴ Trademark for a sour recommended especially for colored and white work.
- "Erusto Filter Soap."** ²⁰⁴ Trademark for free-flowing liquid dry-cleaning soap for use in petroleum solvent systems.
- "Erustolin" B.** ²⁰⁴ Trademark for a rust-removing sour where solubility is not of primary importance.
- "Erusto Liqui-Blue No. 16."** ²⁰⁴ Trademark for an all-purpose blue for use with or without sour.
- "Erusto Oil, Paint & Grease Remover."** ²⁰⁴ Trademark for an all-purpose spotter. Completely soluble in water or solvent.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Erusto Salts Special." ²⁰⁴ Trademark for a quickly soluble, high-rust-removing sour.

"Erustosol." ²⁰⁴ Trademark for a liquid sour high in rust-removing qualities.

"Ervol." ⁴⁵ Trademark for white mineral oil, N. F.

Properties: Sp. gr. 0.860-0.870 (60°F); Saybolt viscosity 125-135 (100°F); odorless and tasteless.

Uses: Pharmaceutical and cosmetic formulations; plasticizers; paper penetrants; foam depressants.

erythorbic acid (formerly called isoascorbic acid) $C_6H_8O_6$.

Properties: Shiny, granular crystals; decomp. 174°C. Soluble in water, alcohol, pyridine; moderately soluble in acetone, slightly soluble in glycerol.

Uses: Antioxidant (industrial and food) especially in brewing industry; reducing agent in photography, etc.

erythrene. See butadiene.

erythrite.

1. Synonym for erythritol.

2. (cobalt bloom) $Co_3(AsO_4)_2 \cdot 8H_2O$.

A natural hydrated cobalt arsenate found in the oxidized parts of cobalt and arsenic-bearing veins. Crimson, peach, red, pink or pearl gray in color, with adamantine or pearly luster. Contains 37.5% cobalt oxide. Soluble in hydrochloric acid. Sp. gr. 2.91-2.95; hardness 1.5-2.5.

Occurrence: United States (California, Colorado, Idaho, Nevada); Ontario.

Uses: Coloring glass and ceramics.

erythritol (tetrahydroxybutane, erythrite)

$CH_2OHCHOHCHOHCH_2OH$. A tetrahydric alcohol found in *Protococcus vulgaris* and other lichens of *Rocella* species.

Properties: White, sweet crystals; m. p. 121-122°C; b. p. 329-331°C; sp. gr. 1.45, soluble in water; slightly soluble in alcohol, insoluble in ether.

erythrityl tetranitrate (erythritol tetranitrate; tetranitrol; nitroerythrite)

$CH_2ONO_2(CHONO_2)_2CH_2ONO_2$.

Properties: Crystals, m. p. 61°C. Explodes on percussion or heating! Soluble in alcohol, ether, and glycerol; insoluble in water. Derivation: By nitration of erythritol.

Use: Medicine (diluted with lactose in non-explosive tablets).

"Erythrocin." ³ Trademark for erythromycin.

erythrol tetranitrate. See erythrityl tetranitrate.

erythromycin. $C_{37}H_{67}NO_{13}$. An antibiotic produced by growth of *Streptomyces erythreus* Waksman. It is effective against infections caused by gram-positive bacteria, including some beta-hemolytic streptococci, pneumococci, and staphylococci.

Properties: White or slightly yellow, odorless, bitter crystalline powder; m. p. 133-138°C. Freely soluble in alcohol, chloroform, and ether; very slightly soluble in

water. Slightly hygroscopic. pH (saturated solution) 8-10.5. pH less than 4 is destructive. Alcoholic solution is levorotatory.

Grade: U. S. P. XVI.

Use: Medicine.

erythromycin ethyl carbonate $C_{40}H_{71}NO_{15}$. The ethyl carbonate ester of erythromycin.

Properties: White, crystalline powder, practically odorless and tasteless. Freely soluble in alcohol; slightly soluble in ether and water.

Grade: U. S. P. XVI.

Use: Medicine.

erythromycin glucoheptonate

$C_{37}H_{67}NO_{13} \cdot C_7H_{14}O_8$. The glucoheptonate salt of erythromycin.

Properties: White crystalline, odorless powder. Freely soluble in water and alcohol; practically insoluble in ether. pH (2% solution) 6.0-7.5.

Grade: U. S. P. XVI.

Medicine.

erythromycin lactobionate $C_{37}H_{67}NO_{13} \cdot C_{12}H_{22}O_{12}$. The lactobionate salt of erythromycin.

Properties: White, practically odorless powder. Freely soluble in water and alcohol.

Grade: U. S. P. XVI.

Use: Medicine.

erythromycin propionate. Listed in the N. N. D.; used as medicine.

erythromycin propionate lauryl sulfate (propionyl erythromycin ester lauryl sulfate, "Ilosone").

Properties: A white substantially tasteless and odorless crystalline powder. It is almost insoluble in water and dilute acids, but is appreciably soluble in dilute alkalis. It melts with decomposition at 135-140°C.

Use: Medicinal.

erythromycin stearate $C_{37}H_{67}NO_{13} \cdot C_{18}H_{36}O_2$.

Stearic acid salt of erythromycin, with an excess of stearic acid.

Properties: White or slightly yellow crystals or powder. Practically odorless or slight musty odor. Slight bitter taste. Saturated solution alkaline to litmus. Practically insoluble in water; soluble in alcohol, methanol, ether, chloroform.

Grade: U. S. P. XVI.

Use: Medicine.

erythrosine $C_{20}H_{14}Na_2O_5$. Sodium (or potassium) salt of 10deosin.

Properties: Brown powder, forms cherry red solution in water; soluble in alcohol.

Use: Coloring.

erythroxylin. See coca.

Es. Symbol for einsteinium.

"Escalol 106." ¹⁰ A proprietary name for glyceryl para-aminobenzoate, a patented sunscreening compound.

"Escofos." ⁴²⁸ Trademark for complex phosphates and silicated alkali for soap regenerator and lime soap stripper action.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"**Escon.**" ²⁹ Trademark for a proprietary polypropylene resin thermoplastic.

esculin (aesculin; esculinic acid)

$C_{15}H_{16}O_9 \cdot \frac{1}{2} H_2O$ (or $1\frac{1}{2} H_2O$). Glucoside derived from inner bark of *Esculus hippocastanum* L. (horse-chestnut).

Properties: White crystals, bitter taste; solutions show faint blue fluorescence. M. p. 160°C (dec); m. p. 205°C (anhydrous); b. p. 230°C (dec). Slightly soluble in cold water and alcohol; soluble in hot water and hot alcohol, very slightly soluble in ether; soluble in acetic acid, dilute alkalies, and hot chloroform.

Use: Sun tan lotions.

esculinic acid. See esculin.

eserine. See physostigmine.

"**Esidrix.**" ³⁰⁵ Trademark for hydrochlorothiazide N. N. D.

Use: Medicine.

"**Es-min-el.**" ⁹³ Trade name for a granular mixture of water soluble salts of copper, manganese, zinc, iron, magnesium and boron.

Containers: 100-lb bags; 5-lb bags; bulk.

Uses: Trace element mineral mixture to alleviate plant nutritional deficiencies and maintain correct level. Applied directly to soil or mixed with NKP fertilizers.

"**Es-min-el**" **Spray or Dust.** ⁹³ Trade name for a physical mixture of water-insoluble salts of copper, manganese, and zinc; a gray powder, similar to soil "Es-min-el," used for application to foliage as spray or dust.

Containers: 4-, 50-lb bags.

esparto (Spanish grass). A grass with a tough fiber, cultivated in Spain and North Africa, and used chiefly for cordage and especially in England for papermaking.

esparto wax. Hard vegetable wax extracted from esparto grass, having a m. p. of 75°C and the ability to blend well, emulsify easily, and impart smoothness to polishes and shoe-finishing preparations.

essential oils. Volatile oils derived from plants, and usually carrying the essential odor or flavor of the plant used. Chemically, essential oils are often principally terpenes (hydrocarbons), but many other classes of compounds are also found. They are to be distinguished from fixed oils such as linseed oil or coconut oil, in that the latter are glycerides of fatty acids and hence saponifiable. Essential oils (except for those containing esters) are unsaponifiable. Some essential oils are nearly pure single compounds, as oil of wintergreen, which is methyl salicylate. Others are mixtures, as spirits of turpentine (pinene, dipentene), and oil of bitter almond (benzaldehyde, hydrocyanic acid). Some contain resins in solution and are then called oleoresins or balsams (q. v.).

Properties: Volatile oils, of pungent taste, usually nearly colorless when fresh, but

becoming darker and thick on exposure to the air; optically active; sp. gr. 0.850-1.100. Soluble in alcohol, carbon disulfide, carbon tetrachloride, chloroform, petroleum ether and fatty oils; insoluble in water, except for individual constituents of some oils which may be partially water-soluble, resulting in a loss of these constituents during steam distillation.

Derivation: Formed and contained in flowers and plants to which they supply the characteristic odor commonly identified with the flower. Some can also be prepared synthetically.

Methods of extraction: (a) By steam distillation; (b) by pressing (fruit rinds); (c) by solvent extraction; (d) by maceration of the flowers and leaves in fat and treating the fat with a solvent; (e) by enfleurage (employed for those very delicate oils whose odors are destroyed by even moderate heat); i. e., exposing odorless fats to the exhalations of flowers until they become strongly charged with the perfume and then treating the fat with a solvent.

Uses: Perfumery; flavors; and thinning and extending precious metal preparations used in decorating ceramic ware.

See also essential oils, terpeneless. For additional data see under specific essential oil.

essential oils, terpeneless. Concentrated essential oils from which the terpenes and sesquiterpenes have been removed by fractional distillation under vacuum. Presence of terpenes in the oils causes deterioration of the odor or flavor on standing (oils become rancid).

Properties: More soluble in alcohol and more concentrated than ordinary essential oils. Essential oils sold as "concentrated" may not necessarily be terpeneless.

"**Essex**" (SRF.) ²⁸⁵ Proprietary brand name for semi-reinforcing furnace carbon black.

Properties: Sp. gr. 1.77; free-flowing pellets, also available in fluffy, unpelleted form as "Essex-UC"; bulk density 35 lbs/cu ft; particle diameter 80 millimicrons; pH 9.5; ash 0.50% max; 99.9% through 325 mesh screen; color (Nigro-meter) 99-100.

Containers: 50-lb paper bags or bulk.

Uses: As a reinforcing extender pigment for compounding in natural rubber and most synthetic rubbers. Contributes to good physical characteristics, at relatively low cost; as a black coloring agent in rubber, paper, plastics, paint, and ink.

"**Esso-Journal.**" ⁵¹ Trademark for a hard, soda soap grease made with a cylinder stock base oil for service in the driving journal boxes of steam locomotives.

"**Essolube.**" ⁵¹ Trademark for detergent motor oils for all types of gasoline and high-speed diesel engines. Three detergency levels are supplied for heavy and light duty service with various quality fuels.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

"**Esso-Mar.**" ⁵¹ Trademark for a high quality lubricating oil for circulating systems such as those of marine turbines. Two heavier grades are used primarily for diesel cylinder lubrication.

"**Essorod.**" ⁵¹ Trademark for a grease lubricant for locomotive side rods. The lubricant has the correct melting point and consistency to provide adequate lubrication without leaking or throwing.

"**Essotane.**" ⁵¹ Trademark for liquefied petroleum gases for domestic and industrial uses. Commonly called "bottled gas."

"**Essotex.**" ⁵¹ Trademark for an emulsible fiber lubricant for processing on the woolen system. Prepared with a highly light-stable base, insuring storage stability. It emulsifies readily with hot or cold water.

"**Essowax.**" ⁵¹ Trademark for fully refined paraffin wax available in slabs and in liquid form in wide range of melting points and hardness.

"**Esstic.**" ⁵¹ Trademark for industrial oils, available in a number of grades suitable for lubricating many types of bearings. Recommended for use in enclosed units such as ring-oiled bearings of electric motors.

"**Estan.**" ⁵¹ Trademark for light colored, general purpose, lime-base greases. Available in wide range of consistencies and suitable for all methods of application. Made with an oil having a minimum of internal friction and bearing drag.

See also "Van Estan."

"**Estane.**" ¹¹⁹ Trademark for a thermoplastic polyurethane material, a poly (ester-urethane) elastomer which provides good physical and chemical properties without curing. Extremely tough and abrasion resistant with high tensile strength at high ultimate elongation, with solvent resistance—particularly to gasoline, low air permeability and exceptional low-temperature flexibility.

Uses: Wire and cable jacketing, fuel hose and tanks, belting, shoe heels.

est'd. Abbreviation for estimated.

ester gums (rosin esters). Hard synthetic resins produced by the esterification of natural resins (especially rosin) with polyhydric alcohols (principally glycerol, but also pentaerythritol).

Grades: By color.

Containers: 300-lb barrels and drums; multiwall paper sacks.

Uses: Paints, varnishes, and lacquers.

"**Esteron.**" ²³³ Trademark for a series of weed and brush control products; they are formulated esters of 2,4-D and 2,4,5-T.

esters. Organic compounds corresponding in structure to salts in inorganic chemistry. They may be considered as derived from the acids by the exchange of the replaceable hydrogen of the latter for an organic alkyl radical. Esters are not

ionic compounds, but salts usually are.

acid	HNO ₃ , nitric acid
salt	KNO ₃ , potassium nitrate
ester	C ₂ H ₅ NO ₃ , ethyl nitrate

estersil. A fine, free-flowing, hydrophobic silica powder obtained by esterification of free silanol groups (-SiOH) on the surface of the silica particles with a monohydric alcohol. See "Valron."

"**Estersol.**" ²³² Brand name for a series of solubilized vat dyestuffs.

"**Estinyl.**" ³²¹ Brand name of ethinyl estradiol.

"**Estonate.**" ⁸⁸ Trademark for a DDT insecticide in both wettable powders and emulsifiable solutions.

"**Estonmite.**" ⁸⁸ Trademark for para-chlorophenyl para-chlorobenzene sulfonate; miticide; available as a dust base, wettable powder and emulsifiable solution; used as an ovicide, specific against the eggs of spider-mites.

"**Estonox.**" ⁸⁸ Trademark for toxaphene in a dust base, wettable powder and in a stabilized emulsifiable carrier; used for control of insects on cotton, seed alfalfa, sugar beets, beans and potatoes.

"**Estor.**" ⁵¹ Trademark for naphthenic base crankcase oils containing detergent additives. Grades are available suitable for all degrees of service severity characterizing modern diesel operation.

estradiol C₁₈H₂₄O₂. One of the female sex hormones. It occurs in two isomeric forms, alpha and beta. Beta-estradiol has the greatest physiological activity of naturally occurring estrogens. The alpha form is relatively inactive. For commonly used preparations, see estradiol esters following, and ethinylestradiol.

Properties of beta form: White or slightly yellow; small crystals or crystalline powder, odorless, m.p. 173-179°C; almost insoluble in water; soluble in alcohol, acetone, dioxane, and in solutions of alkali hydroxides, sparingly soluble in vegetable oils.

Derivation: Isolation from human and mare pregnancy urine; commercial synthesis from cholesterol, ergosterol or diosgenin.

Grade: N. F. XI (beta form).

Use: Medicine.

estradiol benzoate C₁₈H₂₂O·C₇H₅O₂. Benzoic ester of the beta isomer of estradiol (q.v.). Properties: White or slightly yellow to brownish crystalline powder; m.p. 191-196°C; odorless; almost insoluble in water; soluble in alcohol, acetone, and dioxane; slightly soluble in ether; sparingly soluble in vegetable oils. Stable in air.

Grades: U. S. P. XVI.

Use: Medicine.

estradiol cyclopentyl propionate. The cyclopentylpropionic ester of the beta isomer of estradiol.

Properties: White, odorless, crystalline solid; m.p. 148-152°C; freely soluble in

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

chloroform and ether; practically insoluble in water and alkalies; slightly soluble in alcohol and methanol.

Grade: N. F. XI.

Use: Medicine.

estradiol dipropionate $C_{24}H_{32}O_4$. Dipropionic ester of the beta isomer of estradiol.

Properties: Small, white to off-white crystals or crystalline powder; m. p. 104-109°C. Almost insoluble in water; soluble in acetone, alcohol, and dioxane; sparingly soluble in vegetable oils. Solutions are dextro-rotatory.

Grade: U. S. P. XVI.

Use: Medicine.

estradiol valerate (estradiol-17-valerate).

Properties: White crystalline solid, m. p. 143-150°C. Insoluble in water; soluble in sesame oil.

Grade: N. N. D.

Use: Medicine.

estragole (chavicol methyl ether; methyl chavicol; para-allylanisole)

$C_6H_4(C_3H_5)(OCH_3)$.

Properties: Colorless liquid, having a characteristic anise odor; sp. gr. 0.965-0.975 (20/4°C), (n 17.5/D) 1.5230; b. p. 216°C. Soluble in alcohol and chloroform.

Occurrence: In estragon oil, basil oils; anise bark oil, and others.

Uses: Perfumes; flavors.

estragon oil (tarragon oil).

Properties: Colorless to yellowish-green essential oil, peculiar anise-like odor; aromatic but not sweet taste. Keep well stoppered. Solubility in alcohol: In 6 to 11 vols and more of 80% alcohol; in 1 vol and more of 90% alcohol.

Chief known constituent: Estragole.

Constants: Sp. gr. 0.900-0.945 (15°C), optical rotation +2° to +9°, refractive index 1.502 to 1.514; acid value up to 1; ester value 1 to 9, after acetylation 15.

Derivation: Distilled from the flowering herb of *Artemisia dracunculus* L.

Containers: Glass bottles; copper flasks.

Use: Flavoring.

Shipping regulations: None.*

"Estrex." ¹⁵² Trade name for a series of methyl, butyl, propyl and other esters of animal and vegetable fatty acids, primarily oleic and stearic acids.

Uses: As lubricants and lubricating oil additives in cosmetics, defoamers, leather tanning and penetrating oils.

Containers: 5-, 55-gallons, tank cars.

estriol $C_{18}H_{24}O_3$. Estriol is considered an excretory product and usually occurs in conjugation with glucuronic acid, forming estriol glucuronide, which has little biological activity.

Properties: White, odorless, microcrystalline powder; m. p. 282°C. Exhibits reddish fluorescence under filtered ultraviolet light. Undergoes phase change at 270-275°C. Practically insoluble in water;

soluble in alcohol, dioxane, and oils.

Derivation: Isolation from human pregnancy urine; isolation from human placenta; organic synthesis.

Use: Medicine.

estrogens. A general term for female sex hormones. They are responsible for the development of the female secondary sex characteristics such as the deposition of fat and the development of the breasts. The naturally occurring estrogens, such as estradiol, estrone, and estriol, are steroids. Estrogens are produced by the ovary, and to a lesser degree, by the adrenal cortex and testis. Some synthetic non-steroid compounds, such as diethylstilbestrol and hexestrol, possess estrogenic activity.

Use: Medicine.

"Estron." ¹¹⁵ Trademark for synthetic yarn and staple fiber, acetate tow for use in cigarette filter tips, tobacco smoke filters, and tobacco smoke filter tip rods.

estrone $C_{18}H_{22}O_2$. A steroid with some estrogenic activity. It is probably a metabolic product of alpha- and beta-estradiol. It has less estrogenic activity than beta-estradiol but more than estriol (q. v.) or alpha-estradiol.

Properties: Small, white crystals or white crystalline powder; m. p. 258-262°C; odorless; stable in air; insoluble in water; soluble in alcohol, acetone, dioxane, and in solutions of fixed alkali hydroxides.

Derivation: Isolation from human pregnancy urine; synthesis from ergosterol.

Grades: U. S. P. XVI.

Use: Medicine.

"Estynox." ²⁰² Trademark for a group of epoxidized fatty oils and esters used as stabilizing plasticizers for nitrocellulose, ethylcellulose, polyvinyl chloride, natural and synthetic rubbers and other polymers.

"Etamon" Chloride. ³³⁰ Trademark for tetraethylammonium chloride.

"Etchalume." ¹⁴² Trademark for an alkaline detergent for aluminum designed for rapid etching and cleaning. Material contains ingredients to prevent caking or hardening of aluminum hydroxide formed during the etching process.

"Eternalure D-38." ³²⁸ A modified vinyl-type polymer emulsion for use as a textile size and finish of good durability and desirable hand for piece goods. It has high resistance to build up on rolls, cans, and clips during processing and drying and is an effective nylon hosiery finish and snag reducer.

"Ethaf foam." ²³³ Trademark for polyethylene foam.

ethanal. See acetaldehyde.

ethanamide. See acetamide.

ethane (bimethyl, dimethyl; ethyl hydride; methyl-methane) C_2H_6 .

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Colorless gas; odorless; flammable; slightly denser than air; relatively inactive chemically; b. p. -88.63°C ; f. p. -183.23°C (triple point); sp. gr. of liquid 0.446 (0°C); sp. gr. of vapor (air = 1) 1.04 (0°C , 760 mm); critical temperature 32.1°C ; critical pressure (absolute) 718 psi; specific heat at constant pressure 0.897 ; specific heat at constant volume 0.325 ; ratio of specific heats (cp/cv) 1.224 ; explosive limits in air (per cent by volume) lower 3.2 , upper 12.5 ; heat of combustion (approx.) $22,300$ Btu/lb or 1800 Btu/cu ft; flash point -135°C .

Derivation: Fractionation from natural gas.

Grades: 95%; 99%; research.

Containers: Steel cylinders.

Uses: Organic synthesis; refrigerant, fuel.

Shipping regulations: Flammable gas. Red gas label.*

ethanedioyl chloride. See oxalyl chloride.

ethane hydrate. See gas hydrates.

ethanethiol. See ethyl mercaptan.

ethanethiolic acid. See thioacetic acid.

ethanoic acid. See acetic acid.

ethanol. See ethyl alcohol.

ethanolamine (MEA, monoethanolamine; colamine; 2-aminoethanol; 2-hydroxyethylamine) $\text{HOCH}_2\text{CH}_2\text{NH}_2$.

Properties: Colorless, moderately viscous liquid. Ammoniacal odor. Strong base. Chemically active. Miscible with water, soluble in carbon tetrachloride, alcohol, chloroform.

Constants: Sp. gr. 1.0179 ($20/20^{\circ}\text{C}$), b. p. 170.5°C , (760 mm); freezing point 10.5°C ; vapor pressure 0.48 mm (20°C); flash point (open cup) 200°F ; wt/gal 8.5 lbs (20°C).

Typical specifications: Color water-white, sp. gr. 1.017 - 1.027 ($20/20^{\circ}\text{C}$); boiling range (760 mm) not less than 90% over between 165 and 173°C ; equivalent wt 61 - 63 ; av. wt/gal 8.47 lbs (20°C).

Derivation: Reaction of ethylene oxide and ammonia gives a mixture of mono-, di-, and triethanolamines.

Grades: Technical; N. F. XI.

Containers: 1-, 5-gal cans, 55-gal drums, tank cars.

Uses: Scrubbing acid gases (H_2S , CO_2), especially in synthesis of ammonia, from gas streams; non-ionic detergents used in drycleaning, wool treatment, emulsion paints, polishes, agricultural sprays; chemical intermediates; pharmaceuticals, corrosion inhibitor.

ethanol formamide $\text{HOCH}_2\text{CH}_2\text{NHOCH}$.

Properties: Somewhat viscous liquid completely miscible with water, alcohol and glycerol; compatible with polyvinyl alcohol, many cellulosic and natural resins; b. p. 143°C at 2.5 mm Hg; freezing point below -72°C ; sp. gr. ($25/4^{\circ}\text{C}$) 1.170 .

ethanol hydrazine. See beta-hydroxyethylhydrazine.

2-ethanolpyridine $\text{C}_5\text{H}_4\text{NCH}_2\text{CH}_2\text{OH}$.

Constants: B. p. 235°C with decomposition; f. p. -7.8°C ; sp. gr. 1.091 (25°C); refractive index 1.5366 (20°C); approx wt/gal 9 lbs.

Miscible with alcohol, water.

ethanolurea $\text{NH}_2\text{CONHCH}_2\text{CH}_2\text{OH}$. White; solidification point 71 - 74°C ; its formaldehyde condensation products are permanently thermoplastic and water soluble. As increasing amounts of simple urea are mixed with ethanolurea, the condensation products gradually change from the pliable film-forming type of resin into the brittle types. This makes it possible to obtain almost any degree of water-solubility and flexibility that may be desired in the final resin. These modified resins formed with ethanolurea are compatible with polyvinyl alcohol, methyl cellulose, cooked starch and other water-dispersible materials.

"**Ethasan.**" ⁵⁸ Trademark for zinc diethyldithiocarbamate.

"**Ethavan.**" ⁵⁸ Trademark for ethyl vanillin.

"**Ethazate.**" ²⁴⁸ Trademark for zinc diethyldithiocarbamate.

Properties: White powder; sp. gr. 1.45 ; m. p. 173 - 178°C , moderately soluble in benzol and ethylene dichloride, slightly soluble in acetone, insoluble in water and gasoline.

Use: Accelerator for latex, dispersions, cements and proofing, insulated wire.

Also available as a 50% water dispersion, "Ethazate 50-D."

ethchlorvynol (1-chloro-3-ethyl-1-penten-4-yn-3-ol; beta-chlorovinyl ethyl ethynyl carbinal) $\text{HC}:\text{CCOH}(\text{C}_2\text{H}_5)\text{CH}:\text{CHCl}$.

Properties: Colorless to yellow liquid with a pungent aromatic odor, darkens on exposure to light and to air, sp. gr. 1.068 - 1.071 ; refractive index, 1.4765 - 1.4800 (n_{25}^{D}). Immiscible with water; miscible with most organic solvents.

Grade: N. F. XI.

Use: Medicine.

ethene. See ethylene.

ethenol. See vinyl alcohol.

ether (ethyl ether, diethyl ether; sulfuric ether, anesthesia ether, ethyl oxide, diethyl oxide) $(\text{C}_2\text{H}_5)_2\text{O}$.

Properties: Very light, transparent, colorless, volatile, exceedingly flammable, mobile liquid; hygroscopic, pleasant aromatic, ethereal odor, burning and sweet taste. Caution! Strongly narcotic! Have no flames or sparking electric equipment anywhere that ether is being used. The vapor of ether, mixed with air, explodes when ignited.

Ethyl and isopropyl ethers have a tendency to form peroxides which are explosive. Consequently caution must be observed in distilling these ethers unless the peroxides present have first been destroyed by the addition of an easily oxidizable

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

material such as sodium sulfite in water solution.

The presence of peroxides may be determined by the addition of acidified sodium or potassium iodide solutions. A brown coloration developing within a few minutes by liberation of iodine from the iodide indicates that peroxides are present. Peroxides may be determined quantitatively by titrating the liberated iodine with standard sodium thiosulfate solution. Peroxide formation on storage may be inhibited by storing the ether in the presence of water or reducing agents.

B. p. 34.5°C; freezing point -116.2°C; sp. gr. 0.7147 (20/20°C); surface tension 17.0 dynes/cm (20°C); refractive index (n_D 20/D) 1.3526; viscosity 0.00233 poise (20°C); vapor pressure 442 mm (20°C); specific heat 0.5476 cal/g (30°C); flash point -40°C; latent heat of evaporation 83.96 cal/g at b. p.; electric conductivity 4×10^{-13} recip. ohms (25°C); explosive limits in air 2.34-6.15% (20°C); coefficient of expansion 0.00164 per °C, wt/gal 6 lbs (20°C).

Typical specifications: Anesthesia grade: Acidity not more than 0.002% (as acetic), sp. gr. 0.715-0.718 (20/20°C); color water-white; ethanol not more than 2% by weight, dryness, miscible without turbidity with an equal volume of carbon disulfide (20°C); average wt/gal 5.96 lbs (20°C).

Typical specifications: U. S. P. grade (Complies with specifications of U. S. P. XVI). Acidity, free acid not more than the equivalent of 1.6 cc N/50 sodium hydroxide per 100 cc; aldehydes none; color water-white; nonvolatile matter not more than 0.002 g per 100 cc; odor characteristic — no foreign residual odor; peroxides none; sp. gr. 0.713-0.716 (25/25°C).

Typical specifications: Absolute—A. C. S. (Conforms fully to U. S. P. XVI requirements for ether U. S. P. except for higher ether content and correspondingly lower sp. gr., which would be expected in the absolute or dehydrated product offered as absolute ether A. C. S.): acidity, free acid as acetic, not more than 0.0015%; aldehydes negative; color water-white; nonvolatile matter not more than 0.0015%; no foreign residual odor; peroxides negative; sp. gr. not over 0.7100 (25/25°C); substances darkened by sulfuric acid, negative.

Soluble in alcohol, chloroform, benzene, solvent naphtha, and oils; slightly soluble in water.

Derivation: By the action of sulfuric acid on ethyl alcohol, followed by distillation.

Method of purification: Rectification.

Grades: U. S. P. XVI (for anesthesia);

A. C. S. Reagent; A. C. S. Absolute; C. P., concentrated; U. S. P. 1880; washed; motor; electronic.

Containers: 30-, 100-lb drums; tank trucks.

Uses: Manufacture of smokeless powder; medicine; anesthetic; organic synthesis;

analytical chemistry; priming gasoline engines; solvent for fats, oils, resins, waxes, gums and alkaloids; perfumery; pyroxylin; rayon; collodion; plastics; extractant in various processes; concentration of acetic acid; refrigerant; fumigant; dry-cleaning; motor fuels; alcohol denaturant.

Fire Hazard: Danger! Extremely flammable. Highly volatile. Tends to form explosive peroxides. MCA warning label.

Shipping regulations: Flammable liquid. Red label.*

ether (physics). The medium permeating all space postulated at one time by the wave theory of light. The usefulness of this concept is questioned by most modern physicists.

ethers. Chemically, ethers are compounds of neutral character derived from alcohols by elimination of water (one molecule of water from two molecules of alcohol). A better general characterization is that an ether is an organic compound in which an oxygen atom is interposed between two carbon atoms in the molecular structure. Only the lowest member of the series (methyl ether) is gaseous; most of them are liquid, and the highest are solid. The ethyl esters are often incorrectly called ethers, especially in earlier literature, i. e., ethyl acetate referred to as acetic ether. The word ether is also erroneously used instead of ethyl in such terms as ether benzoate. The term ether is regularly and correctly used as synonymous with the most common ether, i. e., diethylether. (See ether).

ethinamate (1-ethynylcyclohexyl carbamate)
 $C_6H_{10}(C \equiv CH)OOCNH_2$.

Properties: White essentially odorless powder. Very slightly soluble in water, freely soluble in alcohol, chloroform, and in ether; melting range: 95°C-98°C; pH of saturated solution 6.5-7.0.

Grade: N. F. XI.

Use: Medicine.

ethine. See acetylene.

ethinylestradiol (ethinylestradiol) $C_{20}H_{24}O_2$.
An estrogen (female sex hormone).

Properties: Fine, white to creamy white, odorless, crystalline powder; sensitive to light. M. p. 142-146°C. Soluble in acetone, alcohol, chloroform, dioxane, ether and vegetable oils; practically insoluble in water; soluble in solutions of sodium or potassium hydroxide. Slightly dextrorotatory in dioxane solution.

Derivation: Preparation from estrone.

Grade: U. S. P. XVI.

Use: Medicine.

ethion (O, O, O', O'-tetraethyl-S, S-methylene-diphosphorodithioate; bis[S-(diethoxyphosphinothioyl)mercapto]methane)
 $C_9H_{22}O_4P_2S_4$. Accepted as generic name by Ent. Soc.

Properties: Liquid; sp. gr. 1.220 (20°C).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Slightly soluble in water; soluble in lactones, xylene, chloroform and methylated naphthalene. Toxicity considered moderate to mammals.

Use: Insecticide and miticide.

ethiops mineral. See mercuric sulfide, black.

ethisterone (pregneninolone; anhydrohydroxyprogesterone; ethynyltestosterone) $C_{21}H_{28}O_2$. A female sex hormone; a derivative of progesterone (q. v.) with similar activity. Effective when given by mouth.

Properties: White or slightly yellow crystals or as crystalline powder. Odorless; stable in air. Affected by light. M. p. 267-275° (dec.). Practically insoluble in water; slightly soluble in alcohol, chloroform, ether, and vegetable oils.

Derivation: From progesterone and other steroids.

Grade: U. S. P. XVI.

Use: Medicine.

ethocaine. See procaine hydrochloride.

"Ethocel," ²³³ Brand name for cellulose resin (ethylcellulose), thermoplastic molding granules. Available in colors and various forms for injection or extrusion molding, also in film and sheet.

Properties: Colorless (unless pigmented), odorless, tasteless and non-toxic, flexible and tough, weather- and shatter-resistant; widely soluble in organic solvents. Stable over a range from 200°F to -40°F.

Chemical properties: Not affected by water, strong or weak alkalies; resistant to weak acids, sunlight and age.

Uses: Decorative items; molded and extruded products, hot melt coatings; pigment dispersion, lacquers; varnishes, enamels; packaging, wire coating and wrapping, etc.

ethodin (6,9-diamino-2-ethoxyacridine lactate monohydrate) $C_{15}H_{15}N_3O \cdot C_3H_5O_3 \cdot H_2O$.

Properties: Pale yellow crystals; darken at 200°C. M. p. 235°C; slowly soluble in 15 parts water, soluble in 9 parts boiling water; soluble in 110 parts alcohol (22°C). Solutions are yellow, fluorescent and stable to boiling.

Purity: 97% (dry basis).

Containers: 1-oz, 1/4 lb, 1 lb.

Uses: Bactericide, surgical antiseptis, preparation of pure gamma globulin.

"Ethoduomeens," ¹⁵ Trade name for ethylene oxide adjuncts of the "Duomeens." They are used as emulsifiers and corrosion inhibitors in certain systems.

"Ethofats," ¹⁵ Trademark for a group of non-ionic surface-active agents. Vary from low-melting solids to liquids in consistency. The solubility characteristics vary from oil to water miscibility and are identified according to an arbitrary solubility number.

"Ethofats" with solubility numbers 20-30 are excellent sudsless detergents; others are useful dry-cleaning aids, emulsifying agents and emulsion breakers.

Containers: Standard 55-gal openhead drums.

ethoheptazine (ethyl heptazine) $C_{16}H_{23}NO_2$. 1-Methyl-4-carbethoxy-4-phenylhexamethyleneimine.

Properties: Liquid; sp. gr. 1.038 (26/4°C); b. p. 133-134°C (1.0 mm); refractive index 1.5210 (26°C).

Use: Medicine.

ethohexadiol. U. S. P. XVI name for 2-ethylhexanediol-1,3.

"Ethol," ²³² Brand name for a series of spirit-soluble dyestuffs.

"Ethomeens," ¹⁵ Trademark for a family of tertiary aliphatic amines possessing one or two alkyl groups ranging from C_8 - C_{18} in chain length and for certain natural-occurring mixtures of these. Can be obtained with varying degrees of cationic strengths from exceedingly strong to an almost non-ionic type. Good stability to strong alkalis and acids. The family members vary from solubility in oils to water miscibility.

Containers: Standard 55-gal openhead Quiklox type non-returnable drums of approx 440 lbs net weight.

Uses: As emulsifiers, wetting agents, herbicide and insecticide emulsifiers.

"Ethomids," ¹⁵ Trade name for mixtures of mono- and di-substituted amides ranging in form from dispersible solids to soluble waxes.

Derivation: By treating unsubstituted amides with ethylene oxide.

Containers: Standard 55-gal openhead drums.

Uses: Wetting agents; cotton detergents; emulsifiers for silicones used in textile finishes.

"Ethone," ²²⁷ Trademark for alpha-methyl anisal acetone, $CH_3OC_6H_4CHCHCOCH_2CH_3$ (1-para-methoxy-phenyl penten-1-one-3); min 99% pure.

Properties: White to pale yellow crystalline material, sharp dry odor, with a slight suggestion of butter, stable; causes discoloration; m. p., 60.0°C min.

Uses: In maple, berry and other flavors.

ethopropazine hydrochloride (10-(2-diethylaminopropyl) phenothiazine hydrochloride) $C_{19}H_{24}N_2S \cdot HCl$.

Properties: White or slightly off white, odorless, crystalline solid. Sparingly soluble in alcohol. Slightly soluble in water.

Grade: N. N. D.

Use: Medicine.

ethosuximide (alpha-ethyl-alpha-methylsuccinimide) $C_7H_{11}NO_2$.

Properties: White to off-white waxy powder or solid having a characteristic odor; soluble in water, alcohol and ether.

Use: Medicine.

ethovan. See ethyl vanillin.

ethoxazene (diaminoethoxyazobenzene hydrochloride) $C_{14}H_{14}N_4O \cdot HCl$. 4-(para-Ethoxyphenylazo)-meta-phenylenediamine hydrochloride. A reddish powder;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

insoluble in water.

Use: Medicine.

para-ethoxyacetanilide. See acetophenetidin.

ethoxybenzidine (di-para-aminoethoxydi-phenyl) $C_6H_4NH_2C_6H_3(OC_2H_5)_2NH_2$.

Properties: Glistening, flat needles. Soluble in alcohol; sparingly soluble in water. M. p. 135°C.

Derivation: By heating ethoxybenzidine sulfonic acid, obtained from benzeneazo-phenetolesulfonic acid, with water in an autoclave.

6-ethoxybenzothiazole-2-sulfonamide. See ethoxzolamide.

6-ethoxy-1,2-dihydro-2,2,4-trimethylquinoline ("Santoflex" AW.) $C_{14}H_{19}NO$.

Properties: Yellow liquid; refractive index 1.569-1.572 (25°C); sp. gr. 1.029-1.031 (25°C).

Containers: 55- and 5-gal drums.

Uses: A preservative to reduce oxidative loss of carotene in dehydrated alfalfa.

2-ethoxyethanol. See ethylene glycol monoethyl ether.

3-ethoxy-4-hydroxybenzaldehyde. See ethyl vanillin.

4-ethoxy-3-methoxybenzaldehyde

$C_6H_3(OC_2H_5)(OCH_3)CHO$. White to light brown crystals having a slight vanillin odor; m. p. 62-64°C. Used as an intermediate.

4-ethoxy-3-methoxyphenylacetic acid

$C_6H_3(OC_2H_5)(OCH_3)CH_2COOH$. An off-white powder; m. p. 119-122°C. Used as an intermediate.

1-ethoxy-2-methoxy-4-propenyl-benzene. See isoeugenol ethyl ether.

4-ethoxyphenol. See hydroquinone monoethyl ether.

ethoxyphenylurea. See dulcin.

ethoxytriglycol. $C_2H_5O(C_2H_4O)_3H$.

Properties: Liquid; sp. gr. 1.0208 (20/20°C); 8.5 lbs/gal (20°C); b. p. 255.4°C (760 mm); vapor pressure less than 0.01 (20°C); freezing point -18.7°C; viscosity 7.80 cps (20°C); completely soluble in water.

Use: Synthesis of dyes.

ethoxzolamide (6-ethoxybenzothiazole-2-sulfonamide) $C_9H_{10}N_2O_3S_2$. Crystals; m. p. 188-190°C. Used in medicine.

"**Ethron.**" ²³³ Trademark for polyethylene resins.

"**Ethycol.**" ²²³ Proprietary products consisting of pigments dispersed in ethylcellulose and plasticizer.

Uses: Protective coatings and inks in which ethylcellulose is a major ingredient.

"**Ethyl.**" ³¹³ Trademark for a line of additives to hydrocarbon fuels and lubricants as well as other products.

Antiknock Compound-TEL-Motor Mix contains 61.5% tetraethyl lead, 17.86%

ethylene dibromide, 18.81% ethylene dichloride, and 1.85% dye, kerosene and antioxidant. Freezing point is -28°F, flash point (open cup) greater than 245°F, density at 68°F 1.59 g/ml. Used to improve octane rating of motor fuels.

Antiknock Compound-TEL-Aviation Mix contains 61.5% tetraethyl lead, 35.68% ethylene dibromide, 2.91% dye, kerosene and antioxidant. Freezing point is +16°F, flash point (open cup) over 250°F, density 1.74 g/ml. Used to improve octane rating of aviation fuels.

Antiknock Compound-TEL-Motor 33 Mix (AK-33X) contains 57.5% tetraethyl lead, 7.0% methyl cyclopentadienyl manganese tricarbonyl, 16.71% ethylene dibromide, 17.60% ethylene dichloride, 1.20% dye, kerosene, antioxidant. Freezing point is -28°F, flash point (open cup) greater than 233°F, density at 68°F 1.58 g/ml. The manganese compound promotes or extends the effect of tetraethyl lead in raising octane number, particularly of paraffinic fuels.

Antiknock Compound-TML-Motor Mix contains tetramethyl lead. Otherwise similar to corresponding TEL-Antiknock Compound. Antiknock Compound-MLA-Motor Mix contains mixed methyl and ethyl lead derivatives. Otherwise similar to corresponding TEL and TML mixtures.

Ignition Control Compound 1 (ICC 1) is tris(chloroisopropyl)thionophosphate (q. v.). Ignition Control Compound 2 is dimethylxyl phosphate (q. v.).

Ignition Control Compound 3 is a mixture of methyl phenyl phosphates, containing 11% phosphorus. Also contains a corrosion inhibitor as a precaution against water contamination. Clear light straw colored liquid, sp. gr. 1.146 at 68°F, flash point (open cup) greater than 109°F, pour point -94°F; miscible with gasoline at 65°F; solubility in typical gasoline at 32°F is 18.5 volume per cent, in water at 86°F approximately 1 weight per cent; may hydrolyze on standing in presence of water. Used in motor fuels to control spark plug fouling, surface ignition, and motor rumble. Caution: Do not take internally. Avoid contact with skin and eyes; flush immediately with much water if contact occurs.

Ignition Control Compound 4 is trimethyl phosphate (q. v.).

Multi-Purpose Additive (MPA) contains 52% mixed substituted oleamides, 37% isopropyl alcohol, 7% aromatic solvent, and 4% water. Clear amber liquid, density 0.888 g/ml at 68°F, flash point (closed cup) 75°F, pour point 50°F. Used to remove and prevent deposits on the throat walls of carburetors, to prevent carburetor icing, and as a corrosion preventative.

Metal Deactivator (MDA) contains 80% N,N'-disalicylidene-1,2-diaminopropane (N,N'-disalicylidene propylenediamine, formula $HOC_6H_4CH=NCH_2CH(CH_3)_2N:CHC_6H_4OH$) and 20% toluene solvent. Amber liquid, density 1.0672 g/ml at 68°F, flash point (open cup) 84°F, fire point 100°F. Soluble

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

in gasoline, insoluble in water. Used to neutralize the catalytic effect of copper in promoting fuel oxidation.

Warning: Avoid contact with skin and eyes; immediately flush with much water if contact occurs; contaminated clothing should be removed promptly and laundered by conventional methods before re-use.

Do not store or handle near open flames.

Antioxidant 701: See 2,6-di-tert-butylphenol.

Antioxidant 702: See 4,4'-methylenebis(2,6-di-tert-butylphenol).

Antioxidant 703: See 2,6-di-tert-butyl-alpha-dimethylamino-para-cresol.

Antioxidant 733, a mixture of tert-butylphenols, contains a minimum of 75% 2,6-di-tert-butylphenol, 10-15% 2,4,6-tri-tert-butylphenol, and the remainder ortho-tert-butylphenol. Amber liquid, density 0.941 g/ml; freezing point 64°F, but supercools to 45°F; flash point (open cup) 230°F.

Used to inhibit formation of gum and peroxides in gasoline, and repress the formation of soluble and insoluble decomposition products of jet fuels during storage; as antioxidant for steam-turbine and industrial oils; also retards decomposition of antiknock compounds.

Antioxidant ZDP is dialkyl zinc dithiophosphate, available as straw colored oil or as solution in lubricating oil.

Used in lubricating oils to reduce wear in high output automobile engines. Also useful as an oxidation inhibitor and to protect bearing metals, particularly copper-lead and cadmium-silver alloys, from corrosive action of oil oxidation products.

Caution: Do not take internally. Avoid breathing of vapor. Avoid contact with skin and eyes. If skin contact occurs, immediately wash with soap and water, for eyes, flush with much water and get medical attention.

Diesel Ignition Improver (DII) is a mixture of primary amyl nitrates, consisting of 60% n-amyl nitrate, 5% isoamyl nitrate, and 35% 2-methyl-n-butyl nitrate. Light straw colored liquid with ethereal odor. Stable on storage. Density 0.998 g/ml, flash point (open cup) 120°F; pour point -190°F; insoluble in water. Used to raise cetane numbers of diesel fuels.

Handling: Not sensitive to thermal or mechanical shock, but keep containers closed and away from heat and flames.

Caution: Relatively non-toxic, but use with adequate ventilation and avoid breathing of vapor. Avoid contact with skin and eyes. In case of contact, wash skin with soap and water; for eyes, flush with much water.

Monopropellant 1 is n-propyl nitrate (NPN).

Monopropellant 2 is 60% ethyl nitrate, 40% n-propyl nitrate (60-40 EPN). White to straw colored liquid with ethereal odor; density 1.087 g/ml; flash point (open cup) 65°F; freezing point less than -100°C.

Caution: Highly flammable liquid. Shipped as a non-explosive, flammable liquid in

steel drums. Store in well ventilated space.

Hazards: Avoid high concentrations of the vapor in air within enclosed spaces.

Avoid undue and prolonged contact with the skin. In event of contact, the skin should be washed immediately with soap and water. Contaminated clothing should be laundered.

See monopropellant.

Oil Soluble Dye - Red. Methyl derivatives of azobenzene-4-azo-2-naphthol. (C.I. 248) Available in various powdered, granular, or bead forms for coloring gasoline.

Oil Soluble Dye - Orange. (C.I. 24) Benzene-azo-2-naphthol. Powder or flakes.

Oil Soluble Dye - Yellow. (C.I. 19) Para-dimethylaminoazobenzene. Flakes.

Oil Soluble Dye - Blue. 1-4-Diisopropyl-aminoanthraquinone. Available in powder and beaded forms.

Oil Soluble Dye - Bronze. Mixture of Red and Orange.

ethyl abietate (abietic acid ethyl ester)

$C_{19}H_{33}COOC_2H_5$.

Properties: Amber-colored, viscous liquid which hardens upon oxidation. Soluble in ether, most varnish solvents; insoluble in water.

Constants: B. p. 350°C; flash point 178°C; m. p. 45°C; refractive index 1.4980; sp. gr. 1.02.

Derivation: (a) By heating together ethyl chloride and an alcoholic solution of rosin and caustic soda. (b) By reacting ethyl iodide with silver abietate.

"Ethylac." ²⁰⁴ Trademark for 2-benzothiazyl-N,N-diethylthiocarbamylsulfide.

Properties: Free-flowing, light yellow to tan powder, sp. gr. 1.27, m. p. 69°C (min).

Use: Rubber vulcanization accelerator.

ethylacetamide $CH_3CONHC_2H_5$.

Properties: Water-white, sp. gr. 0.920 (20/20°C), boiling range 206-208.5°C; flash point 230°F, faint odor.

ethyl acetamidocycanoacetate (acetamidocycanoacetic ester; ethyl N-acetyl-alpha-cyanoglycine) $NCCH(NHCOCH_3)COOC_2H_5$. Solid, m. p. 129°C. Used in amino acid and related compound synthesis.

ethyl acetanilide (ethyl phenylacetamide)

$C_6H_5NC_2H_5COCH_3$.

Properties: White, crystalline solid.

Faint odor. Soluble in most organic solvents. Insoluble in water.

Constants: Sp. gr. 0.994; b. p. 258°C, flash point 124°C; m. p. 54°C.

Grades: Technical.

Use: Substitute for camphor in the nitro-cellulose industries.

ethyl acetate (acetic ether; acetic ester; vinegar naphtha) $CH_3COOC_2H_5$.

Properties: Colorless, fragrant, flammable liquid. Soluble in chloroform, alcohol and ether; slightly soluble in water.

Typical specifications: Commercial, 85-88%:

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Acidity, free acid as acetic, not more than 0.02%; color water-white; distillation range 70-80°C; miscible without turbidity with 20 vols 60° BÉ. gasoline (20°C); nonvolatile matter not more than 0.003 g per 100 cc; odor mild, non-residual; sp. gr. 0.883-0.888 (20/20°C).

95-98% Grade: Acidity, free acid as acetic, not more than 0.02%; color water-white; distillation range 73-80°C; miscible without turbidity with 20 vols 60° gasoline (20°C); non-volatile matter not more than 0.003 g per 100 cc; odor mild, non-residual; sp. gr. 0.895-0.899 (20°C).

99% Grade: Acidity, free acid as acetic, not more than 0.01%; color water-white; distillation range 75-80°C; miscible without turbidity with 20 vols 60° BÉ. gasoline (20°C); non-volatile matter not more than 0.003 g per 100 cc; odor mild, non-residual; sp. gr. 0.900-0.904 (20/20°C), wt/gal 7.50 lbs; flash point 26°F (approx).

Derivation: By heating acetic acid and ethyl alcohol in presence of sulfuric acid, and distilling.

Method of purification: Rectification.

Grades: Commercial, 85-88%; 95-98%, 99%; technical; pure refined; N. F. XI (99%).

Containers: Drums, tank cars.

Uses: Lacquer and plastic solvent, general solvent; organic synthesis, flavoring, perfumery; smokeless powders, artificial fruit essences, bonbons and confections, artificial bristles and horsehair; pharmaceuticals; rayon. Sale is subject to strict government regulation.

Warning: Flammable. MCA warning label.

Shipping regulations: Flammable liquid.

Red label.*

ethyl acetate, anhydrous. See ethyl acetate, grade 99%.

ethylacetic acid. See butyric acid.

ethyl acetoacetate (diacetic ester, acetoacetic ester) $\text{CH}_3\text{COCH}_2\text{COOC}_2\text{H}_5$.

Properties: Colorless liquid, fruity odor.

Soluble in alcohol, slightly soluble in water.

Constants: Sp. gr. 1.0250 (20/4°C) m. p. -80°C; b. p. 180-181°C, wt/gal 8.5 lbs;

vapor pressure 0.8 mm (20°C); flash point 185°F; coefficient of expansion 0.00101/°C.

Typical specifications: Acidity not more than 0.05% (as acetic), sp. gr. 1.023-1.028 (20/20°C); boiling range (50 mm) below 96°C not more than 5%, above 110°C none; purity not less than 97.5%; color not darker 8 mg potassium dichromate in 1 liter of water; solubility complete in alcohol, ether, and ethyl acetate; average wt/gal 8.54 lbs (20°C).

Derivation: By the action of metallic sodium on ethyl acetate, with subsequent distillation.

Method of purification: Redistillation.

Grades: Technical.

Containers: Drums; tank cars.

Uses: Organic synthesis; antipyrine; lacquers; dopes; plastics; manufacture of dyes, pharmaceuticals, antimalarials,

and Vitamin B.

Fire hazard: Combustible but not flammable.

Flash point over 80°F.

Shipping regulations: None.*

ethyl acetone. See methyl propyl ketone.

ethyl acetylene (1-butyne) $\text{C}_2\text{H}_2\text{C}\equiv\text{CH}$.

Properties: Available as liquefied gas;

b. p. 8.3°C; sp. gr. 0.669 (0/0°C); m. p.

-130°C; flash point (Tag open cup) < 20°F;

specific volume 7.2 cu. ft./lb. (70°F); insoluble in water.

Uses: Specialty fuel; chemical intermediate.

Shipping regulations: Flammable gas. Red gas label.*

ethyl N-acetyl -alpha-cyanoglycine. See ethyl acetamidocyanacetate.

ethyl acetylsalicylate $\text{C}_2\text{H}_5\text{OOC}_6\text{H}_4\text{OOCCH}_3$.

Properties: Colorless liquid. Insoluble in

water; soluble in many organic solvents.

Constants: Sp. gr. 1.153; b. p. 272°C.

Use: Medicine.

ethyl acrylate $\text{CH}_2=\text{CHCOOC}_2\text{H}_5$.

Properties: Colorless liquid; b. p. 99.4°C;

m. p. -72.0°C; sp. gr. 0.9230 (20/20°C);

wt/gal 7.6 lbs (20°C); nearly insoluble in water; readily polymerized.

Derivation: (a) Ethylene cyanohydrin, ethyl alcohol, and dilute sulfuric acid; (b) Oxo reaction of acetylene, carbon monoxide, and ethyl alcohol in the presence of nickel or cobalt catalyst.

Grades: Technical (inhibited).

Containers: 1-gal cans; 5-, 55-gal drums; tank cars.

Uses: Polymers; acrylic paints; chemical intermediates.

See also acrylate resins.

ethylalbenzene. See phenylacetaldehyde.

ethyl alcohol (alcohol; grain alcohol; ethanol; fermentation alcohol; Cologne spirits, spirits of wine; ethyl hydroxide) $\text{C}_2\text{H}_5\text{OH}$.

Properties of pure 100% absolute alcohol

(dehydrated alcohol): Colorless, limpid,

volatile liquid, ethereal, vinous odor;

pungent taste. Soluble in water, methyl

alcohol, ether, and chloroform.

Properties of 95% ethyl alcohol: Refractive

index 1.3651 (15°C); surface tension 22.8

dynes/cm (20°C); viscosity 0.0141 poise

(20°C); vapor pressure 43 mm (20°C);

specific heat 0.618 cal/g (23°C); flash

point 14°C (57°F); sp. gr. (15.56°C) 0.816;

b. p. 78°C.

Derivation: (a) From ethylene, either by direct catalytic hydration or by means of ethyl sulfate as an intermediate (phosphoric acid is one of catalysts used); (b) as a by-product of hydrocarbon synthesis from carbon monoxide and hydrogen, and as a by-product of methanol synthesis from these gases; (c) by fermentation of molasses, grains, or other carbohydrates, and sulfite pulp.

Grades: U. S. P. XVI (95% by vol); absolute;

pure; denatured (see denatured alcohol);

Cologne spirits; various proofs, as 190

proof. Note: One-half the proof number

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

gives the percent of ethyl alcohol by volume present in a mixture.

Containers: Drums, tank trucks, tank cars.

Uses: (including those for denatured alcohol) As a solvent and extraction medium; manufacture of intermediates, organic derivatives (especially acetaldehyde), dyes, synthetic drugs, synthetic rubber, detergents, cleaning solutions, surface coatings, cosmetics, pharmaceuticals, explosives; automobile radiator antifreeze; beverages; rocket fuel; and many specialized uses.

Fire hazard: Dangerous.

Shipping regulations: Flammable liquid. Red label.*

ethyl aldehyde. See acetaldehyde.

ethyl aluminum dichloride $C_2H_5AlCl_2$.

Properties: Clear, yellow pyrophoric liquid. B. p. (extrapolated) $194^\circ C$; f. p. $22^\circ C$; weight 10.28 lbs/gal ($25^\circ C$). Flames instantly with air; reacts violently with water.

Derivation: Reaction of aluminum chloride with ethyl aluminum sesquichloride.

Uses: Catalyst for olefin polymerization, aromatic hydrogenation; intermediate.

Shipping regulations: Flammable liquid. Red label.*

ethyl aluminum sesquichloride $(C_2H_5)_3Al_2Cl_3$.

Properties: Clear yellow liquid; b. p. $204^\circ C$, f. p. $-20^\circ C$. Flames instantly with air, reacts violently with water.

Derivation: Reaction of ethyl chloride and aluminum.

Grades: Commercial.

Uses: Catalyst for olefin polymerization, aromatic hydrogenation; intermediate.

Shipping regulations: Flammable liquid. Red label.*

ethyl alpha-allylacetoacetate

$CH_3COCH(CH_2CH=CH_2)COOC_2H_5$.

Properties: Water-white liquid; sp. gr.

($20^\circ C$) 0.989; wt/gal ($20^\circ C$) 8.24 lbs.

Containers: 30-gal aluminum drums (240 lbs net).

Uses: Intermediate for pharmaceuticals, perfumes, fungicides, insecticides, fine chemicals.

ethylamine (aminoethane) $CH_3CH_2NH_2$.

Properties: Colorless, volatile liquid or gas; ammonia odor; strong alkaline reaction. B. p. $16.6^\circ C$; freezing point $-81.2^\circ C$; sp. gr. (liquid, $15/15^\circ C$) 0.689, wt/gal ($20^\circ C$) 5.7 lbs; flash point (open cup) below $0^\circ F$. Miscible with water, alcohol, and ether.

Derivation: From ethyl chloride and alcoholic ammonia under heat and pressure.

Grades: Technical (anhydrous and 70% aqueous solution); pure, 98.5% min.

Containers: 1-gal cans; 5-, 55-gal drums; tank cars.

Uses: Dye intermediates; solvent extraction; petroleum refining; stabilizer for rubber latex; detergents; organic synthesis.

Shipping regulations: Flammable liquid. Red label.*

ethylamine hydrobromide $C_2H_5NH_2 \cdot HBr$.

Properties: White, practically odorless granules; m. p. $158-161^\circ C$; very soluble in water.

Use: Intermediate where liquid ethylamine or liquid hydrobromic acid cannot be used.

ethyl-ortho-aminobenzoate. See ethyl anthranilate.

ethyl-para-aminobenzoate. (benzocaine)

$C_6H_4NH_2CO_2C_2H_5$.

Properties: White, crystalline, odorless, tasteless powder; m. p. $88-92^\circ C$; exhibits local anesthetic properties when placed on the tongue. Soluble in dilute acids, less so in chloroform, ether, and alcohol, slightly soluble in almond or olive oil, very slightly soluble in water.

Derivation: By the ethylation of para-nitrobenzoic acid, followed by reduction.

Method of purification: Recrystallization.

Grades: Technical; pure; N. F. XI.

Containers: Glass bottles; drums.

Use: Medicine.

Shipping regulations: None.*

ethylaminoethanol. See ethylethanolamine.

Mixed ethylaminoethanols (sold in up to tank car lots) may also contain diethylaminoethanol (q. v.).

ethyl amyl ketone (EAK; octanone-3)

$CH_3CH_2CO(CH_2)_4CH_3$.

Properties: Colorless liquid, having a pungent odor. Soluble in 4 vols of 60% alcohol.

Constants: Sp. gr. 0.819-0.824; refractive index 1.416.

Containers: Drums; tank cars.

Use: Perfumery; solvent.

Shipping regulations: None.*

N-ethylaniline $C_6H_5NHC_2H_5$.

Properties: Colorless liquid, becoming brown on exposure to light. Soluble in alcohol; insoluble in water.

Constants: Sp. gr. 0.9631, m. p. $-63.5^\circ C$; b. p. $206^\circ C$; refractive index (n $20/D$) 1.5559.

Derivation: By heating aniline and ethyl alcohol in presence of sulfuric acid, with subsequent distillation.

Method of purification: Rectification.

Grades: Technical.

Containers: Iron drums; tank cars.

Use: Organic synthesis.

Shipping regulations: None.*

ortho-ethylaniline $C_6H_4(NH_2)C_2H_5$.

Properties: Brown liquid; f. p. $-44^\circ C$; sp. gr. ($20^\circ C$) 0.982; b. p. $214^\circ C$; flash point (open cup) $208^\circ F$. Soluble in alcohol and toluene; insoluble in water.

Uses: Chemical intermediate for pharmaceuticals, dyestuffs, pesticides, and other products.

ethyl anthranilate (ethyl-ortho-aminobenzoate) $C_6H_4(NH_2)COOCH_2CH_3$.

Properties: Colorless liquid, having an orange-flower and grape-type odor.

Constants: Sp. gr. 1.117; refractive index

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

1.564; b. p. 260°C.

Uses: Perfumery and flavors, similar to methyl anthranilate (q. v.).

2-ethylanthraquinone $C_{14}H_{10}O_2C_2H_5$.

Properties: Buff to light yellow paste.

M. p. 108.0°C.

Grades: Technical.

Use: Synthesis, especially of hydrogen peroxide.

"Ethyl" Antiknock Compound. ³¹³ See "Ethyl."

ethylarsenious oxide C_2H_5AsO .

Properties: Colorless oil. Garlic-like, nauseating odor. Oxidizes in air and forms colorless crystals. Soluble in acetone, benzene, ether. Sp. gr. 1.802 (11°C); b. p. 158°C (10 mm).

Derivation: By hydrolysis of dichloroarsine.

Grade: Technical.

Use: Organic synthesis.

ethylbenzene (ethylbenzol; phenylethane)

$C_6H_5C_2H_5$.

Properties: Colorless liquid; boiling point 136.187°C; refractive index 1.49594 (20°C), sp. gr. 0.86702 (20°C); f. p. 94.975°C; aniline equivalent 19; wt/gal 7.21 lbs (25°C); flash point 85°F; specific heat 0.41 cal/gm/°C; viscosity 0.64 centipoise (25°C).

Typical specifications (technical grade 95 mole % ethylbenzene): most probable impurities toluene and isopropylbenzene; distillation range 276.8-277.4°F; sp. gr. 0.872 (60/60°F); refractive index 1.496; soluble in alcohol, benzene, carbon tetrachloride, and ether; slightly soluble in water.

Derivation: (a) By heating benzene and ethylene in presence of aluminum chloride, with subsequent distillation; (b) by fractionation directly from the mixed xylene stream in petroleum refining.

Method of purification: Rectification.

Grades: Technical, pure; research.

Containers: Drums, tank cars.

Uses: Organic synthesis; solvent and diluent; intermediate in production of styrene.

ethyl benzoate (benzoic ether) $C_6H_5CO_2C_2H_5$.

Properties: Colorless, aromatic liquid; soluble in alcohol and ether; slightly soluble in hot water. Sp. gr. 1.043-1.046; m. p. -32.7°C, b. p. 212.9°C, refractive index 1.505.

Derivation: By heating ethyl alcohol and benzoic acid in presence of sulfuric acid.

Method of purification: Rectification.

Grade: Technical.

Containers: Iron drums; glass bottles.

Uses: Flavoring extracts; perfumery; solvent mixtures; lacquers; solvent for many cellulose derivatives and natural and synthetic resins.

Shipping regulations: None.*

ethylbenzol. See ethylbenzene.

ethyl benzoylacetate $C_6H_5COCH_2CO_2C_2H_5$.

Properties: Light yellow oil; boiling range 144-148°C (10 mm); sp. gr. 1.111-1.117 (20°C); flash point (open cup) 285°F.

Soluble in most organic solvents; insoluble in water.

Derivation: Reaction of ethyl acetate and ethyl benzoate with metallic sodium.

Method of purification: Vacuum distillation.

Grade: 95% pure.

Uses: Dye and pharmaceutical intermediate.

Shipping regulations: None.*

ethyl ortho-benzoylbenzoate

$C_6H_5COC_6H_4COOC_2H_5$.

Properties: Yellowish white solid; odorless; insoluble in water; soluble in alcohol, acetone, ethyl acetate, and benzol; m. p. not lower than 56-58°C, b. p. 325°C (760 mm).

Derivation: From benzoyl benzoic acid and alcohol.

Use: As a plasticizer for nitrocellulose, synthetic resins, etc.

Containers: 65-lb cans.

Shipping regulations: None.*

ethylbenzylaniline $C_6H_5N(C_2H_5)CH_2C_6H_5$.

Properties: Clear colorless oil; soluble in alcohol and ether; insoluble in water.

Sp. gr. 1.034; b. p. 286°C.

Derivation: By heating ethyl aniline, benzyl chloride, and aqueous caustic soda, with subsequent distillation.

Method of purification: Redistillation.

Grade: Technical.

Containers: Iron drums.

Uses: Dyestuffs; organic synthesis.

Shipping regulations: None.*

ethylbenzyl chlorides (1-chloromethylethylbenzene) $ClCH_2C_6H_4C_2H_5$.

Consists of 70% para- and 30% ortho-ethylbenzyl chloride.

Properties: Sp. gr. 1.0460-1.0475 (25/25°C); refractive index 1.5290-1.5305 (n_D 25/D);

soluble in alcohols; insoluble in water.

Uses: Intermediate.

ethyl biscoumaracetate (ethyl bis(4-hydroxycoumarinyl)acetate) $C_{22}H_{16}O_8$.

A synthetic derivative of bishydroxycoumarin.

Properties: White, odorless, bitter, crystalline solid. M. p. 177-182°C. Another form melts 154-157°. Soluble in acetone and benzene; slightly soluble in alcohol and ether; insoluble in water.

Grade: N. N. D.

Use: Medicine.

ethyl bis (4-hydroxycoumarinyl) acetate.

See ethyl biscoumaracetate.

ethyl borate $(C_2H_5)_3BO_3$.

Properties: Colorless liquid. Mild odor.

It is very stable to heat but hydrolyzes very rapidly in the presence of water, depositing boric acid in finely divided crystalline form.

Constants: B. p. 120°C; sp. gr. 0.863-0.864 (20/20°C); flash point 51.8°F; wt/gal 7.20 lbs (20°C); refractive index 1.37311 (20°C).

Typical specification: Boiling range 112 to 121°C, with not more than 5% distilling below 116°C; purity 98%; decomposes instantly with water.

Uses: Antiseptics; disinfectants; fireproofing of airplane fabrics; antiknock agent.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Fire hazard: Flammable.

Shipping regulations: Flammable liquid.

Red label. *

ethyl bromide (bromoethane) C_2H_5Br .

Properties: Colorless, flammable, volatile liquid; soluble in alcohol and ether; sparingly soluble in water.

Constants: Sp. gr. 1.431 (20/4°C); b. p. 38.4°C; wt/gal 12-12.1 lbs; vapor pressure 386 mm (20°C), critical temperature 231°C, f. p. -119°C; surface tension (10°C) 25.48 dynes/cm, (20°C) 24.15, (40°C) 21.52; latent heat of vaporization 250.8 joules (34.4°C), heat of combustion 340 kg cal/mol (gas); dielectric constant, liquid 9.45 (20°C); constant minimum boiling mixture of ethyl alcohol 7 mole% and ethyl bromide 93 mole% 37.6°C.

Derivation: Red phosphorus is added to absolute ethyl alcohol, bromine is then slowly added to the mixture which is then distilled.

Method of purification: Rectification.

Grades: Technical (98%).

Containers: Drums; tank cars.

Keep tightly closed in a cool place protected from air and light.

Uses: Organic synthesis; medicine (anesthetic); refrigerant, solvent; grain and fruit fumigant.

Warning! Vapor harmful; MCA warning label.

ethyl bromoacetate $CH_3BrCOOC_2H_5$.

Properties: Clear, colorless liquid. Forms colorless needles when cooled by solid carbon dioxide-ether mixture. Partially decomposed by water. Soluble in alcohol, benzene, ether; insoluble in water. Has poison gas characteristics. Sp. gr. 1.53 (4°C); b. p. 168°C; m. p. -13.8°C, vapor density 5.8.

Derivation: Interaction of bromine and acetic acid in the presence of red phosphorus.

Grades: Technical.

ethyl butanoate. See ethyl butyrate.

2-ethylbutanol. See 2-ethylbutyl alcohol.

2-ethyl-1-butene (uns-diethylethylene)

Properties: Colorless liquid; sp. gr. 0.6894 (20/4°C); b. p. 64.95°C; refractive index (n_D 20) 1.3969; soluble in alcohol, acetone, ether, petroleum, and coal-tar solvents; insoluble in water.

Typical specifications: Sp. gr. 0.6880 to 0.6920 (20/4°C); b. p. 64-66°C; refractive index (n_D 20) 1.3960 to 1.3995.

Grade: 95% pure.

Use: Organic synthesis of flavors, perfumes, medicines, dyes, resins.

3-(2-ethylbutoxy) propionic acid

Properties: Water-white liquid; sp. gr. (20/20°C) 0.9600; b. p. (100 mm) 200°C; vapor pressure (20°C) < 0.1 mm; f. p., glass below -90°C; solubility in water (20°C) less than 0.01%.

Uses: Preparation of metallic salts for

paint driers and gelling agents.

2-ethylbutyl acetate $C_2H_5CH(C_2H_5)CH_2OOCCH_3$.

Properties: Colorless liquid; mild odor.

Sp. gr. 0.875-0.881 (20/20°C).

Typical specifications: Acidity not more than 0.10% as acetic; color water-white, sp. gr. 0.875 to 0.881 (20/20°C); boiling range, below 155°C none, above 164°C none (760 mm), purity not less than 90% ethylbutyl acetate; dryness, miscible with 19 vols. 60° BÉ. gasoline at 20°C; average wt/gal 7.33 lbs (20°C).

Grade: Technical.

Use: Solvent for nitrocellulose, gums, resins, and lacquers.

Shipping regulations: None. *

2-ethylbutyl alcohol (2-ethylbutanol; hexyl alcohol, pseudo-) $CH_3CH_2CH(C_2H_5)CH_2OH$.

Properties: Colorless liquid; stable. Miscible with most organic solvents; slightly soluble in water. B. p. 148.9°C; sp. gr. 0.8328 (20/20°C), wt/gal 6.93 lbs (20°C); refractive index 1.4229 (20°C); surface tension 28.05 dynes/cm (28°C), viscosity 0.0563 poise (20°C); specific heat 0.586 cal/g at b. p.; flash point (ASTM open cup) 137°F; coefficient of expansion (per °C) 0.000892 to 20°C, 0.000921 to 55°C; vapor pressure 0.9 mm (20°C).

Typical specifications: Acidity not more than 0.02% (as acetic); color water-white; sp. gr. 0.830 to 0.835 (20/20°C); boiling range (760 mm) 140-155°C, dryness, miscible with 19 vol. of 60° BÉ. gasoline (20°C); non-volatile matter not more than 0.005 g/100 cc; av wt/gal 6.93 lbs (20°C).

Grades: Technical.

Containers: 1-, 5-gal cans; 55-gal non-returnable drums, tank cars.

Uses: Solvent for gums, oils, resins, waxes, dyes, other products; solvent; diluent; synthesis of perfumes, drugs; flavoring materials.

N-ethylbutylamine $C_2H_5NHCH_2CH_2CH_2CH_3$.

Properties: Water-white; amine odor, boiling range 110-113°C; sp. gr. 0.739 (20/20°C); refractive index 1.407 (20°C); flash point 65°F.

Shipping regulations: Flammable liquid.

Red label. *

ethyl butyl carbonate $C_2H_5CO_3C_4H_9$.

Properties: Colorless liquid used as solvent for many natural and synthetic resins; in mixtures for nitrocellulose. Sp. gr. 0.92 to 0.93 (20°C); b. p. 135-175°C; flash point 50°C.

ethyl n-butyl ether (n-butyl ethyl ether)

Properties: Liquid; sp. gr. (20°C) 0.7528; m. p. -103°C; b. p. 92.2°C; flash point 30°F; vapor pressure (20°C) 43 mm; slightly soluble in water.

Containers: Cans; drums.

Uses: Extraction solvent; inert reaction medium.

Hazard! Flammable.

Shipping regulations: Flammable liquid.

Red label. *

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ethyl butyl ketone (3-heptanone)

Properties: Sp. gr. 0.8191 (20/20°C); boiling range 142.8 to 147.8°C; acidity as acetic 0.034%; 95% purity; wt/gal 6.8 lbs.

Containers: Drums; tank cars.

Uses: In solvent mixtures for air-dried and baked finishes; for polyvinyl and nitro-cellulose resins.

2-ethyl-2-butylpropanediol-1,3 (2-butyl-2-ethylpropanediol-1,3)

Properties: White, crystalline solid; sp. gr. (50/20°C) 0.931; b. p. (50 mm) 178°C; f. p. 41.4°C; solubility in water (20°C) 0.8% by wt.

Use: Synthesis of lubricants, emulsifying agents; insect repellents; plastics.

2-ethylbutyl silicate $[\text{CH}_3\text{C}(\text{C}_2\text{H}_5)\text{CH}_2\text{CH}_2\text{O}]_4\text{Si}$.

Properties: Colorless liquid; b. p. (1 mm) 164°C.

Derivation: Reaction of silicon tetrachloride with 2-ethylbutanol.

Uses: Hydraulic fluid; heat transfer liquid.

2-ethylbutyraldehyde (diethyl acetaldehyde) $(\text{C}_2\text{H}_5)_2\text{CHCHO}$.

Properties: Colorless liquid; insoluble in water. Sp. gr. 0.8164 (20/20°C); b. p. (760 mm) 116.8°C; vapor pressure 13.7 mm (20°C); flash point 70°F; wt/gal 6.8 lbs (20°C); coefficient of expansion 0.00111 (20°C); f. p. -89°C; viscosity 0.60 cps (20°C).

Typical specifications: Sp. gr. 0.8170 to 0.823; boiling range 80 to 135°C (760 mm); acidity not more than 2.00% (as ethyl-butyric).

Grades: Technical.

Containers: 1-gal cans; 5-, 55-gal drums.

Uses: Organic synthesis; pharmaceuticals, rubber accelerators; synthetic resins.

Shipping regulations: Flammable liquid. Red label.*

ethyl butyrate (ethyl butanoate) $\text{C}_3\text{H}_7\text{CO}_2\text{C}_2\text{H}_5$.

Properties: Colorless, non-toxic, volatile liquid; pineapple-like odor. Soluble in alcohol and ether; insoluble in water. Sp. gr. 0.8788; m. p. -93.3°C; b. p. 120.6°C; refractive index (n_D 20) 1.400.

Derivation: Ethyl alcohol and butyric acid are heated together in presence of sulfuric acid, with subsequent distillation.

Method of purification: Rectification.

Grades: Technical.

Containers: Iron drums; glass bottles.

Uses: Flavoring extracts; imparting a pineapple flavor; perfumery; solvent mixture for cellulose esters and ethers; many natural and synthetic resins; lacquers; safety glass.

2-ethylbutyric acid (diethyl acetic acid)

Properties: Water-white liquid. Resembles butyric acid in most properties except that its odor is less pronounced and its water solubility limited. Sp. gr. 0.9225 (20/20°C); b. p. (760 mm) 190°C; vapor

pressure 0.08 mm (20°C); flash point 210°F; wt/gal 7.7 lbs (20°C); coefficient of expansion 0.00093 (20°C); f. p. -9.4°C; viscosity 3.13 cps (20°C).

Grades: Technical.

Containers: 1-gal glass jugs; 5-gal carboys; 55-gal stainless steel drums.

Uses: Forms esters; intermediates used in making drugs, dyestuffs, chemicals,

ethyl caffeate $\text{C}_6\text{H}_5(\text{OH})_2\text{CH:CHCOOC}_2\text{H}_5$.

Properties: Yellow to tan crystals; characteristic, aromatic odor; insoluble in water; very soluble in alcohol.

Typical specifications: Melting range 144-147°C, ash 0.1% (max). Moisture content 3% max.

Grade: C. P.

Containers: Bottles; fiber drums.

Uses: Food antioxidant.

Shipping regulations: None.*

ethyl caprate (ethyl decanoate; ethyl caprinate)

Properties: Colorless liquid; fragrant odor. Soluble in alcohol and ether; insoluble in water; sp. gr. 0.862; b. p. 243°C.

Derivation: By heating capric acid, absolute alcohol and sulfuric acid, with subsequent distillation.

Method of purification: Redistillation.

Grades: Technical.

Containers: Iron drums; glass bottles.

Uses: Organic synthesis; manufacturing wine-bouquet and cognac essence.

Shipping regulations: None.*

ethyl caprinate. See ethyl caprate.**ethyl caproate** (ethyl capronate; ethyl hexoate; ethyl hexanoate) $\text{C}_5\text{H}_{11}\text{COOC}_2\text{H}_5$.

Properties: Colorless to yellowish liquid; pleasant odor. Soluble in alcohol and ether; insoluble in water. Sp. gr. 0.873; b. p. 167°C.

Derivation: By heating absolute alcohol and n-caproic acid in presence of sulfuric acid, with subsequent distillation.

Method of purification: Rectification.

Grades: Technical.

Containers: Iron drums; glass bottles.

Uses: Organic synthesis; artificial fruit essences.

Shipping regulations: None.*

ethyl capronate. See ethyl caproate.**ethyl caprylate** (ethyl octoate; ethyl octanoate)

Properties: Colorless liquid; pineapple odor. Soluble in alcohol and ether; insoluble in water. Sp. gr. 0.873; m. p. -48°C; b. p. 207-209°C.

Derivation: By heating caprylic acid, alcohol, and sulfuric acid with subsequent distillation.

Method of purification: Rectification.

Grades: Technical.

Containers: Iron drums; glass bottles.

Uses: Flavoring; fruit essences.

Shipping regulations: None.*

ethyl carbamate. See urethane.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

N-ethylcarbazole (9-ethylcarbazole).

Properties: Leaflets; soluble in ether and hot alcohol. M. p. 69-70°C; b. p. 175°C (5 mm).

Derivation: Action of ethyl chloride on potassium carbazolate.

Uses: Intermediate for dyes, pharmaceuticals, agricultural chemicals.

ethyl carbonate. See diethyl carbonate.

ethyl cellulose. An ethyl ether of cellulose.

Properties: White, granular, thermoplastic solid; variable properties depending on the degree to which hydroxyl radicals of cellulose have been replaced by ethoxy groups. The standard commercial grade has 47-48% ethoxy content (intermediate between compositions corresponding to two and three ethoxy groups per glucose unit of the cellulose). Greater ethoxy content increases solubility in organic solvents, lowers softening temperature, and decreases moisture absorption. The standard grade has sp. gr. 1.07-1.18; refractive index 1.47; high dielectric strength; softening point 100-130°C; and forms tough films, which retain flexibility to low temperatures. Soluble in most organic liquids, and compatible with resins, waxes, oils, and plasticizers; inert to alkalis and dilute acids.

Derivation: From alkali cellulose and ethyl chloride or sulfate; from cellulose and ethyl alcohol in presence of dehydrating agents.

Grades: Technical; N. F. XI. Sold in bags.

Uses: Adhesives; cable lacquers; extrusion wire insulation, injection plastics; protective coatings; hot-melt paper and cloth coating, pigment-grinding base; may be used as toughening agent for plastics, protective coatings, and textile finishing, printing inks, molding powders; proximity fuses; inhibitor tape for rockets; in vitamin preparations.

ethyl centralite. See sym-diethyldiphenylurea.

ethyl chloride (chloroethane) C_2H_5Cl .

Properties: Gas at ordinary temperature, compressed, a colorless, highly flammable, volatile liquid. Ether-like odor, burning taste. Stable and non-corrosive when dry but will hydrolyze in the presence of water or alkalis. Miscible with most of the commonly used solvents; slightly soluble in water. Sp. gr. 0.9214; m. p. -140.85°C; b. p. 12.5°C; critical point 187.2°C (52 atm; sp. gr. 0.33); latent heat of vaporization at 15.0°C 387 joules/g, at 25°C 385 joules/g; heat of combustion 316.7 kg cal/mole (gas), thermal conductivity gaseous state 0.873 (0°C); dielectric constant of liquid 6.29 (170°C) under its own pressure; vapor pressure 1000 mm (20°C); flash point (closed cup) -58°F.

Derivation: (a) From ethylene and hydrogen chloride; (b) by passing hydrogen chloride into a solution of zinc chloride and ethyl alcohol.

Method of purification: Distillation.

Grades: Technical; N. F. XI.

Containers: Cylinders; drums; tank cars.

Uses: Manufacture of tetraethyl lead and ethyl cellulose; anesthetic in medicine and dentistry; organic synthesis, alkylating agent; refrigeration; analytical reagent; solvent for phosphorus, sulfur, fats, oils, resins and waxes; insecticides.

Danger! Extremely flammable. MCA warning label.

Shipping regulations: Flammable liquid. Red label. *

ethyl chloroacetal $ClCH_2CH(OC_2H_5)_2$.

Properties: Water-white liquid with pleasant odor, sp. gr. 1.022 (20°C); boiling range: 54-61°C (20 mm); 149-153°C (760 mm); m. p. -32°C, flash point 117°F; refractive index 1.418 (20°C); soluble in alcohol and ethyl ether; insoluble in water.

ethyl chloroacetate $CH_2ClCO_2C_2H_5$.

Properties: Water-white, mobile liquid; pungent, fruity odor. Decomposed by hot water and alkalis. Soluble in alcohol, benzene, and ether; insoluble in water. Sp. gr. 1.1585 (20°C), b. p. 144.2°C; vapor density 4.23-4.46, flash point 54°C; refractive index (n_D 20/D) 1.4227.

Derivation: (a) By the action of chloroacetyl chloride on alcohol; (b) by treating chloroacetic acid with alcohol and sulfuric acid.

Method of purification: Distillation.

Grades: Technical.

Containers: Bottles, carboys, 55-gal drums.

Uses: Solvent; organic synthesis, military poison gas; vat dyestuffs.

ethyl chlorocarbonate (ethyl chloroformate) $ClCOOC_2H_5$.

Caution! Poisonous! Insoluble in water; soluble in alcohol, benzene, chloroform and ether. Wt/gal 9.46 lbs (approx) (20°C); coefficient of expansion per °F 0.00070, per °C, 0.00126; flash point 61°F (approx).

Typical specifications: Color water-white, dryness, miscible without turbidity with 20 vols 60° B_E gasoline at 20°C; free chlorine none; odor irritating, tear-producing, purity, ester content as ethyl chlorocarbonate, not less than 96%; sp. gr. (20/20°C) 1.135-1.139, b. p. 93-95°C; refractive index (n_D 20/D) 1.3974.

Derivation: By reacting carbon monoxide with gaseous chlorine, producing phosgene ($COCl_2$) which is then reacted with anhydrous ethyl alcohol giving ethyl chlorocarbonate and splitting off hydrochloric acid. Owing to the poisonous and corrosive character of the main raw materials, all reactions take place in special acid-resistant equipment under constant technical control.

Grades: Technical.

Containers: 1-gal bottles, 5-gal carboys.

Use: Organic synthesis (intermediate in making diethyl carbonate and flotation agents).

Fire hazard: Flammable. Keep lights and fire away.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Shipping regulations: Corrosive liquid.
White label.*

ethyl chloroformate. See ethyl chlorocarbonate.

ethylchlorosulfonate $C_2H_5OCISO_2$.

Properties: Colorless, oily liquid. Pungent odor; fumes in moist air. Decomposed by water. Attacks lead and tin, but copper mildly. Iron and steel not affected. Caution! Very irritant! Soluble in chloroform and ether; insoluble in water. Sp. gr. 1.379 (0°C); b. p. 152-153°C; vapor density 5 (air = 1); volatility 18,000 mg/cu m (20°C). Derivation: (a) Action of fuming sulfuric acid on ethylchloroformate; (b) interaction of ethylene and chlorosulfonic acid.

Grades: Technical.

Uses: Organic synthesis; military poison gas.

ethyl cinnamate (ethyl phenylacrylate; cinnamic ether; cinnamyl ether)

$C_6H_5CH:CHCOOC_2H_5$.

Properties: Limpid, oily liquid; strawberry-like odor. Soluble in alcohol and ether; insoluble in water. Sp. gr. 1.045-1.048, refractive index (n 20/D) 1.560; congealing point 7° (min), b. p. 271°C.

Derivation: By heating ethyl alcohol and cinnamic acid in presence of sulfuric acid.

Method of purification: Rectification.

Grades: Technical.

Containers: Bottles; cans; drums.

Uses: Perfumery, flavoring extracts.

Shipping regulations: None.*

ethyl citrate. See triethyl citrate.

ethyl cocoinate (cognac ether). Ethyl esters of mixed fatty acids.

Properties: Yellow, oily liquid; odor of russet apples. Soluble in alcohol and ether; insoluble in water. Sp. gr. 0.855.

Derivation: By the action of dry hydrochloric acid gas on an alcoholic solution of the fatty acids of coconut oil.

Method of purification: Rectification.

Grades: Technical.

Containers: Iron drums, glass bottles.

Use: Flavoring cognac.

Shipping regulations: None.*

ethyl crotonate $CH_3CH:CHCOOC_2H_5$.

Properties: Water-white liquid. Characteristic pungent persistent odor. Soluble in alcohol and ether; insoluble in water. Sp. gr. 0.9207 (20/20°C); b. p. 139°C; flash point 36°F; refractive index 1.4242 (20°C); wt/gal 7.65 lbs (20°C).

Grades: Technical.

Containers: Non-returnable. 1-, 5-gal cans; 55-gal drums.

Uses: Solvent and softening agent; lacquers; organic synthesis.

Shipping regulations: Flammable liquid.

Red label.*

N-ethyl-ortho-crotonotoluide. See crotamiton.

2-ethyl-cis-crotonylurea. See ectylurea.

ethyl cyanide (propionitrile; propanenitrile)

C_2H_5CN .

Properties: Mobile, colorless liquid;

ethereal odor; poisonous! Soluble in alcohol and water. Sp. gr. 0.7829 (20/20°C); refractive index (n 20/D) 1.3664; b. p. 97.4°C; f. p. -92.9°C; flash point 61°F (open cup).

Derivation: By heating barium-ethyl sulfate and potassium cyanide, with subsequent distillation.

Method of purification: Rectification.

Grades: Technical.

Containers: Iron drums; glass bottles.

Keep tightly closed.

Uses: Solvent; dielectric fluid; intermediate.

Shipping regulations: Flammable liquid.

Red label.*

ethyl cyanoacetate (malonic ethyl ester nitrile) $CNCH_2COOC_2H_5$.

Properties: Colorless liquid; b. p. 206-208°C; m. p. -22.5°C; refractive index 1.41751 (20°C/D). Soluble in alcohol and ether; slightly soluble in water and alkaline solutions.

Derivation: Esterification of cyanoacetic acid with ethanol; reaction of an alkali cyanide and chloroacetic ethyl ester.

Method of purification: Vacuum distillation.

Grades: Reagent; technical.

Containers: Tin-lined steel drums.

Uses: Organic synthesis; pharmaceuticals; dyes.

ethylcyclohexane $C_2H_5C_6H_{11}$.

Properties: Colorless liquid; sp. gr. 0.787; boiling point 131.8°C; refractive index (n 20/D) 1.4330.

Grades: Technical.

Use: Organic synthesis.

ethylcyclopentane $C_2H_5C_5H_9$.

Constants: Sp. gr. 0.766, aniline equivalent 1; b. p. 103.5°C, refractive index (n 20/D) 1.4198.

ethyl cyclopentanone-2-carboxylate. See 2-carbethoxycyclopentanone.

ethyl decanoate. See ethyl caprate.

ethyldichloroarsine (dichloroethylarsine)

$C_2H_5AsCl_2$.

Properties: Colorless, mobile liquid. Becomes yellowish under the action of light and air. Fruit-like odor (high dilution). Decomposed by water. Attacks brass, but not iron (dry). Caution! Very irritant! Soluble in alcohol, benzene, ether, and water.

Constants: Sp. gr. 1.742 (14°C); b. p. 156°C (decomposes); m. p. -65°C; coefficient of thermal expansion 0.0011; vapor density 6 (air = 1); volatility 20,000 mg/cu m (20°C); vapor pressure 2.29 mm (21.5°C).

Derivation: Chlorination of ethyl arsenious oxide.

Shipping regulations: Poison, class A.

Poison gas label.* Not accepted by express.

ethyl 4,4'-dichlorobenzilate (4,4'-dichlorobenzilic acid ethyl ester; ethyl 2-hydroxy-2,2-bis(4-chlorophenyl) acetate) $(C_6H_4Cl)_2C(OH)COOC_2H_5$.

Properties: Viscous yellow liquid. Slightly soluble in water; soluble in most organic

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

solvents. Incompatible with alkaline materials or strong acids. Toxicity: Symptoms similar to those caused by DDT.

Use: Acaricide in spider-mite control; synergist for DDT.

ethyldichlorosilane $C_2H_5SiHCl_2$.

Properties: Colorless liquid; b. p. 75.5°C; sp. gr. 1.088 (25/25°C); flash point (Cleveland, open cup) 30°F. Readily hydrolyzed by moisture, with the liberation of hydrogen and hydrochloric acid.

Derivation: By Grignard reaction of trichlorosilane and ethylmagnesium chloride.

Grade: Technical.

Use: Intermediate for silicones.

Shipping regulations: Flammable liquid. Red label.*

ethyldiethanolamine $C_2H_5N(CH_2CH_2OH)_2$.

Properties: Sp. gr. 1.015 (20°C), boiling range 246-252°C; color water-white, odor amine.

Fire hazard: Flash point 255°F.

Uses: Solvent; detergents.

ethyl diiodobrassidate (diiodobrassidinic acid ethyl ester, iodobrassid)

$CH_3(CH_2)_7CICI(CH_2)_{11}COOC_2H_5$ (trans).

Properties: White needles containing 41% iodine. Decomposes slowly in solution yielding free iodine; m. p. 37°C, soluble in alcohol, ether, chloroform, fatty oils, insoluble in water.

Use: Medicine.

Shipping regulations: None.*

ethyldimethylmethane. See isopentane.

ethyldipropylmethane. See 4-ethylheptane.

ethyl N, N-di-n-propylthiolcarbamate. See EPTC.

ethylene (olefiant gas, bicarburetted hydrogen, elayl, ethene) $H_2C:CH_2$.

Properties: Colorless gas with characteristic sweet odor and taste; flammable; forms an explosive mixture with air at a concentration of 3% (approx), m. p. -169°C; b. p. -102.5°C; flash point -136°C, sp. gr. of liquid at 0°C 0.610; vapor density (0°C, 760 mm) (air = 1) 0.975; critical temperature 9.5°C; critical pressure (absolute) 744 psi; explosive limits in air (per cent by volume) lower 3.0, upper 34.0. Has been found in auto exhaust fumes.

Typical specifications: Purity not less than 96% ethylene by gas volume, not more than 0.5% acetylene, not more than 4% methane and ethane; 13.4 cu ft/lb (15.6°C, 760 mm); slightly soluble in water, alcohol, and ethyl ether.

Derivation: Cracking of petroleum and natural gas. Ethylene is a major component of the refinery gas from cracking units, and is sometimes recovered therefrom by distillation or other means. In some cases the ethylene is used in further chemical reactions without purification. Some pure ethylene is produced by passing hot ethyl alcohol vapors over a suitable catalyst, such as activated alumina.

Grades: Technical (95% min); 99.5% min; N. F. XI.

Containers: Cylinders and tube trailers.

Uses: The source of many tonnage ethyl and ethylene compounds (in approximate order of volume): ethylene oxide; polyethylene; synthetic ethyl alcohol; styrene; ethylene dichloride; ethyl chloride; ethylene dibromide, etc. It is also used in the coloring of fruit and blanching of vegetables; to increase growth rate of seedlings, vegetables and fruit trees, for oxyethylene welding and cutting of metals, in medicine (anesthetic).

Fire hazard: Dangerous.

Shipping regulations: Flammable gas. Red gas label.*

ethylene alcohol. See ethylene glycol.

ethyleneamine. See piperazine.

ethylenebis(iminodiacetic acid). See ethylenediaminetetraacetic acid.

ethylene bromide. See ethylene dibromide.

ethylene carbonate (glycol carbonate; dioxolone-2) $(CH_2O)_2CO$.

Properties: Colorless, odorless, low-melting solid. M. p. 36.4°C, b. p. 248°C, sp. gr. (39/4°C) 1.3218, refractive index (n_D 50/D) 1.4158; flash point (open cup) 320°F. Miscible (40°) with water, alcohol, ethyl acetate, benzene, and chloroform. Soluble in ether, n-butanol, and carbon tetrachloride.

Derivation: Interaction of ethylene glycol and phosgene.

Grade: Technical.

Uses: Solvent for many polymers and resins; solvent extraction, organic synthesis of pharmaceuticals, rubber chemicals, textile finishing agents.

ethylene carboxylic acid. See acrylic acid.

ethylene chloride. See ethylene dichloride.

ethylene chlorobromide. See sym-bromochloroethane.

ethylene chlorohydrin (2-chlorethyl alcohol; glycol chlorohydrin) $ClCH_2CH_2OH$.

Properties: Colorless liquid; faint ethereal odor. Soluble in most organic liquids and completely miscible with water. Poisonous! Sp. gr. 1.2045 (20/20°C), b. p. 128.7°C (760 mm), refractive index (n_D 20/D) 1.4419; vapor pressure 4.9 mm (20°C); flash point 140°F; wt/gal 10.0 lbs (20°C); coefficient of expansion 0.00089 (20°C); f. p. -62.6°C, viscosity 0.0343 poise (20°C).

Typical specifications: Anhydrous grade: Acidity not more than 0.02% (as hydrochloric); purity not less than 98.0% ethylene, chlorohydrin; color water-white (if shipped in glass); sp. gr. 1.202-1.208 (20/20°C); boiling range (760 mm) 122-135°C; solubility in water, completely miscible; average wt/gal 10.01 lbs (20°C).

Typical specifications: 38% grade: Purity 38-42% ethylene chlorohydrin by weight; sp. gr. 1.087-1.097 (20/20°C); acidity not more than 0.02% (as hydrochloric);

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

solubility in water, miscible with water without cloudiness; color water-white (if shipped in glass); odor mild, non-residual; average wt/gal 9.1 lbs (20°C).

Derivation: By action of hypochlorous acid on ethylene.

Method of purification: Rectification.

Grades: Refined; anhydrous.

Containers: (36 to 40% grade) bottles; jugs; carboys; (anhydrous) tank cars.

Uses: Solvent for cellulose acetate; solvent mixtures for ethylcellulose, cellulose acetate; synthesis of oil of rose, procaine, indigo, introduction of hydroxyethyl group in organic synthesis; to activate sprouting of dormant potatoes.

Danger! Extremely hazardous liquid and vapor. May be fatal if inhaled, swallowed or absorbed through skin. MCA warning label.

Shipping regulations: Poison, class B. Poison label. *

ethylene cyanide (ethylene dicyanide; succinonitrile) $C_2H_4(CN)_2$.

Properties: Colorless, waxy solid, soluble in alcohol, water, and chloroform. M.p. 57-57.5°C, b.p. 265.7°C (760 mm).

Derivation: By the interaction of ethylene dibromide and potassium cyanide in presence of alcohol.

Method of purification: Crystallization.

Use: Organic synthesis.

ethylene cyanohydrin (beta-hydroxy propionitrile) $HOCH_2CH_2CN$.

Properties: Poisonous, straw colored liquid, m.p. -46°C, b.p. 227-228°C (dec), sp.gr. 1.0404 (25/4°C); vapor pressure 0.08 mm (25°C), 20 mm (117°C), 760 mm (227-228°C). Miscible in all proportions with water, acetone, methyl ethyl ketone, ethanol, chloroform and diethyl ether. Insoluble in benzene, carbon tetrachloride, and naphtha.

Derivation: Ethylene oxide and hydrocyanic acid.

Grade: Technical.

Containers: Steel drums; tank cars.

Uses: Solvent for certain cellulose esters and inorganic salts. Organic intermediate.

ethylenediamine (1,2-diaminoethane) $NH_2CH_2CH_2NH_2$.

Properties: Volatile, colorless, alkaline liquid; ammonia odor. Strong base. Soluble in water, alcohol; slightly soluble in ether; insoluble in benzene.

Constants: Sp. gr. 0.8995 (20/20°C), wt/gal 7.50 lbs (20°C); 899 g/liter (20°C); b.p. 116-117°C; vapor pressure 10.7 mm (20°C); m.p. 8.5°C; viscosity 0.0154 poise (25°C); refractive index 1.4540 (26°C); dielectric constant 16.0 (18°C); ionization constant 7.1×10^{-5} (25°C); pH of 25% solution 11.9 (25°C); latent heat of vaporization 167 cal/g (calc); latent heat of fusion 77 cal/g (0°C); heat of solution 7.6 cal/mole (15°C); heat of combustion 452.6 cal/mole.

Typical specifications: Purity not less than 66% by wt; boiling range (760 mm) below

115°C none; above 122°C none; odor mildly ammoniacal; color water-white.

Derivation: By heating ethylene dichloride and ammonia, with subsequent distillation.

Method of purification: Redistillation.

Grades: Technical; U. S. P. XVI (67% solution); various strengths solutions.

Containers: 55-gal tin-lined drums; tank cars.

Uses: Solvent for albumin and fibrin, medicine; neutralizing acidity of oils; preparing casein and shellac solutions; stabilizing rubber latex; corrosion inhibitor in anti-freeze solutions; textile lubricants; dyes; rubber accelerators; making of ethylenediamine nitrate, chlorate, and EDTA; de-hairing fur skins; emulsifier; organic synthesis. To form water-insoluble polyamide resin adhesives from di- and trimerized unsaturated vegetable oil acids; heat sensitive adhesive in labelling and packaging.

Danger! Causes severe eye and skin burns.

MCA warning label.

Shipping regulations: None. *

ethylenediamine mercury sulfate

$HgSO_4 \cdot 2(CH_2NH_2)_2 \cdot 2H_2O$.

Properties: White powder. Contains approximately 43% mercury. Incompatible with sodium chloride. Do not expose to air.

Soluble in water.

Use: Medicine.

Shipping regulations: None. *

ethylene diamine tartrate. Used to make piezoelectric crystals for control of electric frequencies, etc., as in television.

ethylenediaminetetraacetic acid (EDTA; ethylenedisiminodiacetic acid; ethylenedinitrilotetraacetic acid)

$(HOOCCH_2)_2NCH_2CH_2N(CH_2COOH)_2$. One of the most important organic chelating agents.

Properties: Colorless crystalline solid, decomposing at 240°C. Slightly soluble in water; insoluble in common organic solvents; neutralized by alkali metal hydroxides to form a series of water-soluble salts containing from one to four alkali metal cations.

Derivation: (a) By the addition of sodium cyanide and formaldehyde to a basic solution of ethylenediamine (forms the tetrasodium salt); (b) by heating tetrahydroxyethylethylenediamine with sodium or potassium hydroxide using a cadmium oxide catalyst (forms the tetrasodium salt).

Uses: In detergents, liquid soaps, shampoos, agricultural chemical sprays; for metal treatment such as cleaning and plating operations; for treatment of chlorosis; for decontamination of radioactive surfaces; as metal deactivator in vegetable oils, oil emulsions, pharmaceutical products, etc.; as an anticoagulant of blood; as an eluting agent in ion exchange; to remove insoluble deposits of calcium and magnesium soaps; in textiles to improve dyeing properties and scouring and detergent operations; in rubber and polymers; antioxidant; clarification of liquids; analytical chemistry; in heavy metal poisoning, to chelate lead, copper, etc.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ethylenediaminetetraacetic acid calcium disodium chelate. See calcium disodium EDTA.

ethylenediaminetetraacetic acid, disodium salt (disodium ethylenediaminetetraacetate; disodium dihydrogen ethylenediaminetetraacetate). Used as a dietary supplement or sequestrant in animal feeds; as a sequestrant in vinegar.

ethylenediaminetetraacetic acid salts (EDTA salts). A variety of these are available, with uses identical or similar to the acid. Among them are the tetrapotassium and tetrasodium salts, the disodium dihydrate, trisodium trihydrate or monohydrate, sodium ferric EDTA, dihydrogen ferrous EDTA, disodium calcium EDTA, and a similar range of disodium salts with magnesium, divalent cobalt, manganese, copper, zinc and nickel.

ethylene dibromide (EDB; 1,2-dibromoethane; ethylene bromide) $\text{CH}_2\text{BrCH}_2\text{Br}$.

Properties: Colorless, volatile, nonflammable liquid. Sweetish odor. Emulsifiable. Poisonous! Miscible with most solvents and thinners; slightly soluble in water. Sp. gr. 2.17-2.18 (20°C); wt/gal 18.1 lbs; b. p. 131°C; vapor pressure 17.4 mm (30°C); f. p. 9.10°C; surface tension 38.71 dynes/cm (20°C); latent heat of fusion at 9.55°C 56.62 joules/g, of vaporization at 130.8°C, 193.5 joules; dielectric constant 4.86 (18°C); refractive index 1.5357 (25°C); flash point none; fire point none; specific heat 0.18 cal/g/°C; specific resistivity 2.4×10^9 ohms/cm.

Typical specifications: Colorless; sp. gr. 2.17-2.19 (20/4°C); acidity less than 1 cc (0.01 N NaOH/100 cc oil); boiling range 90% within 2°C.

Derivation: By the action of bromine on ethylene gas.

Method of purification: Rectification.

Grade: Technical.

Containers: 55-gal drums; tank cars.

Uses: Scavenger for lead in gasoline; grain and fruit fumigant; solvent for fats, oils, waxes, gums, resins, other products; waterproofing preparations; celluloid; organic synthesis; wood insecticide; medicine.

Warning! Vapor harmful. Absorbed through skin. Avoid breathing vapor. MCA warning label.

Shipping regulations: None.*

ethylenedicarboxylic acid. See succinic acid.

ethylene dichloride (sym-dichloroethane; 1,2-dichloroethane; ethylene chloride; Dutch liquid; Dutch oil) $\text{CH}_2\text{ClCH}_2\text{Cl}$.

Properties: Colorless, oily liquid; chloroform-like odor; sweet taste. Stable in presence of water, alkalis, acids, or actively-reacting chemicals. Resistant to oxidation. Will not corrode metals. While it will burn, it does so with difficulty and the addition of 25% by volume of carbon tetrachloride is said to render the mixture safe under ordinary conditions. Miscible with most common solvents; slightly

soluble in water.

Constants: B. p. 83.5°C; f. p. -35.5°C; sp. gr. 1.2554 (20/4°C); wt/gal 10.4 lbs; refractive index 1.444; flash point 70°F.

Derivation: By the action of chlorine on ethylene with subsequent distillation, with ethylene dibromide as catalyst.

Grade: Technical.

Containers: 1-, 5-gal cans; 55-gal non-returnable drums; 6000- and 8000-gal tank cars.

Uses: Vinyl chloride; solvent for fats, oils, waxes, some alkaloids, camphor, rubber, "Bakelite," various resins, gums, other products; solvent mixtures for cellulose esters and ethers and other products; oil extraction; fumigants; dry-cleaning solvent mixtures and spotting; lacquers; paint, varnish and finish removers; metal degreasing; textile cleansing processes; soaps and scouring compounds; wetting and penetrating agents; organic synthesis; ore flotation; scavenger for TEL in gasoline.

Warning: Flammable. Vapor harmful. MCA warning label.

Shipping regulations: Flammable liquid. Red label.*

ethylene dicyanide. See ethylene cyanide.

ethylenedinitrilotetraacetic acid. See ethylenediaminetetraacetic acid.

ethylene diphenyldiamine. See N,N-diphenyl ethylenediamine.

ethylene glycol (ethylene alcohol; glycol) $\text{CH}_2\text{OHCH}_2\text{OH}$.

Properties: Clear, colorless, syrupy liquid; sweet taste; hygroscopic; lowers freezing point of water. Soluble in water, alcohol, and ether.

Constants: Sp. gr. 1.1155 (20°C); b. p. 197.2°C; f. p. -13.5°C; wt/gal 9.31 lbs (15/15°C); refractive index 1.430 (25°C); flash point 240.8°F; fire point 248°F.

Derivation: (a) By heating ethylene chlorohydrin with a solution of an alkali carbonate or bicarbonate; (b) oxidation of ethylene with air, followed by hydration of the ethylene oxide formed; (c) from formaldehyde, water and carbon monoxide, with hydrogenation of the resulting glycolic acid.

Grade: Technical.

Containers: 5-, 10-, 55-, 110-gal drums; tank cars. Net contents 45, 90, 465, 930 lbs; 8000 gals.

Uses: Coolant in motors; antifreeze in automobile radiators; brake fluids, glycol diacetate; polyester fibers; manufacture of low-freezing dynamite; dye solvent; extractant for various purposes; solvent mixtures for cellulose esters and ethers, especially cellophane; lacquers; resins; printing inks; wood stains; glue mixtures; leather dyeing; textile processing; tobacco; solvent for waxes, resins, organic chemicals, drugs, and other products.

Shipping regulations: None.*

ethylene glycol diacetate (glycol diacetate) $\text{CH}_3\text{COOCH}_2\text{CH}_2\text{OOCCH}_3$.

Properties: Colorless liquid; faint odor.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Soluble in alcohol, ether, benzene; slightly soluble in water (10%). Sp. gr. 1.1063 (20/20°C); b. p. 190.5°C (760 mm); vapor pressure 0.3 mm (20°C); flash point 220°F; wt/gal 9.2 lbs (20°C); f. p. -41.5°C; refractive index (n 20/D) 1.415.

Derivation: (a) Ethylene glycol and acetic acid; (b) ethylene dichloride and sodium acetate.

Containers: 1-gal cans; 5-, 55-gal drums.

Uses: Solvent for cellulose esters and ethers; resins; lacquers; printing inks; perfume fixative; non-discoloring plasticizer for ethyl and benzyl cellulose.

Shipping regulations: None.*

ethylene glycol dibutyl ether $C_4H_9OC_2H_4OC_4H_9$

Properties: Practically colorless liquid with characteristic odor. Slightly soluble in water; sp. gr. 0.8374 (20/20°C); 7.0 lb/gal (20°C); b. p. 203.6°C (760 mm); vapor pressure 0.09 mm (20°C); freezing point -69.1°C; viscosity 1.34 cps (20°C).

Containers: 1-gal can, 5-, 55-gal drums; (6.5, 30, 380 lbs net wt).

Uses: High-boiling inert solvent, useful in specialized solvent and extraction applications.

ethylene glycol dibutyrate (glycol dibutyrate) $(CH_3OCOC_3H_7)_2$

Properties: Liquid; sp. gr. (0°C) 1.024; refractive index (25°C) 1.424; b. p. 240°C, m. p. less than -80°C; solubility in water, 0.050% by weight.

Use: Plasticizer.

ethylene glycol diethyl ether

$C_2H_5OCH_2CH_2OC_2H_5$

Properties: Colorless liquid; slight, ethereal odor, stable. Sp. gr. 0.8417 (20/20°C); b. p. 121.4°C (760 mm), vapor pressure 9.4 mm (20°C); flash point 95°F; wt/gal 7 lbs (20°C); f. p. -74°C, coefficient of expansion 0.00121 (20°C); viscosity 0.0065 poise (20°C). Partially miscible with water.

Grade: Technical.

Containers: 1-gal cans, 5-, 55-gal drums.

Uses: Organic synthesis (reaction medium); solvent, which added to colloidal systems such as detergents and wetting agents of limited water solubility, permits water dilution while reducing, without gelling, or clouding.

ethylene glycol diformate (glycol diformate) $HCOOCH_2CH_2OOCH$

Properties: As supplied commercially is a mild odored, water-white liquid, soluble in water, alcohol and ether. Sp. gr. 1.2277 (20/20°C); 10.2 lbs/gal (20°C); b. p. 177.1°C (760 mm); vapor pressure 0.5 mm (20°C); f. p. -10°C.

Uses: In the presence of water, it hydrolyzes slowly, liberating formic acid; hence, it may be used where this characteristic is desirable. It is used in embalming fluids.

ethylene glycol dimethyl ether (GDME; 1,2-dimethoxyethane) $CH_3OCH_2CH_2OCH_3$

Properties: Water-white liquid with a mild ether odor. Sp. gr. 0.8683 (20°C);

b. p. 85.2°C; f. p. -69°C; refractive index 1.3792 (20/D); flash point 34°F (open cup); soluble in water and hydrocarbons; pH 8.2.

Use: Solvent.

Shipping regulations: Flammable liquid. Red label.*

ethylene glycol dipropionate (glycol propionate) $(CH_3OCOC_2H_5)_2$. Liquid; sp. gr. (15°C) 1.054; refractive index (25°C) 1.419; b. p. 211°C; m. p. less than -80°C; solubility in water, 0.16% by weight.

Use: Plasticizer.

ethylene glycol monoacetate (glycol monoacetate) $HOCH_2CH_2OOCCH_3$

Properties: Colorless liquid; almost odorless; soluble in alcohol, ether, benzene, and toluene; partially soluble in water. B. p. 181-182°C; sp. gr. 1.108.

Derivation: (a) By heating ethylene glycol with acetic acid (glacial) or acetic anhydride; (b) by passing ethylene oxide into hot acetic acid containing sodium acetate or sulfuric acid.

Grade: Technical.

Use: Solvent for nitrocellulose, cellulose acetate, camphor.

ethylene glycol monobenzyl ether

$C_6H_5CH_2OC_2H_4OH$

Properties: Water-white liquid; faint rose-like odor; sp. gr. 1.070 (20/20°C); b. p. (760 mm) 255.9°C; vapor pressure 0.02 mm (20°C); flash point 265°F; wt 8.9 lbs/gal (20°C).

Grade: Technical.

Containers: 1-gal glass jugs; 5- and 12-gal glass stoppered carboys; 8.5, 40 and 100 lb (net wt).

Uses: Solvent for cellulose acetate, dyes, inks, resins, perfume fixative; organic synthesis (selective hydroxyethylating agent); coating compositions for leather, paper, and cloth; lacquers.

ethylene glycol monobutyl ether (2-butoxyethanol) $HOCH_2CH_2OC_4H_9$

Properties: Colorless liquid; mild odor; high dilution ratio with petroleum hydrocarbons; soluble in mineral oils and water.

Constants: B. p. 171.2°C; sp. gr. 0.9019 (20/20°C); wt/gal 7.5 lbs (20°C); refractive index 1.4190 (25°C); viscosity 0.0642 poise (20°C), specific heat 0.583; vapor pressure 0.76 mm (20°C); flash point 165°F; nitrocellulose-toluene dilution ratio 3.5; coefficient of expansion 0.00092 (20°C).

Grade: Technical.

Containers: 1-gal cans; 5- and 55-gal drums; (7.5, 35, 410 lbs); tank cars up to 10,000 gals.

Uses: Solvent for nitrocellulose resins; spray lacquers; brushing lacquers of four-hour type; varnishes; enamels; dry-cleaning compounds; varnish removers; textile (preventing spotting in printing or dyeing); mutual solvent for "soluble" mineral oils to hold soap in solution and to improve the emulsifying properties. In general, an inert solvent.

Shipping regulations: None.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ethylene glycol monobutyl ether acetate

Properties: Colorless liquid; fruity odor. Soluble in hydrocarbons and organic solvents; insoluble in water. B. p. 192.2°C; sp. gr. 0.9424 (20/20°C); f. p. -63.5°C; flash point 190°F.

Grade: Technical.

Containers: 1-, 5-, 55-gal drums; tank cars.

Uses: High-boiling solvent for nitrocellulose lacquers, epoxy resins, multi-color lacquers; film coalescing aid for polyvinyl acetate latex.

Shipping regulations: None.*

ethylene glycol monobutyl ether laurate

Properties: Liquid; sp. gr. (25°C) 0.985; m. p. -10 to -15°C; insoluble in water.

Use: Plasticizer.

ethylene glycol monobutyl ether oleate

Properties: Liquid; sp. gr. (25°C) 0.892, m. p. less than -45°C; insoluble in water.

Use: Plasticizer.

ethylene glycol monoethyl ether (2-ethoxy-

Properties: Colorless liquid, practically odorless; b. p. 135.1°C (760 mm); sp. gr. 0.9311 (20/20°C); wt/gal 7.7 lbs (20°C); refractive index 1.4060 (25°C); flash point 130°C; miscible with hydrocarbons and water.

Grades: Technical.

Containers: 1-gal cans; 5- and 55-gal drums, net contents 7.5, 35, 420 lbs; tank cars up to 10,000 gallons.

Uses: Solvent for nitrocellulose, natural and synthetic resins; mutual solvent for formulation of soluble oils; lacquers and lacquer thinners; dyeing and printing textiles; varnish removers; cleaning solutions; leather.

Shipping regulations: None.*

ethylene glycol monoethyl ether acetate

Properties: Colorless liquid, mild, pleasant, ester-like odor; b. p. 156.4°C, sp. gr. 0.9748 (20/20°C); wt/gal 8.1 lb (20°C); refractive index 1.4030 (25°C); viscosity 1.32 cps (20°C); flash point 135°F; f. p. -61.7°C; coefficient of expansion 0.00112 (20°C); vapor pressure 1.2 mm (20°C). Miscible with aromatic hydrocarbons, slightly miscible with water.

Grade: Technical.

Containers: 1-gal cans; 5- and 55-gal drums, net contents 8, 40, 440 lbs, tank cars up to 10,000 gals.

Uses: Solvent for nitrocellulose, oils and resins; retards "blushing" in lacquers; varnish removers; wood stains; textiles; leather.

Shipping regulations: None.*

ethylene glycol monoethyl ether laurate

Properties: Liquid; sp. gr. (25°C) 0.89; m. p. -7 to -11°C; insoluble in water.

Use: Plasticizer.

ethylene glycol monoethyl ether ricinoleate

Properties: Liquid; sp. gr. (25°C) 0.929; m. p. less than -10°C; insoluble in water.

Use: Plasticizer.

ethylene glycol monohexyl ether

Properties: Water-white liquid; sp. gr. 0.8894 (20/20°C); 7.4 lbs/gal (20°C); b. p. 208.1°C (760 mm); vapor pressure 0.05 mm (20°C); f. p. -45.1°C; viscosity 5.15 cps (20°C).

Containers: 1-gal can; 5-, 55-gal drums. (7.5, 35, 410 lbs net wt).

Use: High-boiling solvent.

ethylene glycol monomethyl ether (2-methoxy-

Properties: Colorless liquid; mild, agreeable odor; stable; miscible with hydrocarbons, alcohols, ketones, glycols, water.

Constants: B. p. 124.6°C (760 mm); sp. gr. 0.9663 (20/20°C); wt/gal 8.0 lbs (20°C); refractive index 1.4021 (20°C); flash point 115°F; nitrocellulose-toluene dilution ratio 4.0; f. p. -85.1°C.

Grades: Technical.

Containers: 1-, 5-gal cans; 55-gal (non-returnable) drums, net content 8, 40, 440 lbs; tank cars up to 10,000 gal.

Uses: Solvent for nitrocellulose, cellulose acetate, alcohol-soluble dyes, natural and synthetic resins; solvent mixtures; lacquers, enamels, varnishes, leather; perfume fixative; wood stains; sealing moisture-proof cellophane.

Caution! Vapor harmful. MCA warning label.

Shipping regulations: None.*

ethylene glycol monomethyl ether acetate

Properties: Colorless liquid, pleasant, characteristic ester odor; stable; miscible with the common organic solvents; soluble in water.

Constants: Sp. gr. 1.0067 (20/20°C); b. p. 145.1°C (760 mm), vapor pressure 2.0 mm (20°C); flash point 140°F; wt/gal 8.4 lbs (20°C); toluene-nitrocellulose dilution ratio, 2.3; f. p. -65.1°C.

Grades: Technical.

Containers: 1-, 5-gal cans; 55-gal drums, net content 8, 40, 460-lbs. Tank cars up to 10,000 gal.

Uses: Solvent for nitrocellulose, cellulose acetate, various gums, resins, waxes, oils, textile printing; photographic film; lacquers; dopes.

Shipping regulations: None.*

ethylene glycol monomethyl ether acetyl ricinoleate

Properties: Liquid, sp. gr. 0.966; refractive index 1.460; boiling range 220-260°C; m. p. less than -60°C; flash point 218°C; insoluble in water.

Use: Plasticizer.

ethylene glycol monomethyl ether ricinoleate

Properties: Liquid; sp. gr. (25°C) 0.935;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

m. p. less than -60°C ; insoluble in water.
Use: Plasticizer.

ethylene glycol monomethyl ether stearate

Properties: Sp. gr. 0.890; m. p. 21°C ;
insoluble in water.

Use: Plasticizer.

ethylene glycol monoethyl ether

Properties: Colorless, odorless liquid;
b. p. 228.3°C ; sp. gr. 0.8859; flash point
 230°F ; vapor pressure 0.02 mm (20°C).

Uses: Solvent for cellulose esters, and as
a plasticizer.

ethylene glycol monophenyl ether

Properties: Colorless liquid; faint aromatic
odor; stable in presence of acids and
alkalies; partially soluble in water. Sp. gr.
1.1094 ($20/20^{\circ}\text{C}$); b. p. $240-248^{\circ}\text{C}$; vapor
pressure 0.03 mm (20°C); flash point
 250°F ; phenol 0.3% (max), 9.2 lbs/gal.

Grades: Technical.

Containers: 1-, 5-gal cans; 55-gal drums;
net content 9.0, 45 and 510 lbs.

Uses: Solvent for cellulose acetate, dyes,
inks, resins, perfume and soap fixative;
bactericidal agent, organic synthesis of
plasticizers, germicides, perfume mate-
rials and pharmaceuticals.

ethylene glycol monoricinoleate

Properties: Clear, moderately viscous, pale
yellow liquid; mild odor, miscible with
most organic solvents. Sp. gr. 0.965
($25/25^{\circ}\text{C}$), saponification value 170;
hydroxyl value 270; solidifies at -20°C ,
insoluble in water.

Derivation: Castor oil and ethylene glycol.

Grade: Technical.

Containers: 5-gal cans, 55-gal drums.

Uses: Plasticizer; greases; urethane poly-
mers.

"Ethylene Glycol Monostearate 40 and 70." 260

Proprietary brand of the stearic acid ester
of ethylene glycol. 40 and 70 refer to
monoester contents. Balance of composi-
tion is primarily diester with small
amounts of free fatty acid and free glycol.
Waxy solid, practically odorless, white.
Iodine value 0.5; acid value 2.0 max;
melting point $56-60^{\circ}\text{C}$ (40 grade), $52-56^{\circ}\text{C}$
(70 grade); insoluble in water.

Uses: Opacifier in cosmetics and hair
preparations.

ethylene glycol silicate $(\text{HOCH}_2\text{CH}_2)_2\text{SiO}_4$

Properties: Colorless liquid; slowly hy-
drolyzed by acids; miscible with water.

Uses: Non-volatile bonding agent for pig-
ments; weather-proofing paints for pro-
tecting concrete, stone, brick, and plastic
surfaces.

ethylene glycol stearate (glycol stearate)

Properties: Yellow waxy solid; m. p. $57-60^{\circ}\text{C}$; sp. gr. 0.96 (25°C); soluble in alco-
hol, hot ether, and acetone; insoluble in

water.

Containers: 150-lb cartons.

ethylene hydrate. See gas hydrates.

ethylenimine (aziridine) $\text{H}_2\text{C}\overline{\text{N}}\text{HCH}_2$

Properties: Clear colorless liquid; b. p.

56°C ; sp. gr. ($20/4^{\circ}\text{C}$) 0.832; miscible
with water, organic solvents; highly
corrosive but may be stored and handled
in tin, lead, low carbon steel, polyethylene,
"Kel-F" and "Teflon" plastics.

Derivation: From beta-chloroethylamine.

Caution: Polymerizes with explosive effect
at times. Toxic!

Uses: Alkyl substituted forms, called alkyl
aziranes, used as intermediates and for
microbial control; aziridinyl compounds
used also in polymers and as intermediates.
Used in tonnage lots in Germany for textile
and paper processing.

Shipping regulations: Inhibited form:

Flammable liquid. Red label.*

ethylenenaphthalene. See acenaphthene.

ethylene oxide $\text{CH}_3\text{CH}_2\text{O}$

Properties: Colorless gas at ordinary
temperatures. Mobile, colorless liquid
at low temperatures. Soluble in the usual
organic solvents and miscible with water in
all proportions.

Constants: M. p. -111.3°C ; b. p. 10.73°C ;
sp. gr. ($20/20^{\circ}\text{C}$) 0.8711; wt/gal (20°C)
7.25 lbs, viscosity (0°C) 0.32 cps; flash
point (Tag open cup) below -4°F .

Derivation: (a) By the action of caustic
alkali on ethylene chlorohydrin; (b) oxida-
tion of ethylene in the presence of a
catalyst (e. g., silver).

Method of purification: Rectification.

Grades: Technical, pure 99.7%.

Containers: 175-lb cylinders; 400-lb drums;
4000- and 10,000-gal tank cars.

Uses (in approximate order of volume):

Manufacture of ethylene glycol; di- and
triethylene glycols; acrylonitrile; ethanol-
amines, polyglycols (solvents and lubri-
cants); non-ionic detergents; petroleum
demulsifier, miscellaneous uses, including
sterilizing and fumigating; sweetening
gasoline.

Danger: Extremely flammable. Vapor harm-
ful. May cause burns. MCA warning
label.

Shipping regulations: Flammable liquid. Red
label.*

ethylene periodide. See tetraiodoethylene.

ethylene propylene rubber (EPR). A product of
stereospecific copolymerization of ethylene
and propylene, stated to show superior
resistance to ozone, wear, and cracking.

ethylene tetraiodide. See tetraiodoethylene.

ethylene thiourea $\text{NHCH}_2\text{CH}_2\text{NHCS}$

* 2-Imidazolidinethione.

Properties: White to pale green crystals,
faint amine odor; m. p. $199-204^{\circ}\text{C}$; slightly
soluble in cold water; very soluble in hot
water; slightly soluble at room temperature
in methanol, ethanol, acetic acid, naphtha,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

but appreciably soluble in these at higher temperatures. Insoluble in ether, benzene, hexane, ethyl acetate, acetone, chloroform, dioxane, and butanol.

Containers: Fiber drums (150 lbs).

Uses: Suggested for use in electroplating baths, or as an intermediate for antioxidants, insecticides, fungicides, vulcanization accelerators, dyes, pharmaceuticals, synthetic resins.

ethylene urea resins. A type of amino resin (q. v.).

ethyl ethanolamine (ethylaminoethanol)
 $C_2H_5NHCH_2CH_2OH$.

Properties: Sp. gr. 0.914 (20°C); boiling range 167-169°C; color water-white; odor amine. Soluble in water, alcohol, and ether. Flash point 160°F.

Containers: 5-gal cans, 55-gal drums; tank cars.

Uses: Solvent; intermediate.

Shipping regulations: None.*

ethyl ether. See ether.

ethyl 3-ethoxypropionate

$C_2H_5OCH_2CH_2COOC_2H_5$.

Properties: Liquid; sp. gr. (20°C) 0.9496; b. p. 170.1°C; vapor pressure (20°C) 0.9 mm; sets to glass at -100°C; slightly soluble in water.

Containers: Cans.

Uses: Intermediate for vitamin B₁; other chemicals.

ethylethylene. See butene-1.

ethylfluoroformate $FCOOC_2H_5$.

Properties: Liquid. Caution! Very irritant!

Constants: Sp. gr. 1.11 (33°C); b. p. 57°C.

Derivation: Interaction of ethylchloroformate and thallium fluoride.

ethylfluorosulfonate.

Properties: Liquid. Ethereal odor. Caution! Very irritant!

Grades: Technical.

ethyl formate $HCOOC_2H_5$.

Properties: Water-white, unstable liquid.

Pleasant, aromatic odor; flammable.

Miscible with benzene, ether, alcohol, water; gradual decomposition in water.

Constants: Sp. gr. 0.9236 (20/20°C); m. p. -80.5°C; b. p. 54.3°C; flash point -20°C; vapor pressure 200 mm (20.6°C), 300 mm (30.2°C); wt/gal 7.61 lb (68°F); refractive index 1.35975 (20°C); electric conductivity less than 1.45×10^{-9} reciprocal ohms (25°C).

Typical specifications: Purity 95% to 100% ester, by weight; acidity neutral to methyl orange (ethyl formate hydrolyzes in the presence of water); color water-white; odor pleasant, aromatic, non-residual; solubility in water 10% by volume (20°C); solubility of water in ethyl formate 17% by volume (20°C).

Derivation: By heating ethyl alcohol with formic acid in presence of sulfuric acid.

Grades: Technical.

Containers: 1-, 5-gal cans; 55-gal (tin-lined) steel drums. Net content 8, 38, 400 lbs.

Uses: Solvent for cellulose nitrate and acetate; acetone substitute; fumigant; larvicide; synthetic flavors; synthetic resins; medicine.

Danger: Extremely flammable. MCA warning label.

Shipping regulations: Flammable liquid. Red label.*

ethyl 3-formyl propionate $OCHC_2H_4COOC_2H_5$.

Properties: Liquid; sp. gr. 1.0625 (20/20°C); b. p. 190.9°C; f. p. less than -80°C; wt/gal 8.9 lbs; flash point 200°F. Somewhat soluble in water.

Uses: Solvents for lacquers; antibiotic extractions; acetic acid separations; coalescing acids for emulsion paints.

ethyl furoate $C_4H_5OCO_2C_2H_5$.

Properties: White leaflets or prisms. Insoluble in water; soluble in alcohol and ether.

Constants: Sp. gr. 1.1174 (20.8/4°C); m. p. 34°C.

ethyl glycine hydrochloride. See glycine ethyl ester hydrochloride.

ethyl glycooll hydrochloride. See glycine ethyl ester hydrochloride.

4-ethylheptane (ethyldipropylmethane)

$CH_3(CH_2)_2CHC_2H_5(CH_2)_2CH_3$.

Properties: Colorless liquid. Sp. gr. 0.730; b. p. 141.2°C; refractive index (n_D 20) 1.4109.

Grades: Technical.

Use: Organic synthesis.

ethyl heptanoate. See ethyl oenanthatate.

ethyl heptazine. See ethoheptazine

2-ethylhexaldehyde (butylethyl acetaldehyde; octyl aldehyde; 2-ethylhexanal)
 $C_4H_9CH(C_2H_5)CHO$.

Properties: Colorless, high-boiling liquid.

Mild, characteristic odor. Miscible

with most organic solvents; slightly soluble in water.

Constants: Sp. gr. 0.8205 (20°C); b. p. 163.4°C; vapor pressure 1.8 mm (20°C); flash point 125°F; wt/gal 6.8 lbs.

Typical specifications: Acidity not more than 2.0% as 2-ethylhexoic acid; color (500-mm tube) not more than 5 yellow Lovibond; sp. gr. 0.820-0.825 (20/20°C); boiling range, (760 mm) not more than 5% distills below 160°C, not less than 95% distills below 165°C; dryness, miscible with 19 vol 60° BÉ. gasoline at 20°C; non-volatile matter not more than 0.002 g/100 cc; average wt/gal 6.85 lbs (20°C).

Grades: Technical.

Containers: 1-, 5-gal cans; 55-gal non-returnable drums.

Uses: Organic synthesis; perfumes.

2-ethyl hexanal. See 2-ethylhexaldehyde.

2-ethylhexanediol-1,3 (ethohexadiol)

$C_3H_7CH(OH)CH(C_2H_5)CH_2OH$.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

2-Ethyl-3-propyl-1,3-propanediol.

Properties: Practically colorless, somewhat viscous, odorless liquid; hygroscopic; irritating to eyes. Sp. gr. 0.9422 (20/20°C); 7.8 lb/gal (20°C); b. p. 244°C (760 mm); vapor pressure less than 0.01 mm (20°C); freezing point below -40°C; refractive index 1.4465-1.4515, viscosity 323 cps (20°C); soluble in alcohol and ether; partially soluble in water.

Grades: U. S. P. XVI (as ethohexadiol); also industrial grade.

Uses: Insect repellent; cosmetic ingredient; vehicle and solvent in the formulation of printing inks; medicine.

ethyl hexanoate. See ethyl caproate.

2-ethylhexanol. See 2-ethylhexyl alcohol.

2-ethylhexenal. See 2-ethyl-3-propylacrolein.

2-ethyl-1-hexene $\text{CH}_3(\text{CH}_2)_3(\text{C}_2\text{H}_5)\text{C}::\text{CH}_2$.

Properties: Colorless liquid; sp. gr. 0.7270 (20/4°C); b. p. 120°C; refractive index (n_D 20/D) 1.4157, soluble in alcohol, acetone, ether, petroleum, coal-tar solvents; insoluble in water.

Grades: 95% min purity.

Use: Organic synthesis of flavors, perfumes, medicines, dyes, resins.

ethyl hexoate. See ethyl caproate.

2-ethylhexoic acid $\text{C}_4\text{H}_9\text{CH}(\text{C}_2\text{H}_5)\text{COOH}$.

Properties: Mild-odored liquid, slightly soluble in water; sp. gr. 0.9077 (20/20°C); 7.6 lb/gal (20°C); b. p. 226.9°C (760 mm); vapor pressure 0.03 mm (20°C); freezing point -118.4°F, viscosity 7.73 cps (20°C); acid number 370.

Containers: Drums; tank cars.

Uses: As a herbicide and pesticide; souring agent. Its metallic salts, particularly lead, manganese, cobalt and zinc, are used as high-quality paint and varnish driers. Ethylhexoates of light metals, such as lithium, magnesium, calcium, and aluminum, have the property of converting certain mineral oils to greases. Aluminum 2-ethylhexoate is an excellent gelling agent for liquid hydrocarbons such as gasoline and common petroleum fractions used in coating thinners. High molecular weight esters of this acid are especially useful as plasticizers.

2-ethylhexyl. An eight-carbon radical of the formula $\text{CH}_3(\text{CH}_2)_3\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2-$. Many of its compounds were formerly called the general name octyl (q. v.).

2-ethylhexyl acetate (octyl acetate)

Properties: Water-white, stable liquid; very slightly soluble in water; miscible with alcohol.

Constants: Sp. gr. 0.8733 (20°C); b. p. 198.6°C; m. p. about -80°C; vapor pressure 0.4 mm (20°C); flash point 180°F; wt/gal 7.3 lb (20°C); coefficient of expansion 0.00083 (20°C); viscosity 0.0154 poise (20°C).

Grades: Technical (about 95%).

Containers: 1-, 5-gal cans; 55-gal drums.

Use: Solvent for nitrocellulose, resins, lacquers, baking finishes.

2-ethylhexyl acrylate

Properties: Liquid, pleasant odor; sp. gr. 0.8869; b. p. (50 mm) 130°C; vapor pressure at 20°C 0.1 mm; sets to glass at -90°C; flash point 180°F; insoluble in water.

Containers: 400-lb drums; tank cars.

Use: Monomers for plastics, protective coatings, paper treatment. Used widely in water-based paints.

2-ethylhexyl alcohol (2-ethylhexanol; octyl alcohol) $\text{CH}_3(\text{CH}_2)_3\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2\text{OH}$.

Properties: Colorless, slightly viscous liquid. Miscible with most organic solvents; slightly miscible with water.

Constants: Sp. gr. 0.83 (20°C); b. p. 183.5°C; vapor pressure 0.36 mm (20°C); refractive index 1.4300 (20°C); specific heat 0.564 cal/g (25°C); wt/gal 6.9 lb (20°C); flash point 81°C.

Derivation: Aldolization of acetaldehyde or of butyraldehyde, followed by hydrogenation.

Grades: Technical.

Containers: 1-, 5-gal cans; 55-gal drums; tank cars.

Uses: Defoaming agent; wetting agent; organic synthesis; solvent for: gums, resins, waxes, mineral, vegetable and animal oils, fats, dyestuffs, other products; solvent mixtures for nitrocellulose, paints, lacquers, baking finishes; penetrants for mercerizing cotton; textile finishing compounds; making plasticizers; inks; rubber; paper, lubricants; photography; clays; dry cleaning.

2-ethylhexylamine $\text{C}_4\text{H}_9\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2\text{NH}_2$.

Properties: Sp. gr. 0.7894 (20/20°C); 6.56 lb/gal (20°C); b. p. 169.2°C (760 mm); vapor pressure 1.2 (20°C); viscosity 1.11 cps (20°C); flash point 140°F. Soluble in water; solubility of water in (20°C), 25.3%.

Use: Synthesis of detergents, rubber chemicals, oil additives and insecticides.

N-2-ethylhexyl aniline

Properties: Light yellow liquid with mild odor. Sp. gr. (20/20°C) 0.9119; b. p. (50 mm) 194°C; vapor pressure (20°C) < 0.01 mm; freezing point, sets to a glass below -70°C; viscosity (20°C) 7.4 cps; solubility in water (20°C) < 0.01%.

Uses: Solvent; synthesis.

2-ethylhexyl bromide $\text{C}_4\text{H}_9\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2\text{Br}$.

Properties: Sweet, water-white liquid, insoluble in water.

Uses: Introduction of the 2-ethylhexyl group in organic synthesis. Preparation of disinfectants, pharmaceuticals.

2-ethylhexyl chloride $\text{C}_4\text{H}_9\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2\text{Cl}$.

Properties: Colorless liquid. Sp. gr. 0.8833 (20°C); b. p. 172.9°C; refractive index 1.4310; 7.33 lbs/gal; freezing point -135°C. Insoluble in water.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Grades: Technical.

Use: In the synthesis of cellulose derivatives, dyestuffs, pharmaceuticals, textile auxiliaries, insecticides, resins.

2-ethylhexyl octylphenyl phosphite

$(C_8H_{17}O)(C_8H_{17}C_6H_4O)_2P$, or
 $(C_8H_{17}O)_2(C_8H_{17}C_6H_4O)P$.

Properties: Colorless to light yellow liquid with characteristic odor. Sp. gr. (20/4°C) 0.935-0.950; flash point (Cleveland open cup) 385-390°F; insoluble in water.

Containers: 1-, 4-lb bottles; 5-, 55-gal drums.

Use: Antioxidant; plasticizer; flame retardant; lubricating oil additive.

3,3'-(2-ethylhexyl) thiodipropionate (dioctyl thiopropionate; thiopropionic acid, dioctyl ester) $(C_8H_{17}OOCCH_2CH_2)_2S$.

Properties: Sp. gr. (25°C) 0.952. Insoluble in water; soluble in most organic solvents.

Uses: Antioxidant; stabilizer and lubricant.

ethyl hydride. See ethane.

ethyl hydroxide. See ethyl alcohol.

ethyl 2-hydroxy-2,2-bis(4-chlorophenyl) acetate. See ethyl 4,4'-dichlorobenzilate.

ethyl hydroxyethyl cellulose (cellulose ether).

Properties: White granular solid; available in extra low, low, and high-viscosity types. Soluble in mixtures of aliphatic hydrocarbons with small quantity of alcohols.

Uses: Film former in silk screen and gravure printing inks and protective coatings.

ethyl alpha-hydroxyisobutyrate

$(CH_3)_2COHCOOC_2H_5$.

Properties: Water-white liquid; sp. gr. 0.978-0.986 (20°C); b. p. 149-150°C; soluble in water, alcohol, and ether.

Grades: Technical.

Uses: Solvent for nitrocellulose and cellulose acetate; solvent mixtures for cellulose ethers; organic synthesis; pharmaceuticals.

ethylidene acetobenzoate (ethylidene benzoacetate) $C_6H_5COOCH(COCH_3)CH_3$.

Derivation: Interaction of benzoic acid and vinyl acetate in presence of catalysts.

Use: Solvent for cellulose acetate, nitrocellulose, and natural and synthetic resins.

ethylidene aniline $C_6H_5NCHCH_3$.

Properties: Dark red-brown, viscous liquid. Soluble in gasoline and benzene; insoluble in water. B. p. 205°C.

Derivation: Action of acetaldehyde on aniline. Method of purification: Distillation.

Grades: Technical.

Containers: 100-lb veneer-covered paint kits.

Use: Accelerator for rubber vulcanization.

Shipping regulations: None.*

ethylidene benzoacetate. See ethylidene acetobenzoate.

ethylidene chloride (1,1-dichloroethane) CH_3CHCl_2 .

Properties: Colorless, neutral, mobile

liquid; aromatic ethereal odor; hot saccharin taste. Nonflammable. Soluble in alcohol, ether, fixed and volatile oils; sparingly in water.

Constants: Sp. gr. 1.174 (17°C); b. p. 57-59°C; freezing point -98°C; refractive index (n 20/D) 1.4166.

Use: Medicine; extraction solvent; fumigant.

ethylidenediethyl ether. See acetal.

ethylidenedimethyl ether. See dimethylacetal.

ethylidene fluoride. See 1,1-difluoroethane.

ethyl iodide (iodoethane) C_2H_5I .

Properties: Clear, colorless liquid; turns brown on exposure to light. Soluble in alcohol and ether; slightly soluble in water.

Constants: Sp. gr. 1.90-1.93 (25/25°C); m. p. -108°C; b. p. 72°C; refractive index (n 15/D) 1.5168.

Derivation: By digesting red phosphorus with absolute ethyl alcohol, after which iodine is added. The mixture is heated under a reflux condenser and finally distilled.

Grades: Technical.

Containers: Amber glass bottles; 5-gal carboys.

Uses: Medicine; organic synthesis.

ethyl iodoacetate $CH_3ICOOC_2H_5$.

Properties: Dense, colorless liquid. Decomposed by light and air; also (very slowly) by alkaline solutions and water. Caution! Very irritant to the eyes!

Constants: Sp. gr. 1.8; b. p. 179°C; vapor density 7.4; vapor pressure 0.54 mm (20°C).

Derivation: Interaction of potassium iodide with either ethyl bromo- or chloroacetate.

ethyl iodophenylundecylate. See iophendylate.

5-ethyl-5-isoamylbarbituric acid. See amobarbital.

ethylisobutylmethane. See 2-methylhexane.

ethyl isobutyrate $(CH_3)_2CHCOOC_2H_5$.

Properties: Colorless, volatile liquid. Soluble in alcohol and ether; slightly soluble in water.

Constants: Sp. gr. 0.870; b. p. 110-111°C; m. p. -88°C; refractive index (n 20/D) 1.3903.

Derivation: By heating isobutyric acid and ethyl alcohol, with subsequent distillation.

Method of purification: Redistillation.

Grades: Technical.

Containers: Iron drums, glass bottles.

Uses: Organic synthesis; flavoring extracts.

ethyl isocyanate C_2H_5NCO . Liquid; sp. gr.

0.898; b. p. 60°C; soluble in chlorinated and aromatic hydrocarbons.

Use: Pharmaceutical intermediate.

ethyl isothiocyanate. See ethyl thiocarbimide.

ethyl isovalerate (ethyl valerate; valerianic ether) $(CH_3)_2CHCH_2COOC_2H_5$.

Properties: Colorless oily liquid with pleasant, fruity odor. B. p. 135°C; m. p. -99°C; sp. gr. 0.868 (20/20°C); refractive

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

index (n 20/D) 1.4009. Slightly soluble in water; miscible with alcohol, ether, and benzene.

Derivation: By heating sodium valerate and ethyl alcohol in presence of sulfuric acid or hydrochloric acid, with subsequent distillation.

Method of purification: Rectification.

Grades: Technical.

Containers: Iron drums; 1-, 5-, 10-lb bottles.

Uses: Essential oils; perfumery; artificial fruit essences.

Shipping regulations: None.*

ethyl lactate $\text{CH}_3\text{CHOHCOOC}_2\text{H}_5$.

Properties: Colorless liquid. Mild odor.

Miscible with water, alcohols, ketones, esters, hydrocarbons, oils.

Constants: Sp. gr. 1.020-1.036 (20/20°C); b. p. 154°C, flash point 158°F (Tag open cup); wt/gal 8.55 lbs (approx) (20°C).

Derivation: (a) By the esterification of lactic acid with ethyl alcohol, (b) by combining acetaldehyde with hydrocyanic acid to form acetaldehyde cyanohydrin, which is converted into ethyl lactate by treatment with ethyl alcohol and an inorganic acid such as hydrochloric acid.

Grades: Technical (96%).

Containers: 5-, 55-gal (non-returnable) steel drums. Drum cars (min. of 36,000 lbs gross).

Uses: Solvent for nitrocellulose, cellulose acetate, many cellulose ethers, resins, lacquers, paints; enamels; varnishes, emollient; gelatinant; stencil sheets; safety glass.

Shipping regulations: None.*

ethyl levulinate $\text{CH}_3\text{CO}(\text{CH}_2)_2\text{COOC}_2\text{H}_5$.

Properties: Colorless liquid, sp. gr. 1.012, b. p. 205-206°C; soluble in water; miscible with alcohol, refractive index (n 20/D) 1.4229.

Grades: Technical.

Use: Solvent for cellulose acetate and starch ethers.

ethyl magnesium bromide $\text{C}_2\text{H}_5\text{MgBr}$, dissolved in ether.

Properties: Flammable liquid, sp. gr. 1.01.

Containers: Glass bottles; 5-, 55-gal drums.

Use: Grignard reagent.

Hazard: Flammable.

Shipping regulations: Flammable liquid.

Red label.*

ethyl magnesium chloride $\text{C}_2\text{H}_5\text{MgCl}$, dissolved in ether.

Properties: Flammable liquid, sp. gr. 0.85.

Containers: Glass bottles, 5-, 55-gal drums.

Use: Grignard reagent.

Hazard: Flammable.

Shipping regulations: Flammable liquid.

Red label.*

ethyl malonate (malonic ester; diethylmalonate) $\text{CH}_2(\text{COOC}_2\text{H}_5)_2$.

Properties: A colorless liquid; typical sweet ester odor. Virtually insoluble in water, soluble in alcohol, ether, chloroform, and benzene.

Constants: B. p. 198°C at ordinary pressure; m. p. -50°C; sp. gr. 1.055 (25/25°C).

Derivation: By passing hydrogen chloride into cyanoacetic acid dissolved in absolute alcohol, with subsequent distillation.

Method of purification: Distillation.

Grades: Technical; C. P.

Containers: Carboys; drums.

Use: Intermediate, for barbiturates and certain pigments.

Shipping regulations: None.*

ethylmalonic acid $\text{C}_2\text{H}_5\text{CH}(\text{COOH})_2$.

Properties: Colorless crystals. Soluble in water, alcohol, and ether.

Constants: M. p. 111.5°C; decomposes at 160°C.

Derivation: From alpha-bromobutyric acid heated with potassium mercuric cyanide and decomposed with potassium hydroxide.

Method of purification: Crystallization.

ethyl mercaptan (ethyl sulfhydrate; ethanethiol) $\text{C}_2\text{H}_5\text{SH}$.

Properties: Colorless liquid. Flammable; volatile. Penetrating garlic-like odor. Slightly soluble in water; soluble in alcohol, ether, petroleum naphtha. Sp. gr. 0.83907 (20/4°C), b. p. 36°C; m. p. -121°C; refractive index (n 20/D) 1.4305; flash point, below 0°C.

Derivation: By saturating potassium hydroxide solution with hydrogen sulfide, mixing with calcium ethylsulfate solution and distilling on a water bath.

Containers: 55-gal drums, 25-lb cylinders.

Shipping regulations: Flammable liquid.

Red label.*

ethylmercuric acetate $\text{C}_2\text{H}_5\text{HgOOCCH}_3$.

Properties: White crystalline powder; m. p. 178°C; slightly soluble in water; soluble in many organic solvents, may be steam distilled.

Uses: Seed fungicide as dust or slurry with water.

Danger! Poisonous by inhalation or swallowing. May cause skin irritation or delayed chemical burns. MCA warning label.

ethylmercuric chloride $\text{C}_2\text{H}_5\text{HgCl}$.

Properties: Crystals; sp. gr. 3.482; m. p. 193°C. Insoluble in water; slightly soluble in ether, soluble in hot alcohol. Sublimes readily.

Derivation: Reaction of zinc diethyl and mercuric chloride.

Uses: Fungicide for seed or bulb treatment either alone or with other organic mercury compounds.

Danger! Poisonous by inhalation or swallowing, may cause skin irritation or delayed chemical burns. MCA warning label.

ethylmercuric phosphate $(\text{C}_2\text{H}_5\text{HgO})_2\text{PO}$.

Properties: White powder, soluble in water; garlic-like odor.

Process: Reaction of ethylmercuric acetate with phosphoric acid.

Uses: Seed fungicide; timber preservative.*

Warning: Danger! Poisonous by inhalation or swallowing; may cause skin irritation or delayed chemical burns. MCA warning label.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

para-ethylmercurithiobenzenesulfonate, sodium salt ("Sulfo-Merthiolate")

Properties: A white to cream-colored powder with a characteristic odor. It is sensitive to light. It is soluble in water and alcohol and almost insoluble in benzene and ether.

Use: Medicine.

ethylmercury 2, 3-dihydroxypropyl mercaptide

$\text{C}_2\text{H}_5\text{HgSCH}_2\text{CHOHCH}_2\text{OH}$. Organic mercurial compound used as a fungicidal dust or in slurry treatment for control of seed-borne diseases and to reduce losses from seed decay and damping-off of wheat, oats, rye, etc.

ethylmercury-para-toluenesulfonanilide

(EMTS; "Ceresan" M)

Properties: Crystals; pungent odor; nearly insoluble in water.

Uses: As a dust or slurry for control of seed-borne diseases and of fungi by treatment of seeds or bulbs.

Danger: Poisonous by inhalation or swallowing; may cause skin irritation or delayed chemical burns. MCA warning label.

ethyl metaphosphate $\text{C}_2\text{H}_5\text{PO}_3$

Properties: A colorless, odorless, hygroscopic, viscous liquid. Soluble in water (decomposes); soluble in chloroform.

ethyl methacrylate $\text{H}_3\text{C}:\text{C}(\text{CH}_3)\text{COOC}_2\text{H}_5$

Properties: Colorless liquid; b. p. 119°C ; m. p. below -75°C ; sp. gr. 0.911; flash point (open cup) 95°F ; insoluble in water, readily polymerized.

Derivation: Reaction of methacrylic acid or methyl methacrylate with ethyl alcohol.

Grades: Technical (inhibited).

Containers: Drums; tank cars.

Uses: Polymers; chemical intermediates. See also acrylate resins.

5-ethyl-5(1-methyl-1-butenyl)barbituric acid.

See vinbarbital.

ethyl methyl ether $\text{C}_2\text{H}_5\text{OCH}_3$

Properties: Colorless liquid; sp. gr. 0.725; b. p. 10.8°C . Soluble in water, miscible with alcohol and ether.

Use: Medicine.

Shipping regulations: Flammable liquid. Red label. *

3-ethyl-3-methylglutarimide. See bemegride.**ethyl methyl ketone.** See methyl ethyl ketone.**5-ethyl-1-methyl-5-phenylbarbituric acid.**

See mephobarbital.

ethyl methyl phenyl glycidate (so-called aldehyde C-16; "strawberry aldehyde")

Properties: Colorless to yellowish liquid, having a strong odor, suggestive of strawberry. Soluble in 3 vols of 60% alcohol.

Constants: Sp. gr. 1.104-1.123; refractive index 1.509-1.511.

Uses: Perfumery; flavors.

5-ethyl-3-methyl-5-phenylhydantoin

Properties: Crystals with m. p. $136-137^\circ\text{C}$; insoluble in water. Sodium salt is soluble in water giving an alkaline solution.

Derivation: Prepared from 5, 5-ethyl phenylhydantoin by action of one mole of dimethyl sulfate; by treating phenylmethylureidoacetone with hydrochloric acid.

Use: Medicine.

alpha-ethyl-alpha-methylsuccinimide. See ethosuximide.**7-ethyl-2-methyl-4-undecanol** (tetradecanol)

Properties: Liquid; sp. gr. 0.8355 ($20/20^\circ\text{C}$); b. p. 264°C ; flash point 285°C ; insoluble in water.

Uses: Intermediate for synthetic lubricants, defoamers and surfactants.

ethylmorphine hydrochloride

Properties: White crystalline powder; poisonous! Odorless; soluble in water and alcohol; slightly soluble in ether and chloroform.

Constants: M. p., about 123°C (dec).

Derivation: Action of hydrochloric acid on ethylmorphine which is made by action of ethyl iodide on morphine in alkaline solution.

Method of purification: Crystallization.

Grades: Technical, N. F. XI.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None. *

N-ethyl morpholine

Properties: Colorless liquid. Miscible with water.

Constants: Sp. gr. 0.916 ($20/20^\circ\text{C}$); b. p. 138°C ; wt/gal 7.6 lbs (20°C).

Grades: Technical.

Uses: Useful as intermediate in manufacture of dyestuffs, pharmaceuticals, rubber accelerators and emulsifying agents. Solvent for dyes, resins, oils. Catalyst in making polyurethane foams.

ethyl mustard oil. See ethyl thiocarbimide.**ethyl myristate** (ethyl tetradecanoate)

Properties: Liquid, sp. gr. 0.856; m. p. 12°C ; b. p. 295°C . Insoluble in water; soluble in alcohol; slightly soluble in ether.

N-ethyl-alpha-naphthylamine (N-ethyl-1-naphthylamine) $\text{C}_{10}\text{H}_7\text{NHC}_2\text{H}_5$

Properties: Colored oil; b. p. 305°C . Insoluble in water; soluble in alcohol and ether.

Use: Intermediate.

ethyl nitrate $\text{C}_2\text{H}_5\text{NO}_3$

Properties: Colorless, flammable liquid; pleasant odor; sweet taste. Soluble in alcohol and ether; insoluble in water.

Constants: Sp. gr. 1.116; m. p. -112°C ; b. p. 87.6°C .

Derivation: By heating alcohol, urea nitrate and nitric acid, with subsequent distillation.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Method of purification: Rectification.

Grades: Technical.

Containers: Iron drums; glass bottles.

Uses: Organic synthesis; drugs; perfumes; dyes; liquid rocket propellant.

Fire hazard: Dangerous.

Shipping regulations: Flammable liquid.

Red label.*

ethyl nitrite $C_2H_5NO_2$.

Properties: Yellowish, highly aromatic, ethereal, flammable, exceedingly volatile liquid. Soluble in alcohol and ether; insoluble in water.

Constants: Sp. gr. 0.900, b. p. 16.4°C.

Derivation: (a) By the action of ethyl alcohol on nitrous oxide gas. (b) By treating alcohol with alkali nitrites and sulfuric acid.

Grades: Technical.

Containers: Hermetically sealed tubes, 1-lb bottles.

Keep tightly closed and in a cool place, protected from light.

Uses: Organic preparations, medicine.

Fire hazard: Dangerous.

Shipping regulations: Flammable liquid.

Red label.*

O-ethyl-O-para-nitrophenyl benzenethionophosphonate. See EPN.

ethyl nonanoate. See ethyl pelargonate.

ethyl octanoate. See ethyl caprylate.

ethyl octoate. See ethyl caprylate.

ethyl oenanthate (ethyl heptanoate; oenanthic ether; cognac oil) $CH_3(CH_2)_5COOC_2H_5$.

Properties: Clear, colorless oil with fruity odor and taste, sp. gr. 0.87, b. p. 187°C, soluble in alcohol, chloroform and ether; insoluble in water.

Derivation: By heating oenanthic acid and ethyl alcohol in presence of sulfuric acid, and subsequent recovery by distillation.

Grade: Technical.

Containers: Iron drums, glass bottles.

Uses: Artificial cognac flavor; flavor for liqueurs and fruity-type soft drinks.

Shipping regulations: None.*

ethyl oleate $C_{17}H_{33}COOC_2H_5$.

Properties: Light-colored, yellowish oleaginous liquid. Insoluble in water, soluble in alcohol and ether. Solubility of water in product 1.0 cc/100 cc (20°C).

Constants: Wt/gal 7.27 lbs (20°C); refractive index 1.45189 (20°C), m. p. -32°C (approx); sp. gr. 0.867; flash point 175.3°C (347.5°F).

Typical specifications: Boiling range 205-208°C with some decomposition, ester content 99% by wt.

Uses: Solvent; plasticizer; lubricant; water-resisting agent.

"Ethyllose," ⁴²¹ A graft cellulose, i. e., a water insoluble hydroxyethylcellulose.

ethyl oxalate (diethyl oxalate) $(COOC_2H_5)_2$.

Properties: Colorless, unstable, oily, aromatic liquid. Combustible but not flammable. Miscible in all proportions with alcohol, ether, ethyl acetate, and

other common organic solvents; only very slightly soluble in water and gradually decomposed by it.

Constants: Sp. gr. 1.09 (20/20°C); b. p. 186°C; m. p. -40.6°C; wt/gal 8.96 lbs (20°C) (approx); coefficient of expansion per °F 0.00056, per °C 0.00101; flash point 168°F (approx).

Derivation: By standard esterification procedure using ethyl alcohol and oxalic acid. The final purification, however, calls for unusual technique and equipment. *The last traces of water are most difficult to remove and this is accomplished by a special step in the rectification.

Method of purification: Distillation.

Containers: 1-gal cans; 5-, 55-gal steel drums, tank cars.

Uses: Solvent for cellulose esters and ethers, many natural and synthetic resins; radio tube cathode fixing lacquers; dye intermediate; pharmaceuticals; perfume preparations; organic synthesis.

Fire hazard: Combustible but not flammable; flash point over 80°F.

Shipping regulations: None.*

ethyl oxide. See ether.

ethyl 2-oxocyclopentanecarboxylate. See 2-carbethoxycyclopentanone.

ethyl pelargonate (ethyl nonanoate, wine ether) $CH_3(CH_2)_7COOC_2H_5$.

Properties: Colorless liquid; sp. gr. 0.866 (18/4°C), b. p. about 220°C, m. p. -44°C; insoluble in water, soluble in alcohol and ether.

Use: Flavoring material for alcoholic beverages.

3-ethylpentane (triethylmethane) $(C_2H_5)_3CH$.

Properties: Colorless liquid; b. p. 93.468°C; freezing point -118.593°C; sp. gr. 0.69818 (20°C), refractive index (n_D 20/D) 1.3934; soluble in alcohol; insoluble in water.

Grades: Technical.

Use: Organic synthesis.

meta-ethylphenol (3-ethylphenol) $HOC_6H_4C_2H_5$.

Properties: Colorless liquid, m. p. -4°C; b. p. 214°C, sp. gr. 1.001, very slightly soluble in water; miscible with alcohol and ether.

para-ethylphenol (4-ethylphenol) $HOC_6H_4C_2H_5$.

Properties: Colorless needles, m. p. 46°C, b. p. 219°C; soluble in alcohol or ether; slightly soluble in water.

ethyl phenylacetamide. See ethyl acetanilide.

ethyl phenylacetate $C_6H_5CH_2COOC_2H_5$.

Properties: Colorless liquid, with a honey type odor.

Constants: Sp. gr. 1.027-1.032; refractive index, 1.498; b. p. 276°C. Soluble in 8 parts of 60% alcohol.

Uses: Perfumery; flavors.

Shipping regulations: None.*

ethyl phenylacrylate. See ethyl cinnamate.

5-ethyl-5-phenylbarbituric acid. See phenobarbital.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ethyl phenylcarbamate (phenylurethane; ethyl phenylurethane) $C_6H_5NHCOOC_2H_5$.

Properties: White, crystalline product; aromatic odor, clove-like taste. M. p. 51°C. Soluble in alcohol, ether and boiling water; insoluble in cold water.

Derivation: By the action of ethyl alcohol on phenyl isocyanate.

Shipping regulations: None.*

N,N-ethyl phenyl ethanolamine

$C_6H_5NC_2H_5CH_2CH_2OH$.

Constants: Sp. gr. 1.04 (20/20°C); b. p. (740 mm) 268°C; wt/gal 8.7 lbs (20°C).

Typical specifications: Boiling range 260-276°C (740 mm).

Grades: Technical.

Containers: 1-gal cans; 5-, 55-gal drums.

Uses: Organic synthesis; dyestuffs.

2-ethyl-2-phenylglutarimide (glutethimide)

$C_{13}H_{13}NO_2$.

Properties: Occurs as white, crystalline powder. A saturated solution is slightly acid. Freely soluble in acetone, ethyl acetate, and chloroform; soluble in ethanol and methanol; practically insoluble in water. Melting range: 85°-87°C.

Grade: N. F. XI (as glutethimide).

Use: Medicine.

ethyl phenyl ketone. See propiophenone.

ethylphenylurethane. See ethyl phenylcarbamate.

ethylphosphoric acid $C_2H_5H_2PO_4$.

Properties: Pale straw-colored liquid; sp. gr. 1.33 (25°C); can be neutralized with alkalis or amines to give water-soluble salts.

Purity: 97%, with remainder being orthophosphoric acid and ethyl alcohol.

Uses: Catalyst; rust remover; soldering flux; intermediate.

ethyl phthalate. See diethyl phthalate.

ethyl phthalyl ethyl glycolate

$C_2H_5OCOC_6H_4COOCH_2COOC_2H_5$.

Properties: Sp. gr. (25°C) 1.180; refractive index (25°C) 1.498; b. p. (5 mm) 190°C; flash point 193°C, solubility in water, 0.018% by wt.

Use: Plasticizer.

5-ethyl-2-picoline. See 2-methyl-5-ethylpyridine.

1-ethyl-1-propanol. See 3-pentanol.

ethyl propionate (propionic ester)

$C_2H_5COOC_2H_5$.

Properties: Practically water-white liquid. Odor resembling pineapples; soluble in alcohol and ether; in water 2.5% at 15°C, sp. gr. 0.895 (15.5°C), b. p. 99°C; m. p. -73°C; flash point 12°C; refractive index (n_D 20) 1.3844.

Derivation: By treating ethyl alcohol with propionic acid.

Method of purification: Distillation.

Grades: Commercial, 85-90% ester content.

Containers: 50-, 100-gal drums.

Uses: Solvent for cellulose ethers and esters,

various natural and synthetic resins; fruit syrups; cutting agent for pyroxylin.

Fire hazard: Flammable.

Shipping regulations: Flammable liquid.

Red label.*

ethylpropionyl. See diethyl ketone.

2-ethyl-3-propylacrolein (2-ethylhexenal)

$C_9H_{16}O$; $C(C_2H_5)CHO$.

Properties: Yellow liquid. Powerful odor.

Sp. gr. 0.8518 (20/20°C); b. p. 175.0°C (760 mm); vapor pressure 1.0 mm (20°C); flash point 155°F; wt/gal 7.1 lbs (20°C); coefficient of expansion 0.00098 (20°C); viscosity 0.113 poise (20°C).

Typical specifications: Sp. gr. 0.8470-0.8530 (20/20°C); boiling range 165-185°C (760 mm); acidity not more than 2.00% (as butyric).

Grades: Technical.

Containers: 1-gal cans, 5-, 55-gal (tin-lined) drums.

Uses: Insecticide; organic synthesis (intermediate); warning agents and leak detectors.

2-ethyl-3-propylacrylic acid

$C_9H_{16}O_2$; $C(C_2H_5)COOH$.

Properties: A liquid, sp. gr. (20°C) 0.9484, m. p. -7.8°C; b. p. 232.1°C; vapor pressure (20°C) less than 0.01 mm, flash point 330°F; insoluble in water.

Uses: Pharmaceuticals, resins and plastics; lubricants.

4-ethylpyridine $C_5H_4NC_2H_5$.

Properties: B. p. 168°C, sp. gr. 0.9460 (20°C), refractive index 1.5018 (n_D 20), soluble in water.

ethyl pyridylethylacrylate

$CH_2=CHCOOC_2H_4C_5H_4NC_2H_5$.

Properties: Liquid, sp. gr. 1.0458 (20°C); b. p. 181 (50 mm); f. p. -75°C, very slightly soluble in water.

Uses: Manufacture of synthetic plastics and fibers; adhesives, textile finishes and sizes.

ethyl salicylate $C_6H_4(OH)COOC_2H_5$.

Properties: Colorless liquid, with a faint odor of methyl salicylate. Soluble in ether and alcohol, insoluble in water. Sp. gr. 1.127-1.130, refractive index 1.523, b. p. 231-234°C.

Uses: Perfumery; flavors.

"**Ethyl Selenac.**"⁶⁹ Trademark for a proprietary preparation of selenium diethyldithiocarbamate $[(C_2H_5)_2NC(S)S]_4Se$.

Properties: Yellow powder; sp. gr. 1.32 ± 0.03; melting range 59-85°C; soluble in benzene, carbon disulfide, chloroform; insoluble in water, dilute caustic, gasoline.

Uses: Vulcanizing agent, also primary accelerator in natural and butyl rubber and SBR; secondary accelerator (with thiazoles) for natural rubber and SBR.

ethyl silicate (tetraethyl orthosilicate)

$(C_2H_5)_4SiO_4$.

Properties: Flammable, colorless liquid; faint odor; soluble in alcohol; hydrolyzed by water to an adhesive form of silica.

Constants: Sp. gr. 0.9356 (20/20°C); b. p.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

168.1°C (760 mm); vapor pressure 1.0 mm (20°C); flash point 125°F; wt/gal 7.8 lbs (20°C); coefficient of expansion 0.00112 (20°C); f.p. -77°C; viscosity 0.0179 poise (20°C).

Grades: 29% SiO₂; 40% SiO₂.

Containers: 1-gal cans; 5-, 55-gal (tin-lined) drums; tank cars.

Uses: Preservative for stone, brick, concrete, plaster; weatherproof and acid-proof mortar and cements; refractory bricks, other molded objects; heat-resistant paints; chemical-resistant paints; protective coatings for industrial buildings and castings; lacquers; bonding agent; intermediate.

ethyl silicate, condensed. Light-yellow liquid with mild odor consisting of 85% by wt tetraethyl orthosilicate and 15% polyethoxy siloxanes. On hydrolysis or ignition, yields high purity, refractory silica. Used as an intermediate for siloxane compounds; for precision casting of high-melting alloys; pigments binder for paints, surface hardener for sandstones.

ethyl sodium oxalacetate

C₂H₅OOCC(ONa):CHCOOC₂H₅. Light yellow powder, 92% pure.

Derivation: Reaction of pure ethyl acetate and diethyl oxalate with metallic sodium. Containers: 175-lb fiber drums.

Uses: Dyes; synthesis.

ethyl sulfate. See diethyl sulfate.

ethyl sulphydrate. See ethyl mercaptan.

ethyl sulfide (diethyl sulfide) (C₂H₅)₂S.

Properties: Colorless, oily liquid; garlic-like odor; soluble in alcohol and ether, slightly soluble in water; sp. gr. 0.837, m. p. -102°C; b. p. 92-93°C; refractive index (n_D²⁰) 1.4423.

Derivation: By heating potassium ethyl sulfate and potassium sulfide, with subsequent distillation.

Method of purification: Rectification.

Grades: Technical.

Containers: Iron drums.

Uses: Organic synthesis, special solvent.

Shipping regulations: None.*

ethylsulfuric acid (acid ethylsulfate; sulfovinic acid) C₂H₅HSO₄.

Properties: Colorless, oily liquid; soluble in water, alcohol and ether; sp. gr. 1.316, b. p. 280°C.

Derivation: By the action of sulfuric acid on ethyl alcohol.

Method of purification: Distillation.

Grades: Technical.

Containers: Glass bottles; carboys.

Uses: Medicine; precipitant for casein; organic preparations.

ethylsulfurous acid (sulfovinous acid)

C₂H₅HSO₃.

Properties: Crystalline, unstable mass; soluble in alcohol, ether and alkalis.

Derivation: By the action of thionyl chloride on ethyl alcohol.

Method of purification: Crystallization.

Use: Organic synthesis.

Shipping regulations: None.*

ethyl tetradecanoate. See ethyl myristate.

4-ethyl-1,4-thiazane C₄H₉NSC₂H₅.

Properties: Colorless, mobile oil; soluble in water; sp. gr. 0.9929 (15°C), b. p. 184°C (763 mm).

Derivation: Interaction of dichlorodiethyl sulfide and an aliphatic amine in the presence of alcohol and sodium carbonate.

ethyl thiocarbimide (ethyl mustard oil; ethyl isothiocyanate) C₂H₅NCS.

Properties: Colorless liquid, pungent odor; inflames the skin, soluble in alcohol; insoluble in water. Sp. gr. 1.004 (15/4°C); m. p. -5.9°C; b. p. 131-132°C.

Derivation: By the interaction of thiocyanic ether and phosphorus pentachloride, with subsequent distillation.

Method of purification: Rectification.

ethyl thioethanol C₂H₅SC₂H₄OH.

Properties: Pale straw liquid, sp. gr. 1.015-1.025 (20/20°C), distillation range: 180-184°C.

Grade: 95% min.

Containers: 5-, 55-gal drums.

Uses: Synthesis; intermediate.

ethylthiopyrophosphate. See tetraethyldithiopyrophosphate.

"**Ethyl Thirad.**"⁵⁸ Trade name for tetraethylthiuram disulfide.

ethyl-para-toluene sulfonate CH₃C₆H₄SO₃C₂H₅.

Properties: Toxic, unstable solid, m. p. 33°C, b. p. 221.3°C, density 1.17, soluble in many organic solvents; insoluble in water.

Grades: Technical.

Use: Plasticizer for cellulose acetate, accelerator; ethylating agent.

N-ethyl-ortho-toluidine C₆H₄(CH₃)NHC₂H₅.

Properties: Colorless to yellowish oil; soluble in alcohol, ether, and hydrochloric acid; insoluble in water. Sp. gr. 0.9534; b. p. 214°C.

Derivation: By heating ethyl alcohol with ortho-toluidine and hydrochloric acid.

Containers: Barrels.

N-ethyl-ortho-toluidine-para-sulfonic acid

CH₃C₆H₃(NHC₂H₅)SO₃H.

Properties: White solid; soluble in alkaline solution, slightly soluble in water.

Derivation: Sulfonation of ethyl-ortho-toluidine.

Method of purification: Recrystallization.

alpha-(N-ethyl-meta-toluidino)-meta-toluene-sulfonic acid CH₃C₆H₃N(C₂H₅)CH₂C₆H₄SO₃H.

Properties: Light tannish-gray paste.

Solids, approximately 70%.

Grade: Technical.

Use: Intermediate.

ethyl triacetyl gallate

C₂H₅OOCC₆H₂(OOCCH₃)₃.

Properties: Colorless crystals, or white crystalline powder. Insipid taste; odorless, soluble in warm alcohol, and acetone;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

slightly soluble in ether, and alcohol; insoluble in water. M. p. 134-136°C.
Derivation: Action of acetic anhydride, or acetyl chloride, upon ethyl gallate.

ethyltrichlorosilane $C_2H_5SiCl_3$.

Properties: Colorless liquid. B. p. 99.5°C; sp. gr. 1.236 (25/25°C); refractive index (n_D²⁵) 1.4257, flash point (Cleveland open cup) 57°F. Readily hydrolyzed by moisture, with the liberation of hydrochloric acid.

Derivation: By reaction of ethylene and trichlorosilane in the presence of a peroxide catalyst.

Grades: Technical.

Containers: Bottles; 100-, 500-lb drums.

Uses: Intermediate for silicones.

Shipping regulations: Flammable liquid. Red label. *

"Ethyl Tuads." ⁶⁹ Trademark for tetraethylthiuram disulfide, $[(C_2H_5)_2NC(S)S]_2$.

Properties: White to cream powder (also supplied as white to cream rods and as blue rods), sp. gr. $1.42 \pm .03$, melting range 142-156°F, soluble in carbon disulfide, benzol, chloroform, insoluble in water, dilute caustic, gasoline.

Uses: As vulcanizing agent and as primary accelerator in natural, butyl, nitrile rubbers and SBR. As secondary accelerator (with thiazoles) in natural and nitrile rubbers and in SBR. In extruded and molded goods, sponge, tires and tubes, wire and cable applications.

"Ethyl Tuex." ²⁴⁸ Trademark for tetraethylthiuram disulfide.

Properties: Gray powder, sp. gr. 1.17, m. p. 60°C min, soluble in acetone, benzol, gasoline, and ethylene dichloride, insoluble in water.

Uses: Accelerator for natural rubber wire insulation, druggist sundries, mechanicals, proofing, footwear.

ethyl urethane. See urethane.

ethyl valerate. See ethyl isovalerate.

ethyl vanillin (ethovan, bourbonal, vanillal, vanirom, 3-ethoxy-4-hydroxybenzaldehyde) $OHC_6H_3(OC_2H_5)CHO$.

Properties: Fine, white crystalline material having an intense odor of vanillin, affected by light, m. p. 76.5°C, soluble in alcohol, chloroform, and ether, slightly soluble in water.

Grades: N. F. XI.

Containers: 100-lb fiber drums.

Use: Flavors, as a replacement or fortifier of vanillin.

ethyl vinyl ether. See vinyl ethyl ether.

"Ethyl Zimate." ⁶⁹ Trademark for zinc diethyldithiocarbamate, $[(C_2H_5)_2NC(S)S]_2Zn$.

Properties: White powder; sp. gr. $1.48 \pm .03$, melting range 171-182.5°C, moderately soluble in dilute caustic, benzene, carbon disulfide, chloroform; insoluble in water, gasoline.

Uses: Primary accelerator, secondary

accelerator (with thiazoles) for natural and butyl rubber and for SBR.

ethyne. See acetylene.

ethynylation. Condensation of acetylene with a reagent such as an aldehyde to yield an acetylenic derivative. The best example is the union of formaldehyde and acetylene to produce butynediol.

1-ethynylcyclohexanol $HC\equiv CC_6H_{10}OH$.

Properties: Colorless, low-melting solid with sweet odor. M. p. 30-31°C; b. p. 180°C, sp. gr. (20/20°C) 0.967. Slightly soluble in water.

Containers: Cans; drums.

Uses: Stabilization of chlorinated organic compounds; intermediate, corrosion inhibitor for mineral acids.

1-ethynylcyclohexyl carbamate. See ethinamate.

ethynylestradiol. See ethynylestradiol.

beta-ethynyl ethanol. See 3-butyne-1-ol.

ethynyltestosterone. See ethisterone.

ethythrins. Ethyl analog of allethrin, used as insecticide with applications similar to allethrin (q. v.). See also barthrins, cyclothrin and furethrin.

"Eticylol." ³⁰⁵ Trademark for ethynyl estradiol U. S. P.

Use: Medicine.

"Etrolene." ²³³ Trademark for veterinary drug and insecticide containing organophosphorus compounds.

Eu. Symbol for europium.

eucaine hydrochloride (beta-eucaine hydrochloride, betacaine hydrochloride, benzamine hydrochloride) $C_{15}H_{21}NO_2 \cdot HCl$.

Properties: White, odorless crystalline powder. M. p. about 268°C (dec), soluble in water, alcohol, and chloroform.

Derivation: By the action of hydrochloric acid on beta-eucaine.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations. None. *

eucaine lactate (benzamine lactate)

$C_{15}H_{21}NO_2 \cdot C_3H_5O_3$.

Properties: White crystalline powder. M. p. about 152°C. Soluble in water and alcohol.

Use: Medicine.

eucalyptol (cineol, cajeputol) $C_{10}H_{18}O$.

Properties: Colorless oil, camphor-like odor and pungent, cooling, spicy taste. Slightly soluble in water; miscible with alcohol, chloroform, ether, glacial acetic acid and fixed or volatile oils. Sp. gr. 0.921-0.923 (25°C), b. p. 174-177°C; congealing point not below 0°C; refractive index 1.4550-1.4600 (20°C).

Derivation: By fractionally distilling eucalyptus oil, followed by freezing.

Method of purification: Rectification or crystallization by freezing.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Grades: Technical; N. F. XI.
Containers: 25-lb cans; 100-lb drums.
Uses: Pharmacy; flavoring; perfumery.
Shipping regulations: None.*

eucalyptus (blue gum tree; Australian fever tree). Dried leaves of tree *Eucalyptus globulus*.

Habitat: Australia; cultivated in sub-tropics, Europe; northern Africa; south-western United States.

Uses: Source of eucalyptus oil; medicine.
Shipping regulations: None.*

eucalyptus oil.

Properties: Colorless or faintly yellowish, mobile essential oil; aromatic odor; pungent, spicy and cooling taste. Soluble in alcohol; almost insoluble in water. (N. F. grade): Sp. gr. (25/25°C) 0.905-0.925, (n_D 20) 1.4580-1.4700, m. p. not lower than -15.4°C.

Chief constituents: Eucalyptol, 70-90%, aldehydes, terpenes.

Derivation: Distilled from fresh leaves of *Eucalyptus globulus* and a few other species of *Eucalyptus*.

Method of purification: Rectification.

Grades: N. F. XI, rectified.

Containers: Bottles; drums.

Uses: Medicine, ore flotation, perfumery, especially for soaps.

Shipping regulations: None.*

eucalyptus resin oil. See eucalyptus tar.

eucalyptus tar (eucalyptus resin oil). The residue obtained when, following the distillation of eucalyptus leaves, the oil is treated with caustic soda. It consists of a dark-brown syrup.

Uses: Disinfectant, perfuming soaps.

Shipping regulations: None.*

eucatropine hydrochloride (1,2,6,6-tetramethyl-4-mandeloxypiperidine hydrochloride) $C_{17}H_{25}O_3N \cdot HCl$.

Properties: White, granular, odorless powder, m. p. 183-186°C, solutions are neutral to litmus. Very soluble in water, freely soluble in alcohol and chloroform, insoluble in ether.

Grade: U. S. P. XVI.

Use: Medicine.

euclase $Be_2Al_2(SiO_4)_2(OH)_2$. A natural basic aluminum-beryllium silicate.

Properties. Colorless, light blue, or green, vitreous luster, sp. gr. 3.05-3.10, hardness 7.5.

Occurrence: Austria, Russia, Brazil, Peru, Tasmania.

Use: Gem stones.

euflavine. See acriflavine.

eugaliol. See pyrogallol acetate.

eugenic acid. See eugenol.

eugenol (4-allyl-2-methoxyphenol, eugenic acid) $C_9H_8C_6H_3(OH)OCH_3$.

Properties: Colorless or yellowish liquid, oily; becomes brown in the air; spicy odor and taste. Soluble in alcohol, chloroform,

ether, and volatile oils; very slightly soluble in water. Sp. gr. 1.064-1.070; b. p. 253.5°C; refractive index 1.5400-1.5420 (20°C); optically inactive.

Derivation: By extraction of clove oil with aqueous potash, liberation with acid and rectification in a stream of carbon dioxide.

Method of purification: Redistillation.

Grades: Technical, U. S. P. XVI.

Containers: Tins; drums.

Uses: Perfumes; essential oils; medicine (as an active germicide); production of 190-eugenol for the manufacture of vanillin.

Shipping regulations: None.*

eugenol acetate (acetyl eugenol)

$C_9H_8C_6H_3(OCH_3)OOCCH_3$.

Properties: Solid crystals, melting to colorless liquid at warm room temperature; spicy odor of cloves. Soluble in 4 parts of 70% alcohol. Sp. gr. 1.080-1.082; refractive index 1.520; m. p. 27°C.

Uses: Perfumery.

"Eukanol" Bottom A. ³⁰⁷ Trademark for a liquid consisting of a ricinoleic acid-amide ester derivative, used as a cationic leather-finishing agent for bottom coating.

"Eulan" CN. ³⁰⁷ Trademark for a permanent mothproofing agent, consisting of sodium pentachlorodihydroxytriphenyl methane sulfonate; anionic.

Properties: Fine, slightly granular powder. Compatible with acid or chrome dyes as well as with anionic and non-ionic surfactants. Incompatible with basic dyes, cationic surfactants and leveling agents based on albumin decomposition products.

Uses: Permanent mothproofing agent for wool and mohair which is applied in the dye-bath. This product is resistant to washing, dry cleaning, and bleaching.

"Eulan" NKU Extra. ³⁰⁷ Trademark for a mothproofing agent, consisting of dichlorobenzyl triphenyl phosphonium chloride; 31% active. Properties: Powder; dissolves in boiling water with stirring.

Uses: Mothproofing agent for wool and mohair. Applied in a neutral bath following dyeing or wet finishing.

"Eulysine" A. ³⁰⁷ Trademark for a dyeing assistant; an organic amine. Liquid, sp. gr. 1.08.

Uses: Prevents bronzing of sulfur colors, crabbing assistant for woolen and worsted fabrics; pasting agent for all dyes except basics.

"Eunaphtol" AS. ³⁰⁷ Trademark for a naphthol dyeing assistant, composed of a modified lignin-sulfonate.

Properties: Brown liquid; sp. gr. 1.075-1.095; miscible with water.

Uses: Naphthol dyeing assistant which improves fiber penetration and increases stability of the naphtholating liquors. Also recommended for pasting and dissolving naphthols.

euonymit. See dulcitol.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

euonymus (wahoo; arrow wood; Indian arrow wood; bitter ash; burning bush; strawberry tree; spindle tree). Dried root bark of *Euonymus atropurpureus*.

Habitat: United States, east of the Mississippi.

Grade: Technical.

Containers: Boxes; bags.

Use: Medicine.

Shipping regulations: None.*

euphorbia (pill-bearing spurge; snake weed, cat's hair; Queensland asthma weed, flowery-head spurge). Whole plant *Euphorbia pilulifera* or *hirta*.

Habitat: Queensland; India.

Grade: Technical.

Containers: Bales.

Use: Medicine.

Shipping regulations: None.*

"Eureka" Soldering Flux Crystal. ²⁸ Trade-mark for soldering flux crystal composition based on zinc chloride and ammonium chloride.

Properties: White crystalline powder.

Containers: 50-lb and 600-lb drums.

Use: As a flux in soft soldering operations and preparation of liquid soldering fluxes.

"Eureka" Soldering Flux Liquid. ²⁸ Trade-mark for soldering flux liquids based on zinc chloride and other ingredients.

Properties: Clear, colorless water solutions; various gravities and compositions.

Containers: 605-lb drums; 145- and 165-lb carboys.

Uses: As soldering fluxes for soft soldering and as solder and lead-coating fluxes for use in the automotive, can, refrigeration, wire and other industries.

"Euresol." ⁹ Trade name for acetoresorcin (resorcinol monoacetate).

europia. See europium salts.

europium Eu. Atomic number 63, one of the lanthanide or rare-earth elements of the cerium subgroup.

Properties: Steel gray metal, difficult to prepare. Malleable; m. p. 826°C, b. p. 1489°C (approx); sp. gr. 5.24. Oxidizes rapidly in air, may burn spontaneously. Is the most reactive of the rare earth metals; liberates hydrogen from water.

Derivation: Reduction of the oxide with lanthanum or misch metal.

Source: See rare-earth minerals.

Grades: High purity (ingots; lumps).

europium salts

europium chloride $\text{EuCl}_3 \cdot x\text{H}_2\text{O}$. Colorless to pale pink crystals; soluble in water. Obtained by treating the oxide with hydrochloric acid.

europium fluoride $\text{EuF}_3 \cdot 0-2\text{H}_2\text{O}$.

europium nitrate $\text{Eu}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$. Colorless to pale pink crystals; soluble in water. Obtained by treating the oxide with nitric acid.

europium oxalate $\text{Eu}_2(\text{C}_2\text{O}_4)_3 \cdot x\text{H}_2\text{O}$. White powder; insoluble in water; slightly soluble in acids. Grades: 25-50% and 99.8% europium salt. Impure grades may be colored.

europium oxide Eu_2O_3 . White powder; insoluble in water; soluble in acids to give the corresponding salt. Hygroscopic, absorbs carbon dioxide from the air. Obtained by ignition of the oxalate. Grades: 25-50% and 99.8% europium salt. Impure grades may be colored.

europium sulfate $\text{Eu}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$. Colorless to pale pink crystals; slightly soluble in hot water, more soluble in cold. Stable in air. Obtained by treating the oxide with sulfuric acid.

Uses: In red- and infrared-sensitive phosphors; the oxide in nuclear-reactor control rods.

eutactic. Same meaning as tactic (q. v.).

eutectic alloys. See table under fusible alloys.

euxenite (loranskite)

(Y, Ca, Ce, U, Th)(Nb, Ta, Ti)₂O₆. A rare earth mineral (q. v.). Color brownish black; luster brilliant to vitreous; sp. gr. 5-5.9, hardness 5-6.

Occurrence: Norway; Madagascar; Canada, Pennsylvania.

Uses: Source of uranium, niobium, tantalum.

ev. Abbreviation for electron volt.

"Evanacid 3CS." ³¹² Brand name for carboxymethylmercaptosuccinic acid (q. v.).

"Evanohm." ¹⁵⁵ Trademark for an alloy of 75% nickel, 20% chromium, 2.5% aluminum, and 2.5% copper.

Properties: Resistivity 800 ohms per circular mil ft at 20°C, temperature coefficient of resistance $\pm 0.00002/^\circ\text{C}$; very low thermal emf vs copper, high tensile strength in fine sizes, corrosion resistant, non-magnetic, heat resistant to 600°C.

Forms: Wire; insulated wire.

Use: Precision wound resistors.

Evans blue $\text{C}_{34}\text{H}_{24}\text{N}_6\text{Na}_4\text{O}_{14}\text{S}_4$. A diazo dye used in medicine to measure blood plasma volume.

Properties: Bluish green or brown iridescent powder. Odorless and hygroscopic. Very soluble in water, very slightly soluble in alcohol, practically insoluble in benzene, carbon tetrachloride, chloroform, and ether. pH (0.5% solution) 5.5-7.5.

Grade: U. S. P. XVI.

Use: Medicine.

evaporation. Change from liquid to vapor state, either at elevated or normal temperatures. For example sugar solutions and salt solutions are heated in large vessels to remove excess water by evaporation so that solid crystals will form. Also, volatile organic solvents are lost if allowed to stand in open containers even at ordinary temperature.

EVE. Abbreviation for ethyl vinyl ether. See vinyl ethyl ether.

"Evenglo." ¹¹ Trademark for polystyrene plastics available in a wide range of color and various degrees of light transmission and diffusion for use in lighting applications.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- "Everdur."** ³²⁴ Trademark for a group of five copper-silicon alloys, with compositions adjusted to hot and cold working, hot forging, welding, free machining, and for ingots for remelting and casting. The most widely used alloy in this group is "Everdur-1010," with a nominal composition of copper 95.80%, silicon 3.10%, manganese 1.10%. In most environments, "Everdur" alloys are equivalent to copper in corrosion resistance. They are generally resistant to corrosion by marine and industrial atmospheres, fresh water, non-oxidizing mineral acids, alkalis, and salt solutions under many conditions of use.
- "Evipal."** ¹⁶² Trademark for hexobarbital.
- "Evipal" Sodium.** ¹⁶² Trademark for hexobarbital sodium.
- "Exaltolide."** Trademark for macrocyclic lactone of musk-like odor, intense and powerful, used in perfumery.
- "Exaltone."** Trademark for macrocyclic ketone having powerful musky odor, used in perfumery.
- "Excelsior" Carbon Blacks.** ¹³³ Trademark for paint blacks comprising the ordinary color group; high hiding, high tinting strength. "Excelsior," a powdered form of impingement carbon black is used as an all purpose paint black. "Excelsior" Beads comprise a dustless free flowing form of regular color impingement carbon black; show marked advantage over powdered form for ball mill grinding.
Containers: 25-lb bags.
- exchange reaction.** A process whereby atoms of the same element in two different molecules or in two different positions in the same molecule transfer places. Exchange reactions are usually studied with the aid of a tracer or tagged atom.
- "Exkin."** ⁷⁴ Trademark for a series of anti-skinning agents of the volatile oxime type.
Use: Paints.
- exo-.** A prefix used in chemical names to indicate attachment to a side chain rather than to a ring.
See also endo-.
- "Exolvent."** ¹⁴¹ Trade name for a solvent made from aliphatic hydrocarbons.
- "Exon."** ³⁵ Trademark for a series of polyvinyl resins, compounds and latexes composed of polymers and copolymers based on vinyl chloride.
Containers: Resins and compounds: 50-lb bags. Latexes: 55-gal drums, tank trucks, tank cars.
Uses: Resins: Molding, sheeting film, strip coatings, protective coatings, extrusions, paints, ink, adhesives, plastisols, flooring, phonograph records.
Compounds: Wire coatings and insulation, extruded shapes and profiles, moldings, etc.
Latexes: Coating and impregnating cloth and paper to improve strength, appearance and resistance.
- Hazards:** Avoid freezing latex.
- exothermic.** Referring to a process which is accompanied by evolution of heat.
- exotic fuels.** See high energy fuels. The name also refers to those rocket fuels of a non-chemical nature (see rocket propellants).
- expander.** A mixture of lampblack, barium sulfate, and an organic material usually derived from the lignin fraction of wood that increases the capacity of storage batteries presumably by coating the anode and thus preventing the deposit of lead sulfate on the underlying lead metal.
- "Expandex."** ³¹⁹ Trade name for a blood volume expander.
- explosive, high.** A detonating explosive composed either of an explosive compound or a mixture of compounds, which on detonating has a high disruptive effect. The detonation is accomplished intentionally by use of a blasting cap or blasting cap and booster, but most high explosives are also sensitive to shock and high temperature. The actual explosion is the result of an almost instantaneous chemical reaction causing the liberation of large amounts of gases.
Shipping regulations: Explosives, Class A. *
- explosive, low.** An explosive which deflagrates (burns over a relatively sustained period) rather than detonates. See explosive, high.
Shipping regulations: Explosives, Class A. *
- explosive oil.** See nitroglycerin.
- explosives, permissible.** Explosives approved by the Bureau of Mines for use in blasting in coal mines.
- expression.** Removal of a liquid from a solid by pressing, as in manufacture of vegetable oils from meal cakes.
- "Exsize."** ¹¹⁴ Trademark for a series of enzyme desizing agents containing starch-liquefying and proteolytic enzymes.
Derivation: Produced by growing pure cultures of micro-organisms on select media.
Properties: Liquid and dry powder of low specific gravity and viscosity. Predominantly alpha-amylase with small amount of protease.
Use: Desizing agent.
Shipping regulations: None. *
- extraction, liquid-liquid (solvent extraction).**
A process in which one or more components are removed from a liquid mixture by intimate contact with a second liquid which is itself nearly insoluble in the first liquid and dissolves the impurities and not the substance that is to be purified. In other cases the second liquid may dissolve, i. e. extract, from the first liquid, the component that is to be purified, and leave associated impurities in the first liquid. Thus penicillin, which is produced along with many impurities in a dilute aqueous broth, can be recovered by extraction with

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

amyl acetate, which dissolves penicillin but not water or the impurities in it. Lubricating oil is improved in quality by liquid-liquid extraction with any one of several less common liquids such as phenol or furfural.

Liquid-liquid extraction may be carried out by simply mixing the two liquids with agitation, and then allowing the two liquids to separate by standing quietly. It is however often desirable and economical to use countercurrent extraction in which the two immiscible liquids are caused to flow past or through one another in opposite directions with rather intimate contact. Thus fine droplets of heavier liquid can be caused to pass downward through a body of the lighter liquid in a vertical tube or tower which has entrance ports for the heavy and light liquids at top and bottom respectively, and similar exits at the bottom and top for these two streams.

extractive distillation. A variety of distillation that always involves the use of a fractionating column, and which is characterized by use of a purposely added substance whose presence modifies the vaporization characteristics of the materials undergoing separation, so as to make them easier to separate. The additive substance is often referred to as a solvent, and this solvent is usually chosen to be much less volatile than any of the substances being separated. This solvent is added to the downflowing liquid reflux stream near the top of the column, and is removed from the still pot or reboiler at the base of the column. The addition of furfural to mixtures of butadiene and butene hydrocarbons in order to separate the butadiene more easily is an example of extractive distillation.

extract of malt (maltine).

Properties: Light brown, sweet, viscous

liquid; contains dextrin, maltose, a little glucose, and an amylolytic enzyme. It is capable of converting not less than five times its weight of starch into water-soluble sugars. Soluble in cold water, but more readily soluble in warm water. Sp. gr. not less than 1.350 and not more than 1.430 (25°C).

Derivation: By infusing malt with water at 60°C, concentrating the expressed liquid at a temperature not exceeding 60°C, and adding 10% by weight of glycerol.

Grade: N. F. XI.

Use: Medicine.

Shipping regulations: None.*

extreme pressure additives (EP additives).

1. Materials added to cutting oils to impart high film strength. They are mainly sulfur, chlorine, and occasionally phosphorus compounds. Actual conditions, amounts, etc. are trade secrets.

2. Lubricating oil and grease additives added to prevent metal-to-metal contact in highly loaded gears. (See "Aroclor"). In some cases this is accomplished by using additives which react with the metal gears to form a protective coating.

"Ex-Tri." ²³³ Trademark for trichloroethylene (q. v.).

"Exzyme." ¹¹⁴ Trademark for a proteolytic enzyme compound with a proteolytic digesting value of 15000 units/gram. Water soluble.

Uses: In the dry cleaning industry for the removal of soils and stains due to blood, glues, serum, egg, and others of albuminous origin.

Shipping regulations: None.*

eyestone. See copper, aluminated.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

F

F. Symbol for fluorine.

F. Abbreviation for Fahrenheit.

"FA." ²²⁴ Trademark for furfuryl alcohol (q. v.).

"Fabrikoid." ^{28, 56} Trademark for pyroxylin-coated fabrics used for a wide variety of purposes, including bookbinding, footwear, belts, bindings and welts, case covering, and for luggage covering, lining, and trim.

"Fabrillite." ²⁸ Trademark for vinyl resin plastic coated fabrics and also for unsupported vinyl materials. The latter are used for handbags, pocketbooks, looseleaf binders and notebooks, and for lamination to metal for use as decorative trim. The coated fabrics are used for general and automotive upholstery and trim, seat covers, belts, bookbinding, footwear, folding doors and partitions, sports clothes, luggage, wall coverings, etc.

F acid. See 2-naphthol-7-sulfonic acid and 2-naphthylamine-7-sulfonic acid.

factice, rubber. Rubber-like products made by reaction of sulfur or sulfur chloride with vegetable oils. Used in some soft rubber products such as erasers.

"Factolac." ³⁴² Trademark for a blend of gums and sugars used as a flavor emulsifying agent.

FAD. Abbreviation for flavin adenine nucleotide (q. v.).

fahlore (gray copper ore)
(Cu, Fe, Zn, Ag)₁₂(Sb, As)₄S₁₃. A group of minerals consisting essentially of sulf-antimonides or sulfarsenides of copper. Substitution of iron, zinc, silver, mercury, and lead is known for part of the copper, and of bismuth for arsenic and antimony. See tetrahedrite, tennantite, freibergite, and schwartzite.

Fahrenheit. The scale of temperature in which 212° is the boiling point of water at standard atmospheric pressure, and 32° is the freezing point of water. See centigrade for method of converting from Fahrenheit temperature scale to centigrade. See absolute temperature for converting Fahrenheit temperatures to absolute Rankine scale.

"Fairprene." ²⁸ Trademark for a variety of products including:
Industrial cements made from synthetic rubber compounds for cementing rubber sheets and

coated fabrics to leather, fabric, paper, metal and wood.

Protective and waterstop tape used as a seam sealant for shipbuilding and aircraft use in oil-, air-, and water-tight structural joints. Synthetic rubber coated fabrics and sheet stock including silicone rubber and "Viton" A fluoroelastomer. Used for diaphragms, gaskets, washers, packings, seam sealants, curing bags and blankets.

fairy gloves. See digitalis.

fall-out. The deposition upon the earth of the radioactive particles contained in the cloud which forms as a result of a nuclear explosion.

"Falone." ²⁴⁶ Trademark for tris(2,4-dichlorophenoxyethyl) phosphite, a pre-emergence herbicide.

Properties: A viscous amber liquid, sp. gr. 1.434; m. p. 70°C-72°C, soluble in benzene, xylene and aromatic hydrocarbons, insoluble in water. Available as an emulsifiable concentrate (Falone 44E) and a granular solid (Falone 10G).

Uses: A pre-emergence herbicide for the control of annual broad-leaf weeds and grasses on white potatoes, peanuts, strawberries and corn.

Hazards: Do not store near seeds or fertilizer. Avoid contact with skin or eyes. Do not store near heat or open flame.

false saffron. See carthamus.

false topaz. See citrine.

false unicorn. See helonias.

"Fanal." ³⁰⁷ Trademark for phosphotungstic lakes. Used for printing inks. Characterized by brilliancy of shade and good fastness to light.

"Fanox." ⁵¹ Trademark for compounded oils available in several viscosity grades for metal working, and for quenching and cutting oils.

faraday. The quantity of electricity that can deposit (or dissolve) one gram-equivalent weight of a substance during electrolysis. It is about 96,500 coulombs.

farnesol C₁₅H₂₅OH. 3,7,11-Trimethyl-2,6,10(or 11)-dodecatrienol

• Properties: Colorless liquid having a delicate but rather faint floral odor. Soluble in 3 vols of 70% alcohol.

Constants: Sp. gr. 0.885 (15°C), b. p. 145-146°C (3 mm).

Derivation: Found in nature in many flowers

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers" page v.

and essential oils, such as cassie, neroli, cananga, rose, balsams, ambrette seed.

Use: Perfumery.

Shipping regulations: None. *

"Fastel." ²⁰⁶ Brand name of proprietary line of pigments prepared from basic dyestuffs by combination with acids of the phosphomolybdic and tungsto-groups. Used in the production of printing inks.

"Fas-Tin-Flux." ⁷² Brand name for a flux for hot tinning consisting of zinc chloride and additives.

"Fastusol." ³⁰⁷ Trademark of direct colors used on cotton, rayon, paper, leather, and silk. Characterized by very good fastness to light.

fat clay. See ball clay.

fat dyes. Oil-soluble dyes for candles, wax, etc.

fatliquoring agents. Tanning operations tend to deprive hides of their natural oils and they therefore become hard and stiff. It is necessary to replace these natural oils in the leather in order to soften it. This is accomplished by placing the hides in a drum and tumbling them in emulsions of oil-in-water. Such oil-in-water emulsions are known as fat liquors and are usually made from raw oils such as cod, neatsfoot, and the like, rendered soluble by emulsifying with typical dispersing agents such as sulfonated oils.

fat pitch. See stearin and fatty-acid pitches.

fats. Solid glyceryl esters of higher fatty acids such as stearic and palmitic. Such esters and their mixtures are soft solids at ordinary temperatures. Liquid fats are known as animal and vegetable oils.

fatty-acid pitches. See stearin and fatty-acid pitches.

fatty acids. Monobasic organic acids derived from natural fats and oils. The term is also applied to all the monobasic acids of the general formula $C_nH_{2n+1}COOH$, but the following discussion applies only to the acids derived from natural fats and oils. The acids whose molecules have an even number of carbon atoms (usually 8 to 22) arranged in a straight chain are by far the most common and may be either saturated or unsaturated. The most abundant acids have 16 or 18 carbon atoms and these are commercially the most important. For more detail on these acids see palmitic, stearic, oleic, linoleic, and linolenic acids. The last two plus arachidonic acid are sometimes termed "essential fatty acids" by biochemists and nutritionists. The term fatty acid is also used sometimes to refer to the glyceride from which the acid can be derived. Thus an oil may be stated to contain a high percentage of oleic acid, when in fact it contains a high percentage of the corresponding glyceride.

Derivation: By hydrolytic splitting of fats and

oils with glycerol as a by-product; oxidation of hydrocarbons.

Uses: (Usually in the form of mixtures of several acids) Soaps and synthetic detergents, lubricants, rubber products, cosmetics, waterproofing, nutrition, and research.

fatty alcohols. Primary alcohols from C_8 to C_{20} , usually straight-chain. The name once referred to the source of their manufacture, such as the natural fats and wax-containing substances (e.g., sperm oil and spermaceti). More recently high molecular weight alcohols have been produced synthetically, in particular by the Oxo process. The more important methods of production are (a) reduction of vegetable seed oils and their fatty acids with sodium, (b) catalytic hydrogenation of such oils at elevated temperatures and pressures and (c) hydrolysis of spermaceti and sperm oil by saponification and vacuum fractional distillation. The more important commercial saturated alcohols are octyl, decyl, lauryl, myristyl, cetyl and stearyl. The commercially important unsaturated alcohols such as oleyl, linoleyl and linolenyl are also normally included in this group. The odor of the alcohols tends to disappear as the chain length increases. The alcohols are used as solvents for fats, waxes and gums; as resin solvents or co-solvents; as ingredients in pharmaceutical salves and lotions, as lube oil additives; as detergent ingredients; as textile antistatic and finishing agents.

fatty amines. Normal aliphatic amines which have been derived from fats and oils. They may be saturated or unsaturated, primary, secondary, or tertiary, but the alkyl groups are straight-chained and have an even number of carbons in each. The length of the alkyl groups varies from 8-22 carbon atoms.

Derivation: Fatty acids are treated with ammonia and heated to form fatty acid amides which are converted to nitriles and reduced to the amine.

Uses: As organic bases; synthesis; soaps; plasticizers; medicinals; rubber manufacture.

fatty esters. Fatty acids with the active hydrogen replaced by the alkyl group of a monohydric alcohol. The esterification of a fatty acid, $RCOOH$, by an alcohol, $R'OH$, yields the fatty ester $RCOOR'$. The most common alcohol used is methanol, yielding the methyl ester, $RCOOCH_3$. The methyl esters of fatty acids have higher vapor pressures than the corresponding acids and thus can be distilled more easily.

fatty nitriles RCN . Organic cyanides derived from fatty acids.

Derivation: Fatty acids are treated with ammonia and heated to form fatty acid amides which are converted to nitriles.

Uses: Intermediates for fatty amines; lube oil additives; plasticizers.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Fausser process for ammonia. Process for synthesis of ammonia at about 200 atmospheres pressure, 500°C, with promoted iron catalyst, and 10-20% conversion of the hydrogen-nitrogen mixture. The hydrogen is obtained by electrolysis, the nitrogen from air by using extra hydrogen for combustion to remove the oxygen.

Fausser process for nitric acid. A batch process more commonly used in Europe than in the U. S., to produce nearly 100% nitric acid. The mixture of oxides of nitrogen and water from an ammonia oxidation converter is cooled to condense the water so it may be removed. The remaining mixture is refrigerated to -10°C at 10 atmospheres pressure in a tower. Dilute nitric acid and liquid nitrogen dioxide are produced. Oxygen is then introduced in proper proportion and its temperature kept at 70°C with 50 atmospheres pressure for several hours.

"Faxam." ⁵¹ Trademark for a series of general purpose, paraffin-base pale engine oils for application on plain bearings. Also useful as hydraulic media and for process needs.

fayalite. See olivine.

FCC. Abbreviation for fluid-cracking catalyst, as used in the petroleum refining industry. Examples are powdered silica-alumina, in which alumina is impregnated in dry synthetic silica gel, and various natural clays impregnated with alumina.

F. D. A. Abbreviation for Food and Drug Administration.

FD & C dyes. Food, drug and cosmetic dyes. See D & C dyes.

Fe. Symbol for iron.

feather ore. See jamesonite.

"Febis." ⁵¹ Trademark for high quality paraffin base oils containing various compounding agents to suit them for process uses. They find applications as ceramic mold oils, cotton spray oils and on leather aprons of tape condensers.

"Fedrazil." ³⁰¹ Trademark for a combination of pseudoephedrine hydrochloride and chlorcyclizine hydrochloride (q. v.).

FEF black. Abbreviation for fast extruding furnace black. See furnace black.

Fehling's solution. A reagent used in analytical work as a test for sugars. The Association of Official Agricultural Chemists and most of the laboratories abroad use Soxhlet's modification. The official method of preparing this solution, according to the Book of Methods of the Association of Official Agricultural Chemists, is as follows:

Prepare by mixing immediately before use equal volumes of (a) and (b).

(a) Copper sulfate solution: Dissolve 34.639 g of copper sulfate ($\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$)

in water, dilute to 500 cc and filter through prepared asbestos.

(b) Alkaline tartrate solution: Dissolve 173 g of Rochelle salts and 50 g of sodium hydroxide in water, dilute to 500 cc, allow to stand for two days, and filter through prepared asbestos.

Benedict's modification of Fehling's solution, a one-solution preparation that keeps well, is used for the same purpose as the two-liquid Fehling's solution and is sometimes called Fehling's solution.

feldspar (felspar; potassium aluminosilicate). Feldspar is the general name for a group of sodium, potassium, calcium, and barium aluminum-silicates. It is the common mineral in igneous and metamorphic rocks. Commercially, feldspar usually refers to the potassium feldspars, orthoclase and microcline, with the formula KAlSi_3O_8 , usually with a little sodium.

Properties (orthoclase): Color white, gray, flesh-colored and various other shades; luster vitreous; hardness 6; two good cleavages; sp. gr. 2.54-2.57. Insoluble in water or acids.

Grades: (feldspar in general) Usually based on silicon dioxide content, potassium-sodium ratio, iron content, and fineness of grinding.

Containers: Bags, carload lots.

Occurrence: North Carolina, Colorado, New Hampshire, South Dakota, California, Arizona, Wyoming, Virginia, Texas.

Uses: Pottery, enamel, and ceramic ware, glass, soaps; abrasive; bond for abrasive wheels; artificial teeth; cements and concretes, insulating compositions; fertilizer; poultry grit, tarred roofing materials. Nepheline syenite, aplite, talc, and pyrophyllite are now used in place of feldspar in a number of applications.

felspar. See feldspar.

2-fenchanol. See fenchyl alcohol.

fenchol. See fenchyl alcohol.

fenchone $\text{C}_{10}\text{H}_{16}\text{O}$.

Properties: Oil with camphor-like odor.

Constants: Sp. gr. 0.9465 (19°C); b. p. 193°C. Soluble in ether, insoluble in water.

Derivation: A ketone found (a) as dextro-fenchone in oil of fennel, (b) as levo-fenchone in oil of thuja.

fenchyl alcohol (fenchol; 2-fenchanol; 1-hydroxy-fenchane) $\text{C}_{10}\text{H}_{18}\text{O}$.

Properties: Colorless, crystalline substance.

Constants: Sp. gr. 0.962 (approx), boiling range 198-204°C; freezing point 30-34°C; refractive index 1.4626; optical rotation -0.1°.

Derivation: From turpentine and pine oil. Also synthetically.

Grades: Technical.

Uses: Solvent, organic synthesis.

fennel (sweet fennel, foeniculum).

Derivation: Dried, ripe fruit of cultivated

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

varieties of *Foeniculum vulgare*.

Habitat: Southern Europe and western Asia; widely cultivated.

Grades: Technical; graded by country of origin.

Containers: Bags.

Use: Medicine.

Shipping regulations: None.*

fennel oil (fennel-seed oil).

Properties: Colorless or pale yellowish essential oil; characteristic aromatic odor; bitter, camphor-like taste changing to sweetish, mild and spicy. Soluble in 5-8 vols of 80% alcohol, in 1 vol of 90% alcohol, in ether; insoluble in water.

Chief known constituents: Anethole, fenchone, pinene, camphene, dipentene, and phellandrene.

Constants: Sp. gr. 0.953-0.973 (15°C); b. p. 160-220°C, optical rotation +12° to +20°, refractive index 1.528-1.538. Congealing temperature not below 3°C.

Grades and derivation: Fennel oil U. S. P. XVI is derived by distillation from *Foeniculum vulgare*; Roman fennel oil from *F. dulce*. The Roman fennel does not contain fenchone.

Adulteration: Elimination of all or part of anethole content; turpentine oil; alcohol.

Containers: 1-, 5-, 10-lb bottles, 25-, 50-lb tins.

Uses: Medicine, liqueurs; perfumery; flavors.

Shipping regulations: None.*

fennel-seed oil. See fennel oil.

"**Fenso**." ⁵¹ Trademark for a high-speed quenching oil, useful where metallurgical and production requirements dictate more rapid metal cooling than is possible with a straight mineral oil.

fenugreek (*trigonella foenum graecum*).

Derivation: Seeds of *Trigonella*.

Habitat: Egypt, Asia Minor, France and Germany.

Grades: Technical.

Containers: Bags.

Uses: Medicine, veterinary medicine, spices, including curry, flavors, especially maple.

Shipping regulations: None.*

fenuron. Coined name for 3-phenyl-1, 1-dimethylurea.

FEP. Abbreviation for fluorinated ethylene propylene (q. v.), used as in FEP fluorocarbons, FEP resins.

ferbam (ferric dimethyldithiocarbamate)

$[(CH_3)_2NCSS]_3Fe$. A fungicide.

Properties: Black or dark colored, fluffy powder; decomposes above 180°C, usually readily dispersible but very slightly soluble in water; pH of saturated solution 5.0.

Derivation: By addition of carbon disulfide to an alcoholic solution of dimethylamine and precipitation with a ferric salt.

Grades: 76% wettable powder, 87% technical powder.

Containers: 3-lb and 50-lb multiwall paper bags.

Caution! May cause irritation of eyes, nose, throat and skin. MCA warning label.

Use: Fungicide.

ferberite. See wolframite.

"**Ferberk**." ⁸¹ Trademark for ferric dimethyl dithiocarbamate. See ferbam.

"**Fergon**." ¹⁶² Trademark for ferrous gluconate.

fergusonite (Y, Er)(Nb, Ta)O₄. An oxide of yttrium, erbium, niobium, and tantalum, sometimes containing small amounts of other rare earths, and uranium, zirconium, thorium, calcium, iron and titanium. Found in pegmatites.

Properties: Color gray, brown, or black; luster dull to vitreous; streak brown or gray, hardness 5.5-6.5; sp. gr. 5.6-5.8.

Occurrence: North Carolina, South Carolina, Virginia, Texas; Norway; Sweden; Africa.

Use: A rare earth mineral.

"**Fermate**." ²⁸ Trademark for agricultural and horticultural fungicide based on ferbam (ferric dimethyldithiocarbamate).

Containers: 3-, 50-lb bags.

Uses: As a fungicide for control of certain diseases of apples, pears, grapes, tobacco, and ornamentals.

"**Fermentase**." ¹¹⁴ Brand name for a baker's malt syrup of the diastatic variety.

fermentation alcohol. See ethyl alcohol.

"**Fermex**." ¹⁷³ Trademark for a diastatic (protease - amylase) enzyme supplement for baking fermentation used to improve quality and uniformity of bread and other yeast-raised bakery products.

Fermi age. A term used in neutron moderation or slowing-down theory applied to nuclear reactors. Neutrons are slowed in discrete steps by scattering off of the nuclei of the moderator, and if this process is approximated as a smooth process, the Fermi age is related to the mean square path length for a neutron to be slowed to a given energy.

fermion. Also called Fermi particle, or Fermi-Dirac particle. Consideration of symmetry properties of the wave-mechanical description of systems of particles allow the classification of the particles into two kinds. Fermions are particles with half-integral spin, obey the Pauli exclusion principle and only one such particle may occupy a given quantum state. See also boson.

fermium (element 100) Fm. A synthetic radioactive element with atomic number 100 first discovered in the debris from the 1952 hydrogen bomb explosion. Fermium has since been prepared in a nuclear reactor by irradiating californium, plutonium, or einsteinium with neutrons, in a cyclotron by bombarding uranium with accelerated oxygen ions, and by other nuclear reactions. The element is named for Enrico Fermi. It has chemical properties similar to those of the rare earth erbium.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Isotopes are known with mass numbers 254, 255, and 256.

See also actinide elements.

"Ferocator" Salts. ²⁰⁴ Trademark. Laundry sour with good neutralizing value, moderate rust-removing qualities.

ferric acetate, basic (iron acetate, basic)
 $\text{Fe}(\text{C}_2\text{H}_3\text{O}_2)_2\text{OH}$.

Properties: Red powder. Soluble in alcohol and acids; insoluble in water.

Derivation: By the action of acetic acid on ferric hydroxide with subsequent crystallization.

Grades: Technical.

Containers: Wooden barrels, fiber drums.

Uses: Medicine; textile industries.

Shipping regulations: None. *

ferric acetylacetonate $\text{Fe}(\text{C}_5\text{H}_7\text{O}_2)_3$.

Properties: Crystalline powder, m. p. 179-182°C. Slightly soluble in water, soluble in most organic solvents. Resistant to hydrolysis. A chelating non-ionizing compound.

Uses: Moderating and combustion catalyst; solid fuel additive catalyst; bonding agent; curing accelerator; intermediate.

ferric alginate (alginoid iron, algron, iron alginate) $\text{C}_{76}\text{H}_{77}\text{N}_2\text{O}_{22}\text{Fe}_3$.

Properties: Brown powder. Tasteless.

Contains approx 11% iron. Soluble in ammonia; insoluble in water.

Derivation: Interaction of ferric chloride and sodium alginate.

Use: Medicine.

ferric ammonium alum. See ferric-ammonium sulfate.

ferric ammonium citrate (iron ammonium citrate). Protect from light.

Properties: Thin, transparent, garnet red scales or granules, or as a brownish yellow powder; odorless (or slight ammonia odor); saline, mildly ferruginous taste, deliquescent, affected by light. Soluble in water; insoluble in alcohol.

Derivation: By the addition of citric acid to ferric hydroxide, then adding ammonium hydroxide, followed by filtration.

Grades: Technical; N. F. XI (brown and green varieties, the latter containing a lower percentage of iron).

Containers: Bottles, 100-lb drums.

Uses: Medicine; blueprint photography, feed additive.

Shipping regulations: None. *

ferric-ammonium oxalate (iron-ammonium oxalate; ammonioferric oxalate)
 $(\text{NH}_4)_3\text{Fe}(\text{C}_2\text{O}_4)_3 \cdot 3\text{H}_2\text{O}$.

Properties: Green crystals. Soluble in water and alcohol; sensitive to light.

Derivation: By the interaction of ammonium binoxalate and ferric hydroxide.

Method of purification: Crystallization.

Grades: Technical; C. P.

Containers: 1-lb bottles; drums.

Use: Blue print photography.

Shipping regulations: None. *

ferric-ammonium sulfate (iron-ammonium sulfate; ferric ammonium alum; ammonio-ferric sulfate) $\text{FeNH}_4(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$.

Properties: Lilac to violet; efflorescent crystals. Soluble in water; insoluble in alcohol.

Derivation: By mixing solutions of ferric sulfate and ammonium sulfate, followed by evaporation and crystallization.

Method of purification: Recrystallization.

Grades: Technical; C. P.

Containers: Bottles; jars; barrels.

Uses: Medicine; analytical chemistry; textile dyeing (mordant).

ferric-ammonium tartrate (ammonium-iron tartrate; iron-ammonium tartrate).

Properties: Reddish-brown scales. Transparent. Sweet taste. Soluble in water; insoluble in alcohol.

Use: Medicine.

ferric arsenate $\text{FeAsO}_4 \cdot 2\text{H}_2\text{O}$.

Properties: A green or brown powder.

Insoluble in water; soluble in dilute mineral acids.

Use: Insecticide.

Shipping regulations: Poison, class B.

Poison label. *

ferric arsenite. A basic salt of variable composition.

Properties: Brownish-yellow powder. Soluble in acids; insoluble in water.

Uses: Combined with ammonium citrate (ferric ammonium citrate) (q. v.) and used in medicine.

Shipping regulations: Poison, class B.

Poison label. *

ferric benzoate (iron benzoate) $\text{Fe}_2(\text{OCC}_6\text{H}_5)_6$.

Properties: Brown powder. Slightly soluble in water, alcohol, and ether.

Derivation: By the interaction of ferric hydroxide and benzoic acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Boxes; glass bottles.

Use: Medicine.

Shipping regulations: None. *

ferric bichromate. See ferric dichromate.

ferric bromide (ferric tribromide; ferric sesquibromide; iron bromide) FeBr_3 .

Properties: Dark-red, deliquescent crystals. Soluble in water, alcohol, and ether.

M. p., sublimes.

Derivation: By the action of bromine on iron filings.

Method of purification: Crystallization.

Grades: Technical.

Containers: Boxes; glass bottles. Keep cool, well closed, and protected from light.

Uses: Medicine; analytical chemistry; bromine salts.

Shipping regulations: None. *

ferric cacodylate $\text{Fe}[(\text{CH}_3)_2\text{AsO}_2]_3$.

Properties: Yellowish-brown powder; odorless; poisonous. Moderately soluble in cold water, more so in hot water, less so in alcohol.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Use: Medicine.

Shipping regulations: None.*

ferric chloride, anhydrous (ferric trichloride; ferric perchloride, ferric sesquichloride; iron chloride, iron sesquichloride, iron trichloride, flores martis; iron perchloride, molybite) FeCl_3 .

Properties: Black-brown solid; sp. gr. 2.8, m. p. about 300°C ; very soluble in water, alcohol and glycerol.

Derivation: Action of chlorine on ferrous sulfate or chloride.

Grades: Anhydrous 96%, 42° Bé solution, photographic and sewage grades.

Containers: (Solid) barrels, (solution) carboys; tank cars.

Uses: Coagulant for sewage and industrial wastes, also in glycerin manufacture, in etching copper in photoengraving, as a mordant, and to produce decorative surface effects on ceramics. Also an oxidizing, chlorinating and condensing agent, disinfectant, pigment, medicine; feed additive.

ferric chloride hydrate $\text{FeCl}_3 \cdot 6\text{H}_2\text{O}$.

Properties: Orange-yellow very deliquescent crystals. M. p. 37°C , b. p. 280°C , decomposes to yield hydrochloric acid if exposed to moist air or light.

Uses: See ferric chloride, anhydrous.

ferric chromate (iron chromate) $\text{Fe}_2(\text{CrO}_4)_3$.

Properties: Yellow powder, soluble in acids, insoluble in water and alcohol.

Derivation: By adding sodium chromate to a solution of a ferric salt.

Grades: Technical.

Containers: Wooden kegs; fiber drums.

Uses: Metallurgy, ceramics (color), paint pigment.

Shipping regulations: None.*

ferric citrate (iron citrate) $\text{FeC}_4\text{H}_5\text{O}_7 \cdot 3\text{H}_2\text{O}$.

Properties: Reddish-brown scales. Keep away from light. Soluble in water, insoluble in alcohol.

Derivation: By the action of citric acid on ferric hydroxide, and crystallization.

Containers: Amber-glass bottles, cans, drums.

Uses: Medicine; blueprint paper.

Shipping regulations: None.*

ferric dichromate (iron dichromate; ferric bichromate) $\text{Fe}_2(\text{Cr}_2\text{O}_7)_3$.

Properties: Reddish-brown granules. Soluble in water and acids.

Derivation: By heating aqueous chromic acid and moist ferric hydroxide.

Containers: Wooden kegs, fiber drums.

Grades: Technical.

Use: Preparation of pigments.

ferric dimethyldithiocarbamate. See ferbam.

ferric ethylhexoate. See soaps, metallic.

ferric ferrocyanide (iron ferrocyanide; Prussian Blue). Blue pigment described under iron blues (q. v.).

ferric fluoride (iron fluoride) FeF_3 .

Properties: Green crystals; sp. gr. 3.18;

soluble in acids; soluble in water.

Grades: Technical.

Use: Ceramics (porcelain, pottery).

ferric glycerophosphate (iron glycerophosphate) $\text{Fe}_2[\text{C}_3\text{H}_5(\text{OH})_2\text{PO}_4]_3 \cdot x\text{H}_2\text{O}$.

Properties: Yellowish scales, odorless and nearly tasteless; soluble in water; insoluble in alcohol.

Grades: Technical.

Containers: Glass bottles; drums.

Use: Pharmaceutical.

Shipping regulations: None.*

ferric hydrate. See ferric hydroxide.

ferric hydroxide (ferric hydrate; iron hydroxide, iron hydrate; iron oxide, hydrated; ferric oxide, hydrated) $\text{Fe}(\text{OH})_3$.

Properties: Brown flocculent precipitate which dries to the oxide; sp. gr. 3.4-3.9; m. p., loses water below 500°C , soluble in acids; insoluble in water, alcohol and ether.

Derivation: Addition of ferrous sulfate solution to ammonia solution.

Grades: Technical, C. P.

Containers: 1-lb bottles, wooden barrels.

Uses: Pharmaceutical preparations; water purification, manufacturing pigments; rubber pigment, antidote for arsenic poisoning.

Shipping regulations: None.*

ferric hypophosphite (iron hypophosphite) $\text{Fe}(\text{H}_2\text{PO}_2)_3$.

Properties: White or grayish-white powder; odorless, tasteless. Caution: Explosion may occur if triturated or heated with nitrates, chlorates or other oxidizing agents. Slightly soluble in water; more so in boiling water.

Containers: Bottles; drums.

Use: Medicine.

Shipping regulations: None.*

ferric malate (iron malate) $\text{Fe}_2(\text{C}_4\text{H}_4\text{O}_5)_3$.

Properties: Brown, hygroscopic crystals. Keep well stoppered. Soluble in water and alcohol.

Derivation: By the interaction of ferric hydroxide and malic acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Amber-glass bottles.

Use: Medicine.

Shipping regulations: None.*

ferric naphthenate

Properties: A metallic soap.

Derivation: Fusion method, by heating naphthenic acids with the metallic oxide.

Containers: Drums.

Uses: Conditioning and waterproofing agent, sludge preventative, fungicide and paint drier.

ferric nitrate (iron nitrate) $\text{Fe}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$.

Properties: Violet crystals; soluble in water, and alcohol, decomposed by heat.

Derivation: By the action of concentrated nitric acid on scrap iron or iron oxide, and crystallizing.

Grades: Technical; C. P.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Containers:** 1-, 5-lb bottles.
Uses: Dyeing (mordant for buffs and blacks); medicine; tanning; analytical chemistry.
Fire hazard: Dangerous.
Shipping regulations: Oxidizing material.
Yellow label.*
- ferric octoate.** See soaps, metallic.
- ferric oleate** (iron oleate) $\text{Fe}(\text{C}_{18}\text{H}_{33}\text{O}_2)_3$.
Properties: Brownish-red lumps. Soluble in alcohol, ether, and acids; insoluble in water. See also soaps, metallic.
- ferric oxalate** $\text{Fe}_2(\text{C}_2\text{O}_4)_3$.
Properties: Pale-yellow amorphous scale or powder; odorless; decomposes on heating to 100°C. Soluble in water and acids; insoluble in alkali.
Grades: Technical; C. P.
Containers: 50-lb drums.
Uses: Catalyst in making oxygen, silvertone photographic printing papers.
- ferric oxide** (ferric oxide, red, iron oxide; red iron trioxide; iron sesquioxide; ferric trioxide) Fe_2O_3 . See also iron oxide reds.
Properties: Dense, dark-red powder or lumps, sp. gr. 5.12-5.24; m. p. 1565°C, soluble in acids, insoluble in water.
Derivation: (a) Found in nature as hematite ore (see hematite), (b) by calcining ferrous sulfate or oxalate; (c) by dehydrating ferric hydroxide, (d) by-product in some industries.
Grades: Technical, 99.5% pure.
Containers: 100-lb kegs, 300-, 350-, 450- and 500-lb barrels; fiber drums; 800-lb casks.
Uses: Metallurgy, gas purification; paint pigment, polishing compounds; pigment in rubber products, mordant in dyeing textiles; laboratory reagent; catalyst in chemical processes, in medicine; feed additive, magnetic tapes in electronics.
Shipping regulations: None.*
- ferric oxide, hydrated.** See ferric hydroxide.
- ferric oxide, red.** See ferric oxide.
- ferric oxide, yellow.** Impure ferric oxide (water and calcium sulfate are the usual impurities). See iron oxide yellows.
 Natural hydrated yellow iron oxide (limonite) is sometimes referred to as yellow ferric oxide.
- ferric perchloride.** See ferric chloride.
- ferric phosphate** (ferric phosphate, insoluble, iron phosphate) $\text{FePO}_4 \cdot 2\text{H}_2\text{O}$.
Properties: Yellowish-white powder. Insoluble in water, soluble in acids; sp. gr. 2.87.
Derivation: By adding a solution of sodium phosphate to a solution of ferric chloride. The product is filtered and then dried.
Grades: Technical; C. P.
Containers: Drums.
Uses: Medicine; fertilizers; feed additive.
Shipping regulations: None.*
- ferric phosphate, soluble** (ferric phosphate with sodium citrate).
Properties: Bright green crystals; odorless; stable in air; affected by light; soluble in water; insoluble in alcohol.
Derivation: By adding sodium phosphate to ferric citrate.
Grades: N. F. XI; technical; C. P.
Caution: Protect from light.
Use: Medicine.
Shipping regulations: None.*
- ferric-potassium citrate** (iron-potassium citrate).
Properties: Brown scales. Hygroscopic. Odorless. Contains 16% (approx.) iron. Soluble in water; insoluble in alcohol.
Caution: Keep well closed.
Use: Medicine.
- ferric potassium oxalate** $\text{K}_3\text{Fe}(\text{C}_2\text{O}_4)_3 \cdot 3\text{H}_2\text{O}$.
Properties: Emerald-green, monoclinic crystals, sensitive to light. Soluble in water; very slightly soluble in alcohol.
Containers: Drums.
Use: Medicine.
- ferric-potassium sulfate** (iron-potassium sulfate, iron alum) $\text{FeK}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$.
Properties: Pale violet crystals. Soluble in water, insoluble in alcohol; sp. gr. 1.806.
Derivation: By mixing solutions of potassium sulfate and ferric sulfate and crystallizing.
- ferric potassium tartrate.** See iron potassium tartrate.
- ferric pyrophosphate** (iron pyrophosphate) $\text{Fe}_4(\text{P}_2\text{O}_7)_3 \cdot x\text{H}_2\text{O}$.
Properties: Yellowish-white powder; insoluble in water, soluble in dilute acid. 24% Fe minimum. Not to be confused with ferric pyrophosphate soluble.
Containers: Drums.
Uses: Source of nutritional iron and for enrichment of foods not subject to rancidity.
Shipping regulations: None.*
- ferric pyrophosphate, soluble.**
Properties: Apple-green crystals; insoluble in water; insoluble in alcohol. Protect from light.
Derivation: By adding sodium pyrophosphate to ferric citrate.
Containers: 225-lb drums.
Use: Medicine; feed additive.
- ferric resinate** (iron resinate).
Properties: Reddish-brown powder; soluble in ligroin, carbon disulfide, ether, oil of turpentine, slightly soluble in alcohol; insoluble in water.
Containers: Drums.
Use: Drier (paints, varnish). See also soaps, metallic.
- ferric salicylate** (iron salicylate).
Properties: Violet-gray powder. Variable composition. Caution! Keep away from light! Slightly soluble in water.
Use: Medicine.
- ferric sesquibromide.** See ferric bromide.
- ferric sesquichloride.** See ferric chloride.
- ferric sesquioxide.** See ferric oxide.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ferric sesquisulfate. See ferric sulfate.

ferric silicate (iron silicate). Light-brown powder. Decomposed by hydrochloric acid. Insoluble in water.

ferric-sodium citrate (iron-sodium citrate).

Properties: Light-brown scales. Soluble in water.

Use: Medicine.

ferric sodium oxalate (iron-sodium oxalate)

Properties: Emerald-green crystals; decomposed by heat or light; soluble in water and alcohol.

Derivation: By the interaction of sodium acid oxalate and ferric hydroxide.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles; drums.

Caution: Protect from light.

Uses: Photography; blueprinting.

ferric stearate (iron stearate) $\text{Fe}(\text{C}_{18}\text{H}_{35}\text{O}_2)_3$.

Properties: Light-brown powder; soluble in alcohol and ether; insoluble in water.

Derivation: By the interaction of solutions of ferric sulfate and sodium stearate.

Grades: Technical.

Containers: Wooden kegs; fiber drums.

Use: Varnish driers. See also soaps, metallic.

Shipping regulations: None. *

ferric subsulfate. See ferric sulfate, basic.

ferric succinate (iron succinate)

Properties: Reddish-brown powder, insoluble in cold water; partly decomposed by hot, forming a more basic salt, soluble in dilute acids.

Derivation: By addition of ferric chloride to a succinate solution.

Use: Medicine.

Caution: Protect from light.

Shipping regulations: None. *

ferric sulfate (iron sulfate; ferric trisulfate; iron tersulfate; iron sesquisulfate; ferric sesquisulfate; iron persulfate)

Properties: Yellow crystals or grayish-white powder. Soluble in water. Sp. gr.

(a) 3.097, (b) 2.0-2.1; m. p., decomposes.

Derivation: By adding sulfuric acid to ferric hydroxide.

Impurities: Ferrous sulfate; water; sulfuric acid.

Grades: Technical; C. P.; partly hydrated.

Containers: Bottles; wooden barrels; bags.

Caution: Keep well closed and protected from light.

Uses: Pigments; medicine; reagent in analytical chemistry; iron alum manufacture, etching aluminum; disinfectant; textiles, (dyeing and calico printing); water purification; soil conditioner for alkaline soils.

Shipping regulations: None. *

ferric sulfate, basic (basic iron sulfate; ferric subsulfate; Monse's salt; iron subsulfate) $\text{Fe}_4\text{O}(\text{SO}_4)_5$.

Properties: Yellow, hygroscopic powder.

Derivation: By adding ferrous sulfate to hot dilute sulfuric and nitric acids and boiling until all the nitric acid is driven off and filtering if necessary.

Grades: Technical.

Caution: Keep well closed.

Shipping regulations: None. *

ferric tallate. See soaps, metallic.

ferric tannate (iron tannate; iron gallotannate)

Properties: Dark-brown or bluish black powder, variable composition. Soluble in alkalis, insoluble in water, alcohol and ether; soluble in dilute acids.

Derivation: By the interaction of ferric acetate and tannic acid solutions.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None. *

ferric tribromide. See ferric bromide.

ferric trichloride. See ferric chloride.

ferric trioxide. See ferric oxide.

ferric trisulfate. See ferric sulfate.

ferric valerate $\text{Fe}_2(\text{C}_5\text{H}_9\text{O}_2)_2(\text{OH})_4$.

Properties: Brick-red powder with valeric odor; soluble in alcohol; decomposed by boiling water.

Derivation: Interaction of sodium valerate and ferric sulfate in solution.

Use: Medicine.

Caution: Keep tightly closed and protected from light.

Shipping regulations: None. *

ferric vanadate (iron metavanadate) $\text{Fe}(\text{VO}_3)_3$.

Properties: Grayish-brown powder; soluble in acids, insoluble in water and alcohol.

Derivation: By adding a solution of a ferric salt to the liquor obtained by leaching vanadium ores with caustic soda solution or by lixiviating the slags obtained when vanadium ores are fused with soda ash, etc.

Grades: Technical.

Containers: Wooden kegs; fiber drums.

Use: Metallurgy.

Shipping regulations: None. *

"Ferri-Floc." ⁹³ Trade name for partially hydrated ferric sulfate.

Properties: Contains a minimum of 20.5% water soluble-ferric ion; granular, free-flowing and stable.

Containers: 100-lb polyethylene lined bags; 200-lb drums; bulk.

Uses: Coagulant and flocculating agent for water, sewage and waste disposal; pickling agent for copper and brass alloys; fertilizer nutritional trace elements.

ferrimolybdate (molybdic ochre; iron molybdate; molybdate) $\text{Fe}_2(\text{MoO}_4)_3 \cdot 8\text{H}_2\text{O}$.

Natural hydrated molybdate of iron.

Properties: Color yellow; luster silky to earthy, usually occurs as fibrous crusts.

Occurrence: New Mexico, Arizona, California, Nevada, Pennsylvania.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ferrite.

1. Iron which, in pig iron or steel, has not combined with carbon to form cementite (q. v.). It exists in alpha, beta, gamma, and delta forms, which vary in magnetism and ability to dissolve cementite. See also carbon, combined; carbon, graphitic; pearlite; cementite.
2. A compound of ferric oxide with a strong basic oxide, as sodium ferrite NaFeO_2 . See also ferrites.
3. Name applied to magnetic iron oxides (ferromagnetic oxides) having a definite crystal structure (spinel) and the formula $\text{M}^{++}\text{Fe}_2^{+++}\text{O}_4$, in which the divalent metal may be any which fits into the crystal lattice, often iron, nickel, zinc, or manganese. Magnetite itself, FeFe_2O_4 , is a ferrite. The magnetic properties vary according to the divalent atom present, and ferrites are now tailored for their desired effect, as nickel aluminum ferrite:

$$\text{Ni}_{0.86}^{++}\text{Cu}_{0.1}^{++}\text{Mn}_{0.02}^{++}\text{Co}_{0.02}^{++}\text{Al}_{0.3}^{++}\text{Fe}_{1.7}^{+++}\text{O}_4$$

Uses: In electronics as rectifiers, on memory or record tapes, and for permanent magnets; in television, radio, radar, and in computer and missile guidance systems.

ferro-alloys. Alloys of iron with some element other than carbon used as a vehicle for introducing such an element into the manufacture of steel. The element may alloy with the steel by solution or as the carbide, neutralize the harmful impurities by combining with them and separating from the steel as flux or slag before solidification. See specific ferro-alloys.

ferroboron. A ferro-alloy averaging 16.2% boron used as hardening agent in special steels. It also is an efficient deoxidizer. Boron steel is used in controlling the operating rate of the uranium-graphite piles used to produce plutonium.

"Ferrocabo." ²⁸⁰ Trademark for briquetted or granular silicon carbide.

Uses: As a cupola addition in the production of gray iron, or as a ladle addition to steel. It disintegrates into its component elements and acts as a powerful deoxidizer and graphitizer. Machinability and strength of the iron or steel are increased with no loss of hardness.

ferrocene (dicyclopentadienyliron) $(\text{C}_5\text{H}_5)_2\text{Fe}$. A coordination compound of ferrous iron and cyclopentadiene in which the organic portions have typically aromatic chemical properties. See also dicyclopentadienyl metal compounds.

Properties: Orange, crystalline solid, camphor-like odor, m. p. 173-174°C, resists pyrolysis at 400°C; resistant to ultraviolet light. Insoluble in water, slightly soluble in benzene, ether and petroleum ether.

Derivation: From ferrous chloride and cyclopentadiene sodium.

Uses: Additive to jet fuels and furnace oils to improve efficiency of combustion and eliminate smoke; antiknock additive for gasoline; suggested for coating for missiles and satellites; high temperature lubricant; curing agent for rubber and silicone resins; intermediate for high temperature polymers; ultraviolet absorber.

ferrocenes. See dicyclopentadienyl metal compounds.

ferrocerialum. See misch metal.

ferrocholine (iron choline citrate chelate) $\text{C}_{11}\text{H}_{20}\text{FeNO}_9$.

Properties: Greenish-brown to reddish-brown amorphous solid, soluble in water, yielding a stable solution, soluble in acid and alkaline media.

Derivation: Prepared by the reaction of choline dihydrogen citrate with ferric hydroxide.

Grade: N. N. D.

Use: Medicine.

ferrochrome. See ferrochromium.

ferrochromium (ferrochrome). An alloy composed principally of iron and chromium used as a means of adding chromium to steels. It is available in several classifications and grades, generally containing between 60-70% chromium.

Low-carbon ferrochromium: Used for low-carbon high-chromium steels such as stainless steels. Available in six grades of carbon content from 0.03-2.00%. Melting range from 2500-3100°F for 0.03% carbon to 2340-2460°F for 2% carbon.

High-carbon ferrochromium. Used for making medium and high-carbon steels of relatively low chromium content. Available in several grades having 65-70% chromium and 4-9% carbon. Melting range 2230-2790°F.

High-nitrogen ferrochromium: Ferrochromium with nitrogen content about 1%. Available in high and low-carbon grades.

Foundry grade ferrochromium: An alloy especially designed for the ladle addition of chromium to cast iron. May also be used for steel. Contains 6-9% silicon, and 1-7% carbon.

Special ferrochromiums: There are several alloys designed for ladle additions, such as the SM ferrochromiums, which contain 4-6% each of manganese and silicon. Available in low and high-carbon grades.

These alloys are distinguished by the ease with which they dissolve in liquid steel.

The ferrochromiums are available in a variety of crushed sizes and lumps up to 75 pounds.

See chromium iron alloys, steel, stainless, and iron, stainless.

ferroconcrete. See concrete.

ferroelectric. A crystalline solid material such as barium titanate, monobasic potassium phosphate or potassium-sodium tartrate (Rochelle salts) that over certain limited temperature ranges has a natural

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

or inherent deformation (polarization) of the electrical fields or electrons associated with the atoms and groups in the crystal lattice. This results in the development of positive and negative poles and a consequent "direction" of polarization, which can be reversed when the crystal is exposed to an external electric field. Ferroelectric crystals are internally strained and as a consequence show unusual piezoelectric and elastic properties that result in uses in capacitors and transducers where external physical forces are to be related to electrical phenomena.

ferroferric oxide. See iron oxide, black.

"Ferrolon." ²³² Brand name for a series of organic sequestering agents used in textile applications.

ferromagnesite. An iron-bearing variety of magnesite (q.v.) used for refractories owing to its ability to bond under heat.

ferromanganese. An alloy consisting principally of iron and manganese used as a vehicle for adding manganese in the manufacture of steel. It contains between 78-90% manganese, depending on the grade. Available in three classifications:

Standard ferromanganese: Used on all grades of steel including Bessemer, open hearth and electric for forgings, rolled products, and castings. Melting range 1960-3210°F. Typical analysis: manganese 78-82%, iron 12-16%; carbon 6-8%; silicon 1% (max), phosphorus 0.3% (max), sulfur 0.05% (max).

Low-carbon ferromanganese: Used for adding manganese to extremely low-carbon steels and alloys, such as stainless steels in which the carbon often must be kept below 0.1%. Available in several grades with carbon ranging from 0.07% to 0.75% (max) and upper limits on silicon and phosphorus of 1% and 0.06 to 0.2% respectively. Melting range 2190 to 2220°F.

Medium-carbon ferromanganese: Used for ordinary low-carbon steels. Sold in one grade. Manganese 80-85%, carbon 1.5% (max); silicon 1.5% (max).

Ferromanganese is available in ground, crushed and lump sizes ranging from 80 mesh to 75-lb lumps, suitable for ladle or furnace addition.

See manganese steel.

ferromolybdenum. An alloy composed largely of iron and molybdenum used as a means of adding molybdenum in the manufacture of steel. Engineering steels rarely contain more than 1% molybdenum, stainless steels may contain 3% and tool steels can contain as much as 10% molybdenum. Ferromolybdenum is available in several grades in which molybdenum ranges from 55% to 75% and the maximum carbon content is either 0.10%, 0.60%, or 2.50%. Ferromolybdenum is generally added in the furnace, since it does not oxidize under steel-making conditions. M.p. 2965°F (approx). Available in crushed sizes up to one inch.

ferron. See loretin.

ferrophosphorus. Alloys of iron and phosphorus used in the steel industry for adjustment of phosphorus content of special steels; particularly useful in preventing thin sheets from sticking together when rolled and annealed in bundles. Produced in two grades: (a) 18% phosphorus; (b) 25% phosphorus. The 25% grade has advantages incident to one-third less alloy addition to the molten steel.

Containers: Bulk and in casks.

"Ferro-Sequels." ⁵⁷ Trademark for iron preparation in sustained release dosage form.

ferrosilicon. An alloy of iron and silicon used to add silicon to steel and iron. Small quantities of silicon deoxidize the iron and larger amounts impart special properties. (See silicon steels.) It is also used in a process for producing metallic magnesium. (See Pidgeon process.) Ferrosilicon is available in six grades:

15% ferrosilicon: Available both for blast furnace and electric furnace. Used as a deoxidizer and cleanser, and for blocking heats. Generally added in the furnace. The material supplied for electric furnace use is very low in phosphorus. Several grades range from 14-18% silicon. Typical analysis, silicon 14-18%; carbon 1% (max); phosphorus 0.05% (max); sulfur 0.04% (max). Melting range 2220-2250°F. Available in 50- and 100-lb bags.

25% ferrosilicon: Same uses and grades as 15% ferrosilicon, but contains 25% to 30% silicon. Melting range 2200-2400°F. Available crushed and in lump form.

50% ferrosilicon: Most widely-used grade as a deoxidizer and in production of killed and semikilled steels and for making high-silicon steels. Contains 46-52% silicon. Melting range 2210-2230°F. Available in various lump and crushed sizes.

75% ferrosilicon: Preferred for production of high-silicon steels because less cold alloy has to be added to the melt, and this grade of ferrosilicon generates heat when added to the molten steel, obviating the necessity for additional heating. This is a great advantage in producing steels with more than 2% silicon. Contains 74-79% silicon. Melting range 2200-2400°F. Furnished in various crushed and lump sizes.

85% ferrosilicon: Same comments as 75% ferrosilicon. Furnished in two grades, 80-85% silicon, and 85-90% silicon. Melting range 2200-2460°F. Supplied in crushed and lump sizes.

90-95% ferrosilicon: Same comments as 75% ferrosilicon. Melting range 2200-2520°F. In crushed and lump sizes.

Shipping regulations: Ferrosilicon containing between 45-70% silicon will give some evolution of poisonous gases when moisture is present, due to impurities, and is subject to stringent restrictions when being shipped by water.*

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ferrosilicon process for magnesium. See Pidgeon process.

ferroso-ferric oxide. See iron oxide, black.

"Ferro-Sour." ²⁴⁴ A proprietary product consisting of fluorine compounds.

Properties: White powder, sparingly soluble in water; neutralizing value 26.9 oz sodium bicarbonate per lb.

Containers: 150-lb and 300-lb net fiber drums.

Uses: Laundry sour, low cost iron-removing type.

Fire hazard: None.

Shipping regulations: None.*

ferrotitanium. An alloy composed principally of iron and titanium used to add titanium to steel. Three classifications are available.

Low-carbon ferrotitanium: Used in producing stabilized austenitic stainless steel. Reduces tendency for intergranular corrosion in areas adjacent to welds. Available with the following ranges of composition: titanium 20-45%, aluminum 3-7% (max); silicon 4-13% (max); carbon 0.1% (max).

High-carbon ferrotitanium and

Medium-carbon ferrotitanium: Used as deoxidizers and scavengers in steel in quantities such that almost no titanium remains in the steel. Ferrotitanium is a final deoxidizer in killed steels. It prevents segregation and helps control grain size. Titanium 15-20%, aluminum 1-2%, silicon 2-3%, carbon 6-8% (high carbon), 3-5% (medium carbon).

Ferrotitanium is furnished in various lump, crushed, and ground sizes. Special compositions for special applications are available.

"Ferrotone." ³³ Trade name for a phosphoric acid-base rust remover. Packaged in 6-gal carboys and 55-gal drums. Used for removal of rust, rust stains and scale from equipment and decorative surfaces as a replacement for hydrochloric, nitric and other strong fuming acids.

ferrotungsten. An alloy of iron and tungsten used as a means of adding tungsten to steel. See tungsten steels. Contain 70-80% tungsten and no more than 0.6% carbon. It is also available in special grades. Melting range 3000-5000°F. Despite high melting temperature, ferrotungsten dissolves readily in molten steel and addition is not difficult. Furnished in ground and crushed sizes up to one inch.

ferrous acetate (iron acetate)

Properties: Greenish crystals when pure and unexposed to air, usually partly brown from action of air, soluble in water and alcohol, oxidizes to basic ferric acetate in air.

Derivation: By the action of acetic acid or pyroligneous acid on iron, with subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical; C. P.

Containers: 1-lb bottles; wooden kegs.

Uses: Textile dyeing; medicine; dyeing leather black; wood preservative.

Shipping regulations: None.*

ferrous ammonium sulfate (Mohr's salt; iron-ammonium sulfate)

Properties: Light-green crystals. Soluble in water; insoluble in alcohol. Sp. gr. 1.865.

Derivation: By mixing solutions of ferrous sulfate and ammonium sulfate, followed by evaporation and subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical; C. P.

Containers: Wooden kegs, glass bottles.

Caution! Keep well closed and protected from light.

Uses: Medicine; analytical chemistry; metallurgy.

Shipping regulations: None.*

ferrous arsenate (iron arsenate)

Properties: Green, amorphous powder.

Insoluble in water; soluble in acids.

Derivation: By the interaction of solutions of sodium arsenate and ferrous sulfate.

Grades: Technical.

Containers: Boxes; glass bottles.

Uses: Medicine, insecticide.

Shipping regulations: Poison, class B.

Poison label.*

ferrous bromide (iron bromide)

Properties: Green crystalline powder; very deliquescent. Soluble in water and alcohol, sp. gr. 4.636, m. p. 27°C.

Derivation: By the action of bromine on iron filings.

Method of purification: Crystallization.

Containers: Glass bottles.

Caution! Keep tightly closed and protected from light.

Use: Medicine.

Shipping regulations: None.*

ferrous chloride (iron chloride, iron dichloride iron protochloride). (a) FeCl_2 ; (b)

Properties: Greenish-white crystals. Soluble in alcohol and water; sp. gr. (a) 2.988; (b) 1.93.

Derivation: By the action of hydrochloric acid on an excess of iron, with subsequent crystallization.

Grades: Technical; C. P.

Containers: 1-, 5-lb bottles; 100-lb kegs; 200-lb barrels, 500-lb drums.

Caution! Keep tightly closed and protected from light.

Uses: Mordant in dyeing; metallurgy; pharmaceutical preparations, starting point in manufacture of ferric chloride.

Shipping regulations: None.*

ferrous fluoride (iron fluoride) $\text{FeF}_2 \cdot 8\text{H}_2\text{O}$. (Also known: FeF_2 and $\text{FeF}_2 \cdot 4\text{H}_2\text{O}$.)

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Green crystals. Soluble in acids, slightly soluble in water; insoluble in alcohol and ether; sp. gr. 4.09 (anhydrous).

Grades: Technical.

Containers: Boxes.

Use: Ceramics.

Shipping regulations: None.*

ferrous fumarate $\text{FeC}_4\text{H}_2\text{O}_4$. Anhydrous salt of a combination of ferrous iron and fumaric acid. A stable, odorless, substantially tasteless, reddish-brown anhydrous powder. Contains 33% iron by weight. Does not melt at temperatures up to 280°C .

Containers: Fiber drums, 25-lb and 100-lb, Levepak drums, 400-lb.

Uses: Medicine, dietary supplement.

Shipping regulations: None.*

ferrous gluconate (iron gluconate)

$\text{Fe}(\text{C}_6\text{H}_{11}\text{O}_7)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Yellowish gray or pale greenish yellow, fine powder or granules with slight odor. Solution (1 in 20) is acid to litmus. Soluble in water and glycerin; insoluble in alcohol.

Method of purification: Crystallization.

Grades: Pharmaceutical, U.S.P. XVI.

Containers: Cans; fiber drums.

Uses: Medicine, feed additive.

Shipping regulations: None.*

ferrous hydroxide $\text{Fe}(\text{OH})_2$.

Properties: White or green amorphous powder which turns brown in air from oxidation to $\text{Fe}(\text{OH})_3$. Soluble in acids, soluble in presence of ammonium salts, insoluble in water.

ferrous iodide (iron iodide, iron protoiodide)

$\text{FeI}_2 \cdot 4\text{H}_2\text{O}$.

Properties: Crystalline, grayish-black masses. Soluble in water and alcohol.

Constants: Sp. gr. 2.873, m. p. 177°C .

Derivation: By the action of iodine on iron filings.

Grades: Technical.

Containers: 1-lb bottles; wooden barrels.

Caution! Keep tightly closed and protected from light.

Uses: Manufacture of alkali metal iodides; pharmaceutical preparations.

Shipping regulations: None.*

ferrous lactate (iron lactate)

$\text{Fe}(\text{C}_3\text{H}_5\text{O}_3)_2 \cdot 3\text{H}_2\text{O}$.

Properties: Greenish-white crystals, slight peculiar odor. Moderately soluble in water, slightly soluble in alcohol.

Derivation: By interaction of calcium lactate with ferrous sulfate or direct action of lactic acid on iron filings.

Containers: 1-lb bottles.

Caution! Keep well closed and protected from light.

Use: Medicine; dietary supplement.

ferrous magnesium sulfate (iron-magnesium sulfate) $\text{FeSO}_4 \cdot \text{MgSO}_4 \cdot 6\text{H}_2\text{O}$.

Properties: Greenish-white crystals. Soluble in water.

ferrous manganese sulfate (iron-manganese sulfate) $\text{FeMn}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$.

Properties: Yellowish-white powder. Soluble in hot water.

ferrous oxalate (iron oxalate) $\text{FeC}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$.

Properties: Pale yellow, odorless crystalline powder. Soluble in acids; insoluble in water. Sp. gr. 2.28. Releases carbon monoxide when heated.

Derivation: By the interaction of solutions of ferrous sulfate and sodium oxalate.

Grades: Technical; C. P.

Containers: 1-lb bottles; wooden kegs; boxes.

Uses: Medicine; photographic developer.

Shipping regulations: None.*

ferrous oxide (iron monoxide) FeO .

Properties: Black powder; sp. gr. 5.7; m. p. 1420°C . Insoluble in water; soluble in acid.

Derivation: Prepared from the oxalate by heating but the product contains some ferric oxide. (Caution: Poisonous carbon monoxide is released when ferrous oxalate is heated.)

ferrous phosphide (iron phosphide) Fe_2P .

A ferrophosphorus.

Properties: Bluish-gray powder. Soluble in mineral acids (decomposes), insoluble in water. Sp. gr. 6.56; m. p. 1290°C .

Grade: 24-26% phosphorus.

Containers: Barrels; bulk.

Uses: To increase iron and steel casting fluidity, prevent sheet steel sticking in rolling, give wire stiffness and better surface for drawing.

ferrous quinine citrate (iron-quinine citrate).

Properties: Greenish-yellow, thin scales; somewhat deliquescent in air. Slightly soluble in water.

Containers: Glass bottles.

Use: Medicine.

ferrous sulfate (iron sulfate, iron vitriol, green copperas; copperas, green vitriol, sal chalybis) $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$.

Properties: Greenish crystals or granules, often brownish-yellow in color from oxidation and efflorescence. Odorless; soluble in water, with saline taste; insoluble in alcohol.

Constants: Sp. gr. 1.89; m. p. 64°C ; pH (10% solution) 3.7.

Derivation: (a) A by-product from the pickling of steel and in many chemical operations.

(b) By the action of dilute sulfuric acid on iron. (c) Oxidation of pyrites in air, followed by leaching and treatment with scrap iron. (d) As by-product from ilmenite.

Method of purification: Recrystallization.

Grades: Technical, anhydrous, C. P., U. S. P. XVI.

Containers: Bottles, bags; barrels; bulk.

Uses: Water purification; source of other iron salts and oxides; fertilizer; feed additive; writing inks; pigments; medicine; textile industry; leather industry; photography; deodorizer; disinfectant; reagent in analytical chemistry; weed exterminator;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

indigo dyes; wood-preservative compositions; metallurgy (electrolytic iron; precipitating gold from its solutions; etching aluminum); process engraving and lithography; synthetic rubber.

Shipping regulations: None. *

ferrous sulfate, exsiccated (dried ferrous sulfate). Ferrous sulfate deprived of about six of its seven molecules of water of crystallization. Grayish-white powder, slowly soluble in water; insoluble in alcohol. Used in medicine instead of the regular sulfate in making pills (U. S. P. XVI).

ferrous sulfide (iron sulfide; iron protosulfide; iron sulfuret; iron monosulfide) FeS . Properties: Dark-brown or black metallic pieces, sticks or granules. Soluble in acids; insoluble in water.

Constants: Sp. gr. 4.75-5.40; m. p. 1179°C.

Derivation: By fusing iron and sulfur.

Impurities: Arsenic.

Grades: Technical; C. P.

Containers: 100-lb boxes, 500-lb kegs, 900-lb barrels.

Uses: The manufactured sulfide is used for generating hydrogen sulfide, ceramics, making other sulfides.

Shipping regulations: None. *

See also pyrite.

ferrovanadium. An iron-vanadium alloy used to add vanadium to steel. Vanadium appears in engineering steels to the extent of 0.1-0.25%, and in high speed steels to the extent of 1-2.5% or higher. See vanadium steels. Since vanadium oxidizes readily, it is usually added to the ladle for open-hearth steel, although it may be added to the furnace when the basic electric furnace is being used. Several grades are available.

Typical composition: Vanadium 35-55%, silicon 1.5-12%, carbon 0.2-3.5%.

Melting range 2700-2770°F. Furnished in a variety of lump, crushed, and ground sizes.

ferrozirconium alloys. See zirconium-ferro alloys.

ferruginous. Containing iron.

ferrum. Latin name for iron; hence the symbol Fe.

ferrum reductum. See iron, reduced.

fertile material. In nuclear technology, name given to any substance which is not capable of sustaining a chain reaction but which can be converted into a fissionable material in a nuclear reactor. Uranium 238 (converted to plutonium 239) and thorium 232 (converted to uranium 233) are fertile materials.

fertilizers, synthetic. Usually refers to mixed fertilizers, containing nitrogen, phosphorus and potassium (see N-P-K mixtures). However, fertilizers consisting of only one of these essentials are also used in very high volume, as ammonium nitrate, anhydrous ammonia, superphosphate, potassium sulfate.

"Fesolv." ⁴²⁸ Trademark for combination of fluorides containing antichlor.

Properties: Pale green, homogeneous, non-caking powder.

Use: For removal of iron and rust stains plus neutralizing in laundering.

Fessler compound. A combination of salts with flocculating properties similar to casein. Stated to be useful in removing undesirable copper and iron from wines.

fever bark. See alstonia.

F. F. A. Abbreviation for free fatty acid.

Used in describing specifications for fatty esters, glycerides, oils, etc.

FF black. Abbreviation for fine furnace black. See furnace black.

FGAN. Fertilizer grade ammonium nitrate, which see. It is used in blasting agents as well as fertilizers, because its coating of kieselsguhr and its prilled form make it safer to handle than the usual grades.

"Fiba-Weld." ³²⁸ Trademark for a series of water-soluble or dispersible textile finishing agents.

Fiba-Weld A: Antislip finish with fullness.

Fiba-Weld B: Softener used with Fiba-Weld A.

Fiba-Weld N: Antislip finish, rustling finish for taffeta.

Fiba-Weld PJ: Antislip not unduly building up hand.

fiberfill. A fiber which is designed specifically for use as a filling material in such products as pillows, comforters, quilted linings, furniture battings.

"Fiberfrax." ²⁸⁰ Trademark for ceramic fiber made from alumina and silica. Available in bulk as blown, chopped and washed; long staple; paper; rope; roving, blocks.

Properties: Retains properties to 2300°F and under some conditions used to 3000°F; light weight; inert to most acids and unaffected by hydrogen atmosphere; resilient.

Uses: High temperature insulation of kilns and furnaces; packing expansion joints, heating elements, burner blocks; rolls for roller hearth furnaces and piping; fine filtration; insulating electrical wire and motors; insulating jet motors; sound deadening.

"Fiberglas." ¹⁹¹ Trademark for a variety of products made of or with glass fibers or glass flakes including:

Insulating Woods: In batts, blankets, rolls and processed forms for insulating buildings, equipment and vehicles at high and low temperatures.

Mats and Rovings: Used for reinforcing organic and inorganic materials such as polyester and epoxy resins, bitumens, etc., to form boats, roofing materials or for protecting underground pipelines against corrosion.

Coarse Fibers: In the form of packs used for filtering gases or liquids as in heating and ventilating systems and chemical processes. Acoustical products: Sound absorbent

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

materials for acoustically treating residential, commercial and industrial buildings.

Yarns: Made by twisting and plying fine staple fibers or continuous filaments of glass which are fabricated on looms, braiders and other equipment standard in the textile industry. Also used as electrical insulation and as a chemically stable base for various coatings.

fibers, natural. Filaments, threads and bristles of animal or vegetable origin, used for paper, textiles, cordage, or brushes. The animal fibers, of which silk and wool are most important, consist essentially of protein chains and are relatively resistant to acids but easily degraded by alkalis or chlorine bleaches. The vegetable fibers (further classified below) consist essentially of cellulose chains and are relatively resistant to alkalis and chlorine bleaches but are degraded by acids. Vegetable fibers are classified according to source as follows:

1. Seed hairs: cotton, kapok.
2. Leaves (hard fibers): abaca, agave (cantala, henequen, sisal and istle).
3. Stems (soft or bast fibers): flax, hemp, jute, kenaf, ramie.

fibers, synthetic. Filaments, threads and bristles produced synthetically by converting a natural or synthetic raw material to liquid form, forcing this through small openings and immediately converting the resulting liquid thread to solid form. See acetate, rayon, glass fiber, nylon, saran, protein fibers, "Acrilan," "Dacron," "Dyneel," "Orlon," and "Vinyon HH."

"Fibertex." ²³⁶ Brand name for a fibrous material used as an additive to rotary drilling mud to prevent or restore lost circulation in gravelly, fractured, or creviced formations. Effective in most cases of lost circulation, except those taking place in caverns or extremely large crevices. Containers: Multiwall paper bags containing 40 lbs.

"Fibertuff." ¹¹ Trademark for glass-fiber reinforced polystyrene, supplied in rod-shaped pellets. Used for injection molding and characterized by increased rigidity and shock resistance.

"Fibra Flo." ²⁴⁷ Trademark for a line of filter aids comprised of physical mixtures in different proportions of either asbestos fiber and diatomite, asbestos fiber and cellulose fiber, or asbestos fiber alone. **Uses:** As a filter element pre-coating material making possible easier cleaning of elements after a filtration cycle; in special applications to obtain sharp or sparkling clarity.

"Fibrax." ⁵¹ Trademark for sodium-soap grease, a lubricant for plain and anti-friction bearings operating at moderate speeds under high temperatures or heavy loads or both. It seals bearings against

foreign matter, and the high viscosity base oil imparts adhesive properties.

"Fibrex." ¹⁶⁰ Trademark for a non-metallic, non-inductive wire especially designed for overhead power lines. It has extreme resistance to abrasion caused by swaying branches of trees.

fibrin. Generic name for a fibrous form of synthetic polymeric material, used for example as a binder material in the manufacture of textryl. See textryl.

fibrin, muscle. See syntonin.

fibrinogen. A sterile fraction of normal human plasma, dried from the frozen state. In solution it has the property of being converted into insoluble fibrin when thrombin is added.

Properties: White or grayish amorphous substance.

Grade: U. S. P. XVI.

Use: Medicine (blood plasma clotting factor).

fibroin. The fibrous material in silk, a scleroprotein containing glycine and alanine; light yellow silk-like mass. Insoluble in water; soluble in concentrated alkalis and concentrated acids.

fibrolite. See sillimanite.

fibrous silica. An extracted glass filament which has a very high silica content with traces of iron, calcium, and magnesium. The fibers can be produced in a batted form or spun into thread and woven into cloths, tapes, sleeveings, and other textile materials. Thermal and chemical properties are similar to those of vitreous silica.

ficin. A proteolytic enzyme hydrolyzing casein, meat, hide powder, edestin, fibrin, liver, and other protein-like material.

Properties: Buff to cream-colored powder with an acid odor; very hygroscopic; partially soluble in water; insoluble in the usual organic solvents.

Source: Fig latex or sap. Commercially prepared by filtering and drying the latex.

Use: Brewing, cheese, meat, leather, and textile industries.

"Filmcol." ¹²⁵ Trademark for an authorized proprietary ethyl alcohol solvent. "Filmcol" is particularly useful in the film processing, photographic, textile, rubber latex and printing ink industries. The absence of hydrocarbon solvent in the denaturant formula reduces deterioration of rubber press rollers in printing and permits use of "Filmcol" where the presence of even small volumes of hydrocarbon solvents might prove detrimental. In chemical manufacture, "Filmcol" may also be used as a reaction medium for purifying and recrystallizing operations. Other uses include solvent for shellac and spirit varnishes, cleaning compounds, adhesives and latent solvent for nitrocellulose lacquers and other celluloses.

Authorized composition: Specially denatured

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

alcohol No. 1 (190 proof) 100 parts by volume; isopropyl alcohol, 10 parts by volume; methyl isobutyl ketone, 1 part by volume.

Typical properties: Reid vapor pressure 2 psi (100°F); lbs/gal 6.777 (60°F); mild residual odor.

Containers: 55-gal non-returnable drums; 6000 to 10000-gal tank cars; tank trucks.

Warning: Flammable; poisonous if swallowed. Avoid prolonged or repeated contact with skin. Protect eyes against splashes and maintain vapor concentrations at comfort levels.

Shipping regulations: Flammable liquid. Red label.*

"**Filmex**,"¹⁹² Trademark for a proprietary denatured alcohol solvent, subject to government regulations.

Properties: Colorless liquid; sp. gr. 0.81345 (60°F); nonvolatile; infinitely soluble in water; boiling range 77.4-79.3°C, flash point (Tag open cup) 64°F; apparent proof 191.20 (60°F).

Containers: 5- and 55-gal drums; tank cars; tank wagons.

Uses: Cleaning rubber rolls, plates, and type in printing industry; formulating printing inks; drying photographic films.

Hazards: Flash point under 80°F.

Shipping regulations: Flammable liquid. Red label.*

"**Filmfast**,"⁵⁰ Trademark for a spray compound for improving distribution of insecticidal and fungicidal sprays.

filter alum. See aluminum sulfate.

"**Filter-Cel**," See "Celite" Filter Aids.

filter sand. Sand used to filter sediment and suspended matter from water.

filtration. The process of separating suspended solids from their liquid by forcing the latter through a porous medium.

"**Filtrol**,"²¹⁷ Brand name of acid activated clays used as decolorizing adsorbents and catalysts.

Grades: Various, depending upon use.

Particle size: 85-95% through 200-mesh.

Containers: 50-lb multi-ply paper bags.

Uses: Adsorption of color and other impurities from petroleum, animal, vegetable and marine oils, and fats and waxes; re-refining of used crankcase and other industrial oils; petroleum cracking catalyst, catalyst.

finer. The portion of a powder composed of particles which are smaller than a specified size (MPA definition, MPA Standard 9-50T).

finishing compounds. Substances used in the final or finishing stages of manufacture of a product, usually textiles and leather, to make them suitable and marketable for specific purposes. Such compounds contain materials that impart softness, flexibility, stiffness, color, water and fire resistance, etc.

fir, balsam. See Canada balsam.

fire-brick. See brick, fire-.

fire-clay. Clays containing only small amounts of fluxing impurities, but high in silica, alumina and water, and, therefore, capable of withstanding high temperatures. They are usually light in color, ranging from gray to yellowish-red and exhibit wide variation in both chemical and physical properties. Some authorities believe no clay should be classed as a fire-clay unless its fusion point exceeds 1600°C.

They are usually grouped as plastic or flint. There are, however, some having properties which may be considered as intermediate and these are usually referred to as either semi-plastic or semi-flint.

The plastic clays are usually distinguished by a lower ratio of alumina to silica than the flint clays and also contain a higher percentage of impurities together with a lower fusion point. They break down readily on exposure to weather and quickly develop good bonding power. The flint clays are hard and are better able to resist weathering. Plasticity can only be developed in them either by considerable grinding and tempering or by prolonged weathering. They are highly refractory. Semi-plastic and semi-flint clays often possess a high degree of refractoriness sometimes approaching that of the flint clays.

Occurrence: United States (Missouri, Pennsylvania, Maryland, Ohio, Kentucky, New Jersey, Colorado).

Uses: Fire-brick, retorts, furnace linings, crucibles, terra cotta, glass-factory pots and tanks.

fire foam. A blanket of foam composed of alumina and carbon dioxide; produced by interaction of a solution of alum and one of sodium carbonate or sodium silicate and glue.

"**Firefrax**,"²⁸⁰ Trademark for a group of refractory cements made from kaolin or fire-clay base materials for applications where aluminum silicate cements are best suited.

No. 1. Air-setting super-refractory cement.

Application range is from 60-3000°F.

Containers: Shipped in plastic form in water-tight metal drums of 40-, 100-, and 350-lb capacities.

Uses: Laying and repairing fireclay and silica brick work; bond for crushed fire-brick or ganister for patching furnace linings and for making rammed-up or monolithic linings, patching material for by-product coke ovens.

No. 2. Heat-setting refractory cement. Application range is from 2000-2750°F.

Containers: Shipped dry in 100-lb bags.

Uses: Laying and patching fireclay and silica brick in applications subjected to moderate temperature conditions, and as a wash for small pouring ladles in the non-ferrous foundry.

"**Firemaster**" BP4A.⁴²⁶ Trademark for tetrabromobisphenol-A, $C_{15}H_{12}Br_4O_2$.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: An off-white crystalline solid; m. p. 180 to 184°C.

Grade: Technical.

Containers: Fiber drums.

Uses: Flame retardant for plastics.

Shipping regulations: None.*

"Firemaster" PB5. ⁴²⁶ Trademark for pentabromophenol, C_6Br_5OH .

Properties: A lavender crystalline solid; m. p. 225 to 226°C.

Grade: Technical.

Containers: Fiber drums.

Uses: Flame retardant for plastics.

Shipping regulations: None.*

"Firemaster" PHT4. ⁴²⁶ Trademark for tetrabromophthalic anhydride, $C_8Br_4O_3$.

Properties: A pale yellow crystalline solid, m. p. 279.5-280.5°C.

Grade: Technical.

Containers: Fiber drums.

Uses: Flame retardant for plastics.

Shipping regulations: None.*

"Firemaster" T23P. ⁴²⁶ Trademark for tris-(2,3-dibromopropyl) phosphate, $(CH_2BrCHBrCH_2O)_3PO$.

Properties: A viscous, pale yellow liquid, density, 18.5 lb/gal; refractive index, 20°C: 1.5772.

Grade: Technical.

Containers: Steel drums.

Uses: Flame retardant for plastics.

Shipping regulations: None.*

fire point. The lowest temperature at which a liquid evolves vapors fast enough to support continuous combustion. It is usually close to the flash point.

fire retardant finishes. See flameproofing finishes.

fire sand. See furnace sand.

"Firestone" Nylon. ³⁵ Trade name for the polyamide produced by polymerizing caprolactam.

Properties: Crystalline thermoplastic granules (pellets).

Grades: Available in various viscosities, regular and heat stabilized, in natural, black and white and standard colors.

Containers: Vacuum packed 25-lb cans.

Uses: Wire coating, extruded shapes, profiles; filaments; fibers and film, molding.

Hazards: None.

"Fl-Retard." ³⁰⁰ Trademark for a group of flame retardants for application to cotton, rayon, nylon and paper.

fir oil, Douglas. See pine needle oils.

firwood oil. See pine-needle oils.

Fischer's reagent. A reagent used as a test for sugars.

Preparation: 3 parts of sodium acetate and 2 parts of phenylhydrazine hydrochloride in 20 parts of water.

Fischer reagent for water. See Karl Fischer reagent.

Fischer's salt. See cobalt potassium nitrite.

Fischer-Tropsch process. The term is used for any one of several processes originating in Germany for producing hydrocarbons or their oxygenated derivatives from water gas or other mixtures of carbon monoxide and hydrogen.

1. In the Fischer-Tropsch normal pressure process a mixture of hydrogen and carbon monoxide (synthesis gas) is passed over cobalt, nickel, iron, or other catalysts at atmospheric pressure and 150-250°C to produce a complex mixture containing appreciable quantities of higher hydrocarbons useful as liquid fuels.

2. The name Fischer-Tropsch is also sometimes applied to related processes such as that in which pressures of 5 to 20 atmospheres are used to obtain higher yields of hydrocarbons.

3. Finally, the name is also sometimes applied to the Synthol process proposed by Fischer and Tropsch for producing a mixture of alcohols, aldehydes, ketones, and fatty acids from synthesis gas by use of alkaliized iron catalysts.

fisetin $C_{15}H_{10}O_6$. 3,7,3',4'-Tetrahydroxyflavone.

Properties: Yellow needles. The coloring principle of the wood of *Rhus cotinus*, or young fustic. Soluble in alcohol and alkaline solutions; m. p. 330°C.

Use: Natural dyestuff.

fish berry. See cocculus.

fish oil. See cod-liver, halibut, herring, menhaden, porpoise, salmon, sardine, shark, and tuna oils.

fission chemistry. The process by which a chemical change or reaction is brought about by nuclear energy; for example, the production of anhydrous hydrazine from liquid ammonia in a nuclear reactor.

fission, nuclear. The nuclear change of an atom into two atoms of approximately equal weight, as in the element uranium in the explosion of the atomic bomb, and similar processes.

fission products. The nuclear species (i. e., kinds of atomic nuclei) produced by the splitting (fission) of heavy element isotopes such as uranium 235 and plutonium 239. Thirty-four different elements form from the fission of uranium 235 by slow neutrons. These fall into two groups with mass numbers ranging from 85-100 and from 130-150. The most abundant, in order, are zirconium, molybdenum, neodymium, barium, xenon, ruthenium, cerium and calcium. Gross fission products are of potential commercial use for activating phosphors, for cold sterilization of foods and drugs, and for the manufacture of static eliminators.

Fittig's synthesis. The preparation of aromatic hydrocarbons by condensation of aryl halides with alkyl halides in the presence of metallic sodium.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Fixanol." ²⁰⁶ Proprietary products for use in the after-treatment of material dyed with direct cotton dyestuffs by which the material is given very good fastness to water, perspiration, and cross dyeing. A selected range of direct dyestuffs are also marketed under the name "Fixanol." Also dispersing agents for use in viscose manufacture.

fixatives, perfume. See fixing agents, perfume.

fixed nitrogen. See nitrogen fixation.

fixing agents, chemical.

1. Substances which are instrumental in the fixation of various mordants upon textile material by uniting chemically with them and holding them upon the fiber until the dyes may have an opportunity to unite with them.

2. Substances which cause the actual precipitation of the mordant on the fiber by double decomposition.

fixing agents, mechanical.

1. Substances (e. g., albumin) which are capable of holding pigments permanently upon textile fibers.

2. Certain gums and starches which are capable of holding dyes and other substances upon textile fibers for a sufficient length of time to permit some desirable reaction to take place.

fixing agents, perfume (fixatives, perfume).

A substance which, when added to a perfume, prevents the volatilization of its various components too rapidly, and tends to equalize the rates of volatilization of these components. Thus, it will not only increase the odor life of the perfume, but will tend to make the odor character continuously unchanged during the period of evaporation. For many years, the leading fixatives were the animal products, ambergris, civet, musk, and castoreum. Oleoresins, such as oakmoss, benzoin, styrax, and others, are both fixatives and contributors to the odor value of the perfume. Essential oils, as vetiver, patchouli, and orris, can serve as fixing agents, and many synthetics, such as artificial musks, macrocyclic musks, and others, are fixing agents.

flag, sweet. See calamus.

flake lead. See lead carbonate, basic.

flake white. See bismuth subnitrate; bismuth oxychloride.

"Flamenol." ²⁴⁵ Trademark for electrical conductors insulated with a vinyl halide resin such as plasticized polyvinyl chloride.

"Flameproofing Agent 313." ⁷³ Trade name product. Inorganic phosphates.

Properties: White, odorless, crystalline powder; non-toxic and non-irritating to the skin. Readily soluble in water in all proportions.

Containers: 8-, 40-lb cont., 400-lb drums.

Uses: Particularly recommended for the flame-proofing of cotton goods, paper, etc.,

where the elimination of after-glow is an important factor. "Flameproofing Agent 313" does not tender the material nor cause reduction in tensile strength. It is non-hygroscopic so that the materials treated with it do not become damp or sticky in humid weather, or harsh and brittle in dry weather.

flameproofing finishes (fire retardant finishes).

Materials used on cellulose products (wood, paper, cotton and other textiles) to slow down their combustion. Fire retardant finishes in longest use are various water-soluble, inorganic salts, including ammonium bromide, borax, boric acid, phosphates such as diammonium phosphate or sodium phosphate, sodium tungstate and ammonium sulfamate, and mixtures of these. Such solutions are effective when added in amounts of about 7% of the weight of the fabric.

Finishes widely used on military and outdoor fabrics, designated as FWWMR (fire, water, weather, mildew resistant) are based on mixtures of antimony oxide, or oxychloride, and chlorinated organics such as chlorinated paraffin, chlorinated rubber, polyvinyl chloride or polyvinylidene chloride.

Most recent flameproofing agents are phosphorus compounds, such as the polymer resin formed by tetrakis(hydroxymethyl)-phosphonium chloride and melamine. Brominated triallyl phosphate is a similar monomer. Some phosphorus compounds apparently unite chemically with the cellulose and are effective flameproofers but weaken the fabric. The phosphorus resins polymerized or cured right in the fabric seem the most promising of the finishes.

"Flamort" Fire Retardants. ⁴¹⁴ Trademark for a series of fire retardants.

"Flamort" T: Fire retardant for velvet, sateen, silk, damask, viscose rayon.

"Flamort" TC: Fire retardant for cotton, canvas.

"Flamort" Protexile: For flameproofing and mothproofing.

"Flamort" U: Fire retardant for acetate rayon, nylon.

"Flamort" WC: Colorless, fire retardant surface impregnation for wood and paper.

"Flamort" Plastic Coat Clear: Fire retardant for foliage, palm fronds.

Containers: "Flamort" T, TC, Protexile and U: 5-, 10-, 20-, 25-, 50-, 100-lb containers in fiber drums. "Flamort" WC: 6-, 12-, 15-, 21-, 28-, 51-, 99-, 198-lbs in fiber drums. "Flamort" Plastic Coat Clear: quart cans, gallon cans, 5-gal pails, 55-gal drums.

flash distillation. Distillation in which an appreciable proportion of a liquid is converted to vapor in such a way that the final vapor is in equilibrium with the final liquid.

flash point. The lowest temperature at which a combustible liquid will give off a flammable vapor which will burn momentarily.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Flatack Glue No. 3309." ¹⁷⁰ A specially compounded cake form animal-glue base adhesive. Clear yellow, which becomes transparent when reduced with water and applied on material. Suitable for paperbox manufacturing, luggage manufacturing, lining display cases, laminating, bonding, and bindery operations. Available in cake form, weighing approximately 9 pounds each.

flatting agents. Flatting agents are substances ground into minute particles of irregular shape and used in paints and varnishes to cut down reflected light or glare from the finished film.

flavanthrene (indanthrene yellow, chloranthrene yellow) $C_{20}H_{12}O_2N_2$. A vat dye.

Properties: Brownish-yellow needles. Soluble in dilute alkaline solutions.

Derivation: By the action of antimony pentachloride on beta-aminoanthraquinone in boiling nitrobenzene.

Use: Dyeing.

Shipping regulations: None.*

"Flavaxin." ¹⁶² Trademark for riboflavin.

flavianic acid. See 2,4-dinitro-1-naphthol-7-sulfonic acid.

flavin.

1. Isoalloxazine, $C_{10}H_6N_4O_2$, the nucleus of various natural yellow pigments. See riboflavin and flavin enzymes.

2. Quercetin (q. v.), $C_{15}H_{10}O_7 \cdot 2H_2O$, a yellow dye derived from oak bark.

flavin adenine nucleotide (FAD) $C_{27}H_{33}N_7O_{15}P_2$.

A dinucleotide containing riboflavin phosphate linked to adenine mononucleotide in the order riboflavin, pyrophosphate, ribose, and adenine. It functions as a coenzyme for many enzymes, since it has the ability to accept hydrogen atoms, thus oxidizing the substrate.

Derivation: From yeast, liver, kidney, heart, muscle.

Use: Biochemical research.

flavine.

1. Acriflavine hydrochloride (q. v.), a bacteriostatic agent.

2. Flavin (q. v.).

flavin enzymes (flavoproteins). Enzymes composed of protein linked to coenzymes which are mono- or dinucleotides containing riboflavin. Because of their distinctive color they are also called "yellow enzymes." The flavin enzymes function in tissue respiration as dehydrogenases, the hydrogen atoms being taken up by the riboflavin group.

flavin mononucleotide. See riboflavin phosphate.

"Flavite-5." ²⁹⁶ Trade name for limed rosin possessing a capillary tube melting point of (typically) 116°C ., acid value 85, color Mary/Kate (Rosin Standards). Used in printing ink, paint, and varnish.

"Flavophosphine" GDC. ³⁰⁷ Trademark of a basic dyestuff. Used chiefly for the dyeing of leather.

flavoproteins. See flavin enzymes.

flax. Bast fibers, approximately 20 in. long, obtained from the stems of the linseed plant, *Linum usitatissimum*. Finer, stronger and more durable than cotton.

Sources: Russia, Italy, Ireland, France, Egypt.

Uses: Apparel and household fabrics (linens); thread; twine.

"Flaxedil." ⁵⁷ Trademark for gallamine triethiodide (tris-1, 2, 3-diethylaminoethoxybenzenetriethiodide) $C_{30}H_{40}I_3N_3O_3$.

Properties: White, crystalline powder; slightly hygroscopic; odorless, slightly bitter taste; m. p. about 250°C ; an allotropic form exists with m. p. about 150°C . Soluble in water, alcohol, dilute acetone, methanol; very slightly soluble in acetone, ether, benzene, and chloroform. A 2% solution in water is clear, colorless and has a pH of 6.2-7.5.

Use: Medicine.

flax seed. See linseed.

flax-seed oil. See linseed oil.

fleabane oil. See erigeron oil.

flea seed. See psyllium.

flea wort. See psyllium.

"Flectol" H. ⁵⁸ Trademark for polymerized 1,2-dihydro-2,2,4-trimethylquinoline.

Properties: Tan powder, m. p. 120°C min, sp. gr. 1.08; soluble in benzene, alcohol, and naphtha.

Uses: Rubber antioxidant.

"Flexac." ¹⁴⁴ Trademark for polyvinyl acetate emulsions.

Properties: High molecular weight emulsion, capable of film formation at low temperatures. Forms clear, glossy film, resistant to water spotting; solids 55-57%; viscosity 800-1200 cps ($77^\circ/60$ RPM); mean particle size 0.5 micron, pH 5.0-6.5.

Grade: FA-5.

Containers: 55-gal. lined steel or fiber drums.

Uses: Low-cost paints; semi-gloss and floor paints; adhesives; textile sizes, binders and finishes; coatings.

"Flexalyn;" ²⁶⁶ Trademark for a series of synthetic resins of glycol esters of rosin. Acid numbers 8-12; lbs/gal 8.33-8.91; color (U. S. D. A. rosin scale) M to N, refractive index 1.536-1.543; softening point (Hercules drop method) $45-63^\circ\text{C}$; viscosity (80% solution, by wt. in xylene) 271-640 cps (25°C).

Uses: Plasticizing resins, as tackifiers, or as tougheners, in organic coatings, adhesives, waxes, industrial textile sizings, floor coverings, etc.

"Flexamine G." ²⁴⁸ Trademark for a mixture of N,N'-diphenyl-para-phenylene-diamine and

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

a complex diarylamine - ketone reaction product.

Properties: Brownish grey granules; sp. gr. 1.20; melting range 75-90°C; soluble in acetone, benzol and ethylene dichloride; insoluble in water and gasoline.

Uses: A superflexing antioxidant used in tires, camelback, wire insulation, neoprene belting and molded soles.

"Flexbond." ¹⁴⁴ Trademark for polyvinyl acetate copolymer emulsions.

Properties: High molecular weight, internally plasticized copolymer and terpolymers. Sweet, slight odor; milky white color; viscosity varies according to grade; range 100 to 850 cps (60 RPM-RVO Brookfield); % solids varies according to grade, range 51-57%; lbs/gal 9.0-9.1. Emulsions form clear, colorless films with excellent water resistance.

Grades: 800, 811, 855, 306, 100.

Containers: 55-gal lined steel or fiber drums.

Uses: Vehicle for paint formulations, adhesive formulations, coatings and sizings.

"Flexichem." ¹⁵² A trade name for a series of metallic soap based compounds that enjoy wide usage in many industrial applications ranging in use from internal and external lubricants to tableting aids in the manufacture of certain types of pharmaceuticals.

Containers: 50- to 300-lb bags and drums.

"Flexichem 'B'." ¹⁵² Trade name for sodium stearate, a mono salt with the formula $\text{NaC}_{18}\text{H}_{35}\text{O}_2$, available in both Industrial and Food Grades. This product is a uniform, white powder; odor bland, bulk density 27 lbs/cu ft, titer of fatty acids 58°-60°C, iodine value 2.

Containers: 150-lb drums.

"Flexichem 'CS'." ¹⁵² Trade name for calcium stearate, a di salt with the formula $\text{Ca}(\text{C}_{18}\text{H}_{35}\text{O}_2)_2$; available in both Industrial and Food Grades. Color white, odor bland; bulk density 20 lbs/cu ft; average particle size ranges from 5 to 7 microns; titer 58°-60°C, iodine value 2.

Containers: 50-lb drums, paper bags.

"Fleximet." ¹⁵² Same as "Flexichem."

"Flexol." ²¹⁴ Trademark for a line of plasticizers including:

380: di(2-ethylhexyl)isophthalate (q. v.).

426: a mixed alcohol phthalate.

Properties: A light-colored liquid; sp. gr. 0.9941 (20/20°C); 8.3 lb/gal (20°C); b. p. 224°C (5 mm); vapor pressure 1.8 mm (200°C), insoluble in water; viscosity 60.7 cps (20°C).

810: a higher alcohol phthalate.

Properties: A light-colored liquid, sp. gr. 0.9729 (20/20°C); 8.1 lb/gal (20°C), b. p. 245°C (5 mm); insoluble in water, viscosity 101 cps (20°C).

10-10: didecyl phthalate (q. v.).

13-13: di(tridecyl) phthalate (q. v.).

10-A: didecyl adipate (q. v.).

A-26: di(2-ethylhexyl) adipate (q. v.).

B-400: a polyalkylene glycol derivative.

Properties: A light-colored liquid; sp. gr. 0.995 (20/20°C); 8.3 lb/gal (20°C); vapor pressure 0.8 mm (200°C), solubility in water 0.1% by wt (20°C); viscosity 152 cps (20°C).

CC-55: di-2-ethylhexyl hexahydrophthalate (q. v.).

DOP: di-2-ethylhexyl phthalate (q. v.).

EP-8: epoxy ester plasticizer and stabilizer.

Properties: Mol. wt. 416; sp. gr. 0.9221 (20/20°C), 7.7 lbs/gal; f. p. -14.5°C; oxirane oxygen 5.1%; iodine no. 1.5%.

EPO: polymeric epoxy plasticizer and stabilizer.

Properties: Mol. wt. 1000; sp. gr. 0.9956 (20/20°C); 8.3 lbs/gal; pour point 25°F; oxirane oxygen, greater than 6.8%; iodine no. less than 2%.

3G20: triethylene glycol decanoate (q. v.).

3GH: triethylene glycol di(2-ethylbutyrate) (q. v.).

3GO: triethylene glycol di(2-ethylhexoate) (q. v.).

4GO: polyethylene glycol di(2-ethylhexoate) $\text{C}_7\text{H}_{15}\text{OCOCH}_2(\text{CH}_2\text{OCH}_2)_x\text{CH}_2\text{OCOC}_7\text{H}_{15}$.

Properties: A light-colored liquid; sp. gr. 0.9892 (20/20°C), 8.2 lb/gal (20°C); b. p. 250°C (5 mm); insoluble in water, viscosity 25.1 cps (20°C).

JPO: polymeric epoxy plasticizer and stabilizer.

Properties: Mol. wt. 1000; sp. gr. 0.990 (20/20°C), 8.3 lbs/gal, pour point 25°F; oxirane oxygen greater than 6.3%; iodine no. less than 3.0%.

8N8: 2,2'-(2-ethylhexamido)diethyl di(2-ethylhexoate) $(\text{C}_7\text{H}_{15}\text{OCOC}_2\text{H}_4)_2\text{NCOC}_7\text{H}_{15}$.

Properties: A light-colored liquid, sp. gr. 0.9564 (20/20°C); 8.0 lb/gal (20°C); b. p. 256°C (5 mm); vapor pressure 0.60 mm Hg (200°C), insoluble in water; viscosity 139.2 cps (20°C).

PEP: di(isodecyl)-4,5-epoxytetrahydrophthalate. $\text{OC}_9\text{H}_{19}(\text{COOC}_{10}\text{H}_{21})_2$.

Properties: Sp. gr. 0.9867 (20/20°C); 8.2 lbs/gal; pour point +38°C, oxirane oxygen 3%; iodine no. 1%.

R-2H: a polyester.

Properties: A viscous, amber liquid, sp. gr. 1.055 (20/20°C), 8.8 lb/gal (20°C), insoluble in water, viscosity 16,520 cps (20°C).

TOF: tri(2-ethylhexyl)phosphate (q. v.).

"Flexo Wax C." ⁷³ Brand name for proprietary product. Long-chain hydrocarbon.

Properties: Orange-colored amorphous wax. Insoluble in water and alcohols, soluble in hot naphtha, toluene, mineral spirits, mineral oil. A non-crystalline wax with high adhesive properties. Replaces ceresin wax, and beeswax. M. p. 63-68°C, sp. gr. 0.82 (25°C), flash point 257°C.

Containers: 1-gal cans (10-lb slabs), 5-gal cans (82 lbs), 55-gal drums (540 lbs).

Uses: Buffing compounds, polishes; engravings; lithography; adhesive compounds; leather dressings, textile sizes and finishes, modeling waxes; coatings, etc. Adhesive for "Cellophane," cellulose acetate and

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

other materials ordinarily resistant to the usual adhesives.

"Flexo Wax C Light." ⁷³ Trade name product. Long chain hydrocarbon.

Properties: Cream, amorphous wax; m. p. 62-64°C; soluble in hot hydrocarbons, mineral oil and vegetable oils (gels on cooling); insoluble in water and alcohol.

Containers: 10-, 80-lb containers, 360-lb drums.

Uses: Same as "Flexo Wax C" but is particularly recommended where a light-colored product is necessary or desirable. Also as an adhesive in the screen-printing process to hold fabrics firmly onto the table during printing.

"Flexricin." ²⁰² Trademark for a group of castor oil derivatives including (1) alkyl ricinoleates, which are compatible with cellulosic resins, polyvinyl butyral, polyamide, rosin and shellac and used as plasticizers; (2) acetyl ricinoleates, the alkyl esters of acetylated ricinoleic acid used as plasticizers for nitrocellulose, ethyl cellulose, polyvinyl chloride resins and copolymers, natural and synthetic rubbers, and other polymers and as textile lubricants, and (3) polyol ricinoleates used for synthesis, cosmetics, brake fluids, in waxes and greases, and as anti-foam agents.

"Flextack Glue No. 3318." ¹⁷⁰ Cake form, animal-base glue, containing glycerin. Pale yellow, drying transparent.

Use: Recommended for paper, cardboard, leather, coated fabrics, and similar materials.

"Flexzone 3-C." ²⁴⁸ Trademark for N-iso-propyl-N'-phenyl-para-phenylene diamine. Properties: Purple-gray flakes, sp. gr. 1.14, m. p. 70°C minimum, soluble in benzol, ethylene dichloride, gasoline, ethyl acetate. Insoluble in water.

Uses: An all-purpose antioxidant - antiozonant combining protection against flexing, ozone, heat and oxygen in rubber tires, wire and cable, hose, footwear and mechanical goods, also an anti-copper agent.

"Flexzone 6H." ²⁴⁸ Trademark for N-phenyl-N'-cyclohexyl-para-phenylene diamine.

Properties: Grey-violet powder, sp. gr. 1.16; m. p. 103-107°C, soluble in acetone, benzol, MEK, ethyl acetate, ethylene dichloride; insoluble in water.

Uses: Antioxidant - antiozonant for rubber products where outdoor weather resistance and fatigue cracking are problems, such as tires, weather stripping, insulated wire and cable, hose and footwear. It is used mainly in natural and SBR rubber and blends thereof.

flint. A finely crystalline form of native silica or quartz (q. v.), similar to chert, chalcedony, and jasper. A typical analysis gives 98% silica, 1.5% water, and traces of iron, aluminum, calcium, and organic matter.

Properties: Color smoky gray, brownish, blackish, dull yellowish; luster waxy to greasy; hardness 6.5-7; sp. gr. 2.60-2.65. More easily soluble in hot caustic alkali than crystallized quartz.

Occurrence: Europe; U. S.

Uses: Abrasive, balls for ball mills, paint extender; filler for fertilizer, insecticides, rubber, plastics and road asphalt, in ceramics, flint glass, chemical tower packing.

flint glass. A glass in which lead and potassium replace a considerable part of the lime and soda of ordinary glass. This gives a softer, more fusible, more lustrous and brilliant glass with high refraction and low dispersion and therefore of use as an optical glass.

flocculation. See coagulation.

"Flo-chilled." ²⁰³ Trademark for a specific grade of anhydrous caustic soda, crystalline form, exceptionally dustless, free-flowing, uniform in particle size.

"Flomax 25." ³⁰⁴ Trademark for a barium-cadmium organic vinyl stabilizer.

Properties: Clear yellow liquid; sp. gr. 1.03; refractive index 1.48.

Containers: Metal drums containing 40 and 450 lbs.

Uses: Excellent heat stabilizer for severe processing conditions. Specially effective in highly loaded systems, extrusions and in solution coatings.

"Florco." ⁹⁸ Processed Florida fuller's earth for the absorption of oils, grease, and other liquids from floors, decks and similar surfaces.

"Florence" Zinc Oxides. ²⁶⁸ Brand name for a group of zinc oxides manufactured by the French or indirect process, the pigment being made from zinc metal.

Grades: "Florence" White Seal -7, "Florence" Green Seal -8, "Florence" Red Seal -9. Shipped in 50-lb bags.

Uses: Enamels, lacquers, printing inks, plastics, linoleum, insulated wire and cable, rubber, soap, etc.

flores martis. See ferric chloride, anhydrous.

"Florex." ⁹⁸ Florida fuller's earth, the adsorption capacity of which has been increased by a special patented extrusion process to exceed that of any known naturally active clay. It is used chiefly in adsorption refining, including the decolorization, clarification, and neutralization of mineral, vegetable, and animal oils, fats, waxes, and for the filtration of other products. "Florex" is also widely used in the vapor or liquid-phase treatment of cracked or straight-run gasoline in the Gray, Osterstrom, Linde, and other processes. Standard meshes include 16/30, 30/60, 60/100, 100/up and 200/up.

Florida phosphate. Phosphate rock from Florida, usually fluorapatite

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

(CaF)Ca₄(PO₄)₂, encountered as land pebble, hard rock, soft rock, or powder.

"Florigel." ⁹⁸ Florida fuller's earth, selected and processed for maximum gel-forming characteristics. Forms completely reversible gel that is unusually stable in the presence of brines or electrolytes. Emulsifier for oils and slow-break asphalts. Suspension builder for pesticides, polishing agents, waxes, etc. Binder for catalytic and adsorptive materials. Adhesive for applying pesticides to plant surfaces.

"Florigel H-Y." An improved grade of "Florigel;" a high yield salt water drilling clay.

"Florinef Acetate." ⁴¹² Trademark for fludrocortisone acetate (q. v.).

"Florisil." ⁹⁸ A synthetic analytical adsorbent having an exceptionally high capacity. It is valuable for the selective adsorption of vitamins, hormones, dyes, and many other compounds, and is generally applicable to chromatographic adsorption technique. "Florisil" is widely used in the Connor and Straub method for the combined determination of thiamin and riboflavin. It will not break down in aqueous solutions and is free from dusting. Various meshes are available but the 30/60 and 60/100 classifications are usually employed for analysis by the percolation method.

"Florite" Desiccant Grade. ⁹⁸ Granular activated bauxite drying agent for hydrocarbon gases and liquids, air, oxygen, nitrogen, etc. Moisture-adsorptive capacity from 5 to 20%, regenerated when heated to 350°F. Will not dissolve or disintegrate in water. Recognized for long service in natural-gas-drying plants. Available in 4/8, 8/20, and 8/16 mesh sizes.

"Florite" Refining Grade. ⁹⁸ An activated bauxite adsorbent that is used primarily for the decolorization of petroleum oils. It is particularly effective for sweetening and decolorizing petrolatums and waxes. "Florite" is also used as a catalyst, one of the more common applications being in the vapor-phase treatment of gasoline to convert mercaptan sulfur to hydrogen sulfide. The most popular percolation grade is the 20/60 mesh but other mesh classifications are available.

"Floropryl." ¹²³ Trademark for diisopropyl fluorophosphate.
Use: Medicine.

florspar. See fluorspar.

flos-ferri. See aragonite.

flotation. A process for separating minerals from waste rock or solids of different kinds from one another. This is done by agitating the pulverized mixture of solids with water, oil, and special flotation chemicals. When properly chosen, the latter cause preferential wetting of solid particles of certain types by the oil, while other kinds are not wet. The latter are

carried to the surface by the air bubbles and thus floated away and separated from the wetted particles. Most frequently a frothing agent is also used to stabilize the bubbles in the form of a froth which can be easily separated from the body of the liquid. This is froth flotation.

Flotation Oil. ¹⁷⁵ Special grades of coal-tar oils.

Grades: No. 4 (containing approx. 25% of selected tar acids) and No. 634.

Containers: 55-gal steel drums.

Uses: Separating valuable portion of finely ground sulfide ores, particularly copper, for mineral concentration operations.

"Flotox." ²⁵³ Brand name for flotation sulfur products.

"Flovis." ⁷³ Trade name product. Modified polyoxyethylene fatty-acid ester.

Properties: Cream to tan solid; m. p. 39-42°C; sp. gr. 1.02 (25°C), pH 5% aqueous dispersion 3-5 (25°C).

Containers: 8-, 50-lb containers; 450-lb drums.

Uses: Used especially in the textile and adhesive industries for stabilizing starch solutions, fluid or heavy paste, against "setting-up." The starch gel remains considerably more fluid and free from lumps than those not so treated. Any "set" that occurs can be overcome relatively easily by simple stirring.

"Flowbrite." ¹⁴² Trade name for a formulation of oils used at elevated temperature for the bright flowing of electroplated tin.

flower of paradise. See henna.

flowers of antimony. See antimony trioxide.

flowers of sulfur. See sulfur.

flowers of tin. See stannic oxide.

flowers of zinc. See zinc oxide.

flowery head spurge. See euphorbia pilulifera.

"Flozene." ⁴⁵ Trademark for a series of lubricant white mineral oils.

Typical properties (medium): Sp. gr. 0.860-0.870 (60°F), Saybolt viscosity 40 (210°F); odorless.

Uses: Industrial lubricants.

fludrocortisone acetate (9- α -fluorohydrocortisone acetate) C₂₃H₃₁FO₆. 9- α -17- α -hydroxycorticosterone-21 acetate. Properties: White, odorless polymorphic crystals; m. p. 233-234°C. Sparingly soluble in alcohol and very slightly soluble in water.

Grade: N. N. D.

Uses: Medicine, veterinary medicine.

"Fludrocortone." ¹²³ Trademark for fludrocortisone (9- α -fluorohydrocortisone).

***Fluid Ball."** ⁴¹³ Trademark for a propellant casting powder consisting of fully colloided nitrocellulose having an average particle diameter of 50 microns or less. Composition can include liquid or solid modifiers.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Used as binder constituent of modified double base solid rocket propellants.
Containers: Fiber drums, 100-lb. net weight.

Fire hazard: Dangerous.

Shipping regulations: Explosives. Red label.*

fluid catalytic process. A continuous process used mainly for making high octane gasoline by cracking various petroleum fractions in the presence of finely divided alumina-silica gel catalyst. The catalyst is held in suspension by causing the petroleum fraction to flow upward so that the mixture acts like a fluid. The catalyst is withdrawn overhead, separated from the cracked vapors, and sent to another reactor where hot air is the fluidizing medium. In this reactor, called the regenerator, the carbon is burned off the catalyst and the hot catalyst is then sent back to the cracking reactor.

fluidize. In general, to convert to a fluid state; but in recent technology the term refers to processes in which a finely divided solid is caused to behave like a fluid by bringing it into suspension in a moving gas or liquid. The solids so treated are frequently catalysts, hence, the term fluid catalysis. In such a case the fluidized catalyst is brought into intimate contact and causes a desired reaction in the suspending liquid or gas mixture. Local overheating of the catalyst is greatly reduced, and portions of catalyst can be easily removed for regeneration without shutting down the unit. There are also non-catalytic applications in which the fluidized solid enters into direct reaction with the liquid or solid.

fluomethiazide $C_8H_6F_3N_3O_4S_2$. 6-(Trifluoromethyl)-1,4,2-benzothiadiazine-7-sulfonamide-1,1-dioxide.

Properties: White crystalline powder; m. p. 305-307°C (decomposes). Sparingly soluble in water; soluble in lower alcohols; insoluble in ethyl acetate, benzene, toluene; soluble in dilute alkali but unstable in alkaline solution.

Grade: Pharmaceutical.

Use: Medicine.

fluoboric acid HF_4 .

Properties: Colorless, clear, strongly acid liquid, b. p. 130° with decomposition. Miscible with water, alcohol.

Derivation: Action of boric and sulfuric acids on fluorspar.

Uses: Production of fluoborates, specially purified solution used in patented process for electrolytic brightening of aluminum. Also used to form stabilized diazo salts.

"**Fluolite**." ²⁰⁶ Brand name of proprietary fluorescent whitening agents.

fluophosphate alkyl esters. See diisopropyl fluophosphate.

fluophosphates. See fluophosphoric acids.

fluophosphoric acids. Term used to designate several acids containing fluorine and phosphorus. Mono (H_2PO_3F) and di (HPO_2F_2) fluophosphoric acids (also called phosphorofluoridic and phosphorodifluoridic acids) are available as clear, rather viscous nonvolatile anhydrous liquids. Hexafluorophosphoric acid (HPF_6) is available as a 65% solution in water. The mono acid dissolves in water with little hydrolysis. The hexa acid is stable in neutral and alkaline solutions. These acids are suggested for use as metal cleansers, electrolytic or chemical polishing agents, for the formation of protective coatings for metal surfaces and as catalysts.

The sodium, potassium, and calcium salts of monofluorophosphoric acid, and the potassium, ammonium, tetraethylammonium and pyridinium salts of hexafluorophosphoric acid are water-soluble, dry, non-hygroscopic solids, stable towards heat and in water solutions at ordinary temperatures. The m. p. of the sodium mono salt is 625°C, that of the potassium mono salt 825°C, while the potassium hexa salt melts at 575°C, pyridinium hexa salt at 170°C, and tetraethylammonium hexa salt at 255°C. The hexa salts can be stored in solution without decomposition of the PF_6 ion. Suggested uses include maintenance of fluoride atmospheres and the preparation of bactericides and fungicides.

Shipping regulations: Corrosive liquid.

White label.*

fluoranthene (idryl) $C_{16}H_{10}$. A tetracyclic hydrocarbon.

Properties: Colored needles; f. p. 107°C; b. p. 250°C (60 mm); insoluble in water; soluble in ether and benzene.

Derivation: From coal tar.

fluorapatite. See apatite.

"**Fluorel**" Brand 2141 Elastomer. ¹⁵⁸ A fully-saturated fluorinated polymer containing more than 60 per cent fluorine by weight and is non-flammable.

Properties: Light colored gum, with raw properties including specific gravity, 1.85; Shore "A" hardness, 40; embrittlement temperature, -50°F.; excellent storage stability; soluble in esters and ketones. Optimum resistance to fuming nitric and fuming sulfuric acids, acetic acid and hydrochloric acid, bases and common solvents such as aromatic, aliphatic and chlorinated hydrocarbons, alcohols and ethers. Outstanding performance in hydraulic fluids and synthetic lubricants at elevated temperatures. Rated for continuous service at +400°F. and can withstand +600°F. temperatures at limited service. Gum can be air oven aged for 16 hours at 600°F. and retain 65 per cent of original tensile strength. Set as little as 10 per cent after 70 hours at 250°F. Containers: 5, 10, 50 and 100-lb fiber drums. Uses: O-rings, gaskets; hoses; wire and fabric coatings; diaphragms; fuel cells; expellant bladders; sealants; insulation; containers.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

fluorene (alpha-diphenylenemethane)

Properties: Small, white, crystalline plates; fluorescent when impure. Soluble in alcohol, ether, benzene and carbon disulfide; insoluble in water. M. p. 116°C; b. p. 295°C (with decomposition).

Derivation: By reduction of diphenylene ketone with zinc; from coal tar.

Method of purification: Crystallization.

Grades: Technical; 98% pure.

Containers: 1-, 5-, 10-, 25-, 50-lb packages, 200-lb barrels.

Uses: Resinous products; insecticides; dyestuffs.

Shipping regulations: None.*

fluorescein (resorcinolphthalein; diresorcinolphthalein; see also uranine) $\text{C}_{20}\text{H}_{12}\text{O}_5$. C. I. No. 766.

Properties: Orange-red, crystalline powder; very dilute alkaline solutions exhibit a very intense, greenish-yellow fluorescence by reflected light, while the solution is reddish-orange by transmitted light; m. p. decomposes at 290°C; soluble in dilute alkalis, boiling alcohol, ether and dilute acids, glacial acetic acid; insoluble in water, benzene, chloroform.

Derivation: By heating phthalic anhydride and resorcinol.

Grades: The sodium salt (uranine) and potassium salt are marketed.

Containers: Wooden kegs; fiber drums.

Uses: Dyeing sea water for spotting purposes; tracer to locate impurities in wells; dyeing silk and wool, medicine; indicator and reagent for bromine.

Shipping regulations: None.*

fluorescein sodium. U. S. P. XVI name for uranine.

fluorescence. The production of visible light (white or colored) or other radiation by a substance as the result of exposure to and absorption of other radiations of different wave length, such as ultraviolet light, or electric discharges in a vacuum tube. Those substances having this property are known as phosphors, the term usually being restricted to those solids that absorb ultraviolet and emit visible light. In ordinary fluorescent lighting, the tube contains mercury vapor and argon, and the inside walls of the tube are coated with the fluorescent substance, often a zinc or cadmium compound. The passage of an electric current through the mercury vapor-argon mixture produces invisible ultraviolet light which is absorbed by the phosphor and re-emitted as visible light. The whole process occurs at a relatively low temperature (hence called a "cold light" process). Fluorescence is also used to identify or analyze certain minerals quickly such as scheelite and also certain organic derivatives.

fluorescin $\text{C}_{20}\text{H}_{14}\text{O}_5$. A reduction product of fluorescein.

Properties: A light-yellow powder; m. p.

125-127°C; soluble in alcohol or ether; insoluble in water.

Uses: Medicine; reagent.

fluoridation. Addition of about 1 part per million of fluorine (as sodium fluoride, sodium fluosilicate or a similar compound) to public drinking water supplies. The objective is to reduce tooth decay among the persons using the water.

fluorinated ethylene propylene resin (FEP resin). A copolymer of tetrafluoroethylene and hexafluoropropylene with properties similar to polytetrafluoroethylene resin, but which can be melt processed in conventional molding and extrusion equipment for use as wire insulation, cable jacketing, tubing, sheeting, shaped objects, rods, bottles. It can also be applied by fluidized bed coating, and used as a heat-sealable film for printed circuitry, flexible cable, capacitors, gaskets, and seals. Useful up to 200°C and is tough at low temperatures.

Containers: 5-, 50-, 100-lb drums.

fluorinated paraffin. A paraffin oil or wax which has been fluorinated (part of the hydrogen replaced with fluorine), usually by substitution of fluorine in a chlorinated paraffin.

Uses: Inert lubricant and sealant; heat transfer medium.

fluorinating agent. A compound used to introduce fluorine into some other compound. The higher fluorides of cobalt (CoF_3), manganese (MnF_4), silver (AgF_2), and of chlorine and bromine are used for this purpose. The usual procedure involves replacement of chlorine. Thus carbon tetrachloride (CCl_4) is treated with fluorinating agents to produce dichlorodifluoromethane (CCl_2F_2) and similar compounds.

fluorine F. Element in group VII of the periodic classification. Atomic number 9, atomic weight 19.00. The most reactive nonmetallic element.

Properties: Pale yellow gas; b. p. -188°C; m. p. -217.8°C; density of gas 1.695 (air = 1), sp. gr. of liquid (-188°C) 1.108; sp. vol. 10.2 cu ft/lb (70°F). Corrosive and poisonous. Reacts vigorously with most oxidizable substances at room temperature, frequently with ignition. Forms fluorides with all elements except the inert gases.

Occurrence: Widely distributed to the extent of 0.03% of the earth's crust. The chief minerals are fluorapatite, cryolite, and fluorspar.

Derivation: Electrolysis of molten anhydrous hydrofluoric acid - potassium fluoride melts with special copper-bearing carbon anodes, steel cathodes, containers and monel screens.

Containers: Special steel cylinders. Available both as a liquid and a compressed gas.

Uses: As an oxidizer in rocket fuels; production of metallic and other fluorides, particularly cobalt fluoride, antimony

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

fluorides, uranium hexafluorides, and sulfur hexafluorides. The first two are commonly used to introduce fluorine into organic compounds, i. e., the fluorocarbons. Numerous fluorine compounds are made from hydrogen fluoride which is obtained directly from fluorspar, so that elemental fluorine is not needed in the process. See fluorocarbons, fluorosilicic acid, sodium, ammonium, lead, barium, and calcium fluosilicates, various metallic fluorides.

Shipping regulations: Flammable gas. Red gas label.*

fluorine cyanide. See cyanogen fluoride.

fluorite. See fluorspar.

fluoroacetic acid CH_2FCOOH .

Properties: Colorless crystals; m. p. 33°C , b. p. 165°C ; soluble in water, alcohol.

Caution: Poison!

fluoroacetone $\text{CH}_2\text{FCOCH}_3$.

Properties: Yellow liquid. Pungent odor, sp. gr. 0.967 (20°C), b. p. 72.5°C .

Derivation: Interaction of thallium fluoride and bromoacetone.

fluoroacetophenone (phenacyl fluoride, phenyl fluoromethylketone) $\text{C}_6\text{H}_5\text{COCH}_2\text{F}$.

Properties: Brown liquid. Pungent odor.

Caution: Irritant. B. p. 98°C (8 mm).

Derivation: By Friedel-Craft synthesis.

fluoroalcohols. A group of fluorine - containing alcohols are available commercially of the general formula $\text{H}(\text{CF}_2\text{CF}_2)_n\text{CH}_2\text{OH}$ in which $n = 1$ to 5. They include the

C_3 , 1H, 1H, 3H-tetrafluoro-1-propanol ($n = 1$).

C_5 , 1H, 1H, 5H-octafluoro-1-pentanol ($n = 2$).

C_7 , 1H, 1H, 7H-dodecafluoro-1-heptanol ($n = 3$).

C_9 , 1H, 1H, 9H-hexadecafluoro-1-nonanol ($n = 4$).

C_{11} , 1H, 1H, 11H-eicosafluoro-1-undecanol ($n = 5$).

Properties: Density of liquids 1.48-1.66; refractive index 1.318-1.320 (lowest of all known organic compounds), fluorine content 57.5-71.4%.

Derivation: By free radical telomerization of tetrafluoroethylene with methanol.

Grade: Technical.

Uses: Solvents; organic synthesis.

para-fluoroaniline $\text{FC}_6\text{H}_4\text{NH}_2$.

Properties: Liquid, sp. gr. (25°C) 1.1524, b. p. 187.4°C , m. p. 0.82°C , refractive index ($n_{20/D}$) 1.5395.

Uses: Dye intermediate, preparation of para-fluorophenol.

fluorobenzene $\text{C}_6\text{H}_5\text{F}$.

Properties: Colorless liquid with benzene odor; sp. gr. (20°C) 1.0252; refractive index ($n_{25/D}$) 1.4636; b. p. 84.9°C , freezing point 41.9°C . Insoluble in water; miscible with alcohol, ether.

Uses: Insecticide and larvicide intermediate,

identification reagent for plastic or resin polymers.

fluorocarbon-11. See trichlorofluoromethane.

fluorocarbon-12. See dichlorodifluoromethane.

fluorocarbon-22. See chlorodifluoromethane.

fluorocarbon-113. See trichlorotrifluoroethane.

fluorocarbon-114. See dichlorotetrafluoroethane.

fluorocarbon resins. This term includes polytetrafluoroethylene, polymers of chlorotrifluoroethylene (fluorothene), vinylidene fluoride ($\text{H}_2\text{C}=\text{CF}_2$) hexafluoropropylene (C_3F_6) and similar compounds. These polymers are thermoplastic, inert to chemicals and oxidation, have high heat stability, retain their useful properties at both extremely low and high temperatures, have high electrical resistance, low coefficient of friction, and are nonwetttable and resistant to moisture. The materials are available as resins, powders, and dispersions, and as films, sheets, tubes, rods, and tapes. Some materials are rubber-like. Commercially available varieties are "Kel-F," "Teflon," "Fluorel," "Aclar" and "Halon."

fluorocarbons. Compounds of carbon and fluorine with or without hydrogen, analogs of hydrocarbons in which all or nearly all the hydrogen has been replaced by fluorine. They are characterized by extreme chemical inertness, do not burn, and are thermally stable to 500°F or more. They are more volatile and more dense than corresponding hydrocarbons, have low refractive indices, low dielectric constants, low solubilities, low surface tensions, but their temperature coefficient of viscosity is high although viscosities are comparable with those of hydrocarbons.

General uses are as aerosol propellants, blowing agents, fire extinguishing agents, lubricants and hydraulic fluids, flotation and damping fluids, liquid dielectrics and coolants. Specialized uses are as impregnants for electrical insulation, spray-on wax coatings for alkali cleaning tanks, permanent lubricants for instruments and clocks.

See also fluorocarbon resins, and fluorochemicals.

"Fluorochemical FC-101," ¹⁵⁸ Trade name for an inert fluorochemical fluid with unique solubility characteristics, that does not dissolve nor blend with hydrocarbon oils or the additives or detergents widely used in heavy duty lubricants.

Properties: Colorless, odorless, non-flammable liquid insoluble in water, oils and most organic solvents.

Uses: Specifically designed for use as sight glass fluids in force feed lubricators.

"Fluorochemical Liquid, Inert, FC-43," ¹⁵⁸

A fully-fluorinated product composed primarily of an isomeric mixture of the perfluoro amine $(\text{C}_4\text{F}_9)_3\text{N}$.

Properties: Colorless, odorless liquid;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

specific heat, 0.27 Btu/lb at 77°F.; heat of vaporization, 29.8 Btu/lb at b.p.; density (77°F) 1.88 ± 0.02 ; boiling point, 337-355°F.; electric strength (77°F) 35 KV minimum, dielectric constant (75°F) 1.90; viscosity, centistokes (77°F) 2.8 ± 0.5 .

Containers: 4-lb quart bottle in fiber carton, 1- and 5-gal. cans.

Uses: High temperature heat transfer medium, dielectric fluid, pressure medium; liquid pump sealant, and used in metering devices.

"Fluorochemical Liquid, Inert, FC-75." ¹⁵⁸

A fully fluorinated product composed of a mixture of compounds containing eight carbon atoms, principally perfluoro ethers.

Properties: Colorless, odorless liquid.

Boiling point 210-225°F., electric strength (77°F) 35 KV minimum, density (77°F) 1.77 ± 0.02 ; specific heat (Btu/lb/°F at 77°F) 0.248, viscosity, centistokes (77°F) 0.65 minimum, dielectric constant, liquid (75°F) 1.86.

Containers: 2-lb glass bottles in fiber carton, 1- and 5-lb cans.

Uses: Same as for "Fluorochemical Liquid, Inert, FC-43."

fluorochemicals. Organic compounds, not necessarily hydrocarbons, in which a large percentage of the hydrogen directly attached to carbon has been replaced by fluorine. The presence of two or more fluorine atoms on a carbon atom usually imparts great stability and inertness to the compound and fluorine usually increases the acidity of organic acids.

Derivation: (a) Electrolysis of solutions in hydrogen fluoride (Simons process), (b) replacement of chlorine or bromine by fluorine with hydrogen fluoride in the presence of a catalyst such as antimony trifluoride or pentafluoride, (c) addition of hydrogen fluoride to olefins or acetylene.

Uses: Refrigerants, lubricants; heat transfer media, aerosol propellants, fire extinguishers, rodenticides, inert plastics; chemical intermediates.

"Fluorochemical Surfactants." ¹⁵⁸ Trade name for a line of surfactants (FC-95, FC-98, FC-128 and FC-134) that are available as anionic and cationic types and can therefore be used in most aqueous systems. Properties: Most stable and surface-active of all known surfactants. Have unique property of being surface active in organic liquids as well.

Containers: 1-lb pint can in fiberboard carton; 5-lb gallon can in fiberboard carton, 4-gal fiberdrum; 5-gal pail and 7-gal pail.

Uses: Lowering surface tension in a water system to 16 to 18 dynes per centimeter, possessing chemical stability in such systems as 90 per cent hydrogen peroxide, hydrazine and fuming nitric acid; offering complete stability in extreme oxidizing conditions (such as chrome plating baths), and to promote leveling emulsion coatings. These surfactants have the ability to adsorb to many surfaces from solution and provide

corrosion and stain resistance. Use level for "Fluorochemical Surfactants" is extremely low. Therefore they can offer surfactant properties without adverse side effects normally associated with use levels of ordinary surfactants.

fluorodichloromethane. See dichlorofluoromethane.

fluoroethylene. See vinyl fluoride.

"Fluoroflex." ¹⁴ Trademark for a line of products processed from fluorocarbon resin compositions.

fluoroform. See "Genetron" 23.

fluoroformyl fluoride. See carbonyl fluoride.

9-alpha-fluorohydrocortisone acetate. See fludrocortisone acetate.

9-alpha-fluoro-16-alpha-hydroxyprednisolone. See triamcinolone.

"Fluorolubes." ³⁰⁶ Trademark for addition polymers of trifluorovinyl chloride, essentially linear polymers built up of a recurring unit, $-\text{CF}_2\text{CFCI}-$.

Properties: Odorless, non-toxic; high density, non-flammable, free from hydrogen, stable in presence of concentrated mineral acids, alkalis, hydrogen peroxide and other strong oxidizing agents, thermally stable at temperatures up to 300°C, insoluble in petroleum base oils, slightly soluble in the lower alcohols; soluble in benzene, ketones and most chlorinated liquids.

Uses: Lubricant and sealant for plug cocks, valves and vacuum pumps; gasket and packing impregnant, fluid for hydraulic equipment, heat exchange and instrument damping, low temperature lubricant; high density fluids.

9-alpha-fluoro-16-alpha-methylprednisolone. See dexamethasone.

para-fluorophenol $\text{FC}_6\text{H}_4\text{OH}$.

Properties: White crystalline solid; density (56°C) 1.1889, m.p. 48.2°C (stable form), 28.5°C (unstable form), b.p. 185.6°C (760 mm), 78°C (15 mm). Soluble in water.

Use: Fungicide, intermediate for pharmaceuticals and fungicides.

fluorophosphoric acids. See fluophosphoric acids.

"Fluorosol." ²⁴³ Trade name for an optical bleach.

fluorothene. A plastic polymer of trifluoroethylene. $\text{C}_2\text{F}_3\text{Cl}$. Resistant to concentrated acids and alkalis up to 300°F. Swelled by some chlorinated hydrocarbons.

fluorotrichloromethane. See trichlorofluoromethane.

fluorspar (fluorite, florspar) CaF_2 . Natural calcium fluoride occurring in veins either alone or with metallic ores. Color yellow, green, purple, other colors; luster vitreous; good cleavage in 4 directions, hardness 4;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

similar to violets; sp. gr. (25/25°C) 0.919-0.924; refractive index (20°C) 1.446-1.449; soluble in 6 parts of 70% alcohol.

Uses: For violet or violet-leaf effect; blends well with ionones and other violet notes.

follicle-stimulating hormone (FSH). One of the hormones secreted by the anterior lobe of the pituitary gland. It increases the formation of sperm cells by the testis and of graafian follicles by the ovary. Found in pituitary tissue of man, horse, sheep and pig. It is a protein with some carbohydrate.

Properties: White solid, soluble in water and 50% alcohol. Isoelectric point at pH 4.5; activity decreased by action of heat or pepsin. Molecular weight about 70,000.

Use: Medicine.

"**Folrosia.**"²²⁷ Trademark for a cyclic alcohol with a deep red rose fragrance.

Properties: Colorless liquid, sp. gr. 0.914-0.918 (25/25°C), refractive index (n_D 20/D) 1.4650-1.4680. Clearly soluble in 3 parts of 60% alcohol, 1 part of 70% alcohol. Flash point TCC 203°F.

Occurrence: Not found in nature.

Uses: In neroli, muguet, lilac and rose scents.

Hazard: Avoid aluminum containers.

"**Folvite.**"⁵⁷ Trademark for folic acid, (pteroylglutamic acid) C₁₉H₁₉N₇O₆.

Properties: Yellow to yellow-orange crystals, odorless, chars when heated beyond 250°C. Soluble in acetic acid, phenol, pyridine, alkalies, hot dilute hydrochloric acid, hot dilute sulfuric acid; slightly soluble in methanol, very slightly soluble in cold water, 1% w/v in boiling water, insoluble in acetone, chloroform, ether, benzene, and alcohol, pH about 8.4.

Use: Medicine.

"**Folvron.**"⁵⁷ Trademark for folic acid and iron.

"**Fo-Made.**"¹⁶² Trademark for a foam stabilizer for beer.

"**Fomrez.**"¹⁰⁴ Trademark for a line of polyester and polyether resins used in the manufacture of urethane foams.

"**Fonoline.**"⁴⁵ Trademark for petrolatum, U. S. P., of soft consistency and low melting point.

Properties: White or yellow in color; m. p. 112-120°F; Saybolt viscosity (white), 55-75 (210°F), (yellow), 60-85 (210°F), odorless.

Uses: Pharmaceutical and cosmetic preparations; many industrial applications.

food dyes. Dyes which are used to color food products. These dyes must meet rigorous standards for non-toxicity, and should have a high degree of solubility in water, ethanol or glycerin and edible oils, and be resistant to acid or alkali decomposition. Numerous changes are occurring with respect to toxicity tests and standards for acceptance by the federal Food and

Drug Administration (FDA) and similar bodies in other countries. The majority of the synthetic dyes that have been used in food were azo dyes but the violet, blue and green shades have required the use of sulfonated dyes of the triarylmethane and other classes. The most common natural dye used is carotene, suitable for yellow coloring of edible oils and fats.

food of the gods. See asafetida.

fool's gold. See pyrite.

foots (soapstock). The mixture of soap, oil, and impurities that precipitates when natural fatty oils are refined by treatment with caustic soda or soda ash. Usually contains 30 to 50% of free and combined fatty acids, and is used for manufacture of relatively low grade soaps, and also as a source of free fatty acids. A related usage of the term is for the suspended solid matter in crude oils.

"**Forasite.**"³⁶ A phenolic water-soluble adhesive used in bonding comminuted wood products. This resin is applicable to both wet and dry process.

Properties. Solids (PMMA) 40-85%.

"**Foremul.**"⁷⁸ Trademark for a series of polyethylene esters of fatty acids used as emulsifiers in the fat liquoring of leather, degreasing agents, dispersing and stabilizing agents, and in formulation of insecticides and agricultural sprays.

forensic chemistry. The use of chemical knowledge and methods in connection with legal matters, most often those associated with evidence of a crime. Of particular importance are the use of chemical microscopy with or without polarized light to observe crystal characteristics, the use of spot and color reactions, and various spectrophotometer applications. Special methods are necessary for poisonous metals, volatile and gaseous poisons, and nonvolatile organic poisons. Examination of documents to establish the identity and age of ink, and to restore erasures is a special variety of forensic chemistry.

formal. See methylal.

formaldehyde (oxymethylene, formic aldehyde, methanal) HCHO.

Properties: Colorless gas, suffocating pungent odor, poisonous! M. p. -92°C; b. p. -21°C, soluble in water, alcohol and ether. Polymerizes easily. Is usually handled as an aqueous solution, with or without methanol, which acts as an inhibitor of the polymerization.

Properties of 37% solution (also called formaldehyde; formalin; formol): Clear colorless liquid; sp. gr. 1.075-1.081; b. p. 98°C (approx), pH 3.0; flash point 152°F (with 8% methanol).

Derivation: Oxidation of synthetic methanol or low-boiling petroleum gases such as methane, ethane, propane, and butane. Silver or an iron-molybdenum oxide are

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

the most common catalysts.

Grades: Aqueous solutions: 37%, 45%, 50% inhibited (with varying percentages of methanol) or uninhibited (methanol-free); also available in solution in n-butanol, methanol, or urea; U. S. P. XVI (37% aqueous solution containing methanol). See also paraformaldehyde.

Containers: Drums, carboys, tank cars and tank trucks.

Uses: Urea resins; phenolic resins; pentaerythritol; hexamethylenetetramine, melamine resins; polyformaldehyde resins; other chemicals, dyes, medicine (disinfectant, germicide), embalming fluids, preservative; hardening agent, reducing agent, as in recovery of gold and silver; corrosion inhibitor in oil wells.

Warning! Causes irritation of skin, eyes, nose and throat. MCA warning label.

Shipping regulations: None. *

formaldehyde acetamide. See formicin.

formaldehyde aniline (formaniline) $C_6H_5NCH_2$.

Properties: Colorless to yellowish crystals; initial m. p. $133^\circ C$, b. p. $271^\circ C$, sp. gr. 1.14, but these vary somewhat from sample to sample. Soluble in water, ether, alcohol.

Derivation: By condensation of formaldehyde and aniline.

Uses: Rubber accelerator; intermediate in organic synthesis.

formaldehyde cyanohydrin. See glycolonitrile.

formaldehyde-gelatin. See glutol.

formaldehyde, para-. See paraformaldehyde.

formaldehyde, polymerized. See paraformaldehyde and trioxane.

formaldehyde-para-toluidine (anhydro-formaldehyde-para-toluidine, methylene-para-toluidine) $(CH_3C_6H_4NCH_2)_x$.

Properties: White powder with grayish-yellow cast. Aromatic odor. Not toxic to skin, soluble in acetone, sp. gr. 1.11.

Derivation: Reaction between formaldehyde and para-toluidine.

Uses: Rubber (vulcanizing accelerator), dyes.

formalin. See formaldehyde.

formamidated chloral. See chloral formamide.

formamide (methanamide) $HCONH_2$.

Properties: Clear, colorless, hygroscopic oily liquid, sp. gr. 1.146, b. p. $200-212^\circ C$ with partial decomposition beginning about $180^\circ C$, m. p. $2.5^\circ C$. Soluble in water and alcohol.

Derivation: By the interaction of ethyl formate and ammonia, with subsequent distillation.

Method of purification: Rectification.

Grades: Technical.

Containers: Glass bottles, 55-gal iron drums, tank cars.

Uses: Exceptionally good solvent, softener, intermediate in organic synthesis.

Shipping regulations: None. *

formanilide (phenylformamide) C_6H_5NHCHO .

Properties: Colorless to yellowish crystals; soluble in alcohol and water; m. p. $48-50^\circ C$; b. p. $271^\circ C$.

Derivation: By the reaction of aniline and formic acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Tins; glass bottles.

Use: Medicine.

Shipping regulations: None. *

formaniline. See formaldehyde aniline.

"Formaset," ⁴² Proprietary products. Water soluble or dispersible synthetic urea-formaldehyde type resins.

Properties: Colorless liquids and pastes.

Soluble in water at room temperatures.

Containers: 55-gal lined steel drums.

Uses: Creaseproofing and shrinkproofing of textiles.

"Formcel," ³⁵² Trademark for a series of water-free formaldehyde solutions in alcohols.

Uses: Production of alcoholated urea and melamine resins, coatings, laminating and textile-treating resins; embalming fluids.

"Formica," ¹³ High-pressure laminated plastic sheets of melamine and phenolic impregnated materials for decorative applications, and industrial sheets, rods, and tubes of various thermo-setting resins such as silicones, epoxies, melamines, phenolics, etc. combined with various supporting materials such as paper, linen, canvas, glass, etc. for electrical, chemical, and mechanical applications.

formic acid (hydrogen carboxylic acid) $HCOOH$.

Properties: Colorless, fuming liquid, pungent penetrating odor, dangerously caustic.

Soluble in water, alcohol and ether; sp. gr. 1.2201 ($20/4^\circ C$), m. p. $8.3^\circ C$; b. p. $100.8^\circ C$; flash point $156^\circ F$, lbs/gal ($20^\circ C$) 10.16, refractive index 1.3719 ($20^\circ C$).

Derivation: (a) By treatment of sodium formate and sodium acid formate with sulfuric acid at low temperatures, and distilling in vacuo, (b) by acid hydrolysis of methyl formate, (c) as a by-product in the manufacture of acetaldehyde and formaldehyde in hydrocarbon oxidation.

Method of purification: Rectification.

Grades: Technical; 85%; 90%, C. P.

Containers: 150-, 195-lb carboys.

Uses: Chemical (formates, organic esters, oxalic acid, allyl alcohol), dyeing and finishing of textiles and paper, laundry sour; the manufacture of fumigants, insecticides, refrigerants, solvents for perfumes, lacquers, electroplating, use also suggested in tanning and in wine manufacture to aid fermentation, medicine; brewing (antiseptic); food preservative, silvering glass; leather, cellulose formate, rubber coagulant; ore flotation.

Warning! Causes burns, avoid breathing vapor. MCA warning label.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Shipping regulations: Corrosive liquid; white label.*

formic aldehyde. See formaldehyde.

formicin (formaldehyde acetamide)

Properties: Colorless, syrupy liquid. Soluble in water, alcohol and chloroform. Sp. gr. 1.14-1.18.

Derivation: By the interaction of acetamide and formaldehyde, with subsequent distillation.

Method of purification: Rectification.

Grades: Technical.

Containers: Iron drums; glass bottles.

Use: Disinfectant.

Shipping regulations: None.*

formol. See formaldehyde.

formonitrile. See hydrocyanic acid.

"Formopon." ²³ Trademark for sodium formaldehyde hydrosulfite, a powerful, water-soluble reducing agent, used in synthetic rubber polymerization, dyeing and printing of textiles with vat colors, stripping of dyed fabrics, bleaching of soap. "Formopon" Extra is the basic zinc salt, a powerful, acid-soluble reducing agent, used in stripping colors from dyed fabrics and in the manufacture of liquid strippers.

"Formrez." ¹⁰⁴ Trademark for a line of resins used to produce urethane elastomers (solid cast urethanes).

"Formula 40." ²³³ Trademark for alkanolamine salts of 2,4-D weed killers.

"Formula 602." ³³ Trade name for a solvent cleaner composed of chlorinated hydrocarbons and aliphatic hydrocarbons.

Properties: Boiling range 250-360°F. Flash point 135° (C. O. C.); fire point 160° (C. O. C.).

Containers: 55-gal drums.

Uses: For cleaning electrical equipment and grease removal. It leaves no film and evaporates considerably faster than Stoddard solvent.

formula, chemical. There are several kinds that should be distinguished from one another.

A molecular formula uses the symbols of the elements to indicate the number and kind of atoms in a molecule of the compound, as H_2O_2 for hydrogen peroxide, C_2H_2 for acetylene, C_6H_6 for benzene.

An empirical formula is the simplest formula that can be used to express the relative number of atoms that unite to form a molecule of a compound. It does not necessarily indicate the total number of atoms in the molecule. Thus CH might be used as the empirical formula for both acetylene and benzene.

In a structural formula the symbols are written out so as to indicate the way in which the atoms are located relative to one another in the molecule. Such formulas usually give information on the kind of valence bonds that join the atoms. Examples of structural formulas are:

acetylene

benzene

formula weight. The sum of the atomic weights represented in a chemical formula. Thus, since the atomic weight of hydrogen is 1, and oxygen is 16, the formula weight of water (H_2O) is 18.

"Formvar." ⁶¹ Trademark for polyvinyl formal resins (see under polyvinyl acetal resins). Grades available in powder form

	(1)	(2)	(3)	(4)
7/70	21,000	6	45	9
12/85	30,000	6	24	20
7/95 "S"	18,000	8	11	18
15/95 "S"	34,000	8	11	65
15/95 "E"	34,000	5.5	11	50

(1) Molecular weight (weight average)

(2) Average hydroxyl content (as % polyvinyl alcohol)

(3) Average acetate content (as % polyvinyl acetate)

(4) Viscosity (cps) determined with 5 g. resin made to 100 ml. with ethylene chloride at 20°C.

Uses: Wire enamels; electrical insulations; coatings, adhesives; films and molded materials.

formyl fluoride HCOF .

Properties: Colorless, mobile liquid. Decomposes slowly with formation of hydrofluoric acid and carbon monoxide. Caution! Approximately three times more toxic than chloropicrin! Soluble in water (dec). B. p. -26°C.

Derivation: Interaction of benzoyl chloride and a formic acid solution of potassium fluoride.

Grades: Technical.

Uses: Organic synthesis, suggested military poison gas.

5-formyl-5,6,7,8-tetrahydropteroyl-L-glutamic acid. See folinic acid.

forsterite. See olivine.

"Forthane." ¹⁰⁰ Trademark for methylhexanamine (q. v.).

"Forticel." ³⁵² Trademark for a thermoplastic product consisting essentially of cellulose propionate and plasticizers with or without pigments and coloring matter. Available in pellet form for injection and extrusion molding.

Properties: Sp. gr. 1.16-1.24, tensile strength 1,800-6,900 psi; refractive index 1.47-1.48; soluble or softened in some ketones and esters; affected by alcohol and chlorinated solvents; resistant to inks, aromatic hydrocarbons and mineral oils.

Containers: 25-, 50-, 100-, 200-, 250-lb

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

cylindrical fiber containers.

Uses: Fabricated into pen and pencil barrels, desk accessories, telephone bases and handsets, spectacle frames and protective goggles, tool handles and display trays.

"Fortiflex." ⁴²¹ Trademark for a thermoplastic for use in injection molding, extrusion, blow molding, and calendering. "Fortiflex" A is a high density polyethylene consisting mainly of long molecules with occasional short side branches. "Fortiflex" B is a copolymer of ethylene and butene-1.

Properties: Milk-white translucent 1/8 inch pellets. Colors are also available. Density: "Fortiflex" A 0.960; "Fortiflex" B 0.950; melt index 0.2-8; tensile strength 3,100-3,700 (psi); highest use temperature 225°F; flammability 1 (in/min).

"Fortracin." ³⁴² Trademark for animal feed supplements of bacitracin methylene disalicylate.

"Fortrel." ³⁵² A polyester type synthetic fiber.

"Fosbond." ²⁰⁴ Trademark for a group of chemicals used to provide a corrosion-resistant bond between zinc or ferrous metals and a paint film.

"Foscoat." ²⁰⁴ Trademark for a class of chemicals designed to provide a phosphate coating prior to cold working.

"Fosfodril." ⁵⁵ Brand name for a glassy phosphate of high molecular weight (sodium hexametaphosphate).

Properties: Powder or granular, odorless, glassy, hygroscopic salt.

Containers: 100-lb paper bags.

Uses: In petroleum industry, to impart the proper thixotropic properties to the muds used in oil-well drilling, water treatment in oil-well flooding operations.

"Fos-Fol." ¹⁴⁷ Brand name for a product containing 73.8% tributyl phosphorotri-thioite.

Containers: 5- and 30-gal drums.

Use: Cotton defoliant.

"Fosfo Rosin." ⁷⁹ Trademark of an "FF" grade of limed wood rosin containing approximately 4.5% lime.

Constants: M. p. (capillary tube) 88°C, m. p. (ball & ring) 110°C; acid number 86, color "FF".

Containers: Non-returnable 18-gauge black-iron drums of about 500 lbs gross wt. Tare 14-16 lbs.

Uses: Box toes, matches, printing ink; smoking molds; pipe bending.

"Foslube." ²⁰⁴ Trademark for a class of lubricants used to impregnate a phosphate coating prior to cold working.

"Fospray." ²⁰⁴ Trademark for a group of compounds used for the spray application of a phosphate coat prior to cold working.

"Fosrinse." ²⁰⁴ Trademark for a class of chemicals used to render insoluble the

acid salts remaining after phosphate treatment of ferrous metals.

fossil resin. See amber.

fossil wax. See ozocerite.

"Fosterite." ³⁰⁸ Trademark of a family of resins. Largest application is as "solventless" varnishes for electric insulation, also as a photoelastic resin and as a bond for impregnating and laminating asbestos sheets. Rods made of this plastic will carry a beam of light without the dispersion which occurs in air, making it possible to bend a beam of light.

"Fotoceram." ²⁰ Trademark for crystalline ceramic articles made by processing chemically sculptured glass. These products are utilized primarily for high temperature electronic components such as circuit boards.

"Fotocol." ³¹⁹ Trademark for an alcohol-type solvent.

Properties: Water-white; mild, non-residual odor; sp. gr. (60/60°F), 0.812-0.814; acidity as acetic acid, 0.01% max; distillation range, 74-80°C; non-volatile matter, 0.005 g/100 ml max; flash point (Tag closed cup), 38°F, wt/gal at 60°F, 6.77 lb. Containers: 1-gal can; 5-, and 54-gal steel drums.

Uses: Formulation of printing inks; cleaning printing plates and type; drying photographic films; for zinc etchings; shoe dyes. Distribution governed by Bureau of Internal Revenue.

Shipping regulations: Flammable liquid. Red label.*

"Fotoform." ²⁰ Trademark for articles produced by chemically sculpturing any one of several, pre-treated glass compositions.

foul gas. Coke-oven gas or natural gas containing appreciable amounts of hydrogen sulfide and similar contaminants.

"Foundrez." ³⁶ A group of water-soluble phenol-formaldehyde and urea-formaldehyde resins for foundry applications. Also two-stage powdered phenolic resins for use in the shell molding process.

foundry clays. See fire clays.

foundry sand (molding sand). Sand used in making molds for casting metal. Desirable properties vary according to the metal to be cast, but cohesiveness, refractoriness, texture, permeability, and durability are important.

Fourcault process. A method of forming window glass. The molten glass is drawn up from the melt tank in a ribbon, rolled flat, annealed, then cut to the desired size and shape. The rolling and annealing are done while the glass is in the vertical position.

fousel oil. See fusel oil.

Fowler's solution. A solution of potassium arsenite of definite strength, made by

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

boiling arsenic trioxide with potassium bicarbonate solution. Used in medicine as a means of administering arsenic in soluble form.

foxglove. See digitalis.

foxglove blue. A name applied loosely to any of a number of the varieties of iron-blue pigments. See iron blues.

f. p. Abbreviation for freezing point.

Fr. Symbol for francium.

fractional distillation. Distillation in which rectification is used to obtain product as nearly pure as possible. In such operation a part of the vapor is condensed and the resulting liquid contacted with more vapor, usually in a fractionating column with plates or packing. The term fractional distillation is also applied to any distillation in which the product is collected in a series of separate fractions.

"Fractol." ⁵¹ Trademark for a medium viscosity grade of white mineral oil fully meeting U. S. P. requirements for internal use.

francium **Fr.** The name francium has been adopted for element No. 87. It appears to exist only as radioactive isotopes. One isotope is actinium K. Other isotopes have been made artificially. Francium 223 is the longest lived isotope, having a half-life of 21 minutes. Francium belongs to the alkali-metal family. The name virginium has been suggested earlier.

frangula emodin. See emodin.

frangulic acid. See emodin.

Frankfort black. See vegetable black.

frankincense. See olibanum.

frankincense oil. See olibanum oil.

franklinite $(\text{Fe}, \text{Mn}, \text{Zn})(\text{FeMn})_2\text{O}_4$. Black mineral resembling magnetite (q. v.). Luster, metallic or dull. Only slightly magnetic. Frequently associated with red zincite and yellow to green willemite. Slowly soluble in hydrochloric acid, sp. gr. 5-5.2; hardness 6-6.5.

Occurrence: United States (New Jersey).

Uses: Zinc is recovered as zinc white and the residue is smelted for spiegeleisen.

Also has been ground for dark paints.

Frary metal. A lead-base bearing metal containing 97-98% lead alloyed with 1-2% each of barium and calcium. Excellent for low-pressure bearings at moderate temperatures.

Frasch process.

A means by which some 90% of the world's sulfur is obtained. Developed just prior to 1900 by Herman Frasch, the process involves the melting of sulfur underground and forcing it to the surface while it remains molten.

A site is drilled with ordinary oil-well equipment, and three concentric pipes,

the smaller within the larger, are lowered down the well casing. The outer (larger) carries hot water, the inner (smaller) compressed air to aid in lifting the column of molten sulfur, and the intermediate line carries the rising sulfur mixed with air, water and steam.

The temperature of the water when injected is about 100°F above the melting point of sulfur. In operation, the water permeates the sulfur-bearing rock formation and melts the sulfur which flows into a pool at the base of the shaft. The water pressure forces the sulfur into the exposed end of the intermediate-sized pipe, where it proceeds toward the surface. Air from the center pipe, entering the system at 500 psi rises with the sulfur forcing it to the surface.

Fraude's reagent. See perchloric acid.

"Free-Flo" Soda. ²⁴⁴ Trademark for sodium bicarbonate treated to increase flowability and non-caking properties.

Properties: U. S. P. powdered bicarbonate of soda (NaHCO_3) with approximately 0.5% tricalcium phosphate (Ca_3PO_4) added. Na_2O content 37%, bulk density 60 lb/cu ft., specific gravity 2.2.

Containers: 100-lb Multiwall bags, fiber drums, kegs, and bulk shipments.

Uses: Manufacture and compounding of self-rising flours, cake mixes, and sponge rubber.

free radical. An atom or group of atoms such that there is at least one unpaired electron. A few free radicals have been isolated and samples collected (see triphenylmethyl). Most are short-lived intermediates, and others are convenient and useful theoretical or hypothetical concepts. Examples are benzoate radicals ($\text{C}_6\text{H}_5\text{COO}\cdot$) in the decomposition of benzoyl peroxide, and ethyl radicals ($\text{C}_2\text{H}_5\cdot$) in the pyrolysis of tetra-ethyl lead, $\text{Pb}(\text{C}_2\text{H}_5)_4$. Free radicals are always materials with high reactivity and high energy, and can be collected and stored only with special precautions such as collection in solution or at very low temperatures and in the absence of all but inert solvents or diluents. Some efforts have been made to devise means of collecting free radicals for subsequent use to generate power.

See also carbonium ion.

"Freezene." ⁴⁵ Trademark for a series of refrigeration white mineral oils. Typical properties: (medium) sp. gr. 0.875-0.885 (100°F); Saybolt viscosity 140-150 (210°F), odorless.

Uses: Low temperature lubrication.

freezing point. For a pure substance the freezing point or melting point is the temperature at which the liquid and solid are in equilibrium with one another, i. e., at a higher temperature the solid will gradually melt and at a lower temperature the liquid will solidify.

For a mixture the freezing point or

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

melting point varies with the composition, but is still the temperature at which the liquid mixture is in equilibrium with the solid material that separates from it on cooling. This latter is usually one pure component of the mixture but may be a solid solution, or a mixture.

freibergite. A variety of fahlore containing up to 18% silver. Usually steel-gray, sometimes iron-black, streak reddish; sp. gr. 5.05.

Occurrence: Idaho, Colorado, Nevada; Germany.

Fremy's salt. See potassium bifluoride.

French saffron. See crocus.

"Freon."²⁸ Trademark for a line of fluorinated hydrocarbons used as refrigerants, propellants, blowing agents, fire extinguishing agents, and solvents. They are available in amounts from 5 to 650 lbs in cylinders and drums. Most are available in tank car and tank truck quantities. Mixtures are sold for use as aerosol propellants.

"Freon-11" or "F-11". Trichloromonofluoromethane CCl_3F . Used as a refrigerant in industrial and commercial air conditioning systems; also, in industrial process water and brine cooling to -40°F (-40°C); as blowing agent for rigid and resilient plastic foams. Solutions of "Freon-11" and "Freon-12" are used as propellants for a wide variety of aerosol products. Can be tailored to individual pressure requirements from 1 to 69 lb/sq in gauge at 70°F (21.1°C).

"Freon-12" or "F-12". Dichlorodifluoromethane CCl_2F_2 . Used as a refrigerant in a wide variety of refrigeration and air conditioning systems, including industrial, commercial, household and automotive systems. "Freon-12" is used as a propellant for high pressure aerosols such as those containing insecticides, also for surface-coating products such as metallic and pigmented paints and lacquers. Solutions of "Freon-12" are used as aerosol propellants with other "Freon" products; also as low temperature solvents and as blowing agent for rigid and resilient plastic foams. Pressure 70 lb/sq in gauge at 70°F (21.1°C).

"Freon-13" or "F-13". Monochlorotrifluoromethane CClF_3 . Used as a refrigerant in both direct and indirect industrial low temperature cascade systems, aircraft environmental test chambers; shrink fit, toughening and hardening of metals; pharmaceutical processing. Pressure 459 lb/sq in gauge at 70°F (21.1°C).

"Freon-13B1" or "F-13B1". Monobromotrifluoromethane CBrF_3 ; b. p. -72°F (-57.8°C) at 760 mm. Used as a refrigerant in uses similar to those for "F-13", also for shrink fit, toughening and hardening of metals; pharmaceutical processing, and as a fire extinguishing agent. Pressure 199 lb/sq in gauge at 70°F (21.1°C).

"Freon-14" or "F-14". Tetrafluoromethane CF_4 ; b. p. -198.4°F (-128.0°C) at 760 mm; critical temperature -49.9°F (-45.5°C); critical pressure 542 lb/sq in absolute. Used as a refrigerant in extremely low temperature cascade systems for environmental testing, metal conditioning; pharmaceutical processing; freezing and storage of biological products and other cryogenic applications; direct coolant for infrared detector cells; an inert propellant gas to operate satellite guidance and stabilization rockets.

"Freon-22" or "F-22". Monochlorodifluoromethane CHClF_2 . Used as a refrigerant in industrial and commercial low temperature refrigerating systems. Solutions of "Freon-22" with "Freon-11" and "Freon-12" are used as propellants for aerosol products requiring special solvent and pressure qualities, as a chemical intermediate for plastics manufacture. Used as a low temperature solvent in investment casting process for preparation of ceramic molds. Pressure approximately 122 lb/sq in gauge at 70°F (21.1°C).

"Freon-113" or "F-113". Trichlorotrifluoroethane $\text{CCl}_2\text{FCClF}_2$. Used as a refrigerant in industrial and commercial air conditioning systems; in process water and brine cooling to 0°F (-17.8°C). "Freon-113" is used with other "Freon" compounds as a propellant for aerosol products, as blowing agent for rigid and resilient plastic foams; as a chemical intermediate for plastics manufacture.

"Freon-114" or "F-114". Dichlorotetrafluoroethane $\text{CClF}_2\text{CClF}_2$. Used as a refrigerant in fractional horsepower household refrigerating systems and drinking water coolers employing rotary vane type compressors; also, in indirect industrial and commercial air conditioning systems and in process water and brine cooling to -70°F (-56.7°C); as high stability heat transfer medium. Solutions of "Freon-114" and "Freon-12" are used as propellants for aerosol products where active ingredients require extreme stability - cosmetics, for example; also used as blowing agent for rigid and resilient plastic foams. Provide pressure from 12 to 69 lb/sq in gauge at 70°F (21.1°C).

"Freon" C-318 propellant and dielectric gas. Octafluorocyclobutane cyclic $(\text{CF}_2)_4$. B. p. 21.1°F (-6.0°C) at 760 mm. Use: Food grade as propellant for aerosol food products. Tasteless and odorless. Pressure 25 psig at 70°F (21.1°C). Mixture with nitrous oxide as propellant for whipped cream dessert topping, salad dressing and other pressurized food products. As propellant for flavoring extracts, spices and other food additives. As propellant for inhalation pharmaceutical products. Technical grade as dielectric coolant and heat transfer agent for transformers, cables, waveguides, and electronic devices. Dielectric strength 100 KV per inch at 760 mm. Service temperature at least 250°C .

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Freon" BF Solvent. Tetrachlorodifluoroethane $\text{CCl}_2\text{FCCl}_2\text{F}$. Used as a solvent. Also, in mixtures with "Freon" MF and "Freon" TF to provide specific boiling points and properties. As a flash point retarder for hydrocarbons and some higher boiling solvents.

"Freon" MF Solvent. Trichloromonofluoromethane CCl_3F . Used as a cleaner for hermetic motor compressors, oxygen storage tanks, etc. In blends as a cleaner for motion picture and television film, lithographic plates, typewriters, etc. As a flash point retarder for flammable solvents. Also used as an inert, noncorrosive brine and low temperature heat transfer fluid such as in the cold treatment of brazed stainless steels.

"Freon" TF Solvent. Trichlorotrifluoroethane $\text{CCl}_2\text{FCClF}_2$. Used as a solvent; for a cold immersion cleaning, as a vapor degreasing solvent, for ultrasonic or combination ultrasonic-vapor degreasing cleaning. Used as a cleaner for precision equipment such as gyroscopes, for mechanical and electrical controls, precision instruments and gauges, motors and generators, electrical and electronic equipment and assemblies, motion picture film, television and magnetic tapes, printed circuits, and as a flash point retarder in blends. Also used in extraction processes.

"Friarite." ¹¹⁸ A processed anhydrous alkali aluminum silicate with a pH of 5.4 to 6.5. A diluent used in compounding dusting insecticides and wettable concentrates.

friar's cowl. See aconite.

Friedel-Crafts reaction. Reaction originally defined as the condensation of alkyl or aryl halides with benzene and its homologs in the presence of anhydrous aluminum chloride. This definition has been widened to include analogous processes.

"Frigol" White Mineral Oil. ³³⁸ Brand name for a proprietary product. Available in five grades:

	Viscosity	Temp.
"Frigol" 350	340/50	100° F
"Frigol" 250	250/60	100° F
"Frigol" 150	150/60	100° F
"Frigol" 100	95/105	100° F
"Frigol" 185	180/190	100° F

These oils are made from special, low cold-test stocks.

Containers: 1- and 5-gal cans; 15-, 30-, and 55-gal drums, tank cars.

Uses: In the manufacture and servicing of refrigerators and air-conditioning machines.

"Frillon." ²³³ Trademark for a 2, 4, 5-T product.

frit. A term used in the ceramic industry and applied to a semi-fused mass, the constituents of which originally were soluble or insoluble, fusible or infusible. By "fritting" (i. e., preliminary fusing) the

original properties of the constituents are changed; thus, the soluble materials become insoluble and the infusible materials fusible. Accordingly, the substances which could not otherwise be used in a glaze batch, but which are absolutely necessary for the best results, can be used. Other advantages offered by fritting are minimizing danger to health of workers when using lead salts, inducing better suspension of heavy products in the batch, more even distribution of constituents of the batch; ability to fire the glazed ware at a lower temperature. Most of the glazes used on dinnerware and sanitary ware contain frit. See also glazes.

froth flotation. See flotation.

"FR-S." ²⁷⁸ Trademark for general purpose synthetic rubbers and latexes, composed of copolymers of butadiene and styrene. "Hot" Rubbers, "Cold" Rubbers, Oil Extended Rubbers and Latexes are each available in several numbered grades. Containers: Rubber: 75-lb polyethylene-wrapped bales in paper bags; disposable corrugated skid boxes of 30 bales (approx. 1 long ton). Latex: 5-gal drums to tank cars. Uses: Rubber: Tires, hose, belting and packing, molded and extruded automotive and industrial products; soles and heels; hard rubber. Latex: Adhesives; formed rubber, textile and rug backing paper coating and impregnation, modification of plastics to produce high impact strength; asphalt additive.

Hazards: Avoid freezing latex.

Shipping regulations. None. *

fructose (fruit sugar, D(-)-fructose, levulose)

$\text{C}_6\text{H}_{12}\text{O}_6$. A sugar occurring naturally in a large number of fruits and in honey. It is the sweetest of the common sugars.

Properties. Yellowish, white crystals; soluble in water, alcohol and ether; m. p. 103-105°C (dec).

Derivation: By the hydrolysis of inulin; hydrolysis of beet sugar followed by lime separation.

Grades: Technical, N. F. XI.

Containers: Wooden barrels; tins; fibers drums.

Uses: Foodstuffs; medicine, preservative.

fructose-1,6-diphosphate (FDP, fructosediphosphoric acid) $\text{H}_2\text{PO}_4(\text{C}_6\text{H}_{10}\text{O}_4)\text{H}_2\text{PO}_4$. Can be prepared from fructose and certain other sugars by the use of yeasts. It is known to take part in cell metabolism. It is usually handled in the form of its barium or calcium salts, $\text{C}_6\text{H}_{10}\text{O}_{12}\text{P}_2\text{Ba}_2$ and $\text{C}_6\text{H}_{10}\text{O}_{12}\text{P}_2\text{Ca}_2 \cdot \text{H}_2\text{O}$. These are white amorphous powders, soluble in ice water and dilute acid solutions; insoluble in hot water and alcohol.

Uses: Organic synthesis; experimental work in cell metabolism.

fructosediphosphoric acid. See fructose-1,6-diphosphate.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

fructosin. See levulosin.

"**Fruit-freeze.**" ¹²³ Trade name for ascorbic acid for home freezing use.

"**Fruit Fresh.**" ¹²³ Trademark for an ascorbic acid preparation for preserving color and flavor of fruits.

fruit sugar. See fructose.

FSH. Abbreviation for follicle-stimulating hormone.

FT black. Abbreviation for fine thermal black. See thermal black.

"**Fuadin.**" ¹⁶² Trademark for stibophen.

fuchsin (basic fuchsin; magenta). A synthetic rosaniline dyestuff, a mixture of rosaniline and pararosaniline hydrochlorides.

Properties: Dark green powder or greenish crystals with a bronze luster, faint odor. Soluble in water and alcohol.

Grades: N. F. XI.

Uses: Textile and leather industries; as a red dye; pharmaceutical.

Shipping regulations: None.*

fuel cells.

1. Rubberized tanks for the storage of liquid fuels.
2. Electrochemical devices for the continuous production of electricity by conversion of the chemical energy of continually supplied fuel and oxidant. Like primary cells and storage batteries, fuel cells supply low-voltage direct-current energy; unlike these more conventional sources, fuel cells are converters rather than storage devices and produce electrical energy as long as they are supplied with fuel and oxidant.

As industrial sources of power fuel cells give promise of low cost electricity through the highly efficient utilization of cheap, readily available fuels. For special applications they have the advantages of storage batteries without the necessity for recharging.

The principal types of fuel cells under development are:

a. Hydrox, utilizing hydrogen fuel and air or oxygen. The reaction product, water, must be continuously removed from the cell, usually by evaporation or condensation. This is the most highly developed type of cell. One form uses aqueous potassium hydroxide electrolyte while another version employs an ion exchange resin as electrolyte. Still another uses natural gas (methane) as the source of hydrogen and molten alkali carbonates as electrolyte.

b. Carbox, utilizing carbonaceous fuel and oxygen or air. In one example the electrolyte consists of fused carbonate salts at 500-800°C and the electrode reactions involve the interconversion of carbon dioxide and carbonate ions. Carbon dioxide together with oxygen (or air) is supplied to the cathode (positive plate) and the fuel, which may be hydrogen, carbon monoxide, or gaseous hydrocarbons,

supplied to the anode (negative plate).

c. Redox, in which the electrode reaction involves relatively expensive reactants, which are regenerated externally and re-used. In one version, stannous salts are oxidized by bromine in the cell to yield electrical power while the resulting stannic compounds are reduced outside the cell with coal or other carbonaceous fuel. The bromine is regenerated by air oxidation of hydrogen bromide from the cell.

d. Consumable electrode. For special applications a reactive metal, such as sodium amalgam, may be supplied to a cell as fuel to provide a controlled source of energy.

fuel element. See nuclear fuel.

fuel oil. Any liquid or liquefiable petroleum product used for generation of heat or power, exclusive of oils with a flash point below 100°F and oils burned in cotton or woolwick burners (such as kerosine). No. 1 and 2 fuel oils are liquid. The former is used in vaporizing or pot type burners and has a boiling range of about 400 to 625°F. No. 2 is less volatile and is used in domestic heaters not requiring No. 1. No. 4 oil is liquid at room temperature but is very viscous. It is usually used in industrial furnaces with no preheating facilities. No. 5 and 6 fuel oils are solids which must be liquefied by preheating before burning. They are sometimes referred to as bunker fuels, and are used in ships, locomotives, and industrial power plants.

fuel rod. See nuclear fuel.

fuller's earth. A variety of clay-like material which has high natural adsorptive powers. It is usually composed largely of the clay mineral attapulgite with some montmorillonite. Some varieties of bentonite have similar properties after activation. The natural material is treated by extrusion, drying and milling before use.

Occurrence: Florida, Georgia, Texas, Missouri, Illinois, Kentucky, Tennessee, Mississippi, Alabama, California, Utah.

Containers: Bulk, burlap bags, paper bags.

Uses: Decolorizing of oils and other liquids; oil-well drilling muds, insecticides, floor-sweeping compounds, cosmetics, rubber filler, catalyst, carrier for catalysts; filtering medium, pigments.

Shipping regulations: None.*

fuller's herb. See saponaria.

fulling agents. Soap solutions used in "fulling" wool, an operation by which wool fibers are interlocked to a dense, felted condition by means of friction, heat, and moisture.

fulling assistants. Sulfonated oils, wetting agents, sulfonated fatty-alcohol salts, etc., used to increase efficiency of fulling agents.

fulminates. Salts of fulminic acid (isocyanic acid), HN:C:O. The fulminates are extremely explosive, and are used as detonators.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

fumagillin $C_{27}H_{36}O_7$. An antibiotic substance produced by *Aspergillus fumigatus*.

Properties: Light yellow crystals from dilute methanol; m. p. 189-194°C. Insoluble in water, dilute acids, saturated hydrocarbons. Soluble in most other organic solvents.

Grade: N. N. D.

Use: Medicine.

fumaric acid (boletic acid, lichenic acid, allomaleic acid) $HOOCCH:CHCOOH$. The trans-isomer of maleic acid.

Properties: Colorless, odorless crystals, stable in air, sp. gr. 1.625; sublimes 200°C; m. p. 287°C (sealed tube), solubility in water (25°C) 0.63 g/100 g; solubility in alcohol (30°C) 5.76 g/100 g; insoluble in chloroform and benzene.

Derivation: Fermentation of molasses; isomerization of maleic acid; catalytic oxidation of benzene.

Method of purification: Crystallization.

Grades: Technical, crystals.

Containers: 250-lb drums, bags.

Uses: (in approximate order of volume):

Polyester resins; alkyd resins for paints, varnishes, molding powders, etc; rosin esters and adducts, for furniture lacquers and quick-setting printing inks, upgrading natural drying oils (especially tall oil) to improve drying characteristics, in foods, to replace citric and tartaric acids (in very small amounts), mordant, organic synthesis, modified phenolics.

Shipping regulations: None.*

fumaryl chloride $ClCOCH:CHCOCl$.

Properties: Clear, straw-colored liquid, b. p. 158-160°C (760 mm), 62-64°C (13 mm); sp. gr. (20°C) 1.408.

Containers: 150-lb, 13-gal carboys.

Uses: Chemical intermediate in the preparation of pharmaceuticals, dyestuffs, and insecticides.

Shipping regulations: Corrosive liquid. White label.*

"Fumetrol." ²⁸⁸ Trademark for chemical additives to electroplating baths.

Types: 101 and 102 - fume and spray suppressants for use in chromium plating solutions. 201 and 205 - permanently stable, highly effective, fluorinated wetting agents for all chromium plating baths.

fuming liquid arsenic. See arsenic trichloride.

fundamental particle (elementary particle).

Any one of what are thought to be the basic building blocks in the structure of matter. At any stage in the development of physical theory, a particle is called fundamental if it cannot be convincingly interpreted as composed of simpler units. In an earlier era it was thought that the atoms themselves were of this character. Subsequent work has shown that they are in fact assembled from more fundamental particles, electrons and nucleons, and a variety of other fundamental particles of extremely transitory existence have since

been found from experimental work on high energy nuclear reactions, and especially from cosmic ray investigations. The following table summarizes the particles presently known:

Kind of Particle	Number of Given		Mass in Electron		Charge	Class
	Kind	Mass	Units			
photon	1	0	0	0		photon
neutrino	2	0	0	0		lepton
electron	2	1	-	-		
muon	2	206	-	-		
(mu meson)						meson
pion	3	263-273	-	0		
(pi meson)						
kaon	6	966	+	0		
(k meson)						nucleon
proton	2	1836	+			
neutron	2	1838	0			
lambda	2	2182	0			
particle						hyperon
sigma	6	2328-2341	+	0, -		
particle						
xi particle	4	2570	0, -			
(cascade particle)						

Each particle has its antiparticle, and each may have more than one charge type. In some cases the particle is identical with its own antiparticle. Thus the pi zero is its own antiparticle, for pi minus there is an anti pi plus, and for the sigma particles, which occur with charges plus, zero, and minus, there are anti particles with charges minus, zero, and plus respectively. According to this method of classifying, there are thirty-two separately identifiable fundamental particles in the present state of physical theory.

"Fungchex." ⁸¹ Trademark for a mixture of mercuric chloride and mercurous chloride. Used as a turf fungicide.

fungicides. Chemicals which are used as a means of control of fungus growth. Two types of fungicides are generally recognized: those which protect against the growth of fungus and those which are designed to eradicate the fungus already present. Examples of the former are copper compounds (for fruit and vegetables), organic mercurial compounds (for seed treatments), phenolic compounds, and metal organic compounds (as wood preservatives). Examples of the eradicator fungicides are lime sulfur, organic mercurials, formaldehyde, dinitro compounds, certain antibiotics, and the quaternary ammonium derivatives. The term fungistat is sometimes used to refer specifically to those fungicides that inhibit fungus growth but do not kill or destroy the fungus.

fungicidin. See nystatin.

fungistats. Substances that stop or inhibit fungal growth but do not actually kill the fungi.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- "**Fungitrol**." ⁷⁴ Trademark for a series of industrial fungicides. Available as:
 "Fungitrol" 25: solubilized copper cupferron containing 3.6% copper.
 "Fungitrol" 50: contains 5% zinc.
 "Fungitrol" 100 W. D.: water-dispersible quaternary ammonium naphthenate.
 "Fungitrol" 617: coconut amine salt of tetrachlorophenol.
 "**Fungizone**." ⁴¹² Trademark for amphotericin B (q. v.).
 "**Fungizymes**." ⁷⁸ Trademark for a blended mixture of enzymes, deliming and activating salts used in the dehairing and bating of all types of hides.

furacrylic acid. See furylacrylic acid.

- "**Furafil**." ²²⁴ Trademark for lignocellulose produced by the pressure digestion of the acidified residue remaining after extraction of furfural from agricultural raw materials.
 Properties: Dark brown free-flowing powder, burnt sugar odor; absorbs its own weight of water or oil; bulk density 30-35 lbs/cu ft; pH (water extract) 2-3.
 Grades: "Furafil C," "M," "100," and "Fur-Ag" (q. v.).
 Containers: 65- and 100-lb bags; bulk (40 ton min).
 Uses: Additive for bulk, absorbency or conditioning action; extender for phenolic glues for plywood, foundry facings, oil well drilling muds; fertilizer.
 "**Fur-Ag**." ²²⁴ Trademark for a sterilized grade of "Furafil" lignocellulose. Used as an anti-caking agent and organic conditioner in mixed fertilizers.

furaltadone (furmethonol). 5-Morpholino-3-(5-nitrofurfurylideneamino)-2-oxazolidinone. M. p. 206°C (dec). Used in medicine.

furamide. See furoamide.

- furan** (furfuran, tetrol) HC:CHCH:CHO . A heterocyclic ring compound.
 Properties: Colorless liquid turning brown on standing. This color change is retarded if a small amount of water is added to the furan. This material is somewhat toxic and in a room its fumes should not be allowed to reach a very high concentration; sp. gr. 0.9444 (15°C), b. p. 32°C (758 mm); refractive index 1.4216 (n_D 20/D); insoluble in water; soluble in alcohol and ether.
 Derivation: (a) Dry distillation of furoic acid from furfural; (b) especially as an intermediate in the production of adiponitrile.
 Grades: Refined.
 Containers: 7-lb (1-gal) containers; 35- and 375-lb drums; 32,000-lb tank cars.
 Uses: Organic synthesis.
 Shipping regulations: None.*

furancarboxylic acid. See furoic acid.

2,5-furandione. See maleic anhydride.

furan resins. The term refers to monopolymers of furfuryl alcohol, and also to resins obtained by condensation of phenol with furfural or furfuryl alcohol, and to furfural-ketone polymers. The resins are always of a dark color.

The furfuryl alcohol polymers are usually low in viscosity and are used as penetrants into wood, sand, gypsum, and chemical stoneware. After curing by means of heat and acid catalysts, these resins have superior resistance to acids, alkalis and solvents. This type of furan resin is also used as a plasticizer for vinyl resins.

The phenol-furfural resins are usually used to modify the properties of phenol-formaldehyde resins in the direction of improved flow properties or increased resistance to chemical deterioration. The resins also have good adhesive properties and are used as binders in grinding wheels and foundry cores, and as bonding mortars for joining other materials. When used with asbestos or fiberglass filler they serve for molded products useful for their chemical resistance. Furan resins are also used as modifiers of other resins such as epoxies to obtain coatings, castings, laminates, cements, and sealants that have desired penetration, adhesion, or inert character.

- furazolidone** $\text{C}_8\text{H}_7\text{N}_3\text{O}_5$ (N-(5-nitro-2-furfurylidene-3-amino-2-oxazolidone)).
 Properties: Yellow powder; odorless; m. p. 255°C. Slightly soluble in polyethylene glycol; insoluble in water, alcohol, and peanut oil.
 Derivation: Synthetically from furfural, hydroxyethylhydrazine, and diethyl carbonate.
 Grade: N. F. XI.
 Use: Medicine.

furethrin (2-furfuryl-4-hydroxy-3-methyl-2-cyclopenten-1-one ester of 2,2-dimethyl-3-(2-methyl propanyl)cyclopropane carboxylic acid). A synthetic analog of allethrin substituting the 2-furfuryl for allyl in the side chain. Used as insecticide in manner similar to allethrin. Accepted as generic name by Ent. Soc. See also allethrin, barthrin, ethythrins, cyclothrin.

furfural (ant oil, artificial, pyromucic aldehyde, furfuraldehyde; has been called furfurol) $\text{C}_4\text{H}_3\text{OCHO}$ or OCH:CHCH:CHO .

- Properties: Colorless mobile liquid when very pure, changes to reddish brown upon exposure to light and air. Penetrating odor somewhat similar to benzaldehyde. Furfural forms condensation products with many types of compounds, phenol, amines, urea, etc. Soluble in alcohol, ether, and benzene; 8.3% soluble in water at 20°C.
 Constants: Sp. gr. 1.1598 (20/4°C); m. p. -36.5°C; b. p. 161.7°C (760 mm); heat of vaporization 107.5 cal; refractive index 1.5260 (n_D 20/D); flash point (Tag open cup) 150-160°F.
 Derivation: From oat hulls, rice hulls,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

corn cobs by steam-acid digestion.

Grades: Technical, refined.

Containers: 1-, 5-, 10-gal cans; 55-gal drums; tank cars.

Uses: Solvent refining of lubricating oils, butadiene, rosin and other organic materials; solvent for nitrocellulose, cellulose acetate, shoe dyes; wetting agent; preparation of synthetic resins; weed killer, fungicide; furfural derivatives; adipic acid and adiponitrile; bituminous or concrete road construction; production of lysine; refining of rare earths and metals.

Fire hazard: Slight.*

Shipping regulations: None.*

furfural acetic acid. See ferylacrylic acid.

furfural acetone $(C_4H_5O)CH:CHCOCH_3$.

Properties: Light-yellow crystals turning dark reddish-brown on standing. Insoluble in alcohol, ether, and chloroform. M. p. 37-39°C; b. p. 112-115°C (10 mm).

Derivation: Condensation of furfural with acetone in alkali solution (some difurfural acetone is also formed).

Containers: Bottles.

Grades: Technical.

Shipping regulations: None.*

furfural acetophenone $(C_4H_5O)CH:CHCOC_6H_5$.

Properties: Oil; forms polymorphous crystals. Sp. gr. 1.140 (20°C); b. p. 317°C; 187°C (11 mm).

Derivation: Condensation of furfural with acetophenone in alkali solution.

Grades: Refined.

Containers: Bottles.

furfuraldehyde. See furfural.

furfural diacetate $C_4H_5OCH(OOCCH_3)_2$.

Properties: Colorless crystals; m. p. 52-53°C; b. p. 220°C. Insoluble in water; soluble in ether and alcohol.

Derivation: From furfural and acetic anhydride in the presence of stannous chloride.

Grades: Technical.

Containers: Bottles.

Shipping regulations: None.*

furfuraldoxime (furfural oxime)

$C_4H_5OCHNOH$.

Alpha form (sym-form)

Properties: Soluble in water, alcohol, ether, and benzene. M. p. 90-91°C; b. p. 201-208°C with decomposition.

Derivation: From furfural and hydroxylamine.

Beta form (anti-form)

Properties: Needles (from ligroin).

M. p. 74-75°C. Difficulty soluble in cold water; soluble in alcohol, ether, carbon disulfide, benzene, and glacial acetic acid.

Derivation: From furfural and hydroxylamine.

Grades: Technical (probably mixture).

Containers: Bottles.

Shipping regulations: None.*

furfural oxime. See furfuraldoxime.

furfural phenylhydrazone $C_4H_5OCHNNHC_6H_5$.

Properties: Leaflets; insoluble in water;

soluble in alcohol and ether. M. p. 97-98°C

Derivation: Furfural and phenylhydrazine.

Shipping regulations: None.*

furfuramide. See hydrofurfuramide.

furfuran. See furan.

furfurin $C_{15}H_{12}N_2O_3$. An isomer of hydrofurfuramide.

Properties: Brown needles; insoluble in water; soluble in alcohol and ether. M. p. 116°C.

Derivation: Action of dilute alkali on hydrofurfuramide.

Shipping regulations: None.*

furfurol. A misnomer for furfural.

furfuryl acetate $C_4H_5OCH_2OOCCH_3$.

Properties: Colorless liquid turning brown upon exposure to light and air, pungent odor.

Insoluble in water, soluble in alcohol and ether. Sp. gr. 1.1175 (20/4°C), b. p. 175-177°C, refractive index 1.4627 (D).

Derivation: By treatment of furfuryl alcohol with acetic anhydride.

Containers: Bottles.

Grades: Refined.

Use: Flavor.

Shipping regulations: None.*

furfuryl alcohol (furyl carbinol) $C_4H_5OCH_2OH$ or $OCH:CHCH:CH_2OH$.

Properties: Colorless, mobile liquid becoming brown to dark-red upon exposure to light and air. Poisonous! Reacts with explosive violence with mineral acids (even when dilute) and some strong organic acids to form a black, brittle, insoluble, infusible resin. Soluble in alcohol, ether, chloroform, benzene. When freshly prepared it is soluble in water in all proportions, but upon standing for some months or upon exposure to slightly acid conditions it becomes more or less water-insoluble.

Constants: Sp. gr. 1.1285 (20/4°C); b. p. 170°C (750 mm), refractive index 1.4850 (25°C/D), flash point (open cup) 167°F.

Derivation: Catalytic hydrogenation of furfural.

Grades: Technical, refined.

Containers: 1-, 5-, 10-, 55-gal drums; tank cars.

Uses: Wetting agent, synthetic resins; penetrant, solvent for dyes and resins; rocket fuels.

Shipping regulations: None.*

alpha-furfuryl amine $C_4H_5OCH_2NH_2$.

Properties: Colorless liquid; soluble in water, alcohol, and ether. Sp. gr. 1.0550 (17°C); b. p. 145°C (757 mm); refractive index 1.4900 (17°C).

Derivation: (a) Reduction of furfuraldoxime or hydrofurfuramide; (b) furfural and ammonia.

Shipping regulations: None.*

alpha-furfuryl mercaptan. An essential aromatic constituent of roasted coffee beans used as a basic ingredient for synthetic coffee compositions and fortifier for natural coffee blends and flavor adjunct.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

furil $C_4H_3OCOCOC_4H_3O$.

Properties: Yellow needles; practically insoluble in water; difficulty soluble in cold alcohol and ether; soluble in methyl alcohol and chloroform. M. p. 165-166°C.

Derivation: Atmospheric oxidation of furoin.

Grades: Refined.

Containers: Bottles.

Shipping regulations: None.*

furmethonol. See furaltadone.

furnace black. A carbon black made by burning natural gas or vaporized aromatic hydrocarbon oil in a closed furnace with about 50% of the air required for complete combustion. The combustion products are cooled by a water spray and the finely divided carbon is separated from the gases. Furnace black produced from oil can be made in a wide range of closely controlled particle sizes and is particularly suitable for use as a filler and reinforcing agent for synthetic rubber.

Grades: Conducting furnace black (CF); fine (FF); high modulus (HMF); high elongation (HEF); reinforcing (RF); semi-reinforcing (SRF); high abrasion (HAF); super abrasion (SAF); fast extruding (FEF).

furnace oil. Usually means No. 1 fuel oil. See fuel oil.

furnace sand (fire sand). Sand used to line furnace bottoms or walls, particularly in open hearth steel furnaces.

"Furnane" (Red) and (Black). ⁴¹ Trade names for two synthetic resin cements of the vinyl and furan type respectively used in combinations with acid tile for food plant floor construction.

"Furnex." ¹³³ Trademark for semi-reinforcing furnace carbon black (SRF). Used in rubber for compounds needing only medium reinforcement but high resilience, low heat buildup. Provides easy mixing, good calendaring and extrusion properties. Available in several types:

Regular "Furnex" for tire carcasses, wire and cable, footwear, mechanical molded and extruded goods, V-belts, industrial tires, hose and tubing, mats.

"Furnex" H for same application but where slightly higher extrusion and better processing are desirable at same cost.

"Furnex" NS (non-staining) where such properties are desirable as in tire carcasses, refrigerator gaskets, auto window channel and similar goods. Available in 25- and 50-lb bags and hopper cars.

furnish. Term used by paper makers to refer to mixtures containing the constituents of paper as supplied to the papermaking machine.

furoamide (pyromucamide; furamide)
 $C_4H_3OCONH_2$.

Properties: Crystals; sublimes partly at 100°C. M. p. 142°C.

Derivation: Treatment of furoyl chloride with ammonia.

Grades: Refined.

Containers: Bottles.

Shipping regulations: None.*

furoic acid (pyromucic acid; furane carboxylic acid) C_4H_3OCOOH or $OCH:CHCH:COOH$.

Properties: Colorless crystals; m. p. 133-134°C; sublimes at 130°C (50-60 mm).

Slightly soluble in cold water; very soluble in hot water, alcohol and ether; insoluble in paraffin hydrocarbons.

Derivation: Cannizzaro reaction from furofural; oxidation of furfural.

Purification: Sublimation; fractional crystallization from hot water.

Grades: Technical.

Containers: 5-, 10-, 25-, 50-lb packages, 100-lb fiber drums.

Uses: Preservative; bactericide; furoates for perfume and flavoring; fumigant; textile processing.

Shipping regulations: None.*

furoin $C_4H_3OCH(OH)COC_4H_3O$.

Properties: Light-brown needles; insoluble in water, soluble in methyl alcohol and ethyl alcohol. M. p. 138-139°C (corr.).

Derivation: Action of potassium cyanide on furfural.

Grades: Refined.

Containers: Bottles.

Shipping regulations: None.*

furoyl chloride $C_4H_3OCOC_4H_3O$.

Properties: Colorless liquid; powerful lachrymator. Must be handled with extreme care. Soluble in ether; decomposes in water. M. p. -2°C; b. p. 176°C, 66°C (10 mm).

Derivation: Treatment of furoic acid with phosphorus pentachloride.

Grades: Refined.

Containers: Bottles.

Use: Substitute for chloropicrin in disinfecting grain elevators.

Shipping regulations: None.*

furylacrylic acid (furfural acetic acid, furacrylic acid) $C_4H_3OCH:CHCOOH$.

Properties: White powder, slightly soluble in cold water, easily soluble in hot water; soluble in alcohol, ether, and glacial acetic acid. M. p. 141°C, b. p. 117°C (8 mm), 286°C (760 mm).

Derivation: From furfural by Perkins condensation.

Grades: Technical.

Containers: Bottles.

Uses: Derivatives used in perfumes.

Shipping regulations: None.*

furyl carbinol. See furfuryl alcohol.

fusain (mother of coal, mineral charcoal). One of the types of physical structure found in coal (see also clarain, durain, and vitrain). Fusain is a dull, brittle material resembling charcoal. It reduces the caking properties of the coal in which it occurs.

"Fused Salt B." ³³⁷ Trade name for potassium zirconium chloride.

fused salts. Salts (i. e., ionic compounds) in the molten state. High temperatures are usually involved in maintaining the molten

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

state. Sodium chloride is the principal ingredient in many fused salts.

Uses: Production of alkali and other metals by electrolysis: aluminum, sodium, magnesium, titanium, zirconium, niobium, tantalum; as a base for circulating liquid fuels in nuclear reactors; fluxing and de-scaling metals; heat transfer agents.

fusel oil (amyl alcohol, fermentation; grain oil; potato spirit; potato oil). A volatile, poisonous, oily mixture consisting largely of amyl alcohols. Isoamyl alcohol (isobutyl carbinol) and active amyl alcohol (2-methyl-1-butanol) are chief constituents. Ethyl, propyl, butyl, hexyl and heptyl alcohols as well as other alcohols have been separated. Acids, esters, and aldehydes are also present. Normal primary amyl alcohol (1-pentanol) is not found in fusel oil. An appreciable percentage of fusel oil in a liquor has an adverse influence on its taste and physiological effects, but minute amounts are necessary for the characteristic flavor.

Properties: Clear, colorless liquid; disagreeable odor.

Crude: (Typical specifications) Sp.gr. 0.8315 (20/20°C), equivalent wt/gal 6.92 lbs (20°C); distillation range, distillate up to 122°C, 34%, between 122 and 138°C 61%, above 138°C 3.4%; 1.68% ethyl alcohol by volume.

Refined: (Typical specifications) Color water-white, distillation range below 110°C none; below 120°C not more than 15%; below 130°C not less than 60%; above 135°C none, sp.gr. 0.811-0.815 (20/20°C); wt/gal 6.76 lbs (approx) (20°C). Flash point 123°F (open cup); soluble in all proportions 60° gasoline without turbidity, soluble in water, alcohol, and ether.

Derivation: Obtained as a by-product in the alcoholic fermentation of starch- or sugar-containing materials such as potatoes, grapes, beetroots, grain, etc.

Method of purification: Rectification.

Grades: Crude; refined.

Containers: 1-, 5-, 10-gal cans; 5-, 10-, 53-, 104-gal drums; 6000-, 8000-gal tank cars.

Uses: Chemicals (amyl ether, amyl acetate, pure amyl alcohols, nitrous ether, various esters); identification of alkaloids in analytical chemistry; explosives (gelatinizing agent); solvent for fats and oils; artificial fruit syrups; ice cream and soda-water essences; intermediate; pharmaceuticals (preparation and purification of alkaloids, hypnotics, amyl nitrite); nitrocellulose plastics; synthetic rubber; varnishes; lacquers; solvent for resins and waxes; and perfumery.

Fire hazard: Combustible but not flammable; flash point over 80°F.

Shipping regulations: None.*

fusible alloys (low-melting alloys, fusible metals). The term generally means alloys melting below 450°F (233°C). These are usually the binary, ternary, quaternary,

and quinary mixtures of bismuth, lead, tin, cadmium, indium, and less frequently other metals. Eutectic alloys are relatively few in number and are the particular compositions that have definite and minimum melting points as compared with other compositions of the same metals. The more important eutectic alloys are listed in Table I.

Table I
Eutectic Alloys
Percentage Composition

Melting Temp. °C	Bi	Pb	Sn	Cd	Other

The fusible alloys may have various habits of expansion, some behaving typically on solidification, i.e., contracting, others expanding, and others exhibiting considerable "growth" only after solidification, which may continue for 500 to

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

1000 hours. Total growth may be as much as 0.008 inches/inch. All fusible alloys creep under relatively light continuous loads. They are characterized by their "let go" or yield temperature as determined by a standard test procedure. Hardness of fusible alloys ranges from 5 to 22 Brinell, tensile strength between 3000 and 13,000 psi and elongation from 0 to 300%.

The best known fusible alloys are indicated in Table III.

Table III
Common Fusible Alloys

Name	Approx M.P. °C	Percentage Composition			
		Bi	Pb	Sn	Cd
Cerrotru alloy	138.6	58	-	42	-
Cerrobaze alloy	123.8	55.5	44.5	-	-
Rose's alloy	100	50	28	22	-
Newton's metal	95	50	31	19	-
D'Arcet metal	93	50	25	25	-
Wood's alloy	71	50	24	14	12
Wood's metal	71	50	25	12.5	12.5
Lipowitz's metal	70	50	27	13	10
Cerrobend alloy	70	50	26.7	13.3	10

The chief uses are in fusible automatic sprinkler links, in fusible vents in compressed gas tanks, for dental castings, for anchoring punches in metal working tools, anchoring bearings and bushings, for heat transfer liquids, for high temperature liquid seals, for glass to metal seals, as fusible cores in forming operations including tube bending, and for spray coat-

ings of patterns for protection during handling and storage.

fusible metals. See fusible alloys.

fusion. Ordinarily a synonym for melting, e.g., of a crystalline substance. Since melted substances tend to mix readily, the word has assumed the meaning of "melt and blend." The so-called fusion of protons to form helium as utilized in the hydrogen bomb indicates a union of two or more protons to form an element with great liberation of energy.

fusion reactor. See nuclear fusion.

FWWMR. Fire, water, weather, mildew resistant, as applied to fabrics or textiles. See flameproofing finishes.

"Fybrene." ⁴⁵ Trademark for petrolatum, U. S. P., of medium melting point and medium consistency.

Properties: M. p. 115-125°F, Saybolt viscosity 65-90 (210°F), odorless.

Use: Paper industry.

"Fyrex." ¹⁷² Brand name for a substantially neutral ammonium phosphate, fine crystals; soluble in water.

Grades. "Fyrex," "Flexible Fyrex," with added softening agent, "Special Flexible Fyrex," containing both a softening agent and a penetrating agent.

Uses. For flame proofing textiles, wood, and fibers, in the manufacture of matches to prevent afterglow.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

G

g. Abbreviation for gram.

"**G-4**," ¹² Trademark for a brand of dichlorophene (q. v.).

"**G-11**," ¹² Trademark for hexachlorophene U. S. P.

"**G-942**," ²⁸ Trademark for specialty tanning product based on the partial sodium salt of a polymeric carboxylic acid.

Properties: Viscous straw-colored liquid approximately 25% solids, sp. gr. 0.97.

Containers: 55-gal resin-lined steel drums, 475 lbs net.

Uses: As a plumping and tanning agent, primarily for light weight skins. Suitable for most types of leather such as suede, drawn and smooth grain, garment, etc.

Ga. Symbol for gallium.

GA₃. Symbol used for gibberellic acid (q. v.).

G acid. 2-Naphthol-6,8-disulfonic acid.

gadolinite YFeBe₂(SiO₄)₂O₂. A natural silicate of beryllium, iron, and the yttrium and rare earth metals. Black, greenish black, or brown, luster vitreous to greasy, hardness 6.5-7.0, sp. gr. 4.0-4.5, thermoluminescent.

Occurrence: Texas, Arizona, Colorado, Norway, Greenland.

gadolinium Gd. Element having atomic number 64, group III of the periodic table, one of the rare-earth elements of the yttrium subgroup.

Properties: Lustrous metal, sp. gr. 7.87, m. p. 1350°C, b. p. 2700°C (approx). Reacts slowly with water, soluble in dilute acid. Exhibits a high degree of magnetism, especially at low temperatures. Salts are colorless. Only one valence (+3).

Source: See rare-earth minerals.

Derivation: Reduction of the fluoride with calcium.

Grades: Ingots, lumps, turnings, all of high purity.

Uses: Crystalline compounds of gadolinium, especially gadolinium sulfate octahydrate, are used in magnetic method of obtaining extremely low temperatures. Gadolinium has a high thermal neutron capture cross-section, is used as an alloy in stainless steel for nuclear control. Also used as a scavenger for oxygen and nitrogen in titanium and its alloys.

gadolinium chloride GdCl₃·xH₂O. Colorless crystals, soluble in water. Purities up

to 99.9% gadolinium salt.

Containers: Glass bottles, fiber drums.

gadolinium fluoride GdF₃·2H₂O. Available up to 99.9% purity.

Containers: Glass bottles, fiber drums.

gadolinium nitrate Gd(NO₃)₃·xH₂O. Colorless crystals, soluble in water. Purities up to 99.9% gadolinium salt.

Containers: Glass bottles, fiber drums.
Shipping regulations: Oxidizing material. Yellow label.*

gadolinium oxalate Gd₂(C₂O₄)₃·10H₂O. White powder, insoluble in water, slightly soluble in acids. Purities up to 99.9% gadolinium salt.

Containers: Glass bottles, fiber drums.

gadolinium oxide Gd₂O₃. White to cream-colored powder, sp. gr. 7.41, m. p. 2330°C; insoluble in water, soluble in acids to form the corresponding salts. Hygroscopic, absorbs carbon dioxide from the air. Purities up to 99.8% gadolinium oxide.

Containers: Glass bottles, fiber drums.

Uses: Nuclear reactor control rods, neutron shields, catalysts, dielectric ceramics, filament coatings, special glasses, phosphor activator.

gadolinium sulfate Gd₂(SO₄)₃·8H₂O. Colorless crystals, slightly soluble in hot water, more soluble in cold. Purities up to 99.9% gadolinium salt.

Containers: Glass bottles, fiber drums.

Uses: For obtaining extremely low temperatures by the magnetic method.

"**GAF**" **Carbonyl Iron Powders.** ³⁰⁷ Trademark for microscopic, almost perfect spheres of extremely pure iron. They are produced in eleven carefully controlled grades, ranging in particle size from 3 to 20 microns in diameter. The iron content of some types is as high as 99.6-99.9%.

Uses: In high frequency cores for radio, telephone, television, short wave transmitters, radar receivers, direction finders. Also used as alloying agents, catalysts, in powder metallurgy and in magnetic fluids.

gaize cement. See pozzolana cement.

gal. Abbreviation for gallon.

galactin. See luteotropin.

galactose C₆H₁₂O₆. A monosaccharide commonly occurring in milk sugar or lactose. Properties: White crystals; soluble in water and alcohol; slightly soluble in glycerol;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

m. p. 165-168°C.

Derivation: By acid hydrolysis of lactose.

Grades: Technical.

Containers: Bottles; drums; boxes.

Uses: Organic synthesis; medicine.

D(+)-galacturonic acid $C_6H_{10}O_7$ or $COOH(CHOH)_4CHO$. A compound found as a major constituent of plant pectins (q. v.). It exhibits mutarotation, having both an alpha and a beta form.

Properties: The alpha form melts with decomposition at 156-159°C. Soluble in water, slightly soluble in hot alcohol; insoluble in ether.

Derivation: Hydrolysis of pectins.

Use: Biochemical research.

galena (galenite, lead glance) PbS . Natural lead sulfide.

Properties: Color lead gray; streak lead gray, luster metallic, good cubic cleavage; sp. gr. 7.4-7.6, hardness 2.5. Soluble in strong nitric acid, also in excess of hot hydrochloric acid.

Occurrence: Idaho, Utah, Arizona, Missouri, Colorado, Montana, Oklahoma, Canada; South America, Africa.

Use: Chief ore of lead. Frequently recovered for the silver it sometimes contains.

galenite. See galena.

"Galex." ^{122, 235} Trade name for a stable non-oxidizing rosin consisting principally of dehydroabietic acid.

Properties: Light amber, acid number 157, saponification number 163, softening point (B & R Method) 66°C, sp. gr. (20/4°C) 1.082, flash point (Cleveland open cup) 210°C, fire point (Cleveland open cup) 240°C; gasoline insolubles 0.014%, benzene insolubles 0.008%. Soluble in ordinary organic solvents, paraffin wax, beeswax, carnauba wax, compatible with GR-S, Neoprene, natural and reclaim rubber and many natural and synthetic resins.

Uses: Rubber-based pressure sensitive adhesives and tapes, water insoluble adhesives, extender for natural and synthetic resins; in the manufacture of soldering fluxes, metal salts, waterproofing compounds, greases and lubricants, soaps, ceramic printing vehicles, electrical insulation, rubber cement; intermediate for the making of chemicals.

gallamine triethiodide

$C_6H_5[OCH_2CH_2N(C_2H_5)_3I]_3$. Tri (diethylaminoethoxy) benzene triethyl iodide.

Properties: White, fluffy, hygroscopic powder; m. p. 150°C. Freely soluble in water, soluble in alcohol, very slightly soluble in chloroform, insoluble in ether.

Grade: N. N. D.

Use: Medicine.

gallic acid (3,4,5-trihydroxybenzoic acid)

$C_6H_2(OH)_3CO_2H \cdot H_2O$.

Properties: Colorless or slightly yellow, crystalline needles or prisms. Soluble

in alcohol and glycerol; sparingly soluble in water and ether.

Constants: Sp. gr. 1.694; m. p. 222-240°C.

Derivation: By the action of mold on solutions of tannin or by boiling the latter with strong acid or caustic soda.

Grades: Technical.

Containers: Barrels.

Uses: Photography; writing ink; dyeing; manufacture of pyrogallol; tanning agent and manufacture of tannins; paper manufacture, pharmaceuticals; process engraving and lithography; analytical reagent.

Shipping regulations: None.*

gallium Ga. Element of atomic number 31, of group III of the periodic system.

Properties: Silvery-white metal; m. p. 29.7°C; b. p. 1600°C; liquid may be under-cooled to almost 0°C without solidifying; sp. gr. 5.9 (25°C), more dense as a liquid than as a solid; soluble in acid, alkali and slightly soluble in mercury. Gallium reacts with most metals at high temperatures.

Occurrence: Traces are present in a variety of ores and minerals. It is prepared commercially from bauxite, containing approximately one ounce of gallium per ton. Also prepared commercially from zinc ores.

Derivation: Extraction of gallium as gallium chloride by ethyl ether or isopropyl ether and subsequent electrodeposition from a sodium gallate solution.

Uses: Gallium has been suggested for use as a backing material for optical mirrors and as a possible heat exchange medium in nuclear power reactors.

gallium antimonide. See gallium arsenide.

gallium arsenide GaAs.

Properties: Crystals, m. p. 1238°C. Used as a high-purity binary semiconductor. Is sometimes alloyed with indium arsenide in semiconductors. Gallium antimonide, GaSb, is used similarly.

gallium oxides. The sesquioxide, Ga_2O_3 , and suboxide, Ga_2O , are known. Both are stable at ordinary temperatures.

gallium phosphide GaP. Pale orange, transparent crystals or whiskers up to 2 cm long, made by vapor phase reaction, at relatively low temperatures, between phosphorus and gallium suboxide. These crystals are intermediate between normal semiconductors and insulators or phosphors. They operate over a temperature range of -55 to 500°C.

gallium salts. Many salts are known, although they seem to have found little use. Gallium is usually trivalent, but sometimes divalent, as in gallium chloride, $GaCl_3$, and gallium dichloride, $GaCl_2$.

gallocyanine. $C_{15}H_{12}N_2O_5$. A dye made from gallic acid. Used as a biological stain.

gallotannic acid. See tannic acid.

galls (nutgalls: Aleppo galls; Mecca galls; Turkey galls). Excrescences on various kinds of oak trees resulting from the

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

deposition of insect eggs.

Grades: The best grades (55-60% tannic acid) come from Iran, Syria, Turkey, and Tripoli. The poorer grades come from Italy, France, Germany, and Austria.

Colors range from black through green to white, owing to different degrees of maturity, the darker being more mature and containing a greater percentage of tannin.

Containers: Wooden barrels; bags.

Use: Source of gallic and gallotannic acids; tanning industry; ink manufacture; medicine; textile printing; pharmaceuticals.

Shipping regulations: None.*

galvanized iron (hot-dip process). Iron coated with zinc by dipping the metal into a bath of molten zinc held at a temperature somewhat above the m. p. (810-875°F).

"Galvene." ²⁰⁶ Brand name of proprietary line of chemical restrainers used in acid pickling of iron, steel, and ferrous alloys. Recommended for use in hydrochloric and hydrochloric-nitric acid mixtures.

"Galvoline." ²³³ Brand name for a proprietary product consisting of a cored magnesium ribbon used as a continuous anode for the cathodic protection of buried pipe lines and other metal structures.

"Galvomag." ²³³ Trademark for magnesium alloy composition for use in anodes in cathodic protection.

"Galvopak." ²³³ Brand name for a proprietary product consisting of a magnesium anode packed with back-fill material. Used in the cathodic protection of buried pipe lines and other metal structures.

"Galvorod." ²³³ Trademark for a cored magnesium rod used as an anode in the cathodic protection of water-heater tanks.

gamboge (cambogia). A gum-resin from *Garcinia hanburyi*.

Habitat: East Indies.

Chief constituents: Cambogic acid, a resin and a gum.

Grades: Technical, N. F. XI.

Containers: Wooden barrels, fiber drums.

Uses: Medicine, paints.

Shipping regulations: None.*

gametocide. A substance which can control pollinization of plants by selectively killing plant sex cells (gametes). Some suggested gametocides are maleic hydrazide, sodium alpha, beta-dichloroisobutyrate.

gamma acid. See 7-amino-1-naphthol-3-sulfonic acid.

gamma compounds. See explanation under alpha compounds. For specific gamma compounds see under name of compound.

"Gammacorten." ³⁰⁵ Trademark for dexamethasone.

Use: Medicine.

gamma-globulin. A fraction of serum globulin which has been separated by electrophoresis and which contains most

of the antibodies.

Use: Medicine.

gamma rays. Electromagnetic radiation similar to X-rays except that gamma rays originate in the nucleus of an atom whereas x-rays originate in the extra-nuclear structure. Gamma rays usually have higher energies and correspondingly shorter wavelengths than x-rays.

"Gammexane." ²⁰⁶ Trademark for benzene hexachloride.

"Gamtox." ²⁵³ Brand name for a pesticide formulation containing benzene hexachloride

"Ganaseg." ⁴¹² Trademark for 4,4'-diazaminodibenzamidine with two molecules of aceturic acid.

gangue. The minerals and rock material mined with a metallic ore but valueless in themselves or used only as a by-product. They are separated from the ore in the milling and extraction processes. Common gangue materials are quartz, calcite, limonite, feldspar, pyrite, and rock of various kinds.

ganister. A highly refractory siliceous sedimentary rock used for the manufacture of refractory brick. Typical analysis: 98.20% SiO₂, 0.30% Fe₂O₃, 0.90% Al₂O₃, 0.15% CaO, 0.10% MgO.

Occurrence: Pennsylvania, Virginia, Wisconsin, Ohio, Great Britain.

"Gantrisin." ¹⁹⁰ Trademark for a brand of sulfisoxazole (q. v.).

garbage pitch. See stearin and fatty-acid pitches.

garden angelica. See angelica.

garden lavender. See lavender.

"Gardenol." ²²⁷ Trademark for methyl phenyl carbonyl acetate, CH₃COOCHCH₃C₆H₅, (styralyl acetate, sec-phenyl ethyl acetate). Properties. Colorless liquid, powerful green-leal scent, suggestive of gardenia, stable, not known to cause discoloration, sp. gr. (25/25°C) 1.023-1.026; refractive index (20°C) 1.492-1.496, soluble in 2 parts of 70% alcohol.

Uses: In gardenia scents, as well as sparingly in tuberose, jasmine, and other florals.

garden rosemary. See rosemary.

garden sage. See salvia.

gardjan balsam oil. See gurjun balsam oil.

gargan balsam oil. See gurjun balsam oil.

garget. See phytolacca.

garlic. See allium.

garlic oil.

Properties: Pale yellowish liquid; characteristic, exceedingly penetrating odor. Soluble in alcohol, ether, and carbon disulfide.

Chief known constituents: Allylpropyl disulfide and diallyl disulfide.

Constants: Sp. gr. 1.053.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: Distilled from the bulb and herb of *Allium sativum*.

Method of purification: Rectification.

Grades: Technical.

Containers: Glass bottles.

Uses: Flavoring, medicine (skin irritant).

Has been suggested as a bactericide.

Shipping regulations: None.*

garnet. A group of silicate minerals with the general formula $R_3^{II}R_2^{III}(SiO_4)_3$.

R^{II} = Ca, Mg, Fe, or Mn; R^{III} = Al, Fe, Ti, or Cr. Garnets in nature are usually composed of mixtures of various garnet subspecies (see below).

Properties: Color variable, luster vitreous to resinous, streak white; hardness 6.5-7.5, sp. gr. 3.5-4.3. Usually well crystallized.

Varieties:

Grossularite $Ca_3Al_2(SiO_4)_3$.

Pyrope $Mg_3Al_2(SiO_4)_3$. Deep red to nearly black. Often transparent, and then used as a gem. Sometimes known as Bohemian garnet, Cape ruby.

Almandite (almandine) $Fe_3Al_2(SiO_4)_3$.

Andradite $Ca_3Fe_2(SiO_4)_3$.

Spessartite $Mn_3Al_2(SiO_4)_3$.

Uvarovite $Ca_3Cr_2(SiO_4)_3$.

Common garnet. Includes mixtures of almandite, andradite, and grossularite. Rhodolite. A mixture of pyrope and almandite.

Occurrence: Widespread in metamorphic and some igneous rocks. New York, New Hampshire, North Carolina, India, Ceylon; Brazil, Czechoslovakia, Africa, U. S. S. R.

Use: Gem stone, abrasive.

garnet lac. See shellac

garnierite $(Ni, Mg)_6(OH)_6Si_4O_{11} \cdot H_2O$. A natural hydrous nickel-magnesium silicate, occurring as a natural alteration of magnesium silicate rocks.

Properties: Color apple green, luster dull to earthy, greasy feel, streak white to greenish; hardness 2-3, sp. gr. 2.2-2.8.

Occurrence. New Caledonia, North Carolina, Oregon, Africa.

Use: Ore of nickel.

garspar. A mixture of finely ground glass and quartz, produced in the grinding of plate glass.

Use: Substitute for feldspar in ceramics, filler in battery boxes and rubber.

gas. One of the three states of matter. A material in the gaseous state is characterized by very low density and viscosity (relative to liquids and solids); relatively great expansion and contraction with changes in pressure and temperature, ability to diffuse readily into other gases, and ability to distribute itself readily with almost complete uniformity throughout the whole of any container.

A "perfect" gas is one which closely conforms to the simple gas laws for expansion and contraction (Boyle's Law,

Charles' Law).

Use of the word "gas" in the sense of gasoline, or any fuel or illuminant, or for the anesthetic nitrous oxide, is scientifically inaccurate.

gas black (carbon black, channel black, furnace black). Finely divided carbon made by incomplete combustion or thermal decomposition of natural gas. Used as reinforcing agent in tire treads and other rubber products. See carbon black.

"Gas-Chrom" A. ⁴²⁵ "Gas-Chrom" S that has been acid washed to achieve high temperature stability and efficiency in gas chromatography.

gas chromatography. The process in which the components of a mixture are separated from one another by volatilizing the sample into a carrier gas stream which is passing through and over a bed of packing consisting of a 20 to 200 mesh solid support. The surface of the latter is usually coated with a relatively nonvolatile liquid designated the stationary phase. This gives rise to the term gas-liquid chromatography. If the liquid is not present the process is gas-solid chromatography which is also widely useful for analysis. As in other types of chromatography, different components move through the bed of packing at different rates and so appear one after another at the effluent end, where they are detected and measured by thermal conductivity changes, density differences, or various types of ionization detectors.

Gas chromatography is advantageous as a means of analysis of minute quantities of complex mixtures from industrial, biological, and chemical sources, and is also of potential value in actually preparing moderate quantities of highly purified compounds otherwise difficult to separate from the mixtures in which they occur.

"Gas-Chrom" P. ⁴²⁵ "Gas-Chrom" S that has been both acid and alcoholic-base washed to achieve high temperature stability and efficiency, and to eliminate active sites.

"Gas-Chrom" S. ⁴²⁵ Trademark for flux-calcined diatomaceous earth, screened so as to be suitable for use as a support for gas chromatography phases and coatings. Available in closely controlled mesh sizes 60-80, 80-100, 100-120, 100-140, 120-140, 140-200.

gas hydrates. A number of gases form clathrate compounds with water and these are known as gas hydrates. The compounds are solids, and are insoluble in water. They usually form and exist only at relatively low temperatures and high pressures. The solids are formed directly by contact of gas and liquid water. Anywhere from 6 to 18 molecules of water may combine with each molecule of gas, depending upon the nature of the gas.

Interest in the gas hydrates for many years was generated mainly because of the

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

nuisance of such compound formation in gas pipelines. In recent years, the compounds have been proposed as a means of precipitating water from salt solution (or sea water), thus yielding potable water.

The best known gas hydrates are those of ethane, ethylene, propane and isobutane. Other known hydrate formers include: methane and 1-butene, most of the fluorochloro refrigerant gases, nitrous oxide, acetylene, vinyl chloride, carbon dioxide, methyl and ethyl chloride, methyl and ethyl bromide, cyclopropane, hydrogen sulfide, methyl mercaptan and sulfur dioxide.

gas-liquid chromatography. See gas chromatography.

gas liquor. See ammonia liquor.

gas oil. A liquid petroleum distillate with a viscosity and boiling range between kerosene and lubricating oil. The boiling range is about 450-800°F. Used for absorption oil, and for cracking in petroleum refineries.

gasoline (petrol, motor spirits). A mixture of volatile hydrocarbons suitable for operation of an internal combustion engine. The major components are usually hydrocarbons with boiling points ranging from 60-200°C. These include straight-chain and branched-chain paraffins, naphthenes, and aromatic hydrocarbons, such as n-heptane, isooctane, methyl cyclohexane, benzene, and toluene. The usual source of gasoline is by distillation of petroleum and cracking, polymerization and other chemical reactions by which the naturally occurring petroleum hydrocarbons are converted to those that have superior fuel properties. Such catalytic chemical conversion of hydrocarbons has become increasingly important.

A gasoline must have the proper mixture of low-boiling and high-boiling components so that it changes to vapor in the most efficient way when used in a motor. This characteristic is usually specified in terms of boiling range, specific gravity, and vapor pressure. Gasoline must not contain or form any non-volatile or gummy materials, and must have the proper combustion characteristics as measured by "knock rating" (octane number). Other common specifications relate to color, sulfur content, and corrosion.

Practically all commercial gasolines contain small amounts of various additives such as lead tetraethyl to improve octane rating, antioxidants, corrosion inhibitors. See "Ethyl." Special gasolines may contain alcohols or other nonhydrocarbons.

Uses: Fuel for internal combustion engines, solvent; paint mixing; rubber cements, illuminant.

Fire hazard: Dangerous.

Shipping regulations: Flammable liquid. Red label. *

gasoline, alkylate. Gasoline made by alkylation (q. v.).

Gasoline Antioxidant No. 5. ²⁸ A solution of N-n-butyl-para-aminophenol in alcohols having the following weight composition: 50% N-n-butyl-para-aminophenol $\text{HOC}_6\text{H}_4\text{NHC}_4\text{H}_9$; 30% anhydrous isopropanol $(\text{CH}_3)_2\text{CHOH}$, 20% anhydrous methanol CH_3OH .

The solution is readily soluble in gasoline in normal use concentrations. The use of benzene or other aromatic solvent is recommended for preparation of concentrated solutions. Sp. gr. 0.90.

Containers: 55-gal (400 lbs) steel drums.

Use: For reducing the formation of gum and precipitation of lead in gasoline.

Gasoline Antioxidant No. 22. ²⁸ N, N'-di(sec-butyl)-para-phenylenediamine, $\text{C}_6\text{H}_4[\text{NHCH}(\text{CH}_3)(\text{C}_2\text{H}_5)]_2$, containing no solvent. A mobile liquid readily soluble in gasoline in all proportions and at all operating temperatures; sp. gr. 0.94.

Containers: 55-gal (425-lb) steel drums.

Use: For retarding the formation of gum and precipitation of lead in gasoline. Concentration required 0.001 to 0.005% by weight.

gasoline, casinghead. See gasoline, natural.

gasoline, cracked. Gasoline produced by the thermal and/or catalytic decomposition of high-boiling components of petroleum. In general such gasolines have higher octane ratings than gasoline produced by fractional distillation of petroleum. The difference is due to the prevalence of unsaturated, aromatic and branched-chain hydrocarbons in the cracked gasoline. The actual properties vary widely with the nature of the starting material, and the temperature, time, pressure and catalyst used in the cracking process.

gasoline, ethyl. See gasoline, leaded.

gasoline, leaded (gasoline, ethyl). Gasoline to which tetraethyl lead has been added to increase its antiknock properties. See octane number.

gasoline, natural (gasoline, casinghead). A volatile gasoline obtained by recovering the butane, pentane, and hexane hydrocarbons present in small proportion in certain natural gases. It is used in blending to produce a finished gasoline with adjusted volatility.

gasoline, polymer. A gasoline produced by polymerization of low molecular weight hydrocarbons such as ethylene, propene, and butenes. It is used in small amounts for blending with other gasolines to improve their octane number.

gasoline, reformed. A high octane gasoline obtained from low octane gasoline by heating the vapors to a high temperature or by passing the vapors through a suitable catalyst.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

gasoline, straight run. Gasoline produced from petroleum by distillation, without use of cracking or other chemical conversion processes.

"Gastex." ²⁷⁵ Trade name for semi-reinforcing furnace carbon black for use in rubber goods. High loading capacity, good resilience and flex resistance.

Use: Tire carcass and bead insulation, mechanical goods, footwear and soling, wire jackets, belts, hose, packings.

Gattermann-Koch reaction. The formation of aromatic aldehydes from phenols by the use of anhydrous hydrogen cyanide, dry hydrogen chloride, and an aluminum chloride or zinc chloride catalyst.

gaultheria (checkerberry; wintergreen; deerberry; boxberry, teaberry). The leaves of a small evergreen plant *Gaultheria procumbens*.

Habitat: Canada and northeastern United States.

Chief constituents: Methyl salicylate, arbutin, ericolin, and ursol.

Grades: Technical.

Containers: Bales; boxes.

Use: Source of oil.

Shipping regulations: None. *

gaultheria oil. See wintergreen oil.

gaultheria oil, synthetic. See methyl salicylate.

Gay-Lussac acid. The sulfuric acid-nitrogen oxides mixture which is the product of the Gay-Lussac tower in the chamber process for manufacture of sulfuric acid.

This acid has a sulfuric acid strength of 60° Bé, and a nitrogen oxides content of 1-2% calculated as N_2O_3 .

gaylussite $Na_2Ca(CO_3)_2 \cdot 5H_2O$. Natural hydrated carbonate of sodium and calcium, found in dry lakes.

Properties: Colorless to yellowish white and white, luster vitreous, hardness 2.5-3, sp. gr. 1.99.

Occurrence: California, Nevada; Venezuela.

"G.B.S." ²⁸ Trademark for globular sodium bisulfate.

Properties: White, opaque or translucent, globular shaped pellets, soluble in water, aqueous solutions strongly acid in reaction.

Containers: 100- and 400-lb fiber drums.

Uses: An easily handled solid acid which can be substituted for sulfuric acid in many uses, as an ingredient in cleaning compositions and in the preparation of glass and ceramic glazes.

Gd. Symbol for gadolinium.

GDCH. Abbreviation for glycerol dichlorohydrin. See alpha-dichlorohydrin.

GDME. Abbreviation for glycol dimethyl ether. See ethylene glycol dimethyl ether.

GDP. Abbreviation for guanosine diphosphate. See guanosine phosphates.

Ge. Symbol for germanium.

gear case oil. See transmission oil.

Geiger counter. See Geiger-Mueller counter.

Geiger-Mueller counter. A common form of a nuclear radiation detector. It consists usually of a tubular cathode with a coaxial center wire anode, filled with one of several possible mixtures of gases. When a high voltage is impressed across the electrodes, ionizing radiation traversing the tube gives rise to conductivity pulses which may be electrically amplified and registered. Each ionizing event gives rise to one pulse, and the counter tube with its associated electrical circuitry "counts" the number of individual ionizing radiations.

"Gelumite." ²⁶⁶ Trademark for a semigelatin high explosive of relatively high weight strength of 65%; very good water resistance.

Uses: Underground mining; quarrying, construction, and general blasting.

gelatin. A protein obtained from collagen by boiling skin, ligaments, tendons, bones, etc. with water. Its production differs from that of glue in that the raw materials are selected, cleaned and treated with special care so that the resulting product is cleaner, purer and generally clearer and lighter in color than glue.

Properties: Colorless or slightly yellow, transparent, brittle, practically odorless, tasteless sheets, flakes, shreds, pellets, or a coarse or fine powder; swells up and absorbs five to ten times its weight of water; soluble in hot water, glycerol and acetic acid; insoluble in alcohol, chloroform, and other organic solvents.

Grades: Edible, photographic, technical; U.S.P. XVI.

Containers: Barrels; bags, drums, boxes, cases.

Uses: Photographic film, lithography, sizing; plastic compounds, textile and paper work, foods, rubber substitutes; adhesives; cements, capsules for medicinals, artificial silk, matches, light filters, clarifying agent; hectograph masses, bacteriology, medicine.

gelatin, Bengal. See agar-agar.

gelatin, Ceylon. See agar-agar.

gelatin, Chinese. See agar-agar.

gelatin, explosive. A powerful explosive formed by mixing nitrocellulose with about nine times its weight of nitroglycerin, the product being a gelatinized mass. It is less sensitive to shock and friction than ordinary dynamite.

Shipping regulations: Explosive, class A. High explosive label. *

gelatin, Japanese. See agar-agar.

gelatin, nutrient. A culture medium for bacteria consisting of gelatin, beef extract and peptone in various concentrations.

gelbin. See calcium chromate.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"**Gelcarin.**" ¹²⁴ Trade name for a line of carrageenan extractives, hydrocolloids, which may be derived from a number of sea plants in the class of Rhodophyceae, order of Gigartinales. Used in the food, pharmaceutical and cosmetic industries, as gelling agents; stabilizers for emulsions, suspensions, etc.

"**Gelex.**" ²⁸ Trademark for semi-gelatin dynamites (Nos. 1 to 5 inclusive) having plasticity and water-resistance ratings between the ammonia dynamites and Special Gelatins. Have a very good fume rating.

Containers: Cartridges (1 1/4 x 8 in.) per 50-lb case range from 110 for No. 1 to 150 for No. 5.

Use: In mining metallic ores, gypsum, limestone, in quarrying medium hard rock, and in construction work.

"**Gelfoam.**" ³²⁷ Trademark for an absorbable surgical sponge.

Derivation: Processed from a non-antigenic gelatin solution, which is processed into a sponge-like form.

Use: Medicine.

"**Gel-Kote.**" ⁴⁴⁸ Trade name for pigmented polyester resin coatings for polyester products.

"**Gelloid.**" ⁷⁸ Trademark for a line of purified extracts of various types of Irish moss seaweed which are rich in mucilaginous content. The gel-producing ingredient is known as calcium carrageen sulfate. Products of varying gel strength and solubility are prepared by a specialized extraction and filtration procedure with subsequent solvent treatment to give dry, odorless, non-toxic, edible powders used in extensive food and pharmaceutical applications, especially as stabilizers, emulsifiers, moisture retentive agents, and emollient bases.

"**Gelobel.**" ²⁸ Trademark for gelatin-type permissible explosives, high-density and high water-resistance ratings.

Use: For coal mining where high strength, high velocity, concentration of charge, and water resistance are desired.

gel paint (thixotropic paint). A paint formulation which has a semi-solid or gel consistency when undisturbed but which flows readily under the brush or when stirred or shaken. After removal of the stress, it becomes stiff again and has little tendency to spill, drip, or run. The thixotropic quality is obtained by the carefully controlled reaction of a relatively small proportion of a polyamide resin with an alkyd resin vehicle.

gelsemine $C_{20}H_{22}O_2N_2$. An alkaloid.

Properties: White crystals; m. p. 178°C; poisonous! Soluble in alcohol, ether, and dilute acids.

Derivation: From the rhizome and root of *Gelsemium sempervirens*.

Grades: Technical.

Containers: Tins.

Use: Medicine.

Shipping regulations: None.*

gelsemium (yellow jasmine; wild woodbine).

Properties: Yellow masses.

Chief constituents: Gelsemine, gelseminine and gelsemic acid.

Derivation: The dried rhizome and roots of *Gelsemium sempervirens*.

Habitat: Southern United States.

Grades: Technical.

Containers: Bales.

Uses: Medicine, extraction of gelsemine.

Shipping regulations: None.*

"**Gelva.**" ⁶¹ (See also "Gelva" ²⁷⁶). Trademark for vinyl acetate polymers. Resins are available as solids or solutions in a variety of viscosities indicated by a "V-number" (viscosity of 8.6% in benzene as cps). Aqueous emulsions have outstanding stability and generally contain 55% solids (homopolymers or copolymers) with emulsion viscosities from 200 to several thousand cps. T S types (e. g. T S-30) are free filming (forming water-resistant films) with particle sizes generally 1 micron or less. S types (e. g. S-55) have heterogeneous particle sizes and possess exceptional quick tack as an adhesive. Alkali-soluble copolymers (C types) are available as solids or as an emulsion.

Uses: Adhesives; binders, chewing gum bases; coatings; floor polishes; hot melt adhesives, paints, paper treatment, permanent starches; slush molding, textile sizes and finishes; and thickeners.

"**Gelva.**" ²⁷⁶ (See also "Gelva" ⁶¹). Proprietary name for polymerized vinyl acetate resins manufactured outside U. S. A. Available in several standard viscosities: V 1.5, V 2.5, V 7, V 15, V 25, V 45, and V 60.

Properties: Colorless, soluble in lacquer solvents and aromatic hydrocarbons, insoluble in aliphatic hydrocarbons.

Uses: Lacquers, adhesives, coatings; impregnation; chewing-gum base.

"**Gelvatex.**" ⁶¹ Trademark for aqueous emulsions of vinyl acetate polymers and compounded compositions thereof.

"**Gelvatol.**" ⁶¹ Trademark for polyvinyl alcohol resins. Available in 12 grades from partially hydrolyzed to fully hydrolyzed polymers at various viscosities. Compatible with a wide variety of natural and synthetic resins as well as other materials. Usually water-soluble but oil and fat resistant, but readily converted to water resistant. Films are strong, gas and grease proof, orientable to polarized light, suitable for water-soluble packaging. Used as adhesive; coating; emulsifier; hydraulic cement additive; textile sizes; paper coating.

gem-. Prefix which is an abbreviation of geminate, meaning two identical groups attached to the same carbon atom.

geminate. See gem.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- "**Genacryl.**" ³⁰⁷ Proprietary name for basic dyes for acrylic fibers.
- "**Genamid**" **250.** ²⁵⁹ Trademark for a liquid coreactant for epoxy resins. This is a highly refined resinous amine adduct. By combining Genamid 250 with epoxy resins, a room temperature cured copolymer is produced which is clear and tough. This cross linked copolymer has excellent physical strength and outstanding adhesion. Used for coatings, castings, laminates, adhesives, and concrete topping and patching compounds.
- "**GenEpoxy.**" ²⁵⁹ Trademark for epoxy resins. Derivation: Reaction product of bisphenol-A and epichlorohydrin.
 Grades: Liquid resins with viscosities from 500 centipoises to 16,000 centipoises, epoxide equivalent from 172 to 191. Solid resins with epoxide equivalents from 500 to 1,900. Solutions of solid resins in various solvents also available.
 Containers: Liquids in 55-gal steel drums, tank trucks, tank cars. Solids in 200-lb fiber drums; 50-lb multiwall bags. Solutions in 55-gal steel drums, tank cars.
 Uses: Coatings, adhesives; laminates; castings; esters for coatings, potting and encapsulating.
- "**Genetron.**" ⁵⁰ Trademark for a line of fluorinated hydrocarbons. Members of the series include
 "Genetron" 21, dichlorofluoromethane, CHCl_2F .
 "Genetron" 23, fluoroform, CHF_3 .
 "Genetron" 142B, 1, 1-difluoro-1-chloroethane, CH_3CClF_2 .
 "Genetron" 152A, 1, 1-difluoroethane, CH_3CHF_2 .
 "Genetron" 1132A, 1, 1-difluoroethylene, CH_2CF_2 .
 Uses: As aerosol propellants, refrigerants, low temperature solvents, monomers, heavy-duty, fluorocarbon plastics.
- "**Gen-Flo Latices.**" ¹⁷⁹ "Gen-Flo 67" is a styrene-butadiene emulsion polymer containing approximately 67% styrene and 33% butadiene, recommended for manufacturing interior latex paints and textile applications.
 "Gen-Flo 62" contains approximately 60% styrene and 40% butadiene and is recommended for paint, paper, textile and rug backing applications.
 "Gen-Flo" Latices have good film clarity, excellent mechanical stability and alkali resistance.
 Uses: Latex paints, paper coatings, adhesives, textile printing inks, sizes, etc.
- "**Genicop.**" ⁵⁰ Trademark for a DDT-copper formulation which acts as an insecticide and fungicide.
- genin.** The steroid portion which is linked to a sugar residue in certain glycosides. Important genins are found in the digitalis glycosides which are used in medicine as heart stimulants.
- "**Genite**" **923.** ⁵⁰ Trademark for 2, 4-dichlorophenyl ester benzenesulfonic acid; available as 50% emulsifiable or 50% wettable powder. Miticide specific for European red mite and clover mite; gives long lasting control of early mites.
- "**Genithlon.**" ⁵⁰ Trademark for a parathion insecticide.
- "**Genitol.**" ⁵⁰ Trademark for a DDT insecticide.
- "**Genitox.**" ⁵⁰ Trademark for a DDT insecticide.
- "**Gensol No. 6.**" ⁷⁹ Trade name for terpene solvent.
 Properties: Sp. gr. (15.5°/15.5°C) 0.842; refractive index (20°C) 1.465; flash point (open cup) 111°F; Engler distillation 5%, 166°C; 50%, 170°C; 95%, 178°C; Kauri butanol value 59 (basis, toluene = 105).
 Containers: 55-gal drums; tank cars.
 Uses: Odorant for masking other odors; solvent and softener in rubber reclaiming; solvent in printing ink manufacture.
- "**Gen-Tac Latex.**" ¹⁷⁹ Trademark for a latex containing vinyl pyridine, butadiene, and styrene.
 Uses: Used to gain adhesion between natural and synthetic rubber to cotton, rayon, nylon and "Dacron" in applications such as tires, mechanical goods, V-belts, conveyor belts or any application where rubber-to-fabric adhesion is needed.
- "**Genthane-S.**" ¹⁷⁹ Trademark for a polyurethane elastomer. It is processed on conventional rubber processing equipment and has good abrasion resistance, high tensile strength, ozone resistance and hot dry temperature properties.
 Uses: Mechanical goods, grommets, packings, and extrusions.
- gentian** (yellow gentian; bitter root). Dried rhizome and roots of *Gentiana lutea*.
 Habitat: Mountainous regions of Europe and Asia Minor.
 Grades: Technical, N. F. XI.
 Containers: Bales; barrels.
 Uses: Medicine; liqueurs.
 Shipping regulations: None.*
- gentian violet.** See methyl violet.
- gentisic acid** (2, 5-dihydroxybenzoic acid)
 $\text{C}_6\text{H}_3(\text{OH})_2\text{COOH}$.
 Properties: Crystals, m. p. 199-200°C, soluble in water, alcohol, and ether; insoluble in carbon disulfide, chloroform, and benzene.
 Use: Medicine, as sodium gentisate (q. v.).
- "**Gentro.**" ¹⁷⁹ Trademark for a series of staining and non-staining vulcanizable synthetic polymers containing butadiene and styrene manufactured by the cold process. They include staining, oil-extended staining, light-colored non-staining, and light-colored, oil-extended, non-staining polymers. Approximately 1.25% antioxidants are added to insure protection of the polymer during production and storage.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Contains approximately 23.5% styrene and 76.5% butadiene. Polymers mixed with reinforcing pigments give a variety of properties, abrasion resistance, flexibility, color, etc.

Uses: Tires, mechanical goods, proofed goods, extruded goods, shoe soles, heels, housewares, sponge, etc.

"Gentro-Jet." ¹⁷⁹ Trademark for a series of carbon blacks co-precipitated with synthetic SBR polymer. They are produced by a steam-whipped, dispersant-free process. The masterbatches contain staining polymers only and are made with the HAF, ISAF and SAF carbon blacks. Antioxidants are added to insure protection of the polymer during production and storage.

Properties: Black content ranges from 52 parts black per 100 parts polymer to 75 parts black on 137.5 parts oil-extended polymer. Masterbatch mixed with other compounding materials gives high tensile strength and abrasion resistance.

Uses: Tires, tread rubber, mechanical goods, conveyor belts, V-belts, etc.

geochemistry. The study of the chemical composition of the earth in terms of the physicochemical and geological processes and principles that produce and modify the minerals and rocks of the earth. Of practical importance in discovering and establishing the limits of ore deposits, and in understanding geologic phenomena generally.

geometric isomerism. The existence of isomeric forms of a compound because of symmetry or lack of symmetry about the double bond in the molecule of an organic compound. Certain types of ring structure also result in this type of isomerism. See *cis*-.

"Geon." ¹¹⁹ Trade name for a group of polyvinyl chloride resins, plastics, and latices. Available in the following types:

General purpose resins for calendaring, coating, extrusion, and injection molding.

Uses: Sheetting for upholstery, luggage, and wall covering. Film for shower curtains, draperies, tablecloths, and rainwear. Extruded garden hose, chemical tubing, belting, and wetting. Injection molded grommets, gaskets, electrical plugs, toys, and automotive parts.

Rigid type resins for compounding without plasticizer for use in extrusion and molding.

Typical properties:

Flexible "Geon": Sp.gr. 1.2-1.55; tensile strength (psi) 1500-3500; elongation 200-450%; hardness (Shore Durometer) 50-100A, service temperature (max) 170-220°F, flexibility temperature (min) 0 to -70°F; volume resistivity (Ohm-cm at 25°C) $1-10 \times 10^{12}$ to $4-7 \times 10^{14}$ (max); dielectric constant at 60 cycles at 25°C 5.5-9.1.

Rigid "Geon": Sp.gr. 1.32-1.4; tensile strength (psi) 6000-9000; elongation 5-25%; hardness (Shore Durometer) 70-85D;

service temperature (max) 150°F; volume resistivity (Ohm-cm at 25°C) exceeds 10^{16} (max); dielectric constant at 60 cycles at 25°C 3.0-3.2.

Uses: Transparent, translucent, or opaque sheet for embossing, press polishing, or laminating. Extruded chemical piping, rod, sheet, and profiles. Injection molded pipe fittings. Vacuum-formed relief maps, point of display signs, and containers. Compression molded phonograph records.

Insulation types for electrical industry.

Supplied as cubical granules.

Typical properties: Sp.gr. 1.3-1.4, hardness (Durometer) 80-91A, 82C; tensile strength (psi) 1800-3900, elongation 200-340%; insulation resistance (K value) 350-10,000; dielectric strength (volts/ml) 500-800.

Compounded types for extrusion and injection molding with a range of properties depending upon composition.

Properties:

Extrusion compounds: Sp.gr. 1.25-1.48, hardness (Durometer A) 68-95, tensile strength (psi) 1200-3350, ultimate elongation 250-355%, brittle temperature -10 to -40°C; water absorption (24 hours at 100°C) 1.1-3% gain, stock extrusion temperature 350-365°F.

Injection molding compounds: Sp.gr. 1.2-1.4; hardness (Durometer A) 64-80; tensile strength (psi) 1400-2600, ultimate elongation 275-350%, brittle temperature -25 to -30°C, water absorption (24 hours at 100°C) 0.8-2.5% gain, injection molding temperature 340-360°F, injection molding pressure (psi) 16,000-22,000.

Uses: Extruded products including belting, wetting, tubing, and gasketing. Injection molded products are vacuum sweeper parts, handles, dolls, luggage, hair curlers, refrigerator drain rails, and automobile lock knobs.

Latices: Water dispersions of polyvinyl chloride resins. Unplasticized, plasticized, and internally plasticized forms available. Total solids approximately 50-57%, pH ranges from 6-9, sp.gr. 1.083-1.210. Properties of value include low moisture vapor transmission, low gas permeability, resistance to flame and many chemicals.

Uses: Decorative, washable, and wear resistant coatings for paper and fabric. Non-woven fiber binders, heat sealable binders and coatings, fabric sizes, flame-proof coatings and impregnations, food packaging, and leather finishes.

Paste resins: Polymers of controlled even particle size for easy dispersion in a resin-plasticizer system (plastisol), or in a resin-plasticizer-diluent system (organo-sol). Supplied as a fine white powder with a specific gravity of approximately 1.4. Can be formulated for dip coating, spread coating, foaming, molding, or casting. Products exhibit typical "Geon" resin properties.

Uses: Spread coated luggage, upholstery fabric, window shades, and decorative paper. Spray coated woods, and sheet

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

metals. Dip coated gloves, chemical racks, and boots. Cast film, toys, dolls, and prosthetic devices. Slush molded thin walled shapes. Open and closed cell foam and sponge for insulation and shock absorption, and cushioning applications.

Polyblend: A colloidal blend of nitrile rubber and polyvinyl chloride in which the rubber is used as the plasticizer. The nitrile plasticizer is non-migrating, non-extractable, and non-volatile. Polyblend can be used as a thermoplastic vinyl, as a vulcanizate, or to modify conventional vinyls and rubbers.

Uses: Sheet and film for food packaging, upholstery, luggage, and footwear. Extruded straps, belting, and tubing. Coatings for fabrics, paper, wood, and metal.

Solution resins: Designed for high solids solutions, these high molecular weight polymers and copolymers are soluble in ketone systems. A modified vinyl-vinylidene chloride copolymer is specifically designed for direct solubility in toluene, xylene, hydrocarbons, and aromatic naphthas. They form coatings that have good adhesion to tin, aluminum, steel, fabric, paper, and other cellulosic materials. Coatings may be sprayed, brushed, or rolled.

Uses: Water and fire resistant fabrics, paint and lacquer formulations.

Hi-temp "Geon": Polyvinyl dichloride. Thermoplastic. Capable of withstanding temperatures 60°F higher than other vinyls. Tensile strength reaches above 2000 psi at 212°F, and deformation at 264 psi occurs only at temperatures above 215°F. Also has high modulus and impact strength. Can be extruded and molded in conventional equipment.

Uses: Chemical process piping, tanks, ducts, hot and cold water lines, valves.

geophysics. The science of physics as applied specifically to the earth. Of importance in locating oil deposits, oil-well drilling, mining and the study of earthquakes, volcanoes and other terrestrial phenomena.

"Gerallol." ²²⁷ Trademark for a mixture of geraniol and citronellol. Available in 3 grades.

"Gerallol" Extra: Minimum purity 90%, colorless liquid.

"Gerallol" Prime: Minimum purity 85%, slightly yellow liquid.

"Gerallol" HC: Minimum purity 85%, slightly yellow to yellow liquid.

Properties: Light rosy odor, sp. gr. 0.84-0.87, refractive index 1.44-1.46.

Uses: In light bouquets and rose florals.

geranial. See citral.

geranialdehyde. See citral.

geraniol $(\text{CH}_3)_2\text{C}:\text{CH}(\text{CH}_2)_2\text{C}(\text{CH}_3):\text{CHCH}_2\text{OH}$ (3,7-dimethyl-2,6-octadienol).

Properties: Colorless to pale yellow, liquid oil; pleasant geranium-like odor; sp. gr. 0.870-0.890 (15°C); m. p. -15°C, b. p.

230°C; refractive index (n_{20/D}) 1.4710-1.4780; optical rotation -2° to +2°; soluble in alcohol and ether, mineral oil, fixed oils; insoluble in water, and glycerol.

Derivation: From geranium oil; also from citronella and palmarosa oils by forming the double compound with calcium chloride.

Grades: Standard; soap; synthetic.

Containers: Cans, drums.

Use: Perfumery.

Shipping regulations: None.*

geraniol acetate. See geranyl acetate.

geraniol butyrate (geranyl butyrate)

$\text{C}_3\text{H}_7\text{COOC}_{10}\text{H}_{17}$.

Properties: Colorless liquid; b. p. 151°C (18 mm), rose type odor; sp. gr. 0.9008 (17/4°C); insoluble in water; soluble in alcohol, ether.

Occurs in several essential oils.

Use: In perfumes and soaps.

geraniol formate (geranyl formate)

$\text{HCOOC}_{10}\text{H}_{17}$.

Properties: Colorless liquid; b. p. 113°C (15 mm); sp. gr. 0.927 (20/4°C), rose type odor, insoluble in water, soluble in alcohol and ether.

Occurs in several essential oils.

Use: In perfumes and soaps.

geranium (cranes-bill, storksbill; alum root)

Dried rhizome of *Geranium maculatum*.

Habitat: Canada and eastern United States; south to Georgia.

Containers: Bags.

Use: Medicine.

geranium, blood. See sanguinaria.

geranium oil.

Properties: Pale yellow or greenish liquid; exceedingly agreeable rose-like odor. Slightly soluble in water; soluble in alcohol and ether, sp. gr. 0.886-0.898; optical rotation -7° to -12°; refractive index (n_{20/D}) 1.4650-1.47.

Chief known constituents. Geraniol, citronellol.

Derivation. Distilled from the herb of several species of *Pelargonium*, especially *P. graveolens*, *P. capitatum*, *P. odoratissimum*, and *P. roscum*.

Method of purification: Rectification.

Grades: Algerian, Bourbon.

Containers: Cans.

Uses: Perfumery, manufacture of rhodinol.

Shipping regulations: None.*

geranium oil, East Indian. See palmarosa oil.

geranium oil, rose. A geranium oil prepared in southern France by adding rose petals to the *pelargonium* plants during distillation.

geranium oil, Turkish. See palmarosa oil.

geranyl acetate (geraniol acetate)

$\text{CH}_3\text{COOC}_{10}\text{H}_{17}$.

Properties: Sweet, fragrant, clear, colorless liquid; odor of lavender, sp. gr. 0.907-0.918 (15°C); b. p. 128-129°C (16 mm); optical rotation -2° to +2°, refractive index

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

(n 20/D 1.4580-1.4640; soluble in alcohol and ether; insoluble in water and glycerol.

Derivation: (a) Constituent of several essential oils. (b) By heating geraniol and sodium acetate with acetic anhydride.

Grade: Technical.

Containers: Cans; drums.

Use: Perfumery.

Shipping regulations: None.*

geranyl butyrate. See geraniol butyrate.

geranyl formate. See geraniol formate.

German black. See vegetable black.

German fungus. See agaric.

germanic acid. See germanium oxide.

germanic oxide. See germanium oxide.

germanium (Ge). Element of atomic number 32, group IV of the periodic system.

Properties: Grayish-white metal, a semiconductor of electricity, whose conductivity depends largely on the impurities present.

Constants: Sp. gr. 5.46, m.p. 958°C; does not volatilize below 1350°C.

Derivation: Recovered from residues from refining of zinc and other sources, by heating in the presence of air and chlorine. Found also in two ores, argyrodite and germanite.

Method of purification: The chloride is distilled, and then hydrolyzed to the oxide, which is reduced by hydrogen to the metal. Zone-melting is used for final purification, and single semiconductor crystals are made by vaporization of germanium diiodide under conditions such that it dissociates and deposits pure germanium. The impurities in germanium are of controlling importance in its use in transistors.

Uses: Medicine (in form of dioxide), metal is used in vacuum tubes as a high-resistance element, and most importantly, in electronic devices such as transistors and diode rectifiers.

germanium dioxide. See germanium oxide.

germanium oxide (germanic acid, germanic oxide, germanium dioxide) GeO_2 .

Properties: White powder; soluble in alkalies, slightly soluble in acids, water.

Use: Ingredient of special glass mixtures; medicine.

germanium-potassium fluoride (potassium-germanium fluoride) K_2GeF_6 .

Properties: White crystals; soluble in water (hot), insoluble in alcohol.

Grade: Technical.

germanium telluride GeTe . An efficient semiconductor.

German silver. Obsolete name for nickel silver.

German-silver solder. Series of alloys with relatively low silver content (10-20%) and varying amounts of copper, zinc, cadmium and tin. Used for the usual purposes of silver solder.

Germantown black. See lampblack.

germicide. A product which kills bacteria, but its power to prevent further growth is (perhaps) only secondary. There are many proprietary preparations on the markets. See also disinfectants.

getter alloys. Alloys used in radio and television tubes and electric bulbs to absorb residual substances which impair efficient operation.

ghatti gum. The gummy exudation from the stem of *Anogeissus latifolia*.

Properties: Colorless to pale yellow tears, rounded or vermiform. Almost tasteless and odorless, partially soluble in water.

Can be solubilized by autoclaving.

Uses: Similar to arabic gum.

giant granite. See pegmatite.

gibberellic acid (gibberellin X, GA_3) $\text{C}_{19}\text{H}_{22}\text{O}_6$.

A plant-growth-promoting hormone, a metabolite extracted first from fungi and later recognized as occurring in many plants. It is said to be a tetracyclic dihydroxylactonic acid.

Properties: Crystals, m.p. 233-235°C, slightly soluble in water, soluble in methanol, ethanol, acetone. Soluble in aqueous solutions of sodium bicarbonate and sodium acetate.

Uses: Promotion of plant growth, especially seedlings, stem elongation; malting of barley with improved enzymatic characteristics improving fruit setting of citrus, growth control in grapes.

gibberellins. A series of at least four plant hormones, similar in chemical structure, isolated from certain fungi and other plants. These are known as GA_1 , GA_2 , GA_3 and GA_4 and are structural variations of gibberellic acid (GA_3), which is best known and most effective. Since their discovery they have been identified in trace quantities in many plants and appear to be produced within the plant to regulate certain physiological processes. Application as sprays, dusts or as aerosols to fruit, vegetables or ornamental plants have shown many diversified effects. stem elongation in biennials, root elongation; increase in dry weight of leaf, fruit enlargement, increased photosynthetic rate, improved fruit setting. The gibberellins appear to be non-toxic and are accepted for use on certain food crops. See also plant hormones; auxins.

gibberellin X. See gibberellic acid.

"Gibrel." ¹²³ Trademark for compound for promoting plant growth, the potassium salt of gibberellic acid.

giga- Prefix meaning 10^9 units (symbol = G).
1 Gg = 1 gigagram = 10^9 grams.

gigly oil. See sesame oil.

gilder's whiting. See whiting.

gilsonite (uintaite; uintahite). An asphaltite (q. v.), or solidified hydrocarbons, found

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

only in the United States, in Utah and Colorado. One of the purest (99.9%) natural bitumens. It mixes well with the fatty acid pitches in all proportions.

Properties: Color in mass, black; conchoidal fracture; bright to fairly bright luster; brown streak. Sp. gr. 1.05-1.10 (77°F); hardness (Mohs' scale) 2; penetration 0 (77°F); fusing point (K & S) 250-350°F, (B & R) 270-370°F. Behavior on heating in flame, softens and flows; trace to 1% mineral matter. Soluble in all proportions of carbon disulfide. (Usually melted in a varnish kettle, but also soluble in a lukewarm bath of naphtha under mechanical agitation.)

Grades: "Selects" or "firsts," conchoidal and lustrous fracture; "run of mine" or "seconds," semi-conchoidal and semi-lustrous fracture.

Containers: Wooden barrels, multiwall paper sacks; bulk.

Uses: Acid, alkali and waterproof coatings; black varnishes, lacquers, baking enamels and japans; asphalt paints, wire-insulation compounds, printing inks; mineral wax; dielectric compounds; battery boxes; linoleum and floor tile, paving; insulation; water-proofing; fabric saturants and preservatives, also used as source of petrochemicals in some refineries.

Shipping regulations: None.*

gin. An alcoholic beverage made by distilling alcohol through a mixture of herbs and berries (juniper, coriander, etc.) and adjusting to 85 to 100 proof.

gingelly oil. See sesame oil.

ginger (zingiber).

Properties: Irregularly branched pieces; aromatic odor, aromatic, burning taste. Chief constituents: Ginger oil (volatile), a resin and gingerol.

Derivation: The dried rhizome of *Zingiber officinale*.

Habitat: Southern Asia; West Indies; Africa; cultivated in all tropical countries.

Grades: N. F. XI, Cochín; Jamaican, Nigerian, Sierra Leone.

Containers: Tins, boxes, bags.

Uses: Medicine, confectionery; condiment, soft drinks.

Shipping regulations: None.*

ginger oil.

Properties: A pale yellow thick liquid; characteristic odor; aromatic, somewhat burning taste; sp. gr. 0.877-0.888 (15°C), optical rotation -28° to -45°; refractive index 1.488-1.494 (20°C); soluble in alcohol, ether, and chloroform, also in benzyl benzoate, diethyl phthalate, mineral oil, and most fixed oils; insoluble in glycerin, propylene glycol, and water.

Chief known constituents: Citral, borneol and phellandrene.

Derivation: Steam distilled from the dried rhizome of *Zingiber officinale*.

Grade: Technical.

Containers: Glass bottles; tin-lined or

aluminum drums.

Use: Flavoring; preparation of liqueurs and soft drinks.

gingili oil. See sesame oil.

gingily oil. See sesame oil.

Girard's "P" reagent (carboxymethylpyridinium chloride hydrazide; acethydrazidepyridinium chloride) $C_5H_5NCICH_2CONHNH_2$.

Properties: White to faintly pinkish crystals with little or no odor; m. p. 190-200°C; soluble in water; insoluble in oils.

Containers: Bottles; fiber drums.

Uses: Separation of aldehydes and ketones from natural oily or fatty materials; extraction of hormones.

Girard's "T" reagent (carboxymethyltrimethyl ammonium chloride hydrazide; trimethylacethydrazide ammonium chloride) $(CH_3)_3NCICH_2CONHNH_2$.

Properties: White to faintly pinkish crystals, little or no odor; m. p. 182-192°C; soluble in water; insoluble in oils. Very hygroscopic.

Containers: Bottles; fiber drums.

Uses: Separation of aldehydes and ketones from natural oily or fatty materials, extraction of hormones.

Girbotol absorption process (amine absorption process).

A process for the removal of hydrogen sulfide or carbon dioxide from a gaseous mixture. An organic amine such as ethanolamine or diethanolamine, which are basic, is allowed to flow down a tortuous path through a tower where it is contacted by and absorbs the hydrogen sulfide or carbon dioxide from the gas to be purified while it is moving up the tower. The amine which is contaminated with hydrogen sulfide or carbon dioxide is sent from the bottom of the tower to a steam stripper, where it flows countercurrent to steam, which strips the hydrogen sulfide or carbon dioxide from it. The amine is then returned to the top of the absorption tower.

The process employing diethanolamine is widely used in the petroleum industry for purifying refinery and natural gases and for recovery of hydrogen sulfide for sulfur manufacture. Removal of carbon dioxide from gases is usually done with monoethanolamine.

gitoxin $C_{41}H_{64}O_{14}$. A digitalis glycoside.

Properties: White needles, m. p. 266 to 269°C; slightly soluble in water, alcohol, and chloroform.

Derivation: From leaves of digitalis.

Use: Medicine.

"Giv-Tan" F.¹² (2-ethoxyethyl para-methoxycinnamate) $CH_3OC_6H_4CH:CHCOOC_2H_4OC_2H_5$.

Properties: Slightly yellow viscous liquid; practically odorless; sp. gr. 1.1000-1.1040 (25/25°C); refractive index 1.5660-1.5690 (20°C); f. p. below -25°C. Insoluble in water and glycerol, soluble in alcohol and mineral oil.

Grade: 98% minimum.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: 1-, 5-, 10-, 25-, 50-lb tins;
130-, 270-, 450-lb lacquer lined drums.
Uses: Sun-tan lotions.

"GK Compound." ⁴¹ Trade name for a hot-pour, bituminous compound used to joint concrete and vitrified clay sewer pipe.

glacial acetic acid. See acetic acid.

glance pitch (manjak). An asphaltite (q. v.) (solidified hydrocarbons) resembling gilsonite in external appearance but having a decidedly black streak instead of a brown one. It also has a larger percentage of fixed carbon. The best known glance pitch comes from the Barbadoes, the material found on the surface of the veins being harder, more brittle and of a higher fusing point than that at the lower mine levels.

Properties: Black in mass; conchoidal to hackly fracture; bright to fairly bright luster; black streak (on porcelain). Soluble in carbon disulfide (usually greater than 95%).

Constants: Sp. gr. 1.10-1.15 (77°F); hardness (Mohs' scale) 2; penetration 0 (77°F), fusing point (K & S) 250-350°F, (B & R) 270-375°F; behavior on heating, softens and flows in flame, mineral matter less than 5.

Shipping regulations: None.*

See also Syrian asphalt.

glass. An amorphous transparent or translucent brittle material usually made by fusion of silica, soda ash, lime, and salt cake or similar materials. Other materials are used for various special glasses. The term glass is also applied more generally to amorphous solids, formed by cooling of liquids, of any composition. Though physically solid, glass is considered by physicists to be an under-cooled liquid, since its structure is not crystalline but amorphous, as is characteristic of liquids.

The composition of ordinary window glass (soda lime glass, lime glass) may be expressed as approximately 20% sodium oxide, 5% calcium oxide, 70-75% silica and small amounts of other components. The sp. gr. is about 2.65. Plate glass is merely a thicker, more carefully made and finished variety of ordinary glass. A new float process for plate glass looks promising. Ordinary glass is very slowly dissolved by water, but more rapidly attacked by alkaline solutions. See flint glass, crown glass, optical glass. See also "Pyrex," Fourcalt process, Colburn process (for forming glass sheet, etc.).

glass colors. This term is applied to chemicals or mixtures used to confer special properties on glass. In addition to the color-producing compounds separately cited under various colored glasses the following are included as glass colors:

Acid resistant: For tumblers and tableware; substantially impervious to organic acids found in foods.

Alkali resistant: For milk and beverage-bottle labels having great resistance to

alkaline sterilizing solutions.

Leadless type: For special applications.

Sulfide resistant: For illuminating ware; free from atmospheric discolorization.

Very soft nonresistant: For special applications.

glass enamels. A series of finely ground fluxes, basically lead borosilicate, intimately blended with colored ceramic pigments. Different grades give characteristics of acid resistance, alkali resistance, sulfide resistance, or low lead release to meet requirements for various uses. Firing range 1000°-1400°F (537.8°-760°C).

Containers: Dry color, 25-, 50-, 100- and 200-lb fiber drums; paste colors, 100-lb (5-gal) pails; thermofluid enamels, 50-lb (5-gal) pails, 200-lb (20-gal) drums.

Uses: For fired-on labels and decorations on glassware, tumblers, milk bottles, beverage bottles, glass containers, illuminating ware, architectural glass, and signs.

glass fiber. Generic name for a manufactured fiber in which the fiber-forming substance is glass (Federal Trade Commission).

Properties: A continuous filament or staple fiber having unusual resistance to heat and chemicals. It is the strongest fiber known and is perfectly elastic up to its ultimate strength. It is attacked by hydrofluoric acid and alkalis; resistant to most other chemicals and solvents. Colored by resin-bonded pigments or by dyeing an applied protein film. Non-flammable.

Constants: Tensile strength (psi) 204,000-220,000 (yarns), individual fiber, approximately 1,000,000; elongation (yarns and fabric) 1.7-3.3%; sp. gr. 2.54; moisture regain, none; loses strength above 600°F, softens about 1500°F.

Derivation: Molten glass is drawn at high speed through fine orifices.

Uses: Electrical insulation; plastic laminates; filter cloth and paper; surgical sutures; fireproof curtains and drapes. Not suitable for wearing apparel.

glassine. A thin transparent paper used for packaging and made with addition of a urea-formaldehyde resin to improve strength characteristics.

glass, liquid. See sodium silicate.

glass, "Pyrex." See "Pyrex."

glass, safety. A thin plastic sheet is cemented between two sheets of plate glass. The plastic is usually polyvinyl butyral, but various other materials have been used. If the glass is broken, the pieces do not fly but remain attached to the plastic. The term is also applied to highly tempered solid glass.

glass sand. A sand suitable for making glass. The principal component is quartz. A typical analysis is SiO₂ 99.41%, Al₂O₃ 0.21%; Fe₂O₃ 0.07%, CaO 0.07%, MgO 0.68%.

Occurrence: New Jersey, Pennsylvania, West Virginia, Missouri, Illinois, Maryland.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

glass, soluble. See sodium silicate.

glass, volcanic. See obsidian.

glass, water. See sodium silicate.

glass wool. A fibrous wool-like material composed of fine filaments of glass intermingled like ordinary wool. Used in chemical laboratories; also in some producer-gas plants as a dust-filtering agent, and widely used in insulation and air filters.

glauberite. A natural sodium-calcium sulfate. $\text{Na}_2\text{SO}_4 \cdot \text{CaSO}_4$. Found in Arizona and New Mexico.

Glauber's salt. See sodium sulfate decahydrate.

glauucarubin $\text{C}_{25}\text{H}_{36}\text{O}_{10}$. Crystals; decomposing at $250\text{--}255^\circ\text{C}$; slightly soluble in water. Obtained from the meal from Simaruba glauca seeds. Used in medicine.

glaucinite $\text{K}_2(\text{Mg}, \text{Fe})_2\text{Al}_6(\text{Si}_4\text{O}_{10})_3(\text{OH})_{12}$. A natural hydrous silicate of potassium, aluminum, iron, and magnesium, found in greensands, and other sedimentary rocks. Color green, luster earthy, sp. gr. 2.3. Occurrence: New Jersey, Virginia. Uses: Water softener, in foundry molds, fertilizer.

"Glaurin." ⁷³ Trademark for diglycol laurate.

glaze. A term used in the ceramic industry. According to the sense in which it is used it may mean: (1) a vitreous coating on finished pottery or enamelware, (2) the mixed and powdered dry materials of the batch to be used for producing the vitreous coating, (3) an emulsion of these materials suspended in water ("wet glaze"). Glazes may consist of common salt or feldspar but are more usually mixtures of native silicates such as feldspar, kaolin, or Cornish stone with flint, sand, cullet, chalk, borax, soda, white lead, red lead, or litharge. See also frit.

glaze stains. Finely ground calcined oxides of cobalt, copper, iron and manganese used for coloring ceramic glazes.

gliadin (prolamin). A group of simple vegetable proteins or globulins found in gluten, the protein of wheat, rye and other grains. Wheat gliadin has the composition: 52.7% C, 17.7% N, 21.7% O, 6.9% H, 1.0% S. Insoluble in water, soluble in 70-90% alcohol, soluble in dilute acid and in alkali. Use: In chemical synthesis of spinal anesthetics and in pharmaceutical preparations.

"Glidcol-Regular and WW." ²⁹⁶ Trade name for anti-skinning agents used predominantly for protective coatings.

"Glidfoam." ⁴⁴⁸ Trade name for polyurethane resins, basic resins for producing polyurethane foam resin.

"Glidpol." ⁴⁴⁸ Trade name for polyester resin, basic material for molding and laminating of reinforced plastic products.

"Glid-Rez." ⁴⁴⁸ Trade name for clear and pigmented coatings made from butoxy.

resins. Used in finishes for wide variety of products.

"Glid-Tile." ⁴⁴⁸ Trade name for polyester coatings for masonry block, concrete, wood, metal, plastic and wallboard.

"Globaline." ²⁸² Trade name for tetraglycine hydroperiodide.

Properties: Active iodine 39.5-42.6%, ash 0.5% max; total nitrogen 7.35-7.75%; meets government specification MIL-T-283C.

Containers: Drums.

Uses: Used in manufacture of water purification tablets.

"Globar." ²⁸⁰ Trademark for silicon carbide heating elements and resistors, and accessories used therewith.

Properties: Elements have a working temperature up to 2750°F and this range can be extended to 3000°F for short periods of time, low coefficient of expansion; structure of elements not affected by rapid heating and quick cooling; resistance of elements remains practically constant at temperatures above 900°F .

Uses: Electric resistors and heating elements, terminals and other accessories for electric heating elements, electric heating appliances, electric furnaces.

globin. The protein of hemoglobin and similar conjugate proteins.

Source: Hemoglobin.

Use: Medicine.

globin zinc insulin injection. See insulin.

globulin. Any of a group of simple proteins which is coagulated by heat, insoluble in water, soluble in dilute solutions of salts, strong acids and strong alkalis. Enzymes and acids cause hydrolysis of these simple proteins to produce amino acids as the only products. Examples are immune serum or gamma globulins in blood, edestin in hemp seed, myosin in muscle. The blood globulins are used in medicine, and are isolated by alcohol fractionation.

glonoin oil. See nitroglycerin.

"Gloria." ⁴⁵ Trademark for white mineral oil, U. S. P.

Properties. Sp. gr. 0.875-0.885 (60°F), Saybolt viscosity 200-210 (100°F), pour point 15°F ; odorless and tasteless.

Uses: Pharmaceutical and cosmetic formulations; plastics, tobacco; paper, animal husbandry.

GLPC. Abbreviation for gas-liquid partition chromatography. See gas chromatography.

glucagon (hyperglycemic-glycogenolytic factor; HG-factor; HGF). It is produced by the alpha cells of the islands of Langerhans and also, evidence indicates, by the gastric mucosa. It is opposite in effect to insulin, causing hyperglycemia by accelerating liver glycogenolysis but has no effect upon muscle glycogen. It has been isolated and crystallized and appears to be a straight-chain polypeptide with a molecular weight of

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

about 3500. Small amounts of glucagon have been detected in commercial insulin preparations.

Properties: Crystals, insoluble in water at pH 7.0 but readily soluble above pH 10.0. Soluble in acid solutions. Retains most of its activity after incubation with alkali or cystine.

Use: Medicine; biochemical research.

"Glucarine B." ⁷³ Trademark for glycol carbohydrate complex.

Properties: Water-white, syrupy, clear fluid. Soluble in water, methyl alcohol, ethyl alcohol, glycerin, diethylene glycol, "Cellosolve," "Carbitol" and ethylene glycol. Insoluble in toluene, mineral spirits, mineral oil, and vegetable oil. Sp. gr. 1.32 (21°C).

Containers: 1-gal cans (11 lbs), 5-gal cans (55 lbs); 55-gal drums (630 lbs).

Uses: Replaces glycerin where a cheaper, colorless product is desired, especially for cosmetic and technical purposes.

glucose. See maltase.

glucinum. Obsolete name for beryllium.

glucinum compounds. See corresponding beryllium compounds.

gluconic acid (glycolic acid, dextronic acid, glycogenic acid) $\text{CH}_2\text{OH}(\text{CHOH})_4\text{COOH}$.

Properties: Colorless or nearly colorless light brown syrupy liquid with mild acid taste. Soluble in water and alcohol.

Derivation: Bacterial, chemical, or electrochemical oxidation of dextrose.

Grades: Technical, 50% solution.

Containers: Barrels, kegs, glass carboys, tank cars.

Uses: Preparation of pharmaceutical and food products, in cleaning and pickling metals; sequestrant, cleansers for bottle washing, etc.

Shipping regulations: None.*

delta-gluconolactone $\text{CH}_2\text{OHCH}(\text{CHOH})_3\text{C}(\text{O})\text{O}$.

Properties: White crystals.

Constants: M. p. 155°C; b. p. (decomposes), readily soluble in water, slightly soluble in alcohol.

Derivation: From gluconic acid.

D(+)-glucosamine $\text{CH}_2\text{OH}(\text{CHOH})_3\text{CHNH}_2\text{CHO}$.

Properties: Colorless needles from alcohol, m. p. 110°C (dec), very soluble in water, very slightly soluble in methanol and ethanol; insoluble in ether and chloroform.

Use: Biochemical research.

D(+)-glucose. Identical with dextrose (q. v.).

D(+)-glucose is the term preferred by biochemists.

glucose (liquid) (starch syrup; corn syrup).

Thick, syrupy liquid, a mixture of dextrose, maltose, and dextrans with about 20% water.

Properties: Colorless to yellowish; soluble in water, glycerin; sparingly soluble in alcohol.

Derivation: By incomplete hydrolysis of starch and starchy substances by action

of hydrochloric acid.

Grades: Technical, U. S. P. XVI.

Containers: 10-gal cans; 50-gal barrels.

Uses: Ingredient in confectionery, jelly, etc.; reducing agent; in alcoholic fermentations; adulterant in dyewood extracts; tanning; pharmaceuticals; treating tobacco.

glucose oxidase. Suggested as an oxygen scavenger, hence a preservative, for foods such as dried eggs.

glucose 6-phosphate (glucose 6-phosphoric acid; Robison ester) $\text{C}_6\text{H}_{11}\text{O}_5\text{H}_2\text{PO}_4$. An intermediate in carbohydrate metabolism. Usually handled as the barium or dipotassium salts, which are water-soluble.

glucose 6-phosphoric acid. See glucose 6-phosphate.

alpha-glucosidase. See maltase.

beta-glucosidase. See emulsin.

glucosides. See glycosides.

glucosulfone sodium $\text{C}_{24}\text{H}_{34}\text{N}_2\text{O}_{18}\text{S}_3\text{Na}_2$.

para, para'-Diaminodiphenylsulfone-N, N'-di(dextrose sodium sulfonate). Available only in a mixture containing about 88.5% of anhydrous para, para'-diaminodiphenylsulfone-N, N'-di(dextrose sodium sulfonate) and about 11.5% of dextrose.

Properties. White to faintly yellow, odorless, sweet tasting, amorphous solid. Freely soluble in water.

Grade: N. N. D.

Use: Medicine.

D(+)-glucuronic acid $\text{COOH}(\text{CHOH})_4\text{CHO}$.

A widely distributed substance in both plants and animals. It is usually found as part of a larger molecule as in various gums, or combined with phenols or alcohols.

Properties: Exhibits mutarotation. The beta form has m. p. 165°C. Soluble in water and alcohol.

Derivation: From gum acacia.

Use: Biochemical research, medicine.

glucuronolactone $\text{C}_6\text{H}_8\text{O}_6$. The gamma lactone of glucuronic acid. Found in plant gums and animal connective tissues.

Properties: Colorless, odorless, white powder. Sp. gr. 1.76 (30/4°C); m. p. 172-178°C, soluble in water.

Derivation: From glucuronic acid.

Grades: Purified, N. N. D.

Containers: 10-g, 4-, 8-oz vials.

Uses: Growth factor, medicine, pharmaceutical intermediate.

glue. An impure or degraded form of gelatin obtained by action of heat and water on protein animal tissues of bones, hides, horns. It absorbs cold water with much swelling and dissolves in hot water, the solution solidifying to jelly on cooling.

Fish glue is obtained by heating with water the heads, fins, and tails of fish. It has weak jellying properties and is generally made into liquid glue. Liquid glue is made by treating fish or common glue with acetic,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

nitric or hydrochloric acids. The property of gelatinizing is lost by this operation but the adhesiveness is more or less unchanged. A partly decayed gluten obtained from flour in starch making is sometimes called albumin glue. Bone glue is an animal glue made wholly from bones. Casein glue is an adhesive made by dispersing casein in alkaline solutions. There are many formulas and many kinds of casein. It can be used cold. Chrome glue is an insoluble product prepared by mixing glue with ammonium or potassium dichromate or with chrome alum. It is used as a glass cement and for waterproofing materials. Glycerol (flexible; elastic) glue is glue dissolved in glycerol.

"Gluflex." ¹⁵⁷ Trade name for a clear, balanced, non-crystallizing product consisting of sucrose, levulose, dextrose, sodium bisulfite and moisture, and having a solids content of 81.5%.

Properties: Hygroscopic; amber-colored, protected against aldehyde tanning of protein; soluble in water, glycerin, glycols and slightly soluble in alcohol.

Containers: Steel drums (approx. 640 lbs. net).

Uses: Adhesives containing animal protein, gummed tapes.

gluside. See saccharin.

gluside, soluble. See saccharin, sodium.

glutamic acid (alpha-aminoglutaric acid) $\text{COOH}(\text{CH}_2)_2\text{CH}(\text{NH}_2)\text{COOH}$. A nonessential amino acid present in all complete proteins. The naturally occurring form is L(+)-glutamic acid. The monosodium salt, L(+)-sodium glutamate, is important commercially as a flavoring intensifier.

Properties.

DL-glutamic acid (synthetic racemic mixture) crystals; m. p. 225-227°C (dec); slightly soluble in ether, alcohol, and petroleum ether, sp. gr. 1.4601 (20/4°C). D(-)-glutamic acid: leaflets from water, m. p. 247-249°C (dec), sp. gr. 1.538 (20/4°C).

L(+)-glutamic acid: crystals, sublimes at 200°C; decomposes at 247-249°C, nearly insoluble in ether, acetone, cold glacial acetic acid, insoluble in ethyl alcohol and methanol; sp. gr. 1.538 (20/4°C).

Derivation: Hydrolysis of vegetable protein (e.g., beet sugar waste, wheat gluten); organic synthesis based on acrylonitrile.

Containers: Fiber drums.

Use: Medicine, biochemical research; source of sodium salt.

See also sodium glutamate; glutamic acid hydrochloride.

Available commercially as L(+)-glutamic acid.

glutamic acid hydrochloride (alpha-amino-glutaric acid hydrochloride)

$\text{COOH}(\text{CH}_2)_2\text{CH}(\text{NH}_2)\text{COOH} \cdot \text{HCl}$.

Properties: White crystalline powder; sp. gr. 1.525; m. p. 202-213°C (dec), specific rotation (25°C) + 23.5° to + 25.5°.

Very soluble in water, liberating hydrochloric acid; almost insoluble in alcohol and ether.

Derivation: Hydrolysis of gluten; organic synthesis.

Grades: N. F. XI.

Use: In medicine.

See also glutamic acid.

glutamine $\text{H}_2\text{NC}(\text{O})(\text{CH}_2)_2\text{CH}(\text{NH}_2)\text{COOH}$. Both the L- and DL- forms are handled.

Properties: White, crystalline powder; soluble in water; insoluble in most organic solvents. Should be kept dry and refrigerated. M. p. (L-form) 184-185°C (dec.), (DL-form) 176°C.

Containers: Bottles.

Uses: Medicine, culture media; biochemical research.

gamma-glutamylcysteinylglycine. See glutathione.

"Glutan H-C-L." ⁵⁷ Trademark for glutamic acid hydrochloride.

glutaraldehyde $\text{OHC}(\text{CH}_2)_3\text{CHO}$. Handled as 25% aqueous solution, sp. gr. 1.066 (20/20°C); b. p. 101°C, f. p. -5.8°C.

Uses: For cross-linking protein and polyhydroxy materials, imparting improved water resistance to textile sizes, tanning agent.

glutaric acid (n-pyrotartaric acid; pentanedioic acid) $\text{COOH}(\text{CH}_2)_3\text{COOH}$.

Properties: Colorless crystals; m. p. 97°C; refractive index (n_D¹⁰⁶) 1.419; b. p. 302-304°C; soluble in water, alcohol, and ether.

Derivation: From cyclopentanone.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles; kegs.

Use: Organic synthesis.

Shipping regulations: None.*

glutaric anhydride (pentanedioic acid anhydride) $\text{CH}_2(\text{CH}_2\text{CO})_2\text{O}$.

Properties: M. p. 56.5°C; b. p. 148.8°C (12 mm). Soluble in benzene and toluene; highly soluble in water on complete hydrolysis.

Uses: Plasticizers; resin; lubricant; adhesive synthesis; dyes and pharmaceuticals.

glutaronitrile (trimethylenedicyanide; pentanedinitrile) $\text{NC}(\text{CH}_2)_3\text{CN}$.

Properties: Colorless to straw-colored viscous liquid; b. p. 144-146°C (13 mm), sp. gr. 0.989, soluble in water and alcohol, insoluble in ether and carbon disulfide.

Use: Chemical intermediate.

glutathione (gamma-glutamylcysteinylglycine) $\text{C}_{10}\text{H}_{17}\text{O}_6\text{N}_3\text{S}$. A universal component of the living cell. Contains glutamic acid, cysteine, and glycine chemically bound. Hydrolysis sets free these three constituent amino acids.

Properties: White crystalline powder, odorless; m. p. 190-192°C, mild sour taste; soluble in water; insoluble in alcohol.

Use: Experimental work in nutrition and

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

metabolism, of especial interest as relates to radiation damage.

gluten. A mixture of proteins usually derived from corn or wheat, but applicable to similar material from other grains. Gluten is the protein present in flour and bread. Different proteins are present in gluten from different sources.

Properties: A yellowish to gray powder, or a gray brown sticky tough mass that is insoluble in water, soluble in alkali and in strong acetic acid. Crude commercial gluten contains up to 20% starch as a filler.

Derivation: Corn is steeped in water and the gluten and starch become suspended in the water and thus separated from other corn components. Settling or centrifugation permits separation of the starch from the gluten. A similar process can be used for recovering gluten from wheat flour or other sources.

Containers: Drums and cans.

Uses: In certain special breakfast foods and other cereals and foods, as gluten meal for cattle food, for adhesives, for production of certain amino acids.

glutethimide. See 2-ethyl-2-phenylglutarimide.

glutin. Amorphous, odorless, tasteless protein, having great adhesive strength. Soluble in hot water.

Derivation: A constituent of glue and gelatin.

glutoform. See glutol.

glutol (glutoform, formaldehyde gelatin).

Properties: A hard, clear transparent mass which may be pulverized, or white to yellow odorless powder, insoluble in cold water, soluble in hot water under pressure.

Derivation: By the action of a solution of formaldehyde upon gelatin.

"**Glycamide.**"¹²³ Trademark for glycarbylamide (q. v.) for use as a coccidiostat.

glycarbylamide (4, 5-imidazoledicarboxamide) $C_3H_2N_2(CONH_2)_2$. White powder, melting above 360°C; insoluble in water. Used as a coccidiostat for chickens.

glyceraldehyde (glyceric aldehyde)

$HOCH_2CHOHCHO$. Isomeric with dihydroxyacetone. It is produced by the oxidation of sugars in the body. As the simplest aldose, the conformation of d- and l- glyceraldehydes has been designated the reference standard for D- and L- carbohydrates and derivatives.

Properties: (DL glyceraldehyde) Tasteless crystals from alcohol-ether mixture; m. p. 145°C; insoluble in benzene, petroleum ether, pentane.

Grades: 40% aqueous solution.

Uses: Biochemical research; intermediate, nutrition; preparation of polyesters, adhesives; cellulose modifier; leather tanning.

glyceric aldehyde. See glyceraldehyde.

glyceride. An ester of glycerol and fatty acids in which one or more of the hydroxyl groups of the glycerol have been replaced by acid

radicals. The latter may be identical or different, so that the glyceride may contain up to three different acid groups. Glycerides may be made synthetically. The most common ones are based on fatty acids and occur naturally in oils and fats. Mono- and triglycerides (q. v.) are of commercial importance. See under glyceryl for examples.

glycerin. See glycerol.

glycerin carbonate (hydroxymethylethylene carbonate; 2, 3-carbonato-1-propanol)

$CH_2O(CO)OCHCH_2OH$. 4-Hydroxymethyl-1, 3-dioxol-2-one.

Properties: Pale yellow, odorless, hygroscopic liquid. Boiling range 125-130°C (0.1-0.2 mm); freezing point, supercools to a glass, sp. gr. 1.4000 (20/4°C), refractive index (n_D 20/D) 1.4580; flash point 415°F. Miscible with water, alcohol, ether; soluble in ethylene dichloride, insoluble in carbon tetrachloride, benzene, and aliphatic hydrocarbons.

Grades: Technical.

Uses: Solvent, intermediate.

glycerin, dynamite. A grade of glycerol (q. v.).

glycerinophosphoric acid. See glycerophosphoric acid.

glycerol (glycerin, glycyol alcohol) $C_3H_5(OH)_3$. The name glycerol is preferred over glycerin since the former indicates its alcohol structure.

Properties: Clear, colorless, or pale yellow, odorless, syrupy liquid, sweet, warm taste, hygroscopic, sp. gr. (anhydrous) 1.2653, (U. S. P. XVI) greater than 1.249 (25/25°C); (dynamite) 1.2620, m. p. 18°C; b. p. 290°C, soluble in water and alcohol (aqueous solutions are neutral), insoluble in ether, benzene and chloroform. Flash point 177°C.

Derivation: (a) From the spent lye liquor from the saponification of fats and oils in the soap industry, by precipitation of salt, albuminoids and metallic soaps of the higher fatty acids by iron persulfate (crude) or aluminum sulfate and concentration with subsequent steam distillation; (b) from propylene or allyl alcohol by chlorination, and hydrolysis; (c) from acrolein and hydrogen peroxide followed by reduction of the glyceraldehyde.

Method of purification: Redistillation, ion exchange techniques.

Grades: U. S. P. XVI, C. P. (for pharmaceutical and commercial purposes where highest grade of glycerol is required), saponification, soap lye, crude yellow distilled (for commercial purposes where color and extreme purity are not factors); high gravity or dynamite (dehydrated to 99.8-99.9% purity); natural, synthetic; etc.

Containers: Drums; tank cars.

Uses: Alkyd resins; explosives; ester gums, pharmacy; perfumery; plasticizer for regenerated cellulose; cosmetics; foodstuffs (preservative, sweetening), conditioning tobacco; liqueurs; solvent, printer's ink rolls, emulsifying agent; rubber stamp and

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

copying inks; binder for cements and mixes; anti-freeze; paper coatings and finishes; special soaps; lubricant and softener; bacteriostat; penetrant; solvent; hydraulic fluid; humectant.

Shipping regulations: None.*

glycerol boriborate. Pale yellow liquid obtained by heating glycerin, sodium borate and boric acid. Composition varies. Soluble in cold water, absolute alcohol, other alcohols, glycerin. Used as adhesive, binder, fabric softener, fire retardant on fabrics.

glycerol dichlorohydrin. See alpha-dichlorohydrin.

glycerol glue. See glue.

glycerol mannitan laurate. A mixed poly-alcohol fatty acid ester.

Properties: Red-brown oily liquid. Dispersible or insoluble in water and most solvents.

Containers: 1-, 5-gal, 480-lb drums.

Uses: Wetting agent; spreading agent in insecticides.

glycerol monolaurate (glyceryl monolaurate, lauryl glycerin)
 $C_{11}H_{23}COOCH_2CHOHCH_2OH$.

Properties: Cream-colored, semi-solid paste, very faint odor. Dispersible in water; soluble in methanol, ethanol, toluene, naphtha, mineral oil, cottonseed oil, ethyl acetate.

Typical specifications. M. p. 23-27°C; sp. gr. 0.98, F. F. A. less than 2.5%, iodine value 6-8, pH 8.0-8.6 (25°C) (5% aqueous dispersion).

Derivation. An ester of glycerol and lauric acid. See monoglycerides.

Containers: 1-, 5-gal cans, 220-, 400-lb drums.

Uses: Emulsifying and dispersing agent for the manufacture of food products. Emulsifying agent for oils, waxes and solvents, antifoaming agent, dry-cleaning soap base.

glycerol monooleate (glyceryl monooleate)
 $(C_{17}H_{33})COOCH_2CHOHCH_2OH$.

Properties: A yellow oil; sp. gr. (25°C) 0.94; m. p. -5°C, insoluble in water, soluble in alcohol and most organic solvents.

Derivation. See monoglycerides.

Containers: 1-, 5-gal cans, 55-gal drums.

glycerol monoricinoleate (glyceryl monoricinoleate) $C_{17}H_{33}OCOOC_2H_5(OH)_2$.

Properties: Orange-red, oily liquid, titer below 0°C, sp. gr. 1.02; iodine value 65-70, F. F. A. less than 2.5%, pH 9.2-9.5 (25°C) (5% aqueous dispersion), soluble in methanol, ethanol, toluene, cottonseed oil, ethyl acetate; disperses in water, insoluble in naphtha, mineral oil.

Derivation. See monoglycerides.

Grades: Technical.

Containers: 1-, 5-gal cans, 55-gal drums.

Uses: Non-drying emulsifying agent, solvent, plasticizer, in polishes, in cosmetics, in textile, paper, and leather processing.

Lowers surface tension. High lubricating value even at low temperatures.

glycerol monostearate (GMS; glyceryl monostearate; monostearin)
 $(C_{17}H_{35})COOCH_2CHOHCH_2OH$.

Properties: Pure white or cream-colored, wax-like solid with faint odor, and fatty, agreeable taste. Affected by light.

Constants: M. p. 58-59°C (capillary tube); sp. gr. 0.97, F. F. A. less than 5%; iodine value 3-4; pH 9.3-9.7 (25°C) (3%).

Dispersible in hot water. Soluble (hot) in alcohol, oils and hydrocarbons.

Derivation: Stearic acid ester of glycerol. See monoglycerides.

Grades: Edible; cosmetic, N. F. XI.

Containers: 1-, 10-, 50-, 150-, 500-lb drums, barrels.

Uses: Thickening and emulsifying agent for margarine, shortenings and other food products, emulsifying agent for oils, waxes and solvents; protective coating for hygroscopic powders; cosmetics; opacifier; detackifier.

"Glycerol Monostearate 860," ²⁶⁰ Proprietary brand of blend of mono and diglycerides.

"Glycerol Monostearate 866" is the dispersible type. Mono content 45%. Balance diester with small amounts of triester, free fatty acid and free glycerol. Waxy solid; white, mild fatty odor. Acid value 3.0 max (860); 8.0 max (866). Iodine value 3.0 max; m. p. 57-60°C, insoluble in water (860), dispersible in water (866); 860 is nonionic, 866 is anionic; flash point (860) (open cup) 448°F, (866) 394°F.

Uses. Emulsifier, thickener, opacifier in cosmetic, food, pharmaceutical, textile and other emulsion systems.

glycerolphosphoric acid. See glycerophosphoric acid.

glycerol phthalate. See glyceryl phthalate.

glycerol tributyrates. See glyceryl tributyrates.

glycerol tripropionate. See glyceryl tripropionate.

glycerol tristearate. See stearin.

glycerolphosphoric acid (glycerolphosphoric acid, glycerinophosphoric acid)
 $C_3H_5(OH)_2H_2PO_4$.

Properties: Colorless, odorless liquid.

Soluble in water and alcohol.

Constants: Sp. gr. 1.60, m. p. -20°C.

Derivation: By the interaction of glycerol and phosphoric acid.

Method of purification: Distillation.

Grades: Technical.

Containers: 1-oz, 1-lb bottles, carboys.

Uses: Medicine; manufacture of glycerophosphates.

Shipping regulations: None.*

glycerophosphoryl inositol (GPI). A phospholipid extractable in the water-soluble fraction from alfalfa, algae, and other plant matter. Characterized by a high degree of surface-active properties.

Use: Biochemical research.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

glyceryl abietate. An ester gum used as a food additive in citrus-flavored beverages.

glyceryl benzoate (tribenzoin) $C_3H_5(OOCC_6H_5)_3$.
Properties: Colorless, non-hygroscopic, crystalline solid. Soluble in most anhydrous lacquer solvents with the exception of petroleum hydrocarbons.

Constants: Sp. gr. 1.25; m. p. 71°C.

glyceryl alpha-chlorohydrin. See chlorohydrin.

glyceryl diacetate. See diacetin.

glyceryl ditolyl ether. See dicresyl glyceryl ether.

glyceryl heptadecanoate. See intarvin.

glyceryl margarate. See intarvin.

glyceryl monoacetate. See acetin.

glyceryl monolaurate. See glycerol monolaurate.

glyceryl monooleate. See glycerol monooleate.

glyceryl monoricinoleate. See glycerol monoricinoleate.

glyceryl monostearate. See glycerol monostearate.

glyceryl phthalate (glycerol phthalate).

Properties: Water-white, solid resin. Insoluble in water. Soluble (hot) in methanol, ethanol, acetone, ethyl acetate. Partly soluble in toluene, naphtha.

Constants: Sp. gr. 1.29; saponification value 605-615, acid value 300-315; softening point about 67°C.

Grades: Technical.

Containers: 1-gal cans (10 lbs), 5-gal cans (50 lbs); 55-gal drums (580 lbs).

Uses: Synthetic resin used in the manufacture of varnishes, lacquers, etc.

glyceryl ricinoleate. See glyceryl triricinoleate.

glyceryl triacetate. See triacetin.

glyceryl tri-(12-acetoxystearate) (castor oil, acetylated and hydrogenated)
 $C_3H_5(OOCC_{17}H_{31}OCOCH_3)_3$.

Properties: Clear, pale yellow, oily liquid; mild odor; soluble in most organic solvents; insoluble in water. Sp. gr. 0.955 (25/25°C); saponification value 298; iodine value 3; solidifies at 4°C.

Derivation: Hydrogenation of acetylated castor oil.

Grade: Technical.

Containers: 5-gal cans; 55-gal drums; tank cars.

Uses: Plasticizer for nitrocellulose, ethylcellulose and polyvinyl chloride; lubricants; protective coatings.

glyceryl tri-(12-acetylricinoleate) (castor oil, acetylated) $C_3H_5(OOCC_{17}H_{31}OCOCH_3)_3$.

Properties: A clear, pale yellow, oily liquid; mild odor, soluble in most organic liquids, insoluble in water. Sp. gr. 0.967 (25/25°C), saponification value 300, iodine value 76; solidifies at -40°C.

Grade: Technical.

Derivation: Acetylation of castor oil.

Containers: 5-gal cans; 55-gal drums; tank cars.

Uses: Plasticizer for nitrocellulose, ethylcellulose and polyvinyl chloride; lubricants, protective coatings.

glyceryl tributurate (tributyryl; glycerol tributurate) $C_3H_5(OCOC_3H_7)_3$.

Properties: Solid, sp. gr. (20°C) 1.035, refractive index (20°C) 1.4359, b. p. 315°C; m. p. less than -75°C; solubility in water 0.010%.

Containers: Drums.

Use: plasticizer.

glyceryl tricaprinate. See tricaprln.

glyceryl tri-[12-hydroxystearate] (castor oil, hydrogenated) $C_3H_5(OOCC_{17}H_{31}OH)_3$.

Glyceryl triricinoleate which has had the double bond of each ricinoleic group saturated with hydrogen.

Properties: Hard, brittle wax-like solid, yellowish cream to milk white in color.

Typical specifications: M. p. 86-88°C, sp. gr. (100/25°C) 0.899.

Derivation: Hydrogenation of castor oil.

Impurities: Glyceryl stearate.

Uses: Lubricants; metallic soaps; waxes; plasticizers, cosmetics; chemical intermediate. The lithium compound is used in high temperature special greases.

glyceryl trinitrate. See nitroglycerin.

glyceryl trioleate. See olein.

glyceryl tripalmitate. See tripalmitin.

glyceryl tripropionate (glycerol tripropionate)
 $C_3H_5(OCOC_2H_5)_3$.

Properties: Solid, sp. gr. (20°C) 1.078, refractive index (20°C) 1.431; b. p. (20 mm) 177-182°C, m. p. less than -50°C, solubility in water, 0.313% of weight.

Use: Plasticizer.

glyceryl triricinoleate (glyceryl ricinoleate)
 $C_3H_5(OOCC_{17}H_{31}OH)_3$. The triglyceride of ricinoleic acid. It constitutes about 80% of castor oil.

Properties: A light amber oil.

Derivation: Castor oil is refined.

Uses: An emulsifying oil.

glyceryl tristearate. See stearin.

glycidol (2,3-epoxy-1-propanol)
 CH_2OCHCH_2OH .

Properties: Colorless liquid; b. p. 162°C; soluble in water, alcohol and ether.

Derivation: Treatment of monochlorohydrins with bases.

Uses: Stabilizer for natural oils, demulsifier, dye-leveling agent, stabilizer for vinyl polymers.

glycine (amino acid) (aminoacetic acid, glycolic) NH_2CH_2COOH . The principal amino acid in sugar cane.

Properties: White, very sweet odorless crystals; m. p. 232-236°C with decomposition; sp. gr. 1.1607; combines with

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

hydrochloric acid to form the hydrochloride; soluble in water; insoluble in alcohol and ether.

Derivation: By the action of concentrated ammonium hydroxide on monochloroacetic acid, or by alkaline hydrolysis of gelatin.

Grades: Technical; N. F. XI.

Containers: Glass bottles; barrels.

Uses: Organic synthesis; medicine, biochemical research; buffering agent.

Caution: Not to be confused with the photographic developer, para-hydroxyphenylaminoacetic acid, also known as glycine, which is poisonous, nor with the perfume.

glycine (perfume). The extreme dilution of methyl-para-tolyl ketone gives a perfume resembling the odor of the climbing plant glycine (*Wistaria sinensis*), native to China and cultivated elsewhere. The name is also given to bouquets made from violet, lilac and jasmin ottos.

Not to be confused with the glycine which is aminoacetic acid nor with para-hydroxyphenyl glycine, which is poisonous.

glycine (photographic). See para-hydroxyphenyl glycine. Note that this compound is poisonous!

glycine ethyl ester hydrochloride (ethyl glycine hydrochloride, ethyl glycolyl hydrochloride) $\text{H}_2\text{NCH}_2\text{COOC}_2\text{H}_5 \cdot \text{HCl}$.

Properties: White to pale yellow crystals, m. p. 140°C , soluble in water and alcohol, insoluble in hydrocarbons.

Grades: 97% min purity.

Uses: Synthesis; rocket propellants.

glycoblarsol (bismuth N-glycolylarsamate, bismuth para-glycolylaminophenylarsenate) $\text{HOCH}_2\text{CONHC}_6\text{H}_4\text{AsO}_3\text{BiO}$.

Properties: Odorless, yellowish white or flesh-colored, amorphous powder. Decomposes when heated. Very slightly soluble in alcohol and water, insoluble in benzene, chloroform and ether. pH (saturated solution) 2.8-3.5.

Grade: U. S. P. XVI.

Use: Medicine.

glycocholic acid (cholyglycine) $\text{C}_{26}\text{H}_{43}\text{NO}_6$.

Occurs as sodium salt in bile. It is formed by the combination of the amino acid glycine with cholic acid (q. v.). As the sodium salt, it aids in the digestion and absorption of fats.

Properties: Crystallizes from water containing 1.5 moles H_2O . Becomes anhydrous at 100°C . Anhydrous form decomposes at 154 - 155°C . Practically insoluble in water. The sodium salt is soluble in water and alcohol.

Derivation: Precipitation from bile.

Use: Biochemical research.

glycocoll. See glycine (amino acid).

glycocoll copper. See copper glycinate.

glycogen (animal starch, liver starch)

$(\text{C}_6\text{H}_{10}\text{O}_5)_n$. A glucose polysaccharide. It is the storage carbohydrate of the animal organism, found especially in the liver

and rested muscle.

Properties: White powder; forms a dextro-rotatory colloidal solution; partially soluble in water; sweet tasting.

Derivation: Isolated from liver by treatment with 30% sodium hydroxide solution and precipitating glycogen from the solution with alcohol.

Use: Biochemical research.

glycogenic acid. See gluconic acid.

glycol. See ethylene glycol; it is also a general term for dihydric alcohols.

glycol carbonate. See ethylene carbonate.

glycol chlorohydrin. See ethylene chlorohydrin.

glycol diacetate. See ethylene glycol diacetate.

glycol dibutyrate. See ethylene glycol dibutyrate.

glycol diformate. See ethylene glycol diformate.

glycol dimercaptoacetate

$\text{HSCH}_2\text{COOCH}_2\text{CH}_2\text{OOCCH}_2\text{SH}$. B. p. 137 - 139°C (2 mm); insoluble in water; soluble in organic solvents. Purity 95% min.

Uses: Crosslinking agent for rubbers; accelerator in curing epoxy resins.

glycol dipropionate. See ethylene glycol dipropionate.

glycolic acid (glycollic acid; hydroxyacetic acid) CH_2OHCOOH .

Properties: Colorless crystals, deliquescent; m. p. 78 - 79°C , soluble in water, alcohol and ether.

Derivation: From chloroacetic acid by boiling with water or aqueous alkali, by oxidation of glycol.

Method of purification: Crystallization.

Containers: Kegs, special lined fiber drums; tank cars.

Uses: Pesticides, plasticizers, salts as catalysts, pharmaceuticals, dyeing. See also hydroxyacetic acid, technical.

glycollic acid. See glycolic acid.

glycol monoacetate. See ethylene glycol monoacetate.

glycolonitrile (glyconitrile, formaldehyde cyanohydrin) HOCH_2CN .

Properties: Mobile, colorless, odorless oil.

Supplied commercially as a 70% aqueous solution stabilized with a small amount of phosphoric acid. B. p. 183°C (759 mm) (slight decomposition), m. p., does not solidify when cooled to -72°C . Sp. gr. 1.1039 (19°C), refractive index (n_{25}^D) 1.4090; electrolytic dissociation constant $K = 0.843 \times 10^{-5}$ (25°C), pH of stabilized 50% aqueous solution = 1.042 (20°C).

Derivation: Formaldehyde and hydrocyanic acid.

Containers: (70% solution) Drums; tank cars.

Uses: Solvent and organic intermediate.

glycol phthalate, polymerized.

Properties: Light-brown, soft wax. Sp. gr.

1.19; acid value 10-15; free fatty acid 1-2%, sap. value 26.5-28, pH 2.65 (25°C)

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

(5%); m.p. 55°C. Soluble (hot) in water, methanol, ethanol, toluene, acetone, and ethyl acetate. Insoluble (hot) in naphtha, mineral oil, cottonseed oil.

Derivation: Phthalic acid ester of polymerized glycol.

glycol propionate. See ethylene glycol dipropionate.

glycol ricinoleate.

Properties: A light-amber self-emulsifying oil which forms milky emulsions with cold water. It is readily miscible with alcohols, hydrocarbons, solvents, and oils.

glycol salicylate (glycol monosalicylate)
 $C_6H_4OHCOO(CH_2CH_2OH)$.

Properties: Colorless, oily liquid, soluble in alcohol, ether, chloroform, benzene, olive oil, less soluble in water. B.p. 169-170°C (12 mm).

Use: Medicine.

Shipping regulations: None.*

glycol stearate. See ethylene glycol stearate.

glycolylurea. See hydantoin.

"Glycomuls," ⁷³ Trade name for a series of sorbitol fatty acid esters, ranging from liquids to relatively high-melting wax-like solids and with varying surface-active characteristics. Used in foods, cosmetics, pharmaceuticals, chemical specialties.

glyconic acid. See gluconic acid.

glyconitrile. See glycolonitrile.

glycosides. A group of organic compounds, of abundant occurrence in plants, which can be resolved by hydrolysis into sugars and other organic substances, known as aglycones. Specifically glycosides are acetals which are derived from a combination of various hydroxy compounds with various sugars. They are designated individually as glucosides, mannosides, galactosides, etc., and as a group are called glycosides. For example, the action of methanol on glucose or mannose or galactose yields methyl glycosides. Glycosides were formerly all called glucosides, but the latter term is more correctly applied to any glycoside having glucose as its sugar constituent.

"Glycosine," ¹⁹ Brand name for a proprietary product, para-phenetolecarbamide. Synthetic sweetener, 200 times sweeter than sugar.

"Glycosperses," ⁷³ Trade name for a series of sorbitan esters modified with varying chain lengths of ethylene oxide, as well as reaction products of fatty acids and fatty alcohols with ethylene oxide. They are hydrophilic surface-active agents, used like "Glycomuls."

"Glyco Wax" S932. ⁷³ Trademark for a fatty acid ester.

Properties: Cream-colored, brittle wax. Somewhat harder than beeswax. High

luster; insoluble in water; soluble (hot) in toluene, naphtha, mineral spirits, mineral oil, vegetable oil. M.p. 58-60°C; sp. gr. 0.965 (25°C), F. F. A. 0.1%; iodine value, max 10; flash point 328°C.

Containers: 1-gal cans (8-lb slab); 5-gal cans (50-lb slab), 500-lb drums (50-lb slab).

"Glycox Emulsifiers," ⁷³ Trade name product. Modified esters of polyhydric alcohol ethers.

The "Glycox Emulsifiers" are a series of non-ionic emulsifiers and wetting agents suggested for the manufacture of agricultural sprays and insect toxicant emulsions, especially when emulsions are to be prepared under the severe conditions of hard water and solutions of electrolytes and acids. They are water soluble or dispersible and are soluble in a wide range of organic solvents. Of particular interest is their compatibility with anionic and cationic surface-active agents giving increased emulsifying and penetrating properties.

glycyl alcohol. See glycerol.

glycyrrhiza (licorice).

Properties: Glossy black flattened, cylindrical rolls or in masses. Characteristic sweet taste. Yields a brown powder when pulverized. Insoluble in absolute alcohol and ether.

Habitat: United States, southern Europe to central Asia.

Derivation: The evaporated extract of *Glycyrrhiza glabra* or *glandulifera*.

Grades: Technical, U. S. P. XVI.

Containers: Boxes, cartons; barrels.

Uses: Medicine, flavoring tobacco and candy. Ammoniated licorice extract is used as a foam producer.

Shipping regulations: None.*

"Glydag" B. ⁴⁶ Trademark for a concentrated colloidal dispersion of pure electric-furnace graphite in 1,3-butylene glycol.

Properties: Liquid consistency; solids content 10%, sp. gr. 1.07, completely miscible with glycols, water.

Uses: Formulation of lubricants for mechanical rubber parts and surfaces.

"Glydote," ²⁰⁶ Brand name of proprietary textile printing solvent and assistant.

"Glyecine" A. ³⁰⁷ Trademark for a dyeing assistant, comprising thiodiethylene glycol; 100% active.

Properties: Clear, thin, yellow liquid; sp. gr. 1.18; soluble in water, unaffected by alkalis, reducing agents, ordinary acids and other ingredients present in printing pastes.

Uses: Hygroscopic agent in textile printing solvent for basic colors.

glyodin (2-heptadecylglyoxalidine acetate; 2-heptadecyl 2-imidazoline acetate)

$C_{17}H_{35}C_3H_5N_2 \cdot CH_3COOH$.

Properties: Light orange crystals; m.p.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

94°C; insoluble in water.

Use: Fungicide.

Caution! May irritate eyes and skin. MCA warning label.*

glyoxal OHCCHO.

Properties: Yellow crystals or light yellow liquid; mild odor; m. p. 15°C; b. p. 51°C; sp. gr. 1.26 (20/20°C), 10.0 lbs/gal (20°C). Vapor has a green color and burns with a violet flame; refractive index (n_D 20) 1.3826, polymerizes on standing or in presence of a trace of water. An aqueous solution contains monomolecular glyoxal, and reacts weakly to acid. Undergoes many addition and condensation reactions with amines, amides, aldehydes, and hydroxyl-containing materials.

Derivation: Oxidation of acetaldehyde.

Grades: Available as a 30% aqueous solution consisting of various hydrated forms of glyoxal with small amounts of chemically related substances such as glycolic acid, formic acid, glycol, and formaldehyde.

Containers: (solid) Tins or fiber drums; (liquid) drums; tank cars.

Uses: Used as an insolubilizing agent for compounds containing polyhydroxyl groups such as polyvinyl alcohol, starch, "Cellosize" hydroxyethyl cellulose, and cellulosic materials. Used for the insolubilizing of proteins such as casein, gelatin and animal glue, in embalming fluids, in leather tanning, and for dimensionally stabilizing or "shrink-proofing" rayon. Used with "Cellosize" hydroxyethyl cellulose it imparts wet strength to paper stocks without loss of absorbency. Also used as a reducing agent in dyeing textiles.

glyoxaline. See imidazole.

glyoxyldiureid. See allantoin.

"Glyptal" Resins. ²⁴⁵ Trademark for a group of alkyd-type synthetic resins and plasticizers.

"G-M-F." ²⁴⁸ Trade name for para-quinone-dioxime, HONC₆H₄NOH.

Properties: Dark brown powder. Sp. gr. 1.40; decomposes above 215°C. Good storage stability. Slightly soluble in acetone. Insoluble in water, gasoline, benzol and ethylene dichloride.

Use: Rubber vulcanizing agent, used in conjunction with red lead for fast-curing high modulus stock.

GMP. Abbreviation for guanosine monophosphate. See guanosine phosphates; also guanylic acid.

GMS. Abbreviation for glycerol monostearate.

"G.N.S." No. 5. ⁷⁹ Trademark for pine oil.

Properties: Color, yellow; sp. gr. (15.5°C) 0.932; refractive index (20°C) 1.482; flash point (open cup) 167°F. Engler distillation: 5% at 200°, 50% at 212°, 95% at 220°C.

Containers: 55-gal drums; tank cars.

Uses: Mining-flotation; textile dyeing and cleaning; laundries; disinfectants;

insecticides; deodorants; cleaning compounds; coated paper; paint and varnish; paint (casein); pharmaceuticals.

goa powder. See araroba.

goethite FeOOH. A natural hydroxy-oxide of ferric iron.

Properties: Color yellowish brown to dark brown; streak yellowish brown; luster, dull to adamantine; hardness 5-5.5; sp. gr. 4.37. Occurs as radiating fibrous masses. Probably most of the material formerly called limonite is actually goethite with adsorbed water.

Occurrence: Widespread. Minnesota, Michigan, Alabama, Georgia, Texas.

Use: Ore of iron.

gold Au. Element of atomic number 79, of group Ib of the periodic system.

Properties: Yellow, ductile metal; does not corrode in the atmosphere but is attacked by chlorine and by cyanide solutions in the presence of oxygen. Soluble in aqua regia; insoluble in acids.

Constants: Sp. gr. 19.2; m. p. 1062°C; b. p. 2530°C.

Derivation: Generally found native enclosed in quartz with iron pyrite and other minerals, or as gold telluride and recovered by amalgamation with mercury or solution in cyanide (sodium or potassium), followed by precipitation and fusion. See also amalgam, calaverite, krennerite, petzite, sylvanite. Gold is found all over the world, but the great producing centers today are South Dakota, Utah, Alaska, California, South Africa, Australasia, Canada (Ontario, Quebec, Northwest Territory, Klondike region in Yukon Territory and British Columbia), India, China, Russia and Mexico.

Forms available: Sheet, wire, tubing, granulated, leaf, foil. Generally used in the form of alloys with copper or other metals; the gold content being expressed in carats, that is, the number of parts of gold in 24 parts of the alloy. Gold powder and sheet are available up to 99.999% pure.

Containers: Canvas sacks; wooden boxes.

Uses: Coins; jewelry; gold salts; dentistry; amalgams; gilding; decoration; gold leaf; gold plating; laboratory ware; anodes; alloys; solders; in electronics, as semi-conductors, etc.

Shipping regulations: None.* Sale in U.S. and Canada subject to governmental regulations.

gold 198. Radioactive gold of mass number 198.

Properties: Half-life, 2.7 days; radiation, beta and gamma; radiotoxicity, moderately hazardous.

Derivation: Pile irradiation of gold metal.

Forms available: Gold metal, colloidal gold (see radiogold) and gold sodium thiosulfate.

Uses: Internal radiation therapy; to detect leaks in bacterial filters; to locate solidification boundary in continuously cast aluminum; to determine metallic silver

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

in photographic materials, etc. The decay product of Au-198 is stable mercury, Hg-198, which may be distilled from aged neutron irradiated gold for the fabrication of monoisotopic mercury arc light sources.

Shipping regulations: Poison, class D, radioactive material. Red label.*

gold alkyl mercaptides. Used for "thermal" gold plating of plastics, stainless steel, aluminum, magnesium and titanium. These mercaptides decompose at comparatively low temperatures (400-500°F) to form a continuous metallic film. The compounds used are the tert-butyl, tert-dodecyl, tert-octyl and tert-hexadecyl gold mercaptides.

gold, artificial. See stannic sulfide.

gold bloom. See calendula.

gold, blue. An alloy used by jewelers. It contains about 75% gold and 25% iron.

gold bromide. See gold monobromide, gold tribromide.

gold bronze powder. See aluminum bronze powder.

gold, burnish. Liquid mixtures containing gold or organic compounds of gold in solution with or without platinum and silver, which may be added to whiten or impart a green cast to the product.

gold, ceramic decorating. Gold in the form of powder, paste, or liquid for application on ceramic materials. Combined with suitable fluxes and vehicles for particular application.

Brown gold (gold powders). Finely divided, dry preparations containing gold and usually a flux. For dry application by dusting on a tacky surface to produce heavy gold deposits.

Uses: Decorating china, pottery, tile, etc., with fired-on gold designs; for increasing gold content of other gold preparations.

Burnish golds. Finely divided gold powder combined with suitable fluxes and incorporated into low-viscosity vehicles for brush application. Produce heavy, stable, long-wearing gold deposits. Fired to a matt surface, the true gold surface texture developed by burnishing.

Uses: Decorating high grade china and ceramicware with fired-on gold designs.

Electronic golds. Special preparations for conductive coating applications where resistance to strong acids and migration is required.

Uses: For applications on semiconductors (transistors, diodes, etc.), special capacitors, and printed circuits.

Liquid bright golds. Liquid compositions suitable for application by brushing, stamping, spraying or stenciling (squeegee). Fired to a bright mirror surface.

Uses: Decorating pottery, glass, tile, terracotta, enameled metals.

Paste golds. Heavy compositions of powdered gold and flux; suitable for printing by

tissue transfer method or can be diluted for brush application. Fired to matt surface which is burnished to develop true gold texture.

Uses: Decorating high grade chinaware.

gold chloride (a) AuCl_3 (auric chloride; gold trichloride); (b) $\text{AuCl}_3 \cdot 2\text{H}_2\text{O}$; (c) $\text{AuCl}_3 \cdot \text{HCl} \cdot 4\text{H}_2\text{O}$ or $\text{HAuCl}_4 \cdot 4\text{H}_2\text{O}$ (chlorauric acid; gold trichloride acid).

Properties: Yellow to red crystals; decomposed by heat, soluble in water, alcohol and ether.

Derivation: The action of aqua regia on gold.

Method of purification: Crystallization.

Grades: Technical; C. P., usually as chlorauric acid.

Containers: Glass bottles.

Uses: Photography; gold plating; special inks; medicine, ceramics (enamels, gilding and painting porcelain); glass (gilding, ruby glass), manufacture of finely divided gold, manufacture of purple of Cassius.

Shipping regulations: None.*

gold, colloidal. See collaurin.

golden seal. See hydrastis.

gold hydrate. See gold hydroxide.

gold hydroxide (auric hydroxide; gold hydrate) $\text{Au}(\text{OH})_3$.

Properties. Brown powder. Sensitive to light.

Caution! Keep in amber bottle! The hydroxide is probably a hydrated trioxide of gold Au_2O_3 , and loses water easily.

Soluble in hydrochloric acid, solutions of sodium cyanide and alkali hydroxides, insoluble in water.

Grades: Technical.

Uses: Daguerreotypes, gilding liquids, medicine, porcelain, rubber colorization (false teeth), gold plating.

gold iodide (aurous iodide) AuI .

Properties: Greenish-yellow powder. Decomposes slowly. Very slightly soluble in water. Sp. gr. 8.25.

gold leaf. Thin plates of gold that have been placed between layers of gold-beater's skin and hammered until they have spread to a state of extreme fineness. Gold leaf is used for gilding works of art, fabrics, books, etc. See also Dutch metal.

gold monobromide (aurous bromide; gold bromide) AuBr .

Properties. Yellowish-gray mass. Decomposes at 165°C (approx). Insoluble in water.

Grades: Technical.

gold orange. See methyl orange.

gold oxide (auric oxide; auric trioxide; gold trioxide) Au_2O_3 .

Properties: Brownish-black powder; decomposed by heat. Caution! Keep in dark bottle. Soluble in hydrochloric acid; insoluble in water.

Grades: Technical.

Uses: Daguerreotypes; gilding liquids; medicine, porcelain; rubber colorization.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

gold-potassium bromide (potassium auribromide) $\text{AuBr}_3 \cdot \text{KBr} \cdot 2\text{H}_2\text{O}$.

Properties: Violet crystals. Soluble in alcohol, water.

gold-potassium chloride (potassium aurichloride) $\text{AuCl}_3 \cdot \text{KCl} \cdot 2\text{H}_2\text{O}$.

Properties: Yellow crystals. Soluble in water, alcohol and ether.

Derivation: By neutralizing chlorauric acid with potassium carbonate.

Grades: Technical.

Containers: Glass bottles.

Uses: Photography; painting porcelain and glass, medicine.

Shipping regulations: None. *

gold potassium cyanide (potassium cyanaurite) KAu(CN)_2 .

Properties: White, crystalline powder; poisonous! Soluble in water; slightly soluble in alcohol; insoluble in ether.

Derivation: By the action of hydrocyanic acid on potassium aurate.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles, 1 and 10 oz., net.

Uses: Medicine; electrogilding.

gold-potassium iodide (potassium auric iodide) $\text{AuI}_3 \cdot \text{KI}$.

Properties: Black, lustrous crystals; m. p. 150°C , with decomposition, soluble in solution of potassium iodide (dilute), water (decomposes).

Grades: Technical.

"Gold Shield." ³¹⁹ Trademark for a highly refined grain alcohol; high purity and freedom from foreign odor or flavor.

Uses: Industrial, pharmaceutical, and cosmetic purposes.

gold-silicon alloy (silicon-gold alloy). Formed in amorphous foils 10 microns thick by cooling molten gold and silicon almost instantaneously by spreading on a moving wheel. The atoms are "frozen" before crystals can form. Used in electronics.

gold size. A mixture of 2 parts copal varnish, 1 part yellow ochre, 4 parts turpentine, and 8 parts boiled oil, an adhesive composition used to prepare the surface before applying gold leaf.

gold-sodium bromide (sodium auribromide) $\text{AuBr}_3 \cdot \text{NaBr} \cdot 2\text{H}_2\text{O}$.

Properties: Brown-black crystals. Soluble in water.

Use: Medicine.

gold-sodium chloride (sodium-gold chloride; sodium aurichloride, sodium chloraurate; sodium chloroaurate) $\text{NaAuCl}_4 \cdot 2\text{H}_2\text{O}$.

Properties: Yellow crystals; soluble in water and alcohol.

Derivation: By neutralizing chloroauric acid with sodium carbonate.

Method of purification: Crystallization.

Containers: Glass bottles.

Grades: Technical.

Uses: Photography; staining fine glass;

decorating porcelain; medicine.

Shipping regulations: None. *

gold-sodium cyanide NaAu(CN)_2 .

Properties: A yellow powder; soluble in water; contains 46% gold (min).

Containers: Bottles (1, 10-ozs., net).

Use: For gold-plating radar and electric parts, band instruments, razor holders, lamps, clocks, jewelry and tableware. *

gold sodium thiomalate

$\text{NaOOCCH(SAu)CH}_2\text{COONa} \cdot \text{H}_2\text{O}$.

Properties: Fine, white to yellowish-white, odorless powder with metallic taste; affected by light. Very soluble in water; practically insoluble in alcohol and ether. Aqueous solutions are colorless to pale yellow, pH (5% solution) 5.8-6.8.

Derivation: Reaction of sodium thiomalate with a gold halide.

Grade: N. F. XI.

Use: Medicine.

gold-sodium thiosulfate (aurous sodium thiosulfate; sodium aurothiosulfate)

$\text{Na}_3\text{Au(S}_2\text{O}_3)_2 \cdot 2\text{H}_2\text{O}$.

Properties: White crystals. Odorless; contain 37% (approx) gold. Darkens on exposure to light. Soluble in water; insoluble in alcohol.

Grade: N. F. XI.

Use: Medicine.

gold solder. A solder usually composed of gold, silver, copper, zinc, or brass and used principally by jewelers.

gold thioglucose. See aurothioglucose.

gold-tin precipitate. See gold-tin purple.

gold-tin purple (purple of Cassius; gold-tin precipitate).

Properties: Brown powder. Insoluble in water; soluble in ammonia.

Derivation: By the reaction of a neutral solution of gold chloride with stannous and stannic chlorides, yielding a mixture of colloidal gold and tin oxide in varying proportions.

Grade: Technical.

Containers: Tins; glass bottles.

Uses: Manufacture of ruby glass, coloring enamels, painting porcelain.

Shipping regulations: None. *

gold tribromide (auric bromide; gold bromide) AuBr_3 .

Properties: Brownish-black powder; m. p. 160°C , with decomposition. Soluble in alcohol, ether, water (reddish-brown).

Uses: Analysis (testing for alkaloids, spermatoc fluid); medicine.

gold tribromide, acid. See bromoauric acid.

gold trichloride. See gold chloride.

gold trichloride, acid. See gold chloride.

gold trioxide. See gold oxide.

gold, white. A jeweler's alloy consisting of about 75-85% gold, 8-10% nickel and 2-9% zinc.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

gommeline. See dextrin.

goober cake. See peanut cake.

"Good-rite 2007." ¹¹⁹ (Styrene-butadiene resin). Trade name for a reinforcing and stiffening agent compatible with crude and American rubbers. Imparts hardness, abrasion resistance, and flexural strength.

"Good-rite Antioxidants." ¹¹⁹ Trade name for a group of antioxidant materials used in rubber.

"Good-rite Carbopol." ¹¹⁹ (Synthetic hydrophilic polymer). Trade name for a water sensitive synthetic gum with gel forming properties. Useful in the manufacture of cosmetics and pharmaceuticals.

"Good-rite CB." ¹¹⁹ (An acrylic resin). Trade name for a sand binder for foundry applications with the advantages of negligible gas formation, excellent collapsibility and shakeout, and good dimensional stability.

"Good-rite K-702." ¹¹⁹ A solution of polyacrylic acid (25%) in water; clear and colorless, infinitely dilutable with water, compatible with a wide variety of aqueous dispersions, pH 2 to 3, sp. gr. 1.09; viscosity 500 to 1200 cps at 78°F; not subject to hydrolysis or bacterial degradation, contains not over 0.2% other salts.

"Good-rite K-705." ¹¹⁹ A solution of ammonium polyacrylate (25%) in water; clear to very slight haze with trace of yellow color, pH 7 to 9, sp. gr. 1.10, viscosity 1000 to 2000 cps at 78°F, other properties as for K-702.

"Good-rite K-708." ¹¹⁹ A solution of sodium polyacrylate (25%) in water, pH 8 to 10, sp. gr. 1.14, viscosity 1200 to 2400 cps at 78°F; contains 1.25% sodium bicarbonate, other properties as for K-705.

"Good-rite K720 and K721." ¹¹⁹ Trade name for water soluble synthetic resins effective as flocculating agents in sedimentation and filtration systems.

"Good-rite" Plasticizers. ¹¹⁹ Trade name for a group of primary plasticizers for vinyls, rubbers, and other high polymer resins. The specific plasticizers are the dioctyl, octyl-decyl, and didecyl phthalate, or adipate esters.

"Good-rite" GP261 (DOP) is a standard plasticizer exhibiting all around properties in calendaring, extrusion, and plastisol applications. The higher molecular weight phthalates (GP-265 and GP-266) have low volatility properties and are useful in high temperature applications. The adipate plasticizers (GP-233, GP-235, and GP-236) have low temperature flexibility properties. The octyl-decyl and didecyl adipates (GP-235 and GP-236) have low volatility.

"Good-rite" plasticizers are insoluble, or have limited solubility, in water, glycerines, and glycols. They are soluble in most other organic liquids. They are

designed to impart permanent flexibility; low water and soapy water plasticizer extraction; good electrical properties; plastic sol viscosity stability.

Containers: 5-gal cans; 55-gal drums; tank trucks; tank cars.

Typical properties:

GP-261 (dioctyl phthalate): light colored oily liquid; sp. gr. 0.983 (25/25°C); color 50 max (APHA); viscosity 49.5 cps (25°C); acid number 0.075 max, flash point 400°F; fire point 470°F; refractive index 1.4844 (25°C).

GP-265 (octyl decyl phthalate): light colored oily liquid, sp. gr. 0.970 (25/25°C); color 75 max (APHA), viscosity 65.0 cps (25°C); acid number 0.075 max, flash point 415°F; fire point 485°F; refractive index 1.4840 (25°C).

GP-266 (didecyl phthalate): light colored oily liquid, sp. gr. 0.964 (25/25°C); color 75 max (APHA); viscosity 69.4 cps (25°C); acid number 0.075 max; flash point 435°F; fire point 510°F; refractive index 1.4835 (25°C).

GP-233 (dioctyl adipate): light colored oily liquid; sp. gr. 0.925 (25/25°C), color 50 max (APHA), viscosity 12.6 cps (25°C); acid number 0.075 max, flash point 380°F, fire point 450°F, refractive index 1.4470 (25°C).

GP-235 (octyl decyl adipate): light colored oily liquid; sp. gr. 0.918 (25/25°C), color 75 max (APHA); viscosity 17.0 cps (25°C), acid number 0.075 max, flash point 390°F; fire point 465°F; refractive index 1.440 (25°C).

GP-236 (didecyl adipate): light colored oily liquid, sp. gr. 0.915 (25/25°C), color 75 max (APHA); viscosity 19.2 cps (25°C); acid number 0.075 max; flash point 415°F; fire point 495°F, refractive index 1.4505 (25°C).

"Good-rite Vultrol." ¹¹⁹ Trade name for a retarding and anti-scorch agent used in the manufacture of rubber.

goosefoot oil. See chenopodium oil.

"Goremul A." ⁷³ Trademark for condensed glycol ester of high molecular weight fatty acids.

Properties: Tan to brown wax-like material. Dispersible in hot water. Soluble in acetone and ethyl acetate. Soluble (hot) in methanol, ethanol, toluene and cottonseed oil. Partly soluble in mineral spirits and mineral oil.

Constants: Sp. gr. 1.05 (25°C), iodine value 31.5-34.5, pH (5% dispersion) 2.5-3.1; m. p. 44-53°C.

Containers. 1-gal cans (8 lbs), 5-gal cans (50 lbs), 55-gal drums (500 lbs).

Uses: For the manufacture of emulsions stable to acids, salts, and esters, for fluid and paste emulsions containing salt, aluminum chloride, hydrochloric acid, glacial acetic acid, oxyquinoline sulfate, and other chemicals which are difficult to incorporate in emulsions of mineral oil, pine oil, toluene, amyl acetate, etc.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

goslarite (zinc vitriol) $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$. White or yellowish earthy mineral formed by the oxidation of sphalerite in damp locations, especially in the presence of iron sulfides. See also zinc sulfate.

gossypium. See cotton.

gossypol 1, 1', 6, 6', 7, 7'-hexahydroxy-3, 3'-dimethyl-5, 5'-diisopropyl-2, 2'-binaphthyl-8, 8'-dialdehyde. A naturally occurring polyphenol in cottonseed known to be toxic and which reduces the usefulness of cotton seed meal as a poultry feed supplement.

Properties: Appears to have three crystalline modifications, with m. p. of 184°C, 199°C, and 214°C. Insoluble in water; soluble in methanol, ethanol, ether, chloroform and dimethyl formamide. Soluble with decomposition in dilute aqueous ammonia and sodium carbonate.

Uses: Stabilizer for vinyl polymers; rubber antioxidant.

gossypose. See raffinose.

gourd oil. See cucumber oil.

GPI. Abbreviation for glycerophosphoryl inositol.

gr. Abbreviation for gravity.

graft copolymer. See graft polymer.

graft polymer (graft copolymer). A polymer molecule in which the main backbone chain of atoms has attached to it at various points side chains containing different atoms or groups from those in the main chain. The main chain may be either a copolymer or may be derived from a single monomer.

grahamite. An asphaltite resembling albertite in its jet-black luster. It varies in its physical properties, some deposits being fairly pure while others contain as high as 50% mineral matter.

Properties: Black in mass, conchoidal to hackly fracture; very bright to dull luster; black streak. Soluble in carbon disulfide (45-100%).

Constants: Sp.gr., pure varieties containing less than 10% mineral matter 1.15-1.20, impure varieties containing more than 10% mineral matter, 1.175-1.50 (77°F); hardness (Mohs' scale) 2-3, penetration 0 (77°F); fusing point (K & S) 350-600°F, (B & R) 370-620°F, behavior on heating in flame, variety showing conchoidal fracture decrepitates violently, variety showing hackly fracture softens, splits, and burns; mineral matter variable up to 50%.

Occurrence: United States (Colorado, Oklahoma, West Virginia), Mexico; Trinidad; Cuba.

Shipping regulations: None.*

Graham's salt. See sodium hexametaphosphate.

grain alcohol. See ethyl alcohol.

grain oil. See fusel oil.

grains of kermes. See kermes.

gram. One one-thousandth of a kilogram (q. v.). It is approximately the weight of one milliliter of water at 4°C.

gramicidin. An antibiotic produced by the metabolic processes of the bacteria *Bacillus brevis*. It is a polypeptide which is active against most gram-positive pathogenic (disease-causing) bacteria. It is one of the two antibiotic components of tyrothricin (q. v.) but has been isolated and used alone.

Properties: White crystalline platelets; m. p. 229-230°C; soluble in the lower alcohols, acetic acid and pyridine; moderately soluble in dry acetone and dioxane; almost insoluble in water, ether, and hydrocarbons. Depresses surface tension; forms a fairly stable colloidal emulsion in distilled water.

Derivation: From tyrothricin by extraction with a mixture of equal volumes of acetone and ether, followed by concentration in vacuo and dissolving in hot acetone.

Grade: N. F. XI.

Use: Medicine.

gramine (donaxine; 3-[dimethylaminomethyl-indole]) $\text{C}_{11}\text{H}_{14}\text{N}_2$. An indole alkaloid from barley.

Properties: Crystals, m. p. 134°C; slightly soluble in water; insoluble in petroleum ether.

Use: Biochemical research.

grana tilli. See tigilium.

granatum (pomegranate bark).

Derivation: Bark of stem and root of *Punica granatum*.

Habitat: Mediterranean region and eastern, western and southern Asia; cultivated in semitropical countries.

Grades: Technical.

Containers: Bags.

Use: Medicine.

Shipping regulations: None.*

granite. A crystalline granular igneous rock composed essentially of quartz and feldspar. Granites differ widely in their appearance and character.

Uses: Dimension stone; ornamental stone.

granulation. The process of converting a substance into small grain-like particles.

grapefruit oil (oil of shaddock).

Properties: A volatile oil, pale yellow to orange-yellow liquid, with the characteristic citrus note of grapefruit, sp. gr. 0.854-0.860 (15°C); refractive index (n_D 20) 1.4750-1.4780; soluble in benzyl benzoate, fixed oils, mineral oil; slightly soluble in propylene glycol; insoluble in glycerin; unstable in presence of strong alkalis, strong acids.

Derivation: Expressed from the fresh peel

• of *Citrus decumana*.

Containers: Drums.

Uses: Flavors; eau de cologne perfumes.

grapefruit oil, terpeneless. A thick brownish-yellow oil, having a strength about 30 times

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

that of oil of grapefruit, used in eau de cologne perfumes and flavors in which its better solubility is desirable.

grapefruit seed oil. Oil expressed from grapefruit seeds collected from citrus canning plants. After a short fermentation which loosens adhering pulp, the seeds are drained, steamed till the hulls crack and dried to a moisture content of 2.5 to 3.0%. The oil is expressed by an expeller and the filter cake used as fertilizer or cattle feed. The oil is refined by a caustic wash and decolorizing carbon. The unrefined oil has a reddish-brown color, a pleasant nutlike aroma, and an intensely bitter taste; sp. gr. 0.9179-9.9199, refractive index ($n_{25/D}$) 1.4688-1.4700. It becomes cloudy at about 15°C (59°F), pasty at 4°C (39.2°F), buttery at -4°C (24.8°F), and solid at -10°C (14°F).
Uses: Lubricant for leather and textile fibers.

grape-seed oil (grape-stone oil; winestones oil; raisin-seed oil).

Properties: Yellow, liquid, fixed oil; unpleasant odor; bitter taste; soluble in benzene, solvent naphtha, and carbon disulfide; sp. gr. 0.9202-0.9350; solidification point -10° to -15°C; saponification value 178-180; iodine number 94-96.5; Maumené number 52-54.

Derivation: From the dried, ground seeds of the grape *Vitis vinifera* by steeping in water, heating and pressing, or by extraction with a volatile solvent.

Method of purification: Decolorization with bone-black.

Grades: Technical.

Containers: Tins, iron drums.

Uses: Lubricant; fuel; illumination; food, soapmaking.

Shipping regulations: None.*

grape-stone oil. See grape-seed oil.

grape sugar. See dextrose.

"Graphallast."⁸² Trade name for a group of graphite and hydrocarbon oilless materials. Used for low friction bushings, bearings, and seals in submerged applications in many corrosive chemicals at normal temperatures below 150°F. Resistant to scuffing or abrasion when submerged.

"Graphalloy."⁸² Trade name for a series of oilless, self-lubricating, long-life, low-friction materials consisting of graphite and a metal or alloy such as Babbitt, bronze, cadmium, copper, gold, or silver. These "Graphalloy" materials are widely used for bearings, bushings, seals, electric brushes, brush assemblies, brush and slip-ring assemblies, and non-freezing electric contacts. Many grades are available to meet most chemical applications. Cryogenic applications to -450°F; or to +750°F in air.

"Graphicell."²¹⁴ A proprietary product, 99% graphitic carbon, but otherwise similar to "Carbocell."

"Graphic Red."¹⁴¹ Trade name for lithol red pigments.

Composition: Sodium, barium, strontium, or calcium salts of diazotized Tobias acid coupled with beta-naphthol.

Properties: They have fair light resistance, fair resistance to heat and good resistance to acid and alkali. They are non-bleeding in water and organic vehicles.

Grades: "Graphic Red" Y: light yellow shade red (sodium salt); "Graphic Red" M: medium red (barium or strontium salt); "Graphic Red" R: dark bluish red (calcium salt); "Graphic Maroon": light or dark maroon (calcium salt).

Uses: Printing inks, paints, rubber, floor coverings, crayons.

graphite (black lead, plumbago). The crystalline allotropic form of carbon characterized by a hexagonal arrangement of the atoms. Occurs naturally in Madagascar, Ceylon, Mexico and numerous other places in deposits of varying purity. Also produced synthetically by heating petroleum coke to about 3000°C in an electric resistance furnace.

See also graphite, pyrolytic.

Properties: Relatively soft, greasy feel, steel gray to black color with a metallic sheen; sp. gr. 2.0-2.25 depending upon origin; apparent specific gravity artificial graphite 1.5-1.8. In fabricated forms, electric resistivity 800-1300 micro-ohm/cm; specific heat 0.16 at room temperature, 0.40 at 1500°C, tensile strength 400 to 2000 psi; compressive strength usually about 1700-7500 psi. See also carbon.

Grades: Powdered, flake, crystals.

Containers: Bags; fiber drums.

Uses: Granular or flake forms: pencils, crucibles, retorts, foundry facings, molds, lubricants, paints and coatings, boiler compounds, stove polish, powder glazing, electrotyping.

Fabricated forms: Cores, molds, chills, crucibles, electrodes (furnace), electrodes (electrolytic), chemical equipment, electronic anodes, motor and generator brushes.

graphite, blue. A complex of carbon, fluorine and hydrogen fluoride formed when certain types of graphite are used as anodes during production of elemental fluorine by electrolysis of molten potassium fluoride-hydrogen fluoride mixtures. Also formed when fluorine is passed through a suspension of graphite in hydrogen fluoride.

graphite, pyrolytic (pyrographite). A dense graphite, stronger and more resistant to heat than ordinary graphite, and expected to find use in rocket nozzles, missiles in general, nuclear reactors. It is made by a recrystallization process from ordinary graphite. Forms of the latter are heated in a stream of hydrocarbon gas. The carbon in the gas is deposited on the original form with the carbon crystals in alignment along the flat planes of the form. Such a graphite has a high tensile strength even at 5000°F. Sheets only one mil thick are impervious to

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

liquids and gases. Its destruction temperature is about 6600°F.

"**Graphlon.**" ⁸² Trade name for a group of widely used graphite and resin materials that exhibit extremely high chemical inertness. "Graphlon" bearings, bushings, and seals withstand corrosive chemicals which would destroy most other materials. Operating range from -450° to +450°F in air.

"**Graphmetex.**" ⁸² Trade name for a group of special thermosetting resins employed as insulating spacers and holders for electrical components. Inert to most chemicals and solvents; fungus resistant, with excellent dielectric properties and high resistivity.

GRAS. Abbreviation for generally recognized as safe. Used of food additives.

"**Gravidox.**" ⁵⁷ Trademark for thiamine-pyridoxine.

"**Gravinol.**" ³ Trademark for a mixture of brominated olive oil and brominated corn oil.

Properties: Clear, reddish-brown, oily liquid with no taste or odor, sp. gr. between 1.305 and 1.315 at 25°C.

Use: Weighting agent for citrus oils in the production of citrus emulsions for use in soft drinks.

gray acetate. See calcium acetate.

gray antimony. See stibnite.

gray copper ore. See tennantite; tetrahedrite; fahlore.

gray manganese ore. See manganite.

grease oil. See lard oil.

green. Used in the chemical industries to mean uncured or untreated material.

green broom. See scoparius.

green cinnabar. See chromic oxide.

green copperas. See ferrous sulfate.

green glass. A chromium compound is used with ordinary glass. Cupric oxide gives blue green.

"**Green-Gold.**" ²⁸ Trademark for yellow azo nickel pigment.

Uses: In paint, printing ink, plastics, and other applications where lightfastness is required.

green hellebore. See veratrum.

Greenland spar. See cryolite, natural.

greenockite CdS. A native cadmium sulfide containing 77.7% cadmium. Honey, citron or orange-yellow color; orange-yellow to brick-red streak, adamantine to resinous luster. Usually found with sphalerite (q.v.).

Constants: Sp. gr. 4.9-5.0; hardness 3-3.5.

Occurrence: United States (Pennsylvania, Missouri, Arkansas); Scotland; Bohemia.

green oil. A term given in the Scottish shale-oil industry to the once-run crude shale oil after chemical treatment. Also applied to anthracene (q.v.).

greensalt. A wood preservative containing chromated copper arsenate.

green salt. See uranium tetrafluoride.

greensand marl. A mixture of clay and calcite with glauconite. The principal source of glauconite (q.v.).

green soap. See soap, soft.

green verditer. A paint pigment consisting of the hydroxycarbonate of copper. See malachite.

green vitriol. See ferrous sulfate.

"**Greenz.**" ⁴⁸ Trademark for an ammonium lignin sulfonate containing 4.5% iron, for use as an agricultural spray or soil additive in the treatment of iron chlorosis.

Griess reagent. A reagent used in analytical work for detecting nitrous acid. It consists of 0.1 gram pure white alpha-naphthylamine dissolved in 100 cc of water to which is added a solution of 5 cc glacial acetic acid and 1 gram sulfanilic acid in 100 cc of water.

"**Griffco.**" ³⁰⁹ Trademark for a polyvinyl acetate emulsion useful as a base for adhesives and paint.

Griffiths' white. See lithopone.

Grignard reagents. A very important class of reagents of synthetic organic chemistry, made by union of metallic magnesium with an organic chloride, bromide, or iodide, usually in the presence of an ether, and in the complete absence of water. These reagents have the general formula RMgX where R is an alkyl or aryl or other organic group, and X represents a halogen. The value of the reagents lies in their ease of reaction with water, carbon dioxide, alcohols, aldehydes, ketones, amines, etc., to produce a great variety of organic compounds, usually with good yields. Examples of Grignard reagents are ethyl magnesium chloride (C₂H₅MgCl), methyl magnesium bromide (CH₃MgBr), etc.

Grillo (Grillo-Schroeder) process. Uses magnesium sulfate as a carrier for platinum catalyst in widely used platinum contact process system in the synthesis of sulfuric acid in the United States.

grindelia (gum plant, tar weed).

Derivation: Dried leaves and flowering tops of various species of Grindelia.

Habitat: California, southwestern United States.

Grades: Technical.

Containers: Bags, bales.

Use: Medicine.

griseofulvin. An antifungal antibiotic derived from *Penicillium griseofulvum*. It is said

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

to be 7-chloro-4,6-dimethoxycoumaran-3-one-2-spiro-1'-(2'-methoxy-6'-methylcyclohex-2'-ene-4'-one).

"Groco." ⁴¹⁰ Trade name for a line of animal and vegetable fatty acids.

Groco 2, 4, 8, 18: Distilled red oil (oleic acid).

Groco 5L: Low linoleic white oleine.

Groco 6: White oleine.

Groco 20: Distilled linseed fatty acids.

Groco 24, 26: Distilled coconut fatty acids.

Groco 27, 28: Distilled soya bean fatty acids.

Groco 29: Distilled corn fatty acids.

Groco 30: Distilled cottonseed fatty acids.

Groco 40, 41: Distilled tallow fatty acids.

Groco 45, 46: Distilled palm oil fatty acids.

Groco 53, 54, 55, 55L, 65, 65C: Distilled stearic acid.

Groco 56: Hydrogenated stearic acid.

Groco 57, 58: Hydrogenated tallow fatty acids.

grog. A term applied in the ceramic industry to various crushed refractory materials which are added to the batch to reduce lamination in plastic clays and also to reduce shrinkage on drying. Such materials crushed for this purpose are pottery, fire brick, quartz, quartzite, burned ware, saggars, kiln and boiler clinkers.

grossularite. See garnet.

ground-nut. See peanut.

ground-nut cake. See peanut cake.

ground-nut oil. See peanut.

growth hormone. See somatotrophic hormone.

growth regulators (plants). See plant hormones; auxins.

growth substances (plants). See plant hormones; auxins.

GR-S. Abbreviation for government rubber-styrene. Designation for the standard synthetic rubber made in U. S. Government plants in 1943 and following years. Produced by emulsion polymerization of 75 parts butadiene and 25 parts styrene, and also referred to as Buna-S. The more accepted designation now is SBR (styrene-butadiene rubber).

G salt. The sodium or potassium salt of 2-naphthol-6,8-disulfonic acid (G acid).

g-strophanthin. See ouabain.

"G. T. O. No. 5." ¹⁸⁸ Brand name for a general purpose industrial odorant.

GTP. Abbreviation for guanosine triphosphate. See guanosine phosphates.

guacetin. See guaiacetin.

guaethol. See ethyl guaiacol.

gualac (guaiac gum; guaiac resin). A resin from certain Mexican and West Indian trees, especially *Guaiacum santum* and *G. officinale*.

Soluble in alcohol, ether, acetone, chloroform and caustic soda.

Grade: Technical.

Uses: Medicine; source of antioxidants for fats and foods.

Shipping regulations: None. *

gualacetin (guacetin, sodium pyrocatechin acetate; sodium phenoneacetate)

$C_6H_4(OH)OCH_2COONa$.

Properties: White powder; soluble in water.

Derivation: By the action of sodium carbonate on phenoneacetate.

Method of purification: Crystallization.

Grade: Technical.

Containers: Glass bottles. Keep solution in well filled bottles and protected from light.

Use: Medicine.

Shipping regulations: None. *

gualac gum. See guaiac.

guaiacol (methylcatechol; pyrocatechol methyl ester; ortho-methoxyphenol; ortho-hydroxy-anisole) $OHC_6H_4OCH_3$.

Properties: Faintly yellowish, limpid, oily liquid or yellow crystals; characteristic aromatic odor. Guaiacol constitutes 60-90% of beechwood creosote. Soluble in alcohol, ether, chloroform and glacial acetic acid; moderately soluble in water. Sp. gr. 1.1395; m. p. 27.9°C; b. p. 205°C.

Derivation: (a) By extracting beechwood creosote with alcoholic potash, washing with ether, crystallizing the potash compound from alcohol and decomposing it with dilute sulfuric acid. (b) Also from ortho-anisidine by diazotization and subsequent action of dilute sulfuric acid.

Method of purification: Recrystallization.

Grade: Technical.

Containers: (Crystals). Drums and tins, (liquid) drums and carboys.

Uses: Medicine, preparation of catechol and guaiacol compounds.

Shipping regulations: None. *

guaiacol benzoate $C_6H_5COOC_6H_4OCH_3$.

Properties: White odorless, almost tasteless powder; m. p. 57-58°C, slightly soluble in water, soluble in hot alcohol, ether and chloroform.

Use: Medicine.

guaiacol carbonate (neutral guaiacol carbonate) $(C_7H_7O)_2CO_3$.

Properties: Small colorless crystals or white crystalline powder. Either slight aromatic odor and taste or odorless and tasteless. Soluble in chloroform, ether; less soluble in alcohol; insoluble in water; m. p. 86-88°C.

Derivation: (a) Reaction between sodium guaiacolate and carbonyl chloride. (b) Reaction between guaiacol and methyl chloroformate.

Containers: 1-lb cartons, 50-lb drums.

Use: Medicine.

guaiacol cinnamate $C_6H_5CHCHCOO(C_6H_4OCH_3)$.

Properties: White needles; tasteless; odorless. Soluble in alcohol, acetone, benzene, chloroform; insoluble in water. Fusing point 130°C.

Use: Medicine.

Shipping regulations: None. *

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

gualac resin. See guaiac.

guaiac-wood oil.

Properties: A very thick and viscid oil, becoming crystalline at ordinary temperatures; very agreeable violet and tea-like odor. Soluble in alcohol, ether and chloroform.

Chief known constituent: Guaiol (tiglic aldehyde).

Constants: Sp. gr. 0.965-0.975; optical rotation -6° to -7° .

Derivation: Probably from *Bulnesia sarmienti*.

Method of purification: Rectification.

Grade: Technical.

Containers: Cans; glass bottles.

Use: Perfumes.

Shipping regulations: None. *

"**Guai-A-Phene.**" ²⁹⁶ Trademark for a phenolic type anti-skinning agent used for the prevention of gelling, skinning, and oxidation in paint, varnishes, printing inks, linoleum, and the like.

guanicaine. See di-para-anisyl-para-phenetyl-guanidine hydrochloride.

guanidine (carbamidine, iminourea)
 $\text{NHC}(\text{NH}_2)_2$.

Properties: Colorless crystals; m. p. 50°C , decomposes at 160°C . Soluble in water and alcohol.

Derivation: (a) By heating calcium cyanamide with ammonium iodide. (b) By treating urea with ammonia under pressure. (c) By the action of aqua regia on dicyandiamine. (d) From guanidine carbonate.

Grade: Technical.

Containers: Tins.

Use: Organic synthesis.

Shipping regulations: None. *

guanidine-aminovaleric acid. See arginine.

guanidine carbonate (carbamidine carbonate)
 $(\text{H}_2\text{NCNHNH}_2)_2 \cdot \text{H}_2\text{CO}_3$.

Properties: White granules. Soluble in water, slightly in alcohol and acetone.

Constants: Decomposes at 197 - 199°C without melting; sp. gr. 1.25.

Derivation: From dicyandiamide.

Grade: Technical, over 95% pure.

Containers: Fiber drums, 200 lbs, net.

Uses: As a strong organic alkali, in organic synthesis, soap and cosmetic products.

guanidine hydrochloride $\text{NHC}(\text{NH}_2)_2 \cdot \text{HCl}$.

Properties: White powder; m. p. about 183°C . Soluble in water and alcohol; pH of aqueous solution 6.2 for 10% solution.

Grades: 88% and 95% pure.

Containers: Paper bags or fiber drums.

Uses: Exceptionally water-soluble source of guanidine for organic syntheses.

guanidine nitrate $\text{H}_2\text{NC}(\text{NH})\text{NH}_2 \cdot \text{HNO}_3$.

Properties: White granules. Soluble in water and alcohol; slightly soluble in acetone. Melting range 206 - 212°C .

Derivation: From cyanamide or dicyandiamide.

Grade: Technical, over 95% pure.

Containers: Fiber drums, 200 lbs, net; multiwall paper sacks.

Uses: In manufacture of explosives, and as an ingredient of explosive mixtures (guanidine nitrate itself is not explosive); disinfectants; photographic chemicals.

Shipping regulations: Oxidizing material. Yellow label. *

dl-alpha-guanidinopropionic acid. See N-amidinoalanine.

guanine $\text{C}_5\text{H}_5\text{N}_5\text{O}$ (2-amino-6-oxypurine). A purine that is a constituent of ribonucleic acid and deoxyribonucleic acid. Usual sources are guano, sugar beets, yeast, clover seed, and fish scales.

Properties: Amorphous or small colorless rhombic crystals. M. p. 360°C (dec). Insoluble in water; sparingly soluble in alcohol and ether; freely soluble in ammonium hydroxide, alkali hydroxides, and dilute acids.

Derivation: Isolation following hydrolysis of nucleic acids (usually from yeast); organic synthesis.

Use: Biochemical research.

Available as hydrochloride or hemisulfate.

guanine riboside. See guanosine.

guano. A term originally limited to true guano, which consists of the dried excrements, feathers, and carcasses of sea fowl. It was formerly obtained exclusively from certain islands off the coast of Peru and Chile. Now obtained, in addition, from other sources. Typical analysis, Peru guano: Moisture 23%, ammonia 11%, phosphoric acid 12%.

The significance of the term has been broadened to include other varieties, as bat guano, fish guano, phosphatic guano (leached of its nitrogen content by rain), etc. Guano is also known by the geographical location from which it is obtained, as Ballestas guano, Cantores guano.

Containers: Bags, bulk.

Use: Fertilizer.

guanosine (guanine riboside) $\text{C}_{10}\text{H}_{13}\text{N}_5\text{O}_5$.

The nucleoside containing guanine and D-ribose.

Properties: White, crystalline, odorless powder with mild, saline, or saline and bitter taste. M. p. 237 - 240°C (dec). Very slightly soluble in cold water; soluble in boiling water, dilute mineral acids, hot acetic acid, and dilute bases; insoluble in alcohol, ether, chloroform and benzene.

Derivation: Found in pancreas, clover, coffee plant, and pollen of pines, prepared from yeast nucleic acid.

Use: Biochemical research.

guanosine monophosphate. See guanylic acid.

guanosine phosphates. Nucleotides used by the body in growth processes; important in biochemical and physiological research. Those isolated are the monophosphate (GMP), the diphosphate (GDP) and the triphosphate (GTP).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Guantal." ⁵⁸ Trademark for diphenylguanidine phthalate (q. v.).

guanylic acid (GMP; guanosine monophosphate) $C_{10}H_{14}N_5O_8P$. The nucleotide consisting of guanine, D-ribose, and phosphoric acid; important in growth processes of the body.

Properties: Dihydrate, in form of long prisms, becomes anhydrous at 118°C. Decomposes at 180°C. Acid to litmus. Soluble in cold water; freely soluble in hot water.

Derivation: Isolation from nucleic acid of yeast or pancreas.

Use: Biochemical research.

guanyl nitrosaminoguanylidene hydrazine.

Shipping regulations: Explosive, class A.

Initiating explosive label. Not accepted by express. *

guanyl nitrosaminoguanyl tetrazene. See tetrazene.

guanyl urea sulfate (carbamylguanidine sulfate; dicyanodiamidine sulfate)

$(C_2H_6ON_4)_2 \cdot H_2SO_4 \cdot 2H_2O$.

Properties: White powder, over 97% pure. Soluble in water and alcohol.

Derivation: From cyanamide or dicyandiamide.

Uses: Analytical reagent for nickel; in manufacture of dyes and in organic synthesis.

guapi bark. See cocillana.

"Guardkote." ¹²⁵ Trademark for fast-setting two-component liquid systems based on "Epon" resins and designed specifically for highway resurfacing and repair. They are used in combination with sharp aggregates to waterproof and deslick portland cement or bituminous concrete pavements.

guar flour. See guar gum.

guar gum (guar flour). The ground endosperms of *Cyanopsis tetragonoloba*, cultivated in Pakistan as livestock feed. The water-soluble portion of the flour (85%) is called guaran, and consists of 35% galactose, 63% mannose; 5-7% protein.

Properties: Light-gray powder. Dispersible in hot or cold water. Has 5-8 times the thickening power of starch.

Grades: Industrial; technical; edible.

Containers: Bags.

Uses: Paper manufacture; foods; cosmetics, pharmaceuticals; textiles; printing; polishing; atomic metal processing.

guayule. A shrub native to Mexico, but also planted in western United States during 1941-1945. It has a fairly high rubber content, but because of a high percentage of resins and for other reasons it is not competitive as a source of rubber.

guaza. See cannabis.

Guggenheim process. A process for the manufacture of sodium nitrate from the Chilean nitrate ore, caliche, in which heat is efficiently utilized and handling costs are kept to a minimum.

guhr. See diatomite.

Guignet's green.

Derivation: Chrome green made by fusing potassium chromate and boric acid. The mass is washed, ground and dried. The chromium borate formed is decomposed by water. The final product is insoluble in water.

Grade: Technical.

Containers: Wooden kegs; fiber drums.

Use: Paint pigment.

Shipping regulations: None. *

"Gumafoam S." ³²⁸ Trademark for a product consisting of plasticized vegetable gum solution and providing a bodying finish to textile fabrics.

gum, ammoniac. See ammoniac.

gum arabic. See arabic, gum.

gum artificial. See dextrin.

gumbo clay. A series of fine-grained highly plastic and tough clays which are chiefly used in the manufacture of railroad ballast. They cannot be used for brick making due to their high shrinkage on burning.

Occurrence: West-central states of the United States.

gum camphor. See camphor.

gum lac. See shellac.

gum plant. See grindelia.

gum rosin. See rosin.

gums.

1. In general, the dried exudations of secretions of plants. They vary in properties with the plant and almost defy classification. Their nomenclature is equally uncertain. Common usage leans to a rough grouping under water-soluble gums (see 2), oleoresins, resins, and rubber or rubberlike substances such as chicle. See oleoresins and various headings under resins and rubber.

2. Specifically, plant exudations which are soluble in water or swell in water. They consist largely of carbohydrates and are hydrophilic colloids. Examples are arabic, tragacanth, agar.

Many natural gums and resins are listed commercially under the name gum, as gum arabic, gum dammar, gum tragacanth, etc. These are entered in this dictionary under the specific name, as arabic, dammar, tragacanth, etc.

gum sugar. See arabinose.

gum thus. See turpentine or olibanum.

gum turpentine. See turpentine.

guncotton. See nitrocellulose.

"Gunk." ¹⁸⁶ Trademark for a line of soaps and compounds consisting of degreasing and decarbonizing solvents, acid and alkaline powders and liquids.

Containers: Pint, quart, 1-, 5-, 15-, 30-, and 50-gal drums.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Uses: In automotive, airmotive, industrial and commercial fields for carbon digesting, paint stripping, derusting and descaling.

"Gunk" **Carbon Met.** ¹⁸⁶ Trade name for a fast-drying, halogenated aromatic hydrocarbon solvent for liquid degreasing of metals.

"Gunk" **C. C.** ¹⁸⁶ Trade name for a mild aromatic solvent specifically for cleaning carburetors and fuel pumps; a non-caustic, self-emulsifying and self-scouring liquid.

"Gunk" **Compound I. S.** ¹⁸⁶ Trade name for an industrial shampoo; a self-emulsifying and self-scouring, water-soluble degreaser for typewriters and hand wiping of machinery.

"Gunk Compound Motor Fizik." ¹⁸⁶ Trademark for a solvent oil used for dissolving carbonaceous tars and gums from engine head and valves, pistons, rings, and crankcases of internal combustion engines and as a pour point depressant in crankcase oil and gas line anti-freeze.

"Gunk Hydro-Seal." ¹⁸⁶ Trademark for a diphasic self-emulsifying and self-scouring carbon digester for decarbonizing and paint stripping engines and metal structures.

"Gunk Motor Purge." ¹⁸⁶ Trademark for a self-emulsifying and self-scouring solvent for washing gums and carbonaceous tars from the inside of gasoline or diesel engines through solvent action coupled with soap and water detergency.

"Gunk" **Neo Met.** ¹⁸⁶ Trade name for a non-flammable, fast-evaporating solvent for dry cleaning metal parts and electrical components, specifically replacing carbon tetrachloride.

"Gunk" **Super Concentrate Degreaser.** ¹⁸⁶ Trade name for a concentrated self-emulsifying, self-scouring, oil-soluble, water-miscible liquid soap to be extended with petroleum distillate and rinsed with water, for removing grease and oil from engines, floors, etc.

gun metal. An alloy of copper with 10% tin.

gun powder (black powder). A mixture of sodium nitrate or saltpeter, sulfur, and charcoal in varying proportions. A typical formula is as follows: 70-75% saltpeter, 10-14% sulfur, 14-16% charcoal. It is designated according to size: Mealed, superfine grain or FFG, fine grain or FG, large or coarse grain or LG; large grain for rifles RLG, mammoth.

Containers: Kegs; special fiber containers; tin cans.

Shipping regulations: Explosive; class A by freight. Not accepted by express.*

gunpowder, white (white powder). A mixture of 2 parts potassium chlorate, 1 part potassium ferrocyanide and 1 part sugar.

Shipping regulations: High explosive.*

gurjun balsam (East Indian copaiba balsam). Oleoresinous secretion from a species of

Dipterocarpus tree in India and China.

Similar to copaiba.

Use: Source of oil.

Shipping regulations: None.*

gurjun balsam oil (gargan balsam oil; gardjan balsam oil; East Indian copaiba balsam oil; Indian wood oil).

Properties: Yellow, somewhat viscous essential oil. Solubility in alcohol: In 7-10 vols of 95% alcohol (solubility not unlimited).

Chief known constituents: Sesquiterpenes known as gurjunenes.

Constants: Sp. gr. 0.918-0.930; optical rotation -35° to -130° , refractive index 1.501-1.505; acid value up to 1; ester value up to 8, after acetylation 6-10.

Derivation: By distilling the balsam and oils obtained from various species of genus Dipterocarpus.

Use: Adulterant of other volatile oils.

Shipping regulations: None.*

guru. See cola.

"Guthlon." ¹⁸¹ Trademark for O,O-dimethyl S-4-oxo-1,2,3-benzotriazin-3(4H)-ylmethyl phosphorodithioate (q.v.).

gutta-percha (isonandra gutta) (C₁₀H₁₆)_x. See also polyisoprene. A rubber-like material obtained from the milky juice of leaves and bark of the genus Palaquium and Payena of tropical Asia, South America, and the Philippines. The material is skimmed from a water layer, purified, and in the process turns yellowish or gray. Melting point approximately 100°C; partly soluble in carbon disulfide, chloroform, solvent naphtha, and warm benzene.

Grades: Red Macassar (superior); gutta siak and gutta soh.

Uses: Insulating electric wires, cables and conduits; dentistry, making impressions of medals; waterproofing, fastening incandescent electric bulbs into their sockets; machinery belting; cutlery handles.

Shipping regulations: None.*

"Guyatt." ⁵¹ Trademark for a dark, fibrous lubricant used in plain or roller bearings where a semifluid or a stiff grease possessing good high-temperature characteristics is desired and no water contamination occurs.

gynesine. See trigonelline.

gynocardia oil. See chaulmoogra oil.

gynocardic acid C₁₇H₃₃COOH. A term used to denote the acids of the oil expressed from the seeds of Gynocardia odorata; also the acids from chaulmoogra oil.

Properties: White leaflets; m. p. 67.5°C; insoluble in water; soluble in most organic solvents.

Shipping regulations: None.*

gyplure. A synthetic product, 12-acetoxy-1-hydroxy-cis-9-octadecene, used as a sex attractant for the male gypsy moth. The natural product, found in the female moths, is said to be d-10-acetoxy-1-hydroxy-cis-7-hexadecene.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

gypsum $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$. A natural hydrated calcium sulfate.

Properties: White or colorless, sometimes tinted grayish, reddish, yellowish, bluish, or brownish. White streak; pearly, silky or vitreous luster; can be easily scratched by finger nail, sp. gr. 2.31-2.33; hardness 1.5-2. Loses $1\frac{1}{2}$ H_2O at 128°C , and $2\text{H}_2\text{O}$ at 163°C . Insoluble in water; soluble in ammonium salts, acids and sodium chloride.

Varieties:

Alabaster: Fine grained and compact.

Satin spar: Fine translucent fibrous varieties, pearly, opalescent appearance.

Not to be confused with the variety of calcite also called satin spar.

Selenite: Colorless, clear crystals or in broad folia.

Rock gypsum: Dull-colored rock often with clay, calcium carbonate, silica.

Occurrence: Gypsum is mined in many countries.

Grades: Crude; ground, anhydrous.

Containers: Bags, multiwall paper sacks, shipped in bulk in boxcars and ships.

Uses: About one fourth of the total is sold

uncalcined, chiefly for Portland cement retarder and agricultural use. Large-scale uses for the calcined material are: wallboard, lath, sheathing board, tile, and plasters, including special plasters such as plate-glass, pottery and dental plasters. See also gypsum cements. Other uses are: in metallurgy, paper, paints, textiles, baking powders, phosphors; source of sulfuric acid, smelting zinc ores; drying agent; fertilizer ingredient.

gypsum cements (plaster of Paris; Keene's cement, Parian cement; Martin's cement; Mack's cement). A group of cements which consist essentially of calcium sulfate and are produced by the complete or partial dehydration of gypsum, $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$. They usually contain additions of various sorts, these additions causing the differentiation of various special names. For example, Keene's cement contains alum or aluminum sulfate, Mack's cement contains sodium or potassium sulfate, Martin's cement contains potassium carbonate and Parian cement contains borax.

gypsum plaster. See gypsum cements.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

H

H. Symbol for hydrogen.

HA. Abbreviation for hydroxylanisole. See hydroquinone, monomethyl ether.

Haber process. Original process for synthesis of ammonia from nitrogen and hydrogen. See ammonia synthesis and Haber-Bosch process.

Haber-Bosch process. Early process for synthesis of ammonia, operating at 200 atmospheres pressure, 550°C, with a promoted iron catalyst. Only eight per cent conversion of the nitrogen-hydrogen mixture was obtained per pass through the reaction zone, but recirculations increased the overall yield. Hydrogen and nitrogen were obtained from water gas and producer gas. See ammonia synthesis.

H acid. See 1-amino-8-naphthol-3,6-disulfonic acid.

haematin. See hematin.

haemoglobin. See hemoglobin.

HAF black. Abbreviation for high abrasion furnace black. See furnace black.

hafnium Hf. Element of atomic number 72, group IVb of the periodic table.

Properties: Metal resembling zirconium; sp. gr. 13.1, m. p. about 2000°C, b. p. above 5400°C. It differs from zirconium in that it has a high (115 barns) thermal neutron cross section.

Occurrence: In most zirconium ores.

Derivation: Very difficult to separate from zirconium. The techniques employed consist of fractional crystallization, fractional precipitation, fractional decomposition of certain compounds, fractional distillation, solvent extraction, ion exchange and adsorption. The metal is prepared by the thermal decomposition of the tetraiodide. (See zirconium.)

Uses: Manufacture of tungsten filaments, most hafnium has been sold to the Atomic Energy Commission, and is used primarily as a control element in nuclear reactors.

Shipping regulations: Powder and sponge, wet or dry; flammable solid. Yellow label.*

hafnium carbide HfC. Used for nuclear reactor control rods. Has high thermal neutron absorption cross section and very high melting point, 3890°C (7030°F).

"Hagacide" No. 101. ¹⁰⁸ Trademark for an organic biocide based on quaternary ammonium compounds carefully selected

for maximum effectiveness in industrial water systems.

Uses: Inhibits the growth of protozoa, algae, fungi and bacteria. Also inactivates enzymes for better control of odors in air conditioning systems. Most effective for sulfate-reducing bacteria. Not recommended for potable waters.

"Hagacide" No. 106. ¹⁰⁸ Trademark for an organic biocide based on quaternaries different from "Hagacide" 101 and carefully selected for maximum effectiveness in industrial water systems particularly with respect to slime bacteria.

Containers: 40-lb cans; 435-lb steel drums.

Uses: Inhibits growth of protozoa, algae, fungi and bacteria. Also inactivates enzymes for better odor control in air conditioning systems. Most effective on gram negative slime bacteria. Not recommended for potable waters.

"Hagacide" No. 203. ¹⁰⁸ Trademark for a liquid organo-metallic biocide made up in a biocidal solvent for industrial water systems. Readily dispersible in water. Is preferentially adsorbed on wood and metal surfaces providing reserve power.

Containers: 34-lb cans; 360-lb steel drums.

Uses: Inhibits growth of fungi, algae, and sulfate reducing bacteria. Especially suited for cooling tower systems because of unique property of forming a microscopic biocidal film, resistant to water leaching on wood surfaces. Not recommended for potable waters.

"Hagacide" No. 204. ¹⁰⁸ Trademark for a blended organic biocide containing both quaternaries and organo-metallic compounds specially formulated to provide a high degree of toxicity to all microorganisms encountered in industrial water systems.

Containers: 40-lb cans, 435-lb drums.

Uses: Inhibits growth of all organisms encountered in industrial cooling water systems. Forms biocidal film, resistant to water leaching on wood surfaces in systems providing residual treatment. Not recommended for potable waters.

"Hagafilm." ¹⁰⁸ Trademark for a protective film-forming amine added to boilers or steamlines to inhibit condensate corrosion, caused by oxygen and low pH. Available in liquid and solid forms.

Containers: Liquid: 5-gal cans, 55-gal drums; solid: 55-lb drums.

See also "Hagamin" and "Hagevap."

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"**Hagamin.**" ¹⁰⁸ Trademark for a liquid, volatile, alkaline amine of either 99% or 50% active material content used in steam-boilers for inhibiting condensate corrosion by raising the pH value.

"**Haganox.**" ¹⁰⁸ A tan water-soluble powder. Containers: 100-lb bags.

Uses: To chemically remove dissolved oxygen left in the feed-water after mechanical deaeration.

"**Hagatreat**" ¹⁰⁸ Trademark for a blend of several corrosion inhibitors, one of which is chromate.

Containers: 125-lb lined steel drums.

Uses: Provides corrosion control in recirculating cooling water systems in industrial plants.

"**Hagevap.**" ¹⁰⁸ Trademark for a powdered organic dispersing agent and antifoam compound used for minimizing scale formation in boilers.

Containers: 75-lb drums.

Hahnemann's soluble mercury. See mercurous nitrate, ammoniated.

"**Halane.**" ²⁰³ Trademark for 1,3-dichloro-5,5-dimethylhydantoin. It contains 66% minimum available chlorine and reacts with water to liberate hypochlorous acid at a slow and controlled rate. Major uses are in dry household laundry bleaches and in water treating.

halazone (para-N,N-dichloro-sulfamylbenzoic acid; para-sulfondichloraminobenzoic acid) $\text{HOOC}_6\text{H}_4\text{SO}_2\text{NCI}_2$.

Properties: White crystalline powder, strong chlorine odor, affected by light. Soluble in glacial acetic acid, benzene, slightly soluble in water, chloroform, insoluble in petroleum ether.

Constants: M. p. 195° with decomposition. Grades: N. F. XI.

Uses: In the form of tablets as a powerful water disinfectant.

Shipping regulations: None.*

half life.

1. The time required for the decomposition of half of a sample of a radioactive substance, and thus a measure of the rate of such processes. Half lives vary from fractions of a second for some of the radioactive elements produced in recent nuclear studies to thousands of years for relatively stable radioactive elements such as uranium.

2. The term is also applied to any process in which a single substance changes in some way.

halibut liver oil (haliver oil).

Properties: Pale yellow to dark red liquid; characteristic, slightly fishy but not rancid, odor and fishy taste, soluble in alcohol, ether, chloroform, and carbon disulfide, insoluble in water.

Constants: Sp. gr. 0.920-0.930, saponification number 160-180; iodine number 120-136, refractive index about 1.47.

Derivation: By expressing and boiling halibut livers.

Method of purification: Filtration.

Grades: Crude, refined, N. F. XI.

Containers: Wooden barrels, steel drums.

Uses: Medicine, source of vitamins A and D, leather dressing.

Shipping regulations: None.*

halides. Binary compounds of the halogens (q. v.).

halite (rock salt) NaCl . A natural sodium chloride found in the earth in beds varying from a few feet to over three thousand feet in thickness. Color, white or colorless, but often yellow, brown, deep blue from impurities, streak, white; vitreous luster; taste salty.

Constants: Sp. gr. 2.1-2.6; hardness 2.5.

Occurrence: United States (Utah, California, New York, Texas, Pennsylvania, Virginia, Michigan, Ohio, Louisiana); Russia, Italy; Poland, Spain, Transylvania, Alsace; Roumania, Germany, Peru, Switzerland, England, Austria, India, Siberia, China, Canada.

Uses: See sodium chloride.

haliver oil. See halibut liver oil.

halloysite $\text{Al}_2\text{O}_3 \cdot 3\text{SiO}_2 \cdot 2\text{H}_2\text{O}$. A variety of clay (q. v.), used to some extent in refractories and as a petroleum cracking catalyst.

Hall process. The electrolytic process by means of which metallic aluminum is recovered from aluminum oxide (usually bauxite). The aluminum oxide, after being purified from iron and other substances in preliminary chemical operations, is dissolved in a bath of molten cryolite (sodium aluminum fluoride). Passage of a direct current through this molten mixture results in formation and liberation of carbon dioxide at the carbon anodes, and production and collection of molten aluminum in the bottom of the cell, whose carbon lining serves as the cathode. The molten aluminum is periodically tapped through a suitable opening.

halocarbon plastics. Plastics based on resins made by the polymerization of monomers composed only of carbon and a halogen or halogens (ASTM D883-54T). The halocarbon plastics are characterized by extreme chemical resistance, excellent electrical properties, and good resistance to heat. See also "Fluorothene," "Kel-F," "Teflon."

halogenation. Incorporation of one of the halogen elements, usually chlorine or bromine, into a chemical compound. Thus benzene (C_6H_6) is treated with chlorine to form chlorobenzene ($\text{C}_6\text{H}_5\text{Cl}$), and ethylene (C_2H_4) is treated with bromine to form ethylene dibromide ($\text{C}_2\text{H}_4\text{Br}_2$). Compounds of chlorine and bromine are sometimes used as the source of the halogen, phosphorous pentachloride being a good example.

halogens. The chemically related elements, fluorine, chlorine, bromine, and iodine, and also astatine.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Halon." ¹⁷⁵ Trademark for chlorotrifluoroethylene synthetic resin (q. v.).

Properties: Zero moisture absorption; non absorbent; good abrasion resistance; impact, tensile, and compressive strength; non-flammable; excellent machinability; high volume and surface resistivity at high and low temperatures; low dielectric constant and good power factor at high temperature and high frequency, moldable by compression, extrusion, injection, and transfer molding techniques.

Types: "Halon" VK: Serviceable to 350°F, sp. gr. 2.1, hardness (Rockwell R) 75, elongation (% at 75°F) 150.

"Halon" TVS: Serviceable to 390°F; sp. gr. 2.16, hardness (Rockwell R) 95, elongation (% at 75°F) 205.

Caution: At processing temperatures small quantities of harmful gaseous products are released. Proper ventilation is recommended to remove these volatile products. Waste should be buried, not incinerated.

"Halopont." ²⁸ Trademark for a line of pigment colors used for tinting white paper.

halothane (2-bromo-2-chloro-1,1,1-trifluoroethane) CF_3CHBrCl .

Properties: Non-flammable, volatile liquid, sweetish odor. Sp. gr. (20/4°C) 1.86, b. p. 50.2°C (760 mm), 20°C (243 mm). Light sensitive, may be stabilized with 0.01% thymol. Slightly soluble in water, miscible with many organic solvents.

Containers: Bottles.

Grade: N. N. D.

Use: Medicine (anesthetic).

hamamelis (witch-hazel, winter bloom, snapping hazel; striped alder, tobacco wood).

Derivation: Dried leaves and bark (also twigs) of *Hamamelis virginiana*.

Habitat: North America (New England to Minnesota, southward to Louisiana).

Grades: Technical.

Containers: Bags, bales.

Uses: Alcoholic extract used in medicine; pharmacy, toilet preparations.

Shipping regulations: None. *

"Hanane." An English product — a mixture of bis-(dimethylamino)-fluorophosphine oxide and bis-(dimethylamino)-phosphonous anhydride. Colorless liquid, faint odor, vapor pressure 0.6 mm at 25°C. Soluble in water and most organic liquids. Dangerous to handle. Used as a systemic insecticide.

"Hansa." ³⁰⁷ Trademark of proprietary line of pigments. Used for wallpaper, lacquer, plastics, paints, rubber and coated paper. Characterized by very good fastness to light, etc.

Hansa Yellow. A class name for a group of organic azo pigments that have good brightness, light-fastness and alkali resistance. Their tinting strength is about four times that of a good chrome yellow of approximately the same shade. Hansa Yellow has comparatively poor opacity in enamels and

poor flow and is seldom used except where a non-toxic pigment is required, prohibiting the use of a chrome or cadmium yellow. The heat resistance of Hansa Yellow is not particularly good, and therefore it is not well adapted for use in baking enamels.

Containers: Barrels.

Hansgird process. The production of magnesium from magnesium oxide by carbon reduction. Magnesium oxide is fed into an electric arc furnace lined with carbon where it is vaporized at a temperature of 2100°C. The mixture of magnesium vapor and carbon monoxide is withdrawn from the furnace and cooled to 200°C by diluting with natural gas (so the carbon monoxide will not oxidize the magnesium). A fine dust, containing 65% magnesium mixed with the oxide and carbon, is collected with electrostatic precipitators and sublimed at 750°C in electric retorts using high vacuum. The product thus obtained is better than 99% pure magnesium.

"Harbide." ⁴⁴⁶ Trade name for a silicon carbide brick, formed by impact pressing, having low permeability, dense impervious surfaces, high resistance to oxidation.

Uses: Ceramic kiln furniture, boiler furnace settings, recuperator tubes, radiant tubes, retorts, and in applications which are exposed to mechanical abrasion.

"Harchem." ¹⁸⁹ Brand name for proprietary grades of sebacic acid, capryl alcohol (a sec-octyl alcohol) and methyl hexyl ketone (q. v.).

"Harchemex." ¹⁸⁹ Trade name for a compound of mainly C_{14} and C_{16} straight chain primary alcohols in the approximate ratio of 2 to 1. Properties: M. p. 32-36°C; color (NPA) 1.5 max; sp. gr. 0.840 (approx) at 30/20°C.

Uses: Wetting agents, germicidal quaternary ammonium compounds; lubricating oil additive.

"Harcure A." ¹⁸⁹ Trade name for a linear polymeric anhydride curing agent for epoxy resins. Imparts excellent flexibility and good resistance to thermal and mechanical shock. Good electrical properties and holds up well under high operating temperatures. Properties: Light tan solid; m. p. 75-82°C, sp. gr. 1.0-1.05 at 85°C; bulk density 5 lbs/gal.

Uses: In fluidized bed powders, in electrical encapsulations, in coatings and in impregnated glass fiber laminates.

hard coal. See anthracite.

hardened oils. See hydrogenated oils.

"Hard Hydrocarbon." ⁶⁹ Brand name for an air-blown petroleum residue mineral rubber. Properties: Black, brittle solid (also supplied as granular powder); sp. gr. 1.04 ± .03; softening point 300-315°F.

Uses: Diluent, extender and processing aid in rubber compounding.

hard lead. See antimonial lead alloys.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

hardness. See Mohs' scale.

hardwood ashes. See wood ashes.

"Harflex." ¹⁰⁹ Trademark for a line of plasticizers.

Harflex 10: Dimethyl sebacate. Used where extreme efficiency and low temperature properties are of prime importance.

Harflex 40: Dibutyl sebacate. Claimed to be the most efficient non-toxic plasticizer made. F. D. A. approval for use in food wrap.

Harflex 50: Dioctyl sebacate. (See di(2-ethyl-hexyl) sebacate. Used where extreme low temperature flexibility, high efficiency and low volatility are required. Exhibits good resistance to extraction by soap and water, and has good heat and light stability.

Harflex 90: Dibenzyl sebacate. Low volatility; used in products designed for high temperature service.

Harflex 110: Diisodecyl phthalate.

Harflex 120: Disooctyl phthalate.

Harflex 130: Isooctyldecyl phthalate.

Harflex 140: Dibutyl phthalate.

Harflex 150: Dioctyl phthalate. See di(2-ethyl-hexyl) phthalate.

Harflex 180: Dicapryl phthalate.

Harflex 210: Diisodecyl adipate.

Harflex 250: Dioctyl adipate.

Harflex 300: A high molecular weight polymeric plasticizer with a fairly low viscosity and good permanence. Compatible with polyvinyl chloride and various synthetic elastomers.

Properties: Color (Gardner) 5 max; sp. gr. 1.096 (25/25°C); viscosity (210°F) 120 ± 5 cts.

Containers: 480-lb drums.

Uses: Cable jackets, textile coatings, upholstery materials, baby pants.

Harflex 305: Polymeric plasticizer with a relatively low viscosity.

Properties: Color (Gardner) 5 max, sp. gr. 1.087 (25/25°C), viscosity (210°F) 95 ± 5 cts.

Containers: 480-lb drums.

Uses: In all types of vinyl formulations.

Harflex 320: General purpose polymeric plasticizer. Combines good permanence with easy processing and a very low viscosity. Superior to monomeric plasticizers in resistance to extraction by oils and aromatic hydrocarbons.

Properties: Color (Gardner) 4.5; sp. gr. 1.085 (25/25°C), viscosity (210°F) 86 ± 5 cts.

Containers: 480-lb drums.

Uses: Shoe liners, coated fabrics, flooring.

Harflex 325: A non-migratory polymeric plasticizer that combines good processing characteristics with excellent permanence; fast fusing and medium viscosity.

Properties: Color (Gardner) 7 max; sp. gr. 1.100 (25/25°C); viscosity (210°F) 135 ± 5 cts.

Containers: 480-lb drums.

Uses: In compounding plastisols, organosols, refrigeration and freezer gaskets, food belting, upholstery, electrical cable

insulation and wall covering.

Harflex 330: A non-migratory plasticizer of excellent permanence; efficient and has very low odor, and low volatility.

Properties: Color (Gardner) 1 max; sp. gr. 1.086 (25/25°C); viscosity (210°F) 185 ± 5 cts.

Containers: 480-lb drums.

Uses: Vinyl refrigerator gaskets, in auto crash pad film, electrical wire insulation, synthetic rubbers.

Harflex 340: A polar polymeric plasticizer of medium viscosity. Contributes good adhesion, low migration and quick adhesion to a polyvinyl acetate adhesive. Also used in aiding viscosity stability of a compound.

Harflex 370: A very permanent polymeric plasticizer of relatively high viscosity.

Properties: Color (Gardner) 6 max; sp. gr. 1.06 (25/25°C); viscosity (210°F) 550 ± 50 cts.

Containers: 480-lb drums.

Uses: Plasticizer for all types of vinyl formulations; also used in conjunction with isocyanates to make urethane foam systems.

Harflex 375: An extremely fine polymeric plasticizer of high viscosity. Excellent permanence to extraction and migration.

Properties: Color (Gardner) 7 max; sp. gr. 1.055 (25/25°C); viscosity (210°F) 3600 ± 100 cts.

Containers: 480-lb drums.

Uses: Electrical tapes and wire coatings; vinyl foams.

Hargreaves process. The manufacture of sodium sulfate (salt cake) from sodium chloride and sulfur dioxide. A mixture of sulfur dioxide and air is passed through sodium chloride brine in a countercurrent manner to produce sodium sulfate and hydrochloric acid.

Harris process. Process for the removal of arsenic, antimony, tin, and zinc from virgin or secondary lead by agitating the molten metal with molten caustic soda and salt. All undesirable metals are oxidized and the oxides dissolved in the caustic with exception of silver which is removed in a subsequent desilvering operation.

hartshorn. See ammonium carbonate.

hartshorn oil. See bone oil.

HAS. Abbreviation for hydroxylamine acid sulfate.

"Hascrome." ²¹⁴ Trademark for iron-base impact-resistant, hard-facing rod containing chromium and manganese. Used for welding to wearing parts, such as crusher jaws and dipper teeth.

hashish. See cannabis.

"Hastelloy." ²¹⁴ Trademark for a series of nickel-base alloys, having high resistance to corrosives, such as hot hydrochloric acid, hot sulfuric acid, wet chlorine, etc., as well as excellent physical and mechanical properties. Used for agitators, autoclaves, concentrators, heat exchangers,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

exhausters, evaporators, condensers, dryers, heating and cooling coils, injectors, blowers, burner parts, chlorinating equipment, pickling equipment, pyrometer equipment, thermometer wells, pipe and fittings, pumps, valves, kettles, tanks and vessels for all kinds of chemical plant service.

Also applies to certain nickel base high temperature alloys.

hatchettine. Synonym for hatchettite (q. v.).

hatchettite (hatchettine; adipocerite). A soft variety of ozocerite (q. v.) or mineral wax. Color yellowish white, yellow, or greenish yellow; fuses at about 120°F. Sp. gr. 0.90-0.98 at 77°F. Found in bogs and coal beds in Great Britain.

"Haveg." ³⁴⁹ Trademark for a series of corrosion resistant compounds fabricated into chemical process equipment. Available as:

"Haveg 31" - Xylenol resin-leached asbestos combination.

"Haveg 41" - Phenol resin-leached asbestos combination.

"Haveg 61" - Furane resin-leached asbestos combination.

"Haveg 043" - Phenolic resin-graphic combination.

"Haveg 6720" - Glass reinforced furane resin.

"Haveg 7710" - Glass reinforced polyester resin.

"Haveg 7790" - Glass reinforced polyester resin.

"Haveg 9710" - Glass reinforced epoxy resin.

"Havelast." ³⁴⁹ Trademark for an elastomeric binder or impregnant for various reinforcing materials such as "Sil-Temp", as fabric or rovings, asbestos, glass or graphite. Used in the rocket and missile industry when resiliency is desired.

hayo. See coca.

"Haystellite." ²¹⁴ Trademark for tungsten carbide possessing great hardness and toughness.

Forms: Inserts; composite rod; tube rod.

Uses: Application, by welding, to oil-well drilling tools and other parts subjected to extreme abrasion.

Hb. Symbol for hemoglobin.

"HB-20." ⁵⁸ Trademark for a partially hydrogenated alkylaryl hydrocarbon.

Specifications: Light amber to dark-brown liquid; refractive index (25°C) approx.

1.54; sp. gr. (25°/15.5°C) approx. 0.96.

Containers: 450-lb drums, tank cars.

Use: Extender plasticizer for vinyls.

"HB-40." ⁵⁸ Trademark for partially hydrogenated terphenyl.

Properties: Clear, mobile, high-boiling hydrocarbon; almost colorless, with faint, pleasant odor; 8.37 lb/gal; refractive index 1.5675 ± 0.0075 (25°C); insoluble in water; miscible in all proportions at room temperature with a number of solvents and oils.

Uses: Plasticizer for vinyl compounds, for styrene water dispersion paints, paper coatings, adhesives and styrene casting resins.

H-bomb. Abbreviation for hydrogen bomb. See nuclear fusion.

HCCH. Abbreviation for hexachlorocyclohexane (q. v.).

HCG. Abbreviation for human chorionic gonadotropin.

See chorionic gonadotropin.

HCH. Abbreviation for hexachlorocyclohexane (q. v.).

He. Symbol for helium.

health physics. The branch of physics which deals with the protection of personnel from the hazards of radiation. The chief duties of a health physicist are to set the standard for safe levels of exposure to various radiations, to aid in the detection of radiation in order to avoid overexposures, and to develop suitable methods for protection against radiation.

heating oil. See fuel oil.

heat of fusion. The quantity of heat required to convert unit weight of a solid to the liquid state. This varies somewhat with temperature, and to a much less extent with pressure.

heat transfer salt. See "Hitec" Heat Transfer Salt.

heavy chemicals. Chemicals produced in tonnage and carload quantities at low prices, such as sulfuric acid, ammonia, soda ash.

heavy hydrogen. See deuterium.

heavy oils. Oils distilled over from coal-tar between 230 and 330°C, the exact range not at all definite.

Shipping regulations: None.*

heavy oxygen. See oxygen 18.

heavy spar. See barite.

heavy spar, artificial. See barium sulfate.

heavy sulfur. See sulfur.

heavy water. Term that may be applied to any of the isotopic varieties of water whose molecules are composed of atoms of hydrogen and/or oxygen having atomic weights greater than 1 and 16 respectively. Also applied to ordinary water containing a higher proportion of these heavy water molecules than is normally present in natural water. The term could also mean H₂O¹⁸, D₂O¹⁸, but is more commonly applied to deuterium oxide (D₂O) which is composed of deuterium (heavy hydrogen, atomic weight 2) and ordinary oxygen. Deuterium oxide is present to the extent of about 1 part to 5,000 of ordinary natural water. Deuterium oxide melts at 3.8°C, boils at 101.4°C and has sp. gr. of 1.1056 at 25°C. Heavy water is used as a

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

moderator in nuclear reactors.

Derivation: (a) During World War II, made by the U. S. government by fractional distillation. This was much more expensive than (b) the Spevack process, which is a dual temperature isotopic exchange in which water and hydrogen sulfide exchange deuterium and hydrogen so that two water streams result, one richer in heavy water than the other. Process (c) uses liquid ammonia and ammonia synthesis gas, containing nitrogen and hydrogen. By temperature manipulation the deuterium present in the synthesis gas is concentrated in the liquid ammonia and is further concentrated by distillation. The deuterium is then transferred to water and can be concentrated in a special Kuhn still to about 99.8% D₂O.

See also tritium (hydrogen of atomic weight 3) which combines with oxygen to give another variety of heavy water.

hectorite Mg_{2.67}Li_{0.33}Si₄O₁₀(OH)₂. One of the montmorillonite group of minerals that are principal constituents of bentonite clays. The composition varies because magnesium and lithium are exchangeable, replaceable by calcium, sodium and other elements. Hectorite occurs in the Mohave Desert and is used as a source of a commercial mineral gel with uses as an adsorbent, flocculating agent, stabilizer for suspensions, emulsions, and a film forming material.

hedeoma oil (American pennyroyal oil, pulegium oil).

Properties: A pale yellowish lmpid liquid, essential oil, characteristic, pungent, mint-like odor and taste. Sensitive to light. Soluble in two or more parts of 70% alcohol, ether and chloroform, slightly soluble in water; sp. gr. 0.925-0.940; refractive index 1.482.

Chief constituents: Pulegone, hedeomol. **Derivation:** Distilled from the leaves and tops of *Hedeoma pulegioides*.

Adulteration: Mineral oil, turpentine, resin oil. Detected by their difficult solubility in 70% alcohol.

Method of purification: Rectification.

Grades: Technical.

Containers: 5-, 10-lb bottles; 25-, 50-lb tins.

Uses: Medicine; insectifuge; perfumery; manufacture of pulegone and its derivatives.

Shipping regulations: None. *

alpha-hederin. See helixin.

hedonal (methylpropylcarbinolurethane)

Properties: White crystalline powder; feeble aromatic odor and taste; soluble in alcohol, ether, organic solvents; sparingly soluble in cold water; more soluble in hot water.

Fusing point 76°C. **B. p.** 215°C.

Use: Medicine.

Shipping regulations: None. *

HEF black. Abbreviation for high elongation furnace black. See furnace black.

Hehner number. The percent by weight of water-insoluble fatty acids in oils and fats.

helcosol. See bismuth pyrogallate.

helenine. A nucleoprotein derived from the mold *Penicillium funiculosum* and used with some success as an antiviral drug.

Helianthine B. See methyl orange.

"Helindon." ³⁰⁷ Trademark of vat dyestuffs. Used for the dyeing of wool. Characterized by excellent fastness properties.

"Hello." ³⁰⁷ Trademark of organic pigment dyestuffs. Used for paints, lacquers, printing inks, wallpaper, coated paper, rubber and organic plastics. Characterized by very good general fastness properties.

hellodor. See beryl.

"Hellogen." ³⁰⁷ Trademark for phthalocyanine dyestuffs. Used for paints, lacquers, printing inks, wallpaper, coated paper, rubber, and organic plastics. Characterized by outstanding fastness to light as well as brilliancy of shade.

"Hellogen." ³⁴² Trademark for brand of atomic iodine solutions for general sanitizing purposes.

"Heliophan." ¹⁹ Trademark for (homo)-menthyl salicylate (q. v.).

heliotropin (piperonal, piperonyl aldehyde) C₆H₅(CH₂OO)CHO(bicyclic).

Properties: White, shining crystals; turns red-brown on exposure to light; sweet floral odor, typical of heliotrope, m. p. 35.5-37°C; b. p. 263°C; soluble in alcohol and ether, insoluble in water, glycerol.

Derivation: By oxidation of isosafrole.

Method of purification: Crystallization.

Grades: Technical, recrystallized.

Containers: Bottles; tins, drums.

Uses: Medicine, perfumery; sultan preparations.

Shipping regulations: None. *

"Heliozone." ²⁸ Trademark for a rubber chemical.

Properties: Greenish, waxy material.

Containers: Drums (150-lbs net).

Use: To retard sun-checking and cracking of rubber and synthetic rubber.

helium He. Element of atomic number 2, group 0 of periodic table.

Properties: Colorless, odorless, tasteless inert gas; does not combine chemically with any other substance, forms hydrates under certain special circumstances; b. p. -260.0°C; f. p. -272.2°C, the lowest of any substance, density of gas 0.1785 g/l at 0°C, or 0.138 compared with air as unity, very slightly soluble in water; insoluble in alcohol.

Source: Liquefaction of all other components of certain natural gases; also as a by-product of liquid air processing for oxygen production.

Grade: U. S. P. XVI; technical; 99.9% pure min.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Containers: Cylinders; tank cars.

Uses: Inflation of balloons and dirigibles; diluent for oxygen or anesthetic gases in medicine; component of "air" supplied to men working in tunnels digging under pressure, also for filling luminescent electric-light tubes; low-temperature research; leak detection; inert shield for arc welding; carrier gas in gas chromatography; inert atmosphere in making semiconductors and processing titanium and zirconium; heat transfer agent in nuclear reactors, low temperature work in electronics.

Shipping regulations: Non-flammable gas. Green gas label. *

helium 3. A stable isotopic form of helium, one-millionth as abundant in nature as ordinary helium. Useful in theoretical investigations of nuclear chemistry.

helixin (alpha-hederin) $C_{41}H_{64}O_{11}$.

Properties: Solid, m. p. 256-257°C, insoluble in water, petroleum ether; soluble in alcohol, acetone, glacial acetic acid, dilute aqueous basic solutions.

Derivation: From ivy leaves.

"Helix" Rosin. ⁷⁹ Trademark of a specially processed pale wood rosin containing approximately 5.5% of chemically combined lime, a product containing very little free lime.

Constants: M. p. (capillary tube) 113°C; m. p. (ball & ring) 133°C, acid number 73; color "WG-WW."

Containers: Non-returnable light-weight galvanized drums of about 500 lbs gross wt. Tare 14-16 lbs.

Uses: Linoleum print paint, varnish-air drying, varnish-baking, varnish-gloss oil, printing ink.

hellebore.

(a) Black; dried rhizome of perennial evergreen herb *Helleborus niger*.

(b) White, dried powdered rhizomes of genus *Helleborus*.

(c) Green, dried rhizomes and roots of *Veratrum viride*.

Uses: Medical, white variety is used as insecticide.

helleborein $C_{37}H_{56}O_{18}$.

Properties: Glucoside crystallizable in yellow prisms. Tastes both sweet and bitter. Poisonous! Soluble in water, weak alcohol; less soluble in ether and absolute alcohol, m. p. 270°C.

Derivation: From black and green hellebore.

Use: Medicine.

"Helmerco" Colors. ⁵⁷ A class of lakes which are but very slightly soluble in water. For use on paper stock by beater dyeing through the use of alum and rosin; also for coating and wall paper printing.

helonias (false unicorn; starwort). Dried rhizome and roots of *Chamaelirium luteum*.

Habitat: United States.

Containers: Bales.

Use: Medicine.

helvite $Mn_4Be_3(SiO_4)_3S$. A natural silicate of beryllium and manganese. Color red to brown; hardness 6; sp. gr. 3.3.

Occurrence: New Mexico, Virginia; Europe; U. S. S. R.

Use: Possible source of beryllium.

hem. See heme.

hematein $C_{16}H_{12}O_6$. An oxidation product of hematoxylin, the coloring principle of logwood. Not to be confused with hematin.

Properties: Green to reddish-brown crystals; m. p. 250°C with decomposition; insoluble in water; slightly soluble in alcohol and ether, soluble in dilute sodium hydroxide giving a bright red color, soluble in ammonia with brownish-violet color.

Derivation: By adding ammonia to logwood extract and exposing to air.

Uses: Indicator; biological stain.

hematin (haematin) $C_{34}H_{32}N_4O_4 \cdot FeOH$. Not to be confused with hematein. The hydroxide of heme (q. v.).

Properties: Blue to brown-black powder; decomposes at 200°C without melting; soluble in alkalies, hot alcohol or ammonia; slightly soluble in hot pyridine; insoluble in water, ether and chloroform.

Derivation: By dissolving hemin in dilute potassium hydroxide, precipitating with acetic acid and recrystallizing from pyridine.

hematite. Same as hematite, red.

hematite, brown. See limonite.

hematite, red (red iron ore; bloodstone). Iron oxide (Fe_2O_3), with impurities.

Properties: Brilliant black to blackish red or brick red mineral with brown to cherry red streak and metallic to dull luster. Sp. gr. 4.9-5.3; hardness about 6.

Occurrence: Michigan, Minnesota, Wisconsin, Alabama and other parts of U. S. Also in numerous other parts of the world.

Uses: The most important ore of iron. Also certain varieties are used as paint pigments and for rouge.

See also iron oxide reds and ferric oxide for other synonyms and uses.

hematoporphyrin $C_{34}H_{38}O_6N_4$. Deep red crystals soluble in alcohol, sparingly soluble in ether; insoluble in water. Obtained from hemin or hematin by the action of strong acids. It is non-toxic and is reported to be preferentially absorbed by cancerous tissues, making them fluoresce under ultraviolet light.

hematoxylin (hydroxybrasilin; logwood crystals) $C_{16}H_{14}O_6 \cdot 3H_2O$. The coloring principle of logwood.

Properties: Colorless to yellowish crystals, redden on exposure to light; m. p. 140°C (anhydrous); soluble in alcohol and ether; slightly soluble in water.

Derivation: By concentrating logwood liquor in evaporating pans and crystallizing.

Grades: Technical, sold on basis of tinctorial value.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: 350-, 400-lb wooden barrels.
 Uses: Textile and leather dyeing; manufacture of ink and stain in microscopy; indicator in the titration of alkaloids; medicine.
 Shipping regulations: None.*

hematoxylon. See logwood.

heme (hem) $C_{34}H_{32}FeN_4O_4$. The non-amino acid portion of hemoglobin consisting of reduced (ferrous) iron bound to proto-porphyrin (see porphyrins).

hemicellulose. A type of natural substance more complex than a sugar and less complex than cellulose, and occurring in woody tissue along with cellulose. Obtained in pure form from corn grain hulls (corn fiber) by lime water extraction.

hemimorphite. See calamine (mineral).

hemin (Teichmann's crystals) $C_{34}H_{32}N_4O_4FeCl$. The chloride of heme.

Properties: Crystals which are brown by transmitted light and steel blue by reflected light. Sinters at $240^{\circ}C$. Freely soluble in ammonia water; soluble in strong organic bases, insoluble in carbonate solutions, dilute acid solutions; insoluble but stable in water.

Derivation: By heating hemoglobin with acetic acid and sodium chloride.

Use: The isolation of hemin is used for the identification of blood stains.

hemlock bark. Bark of the hemlock fir *Tsuga canadensis*.

Habitat: Northern and western parts of the United States and Canada.

Uses: Tanning industry; boiler compounds; pharmaceutical preparations.

Shipping regulations: None.*

hemlock gum. Incorrect name for hemlock pitch (q. v.).

hemlock needle oil. See spruce oil.

hemlock oil. See spruce oil.

hemlock pitch (Canada pitch). The resinous exudation from *Tsuga canadensis* or hemlock.

hemoglobin (Hb). Suggested empirical formula: $(C_{738}H_{1166}FeN_{208}S_2)_4$. The important respiratory protein of the red blood cells; it is necessary in the transfer of oxygen from the lungs to the tissues and of the carbon dioxide from the tissues to the lungs.

Hemoglobin is a conjugated protein consisting of approximately 94% globin (protein portion) and 6% heme (q. v.). Each molecule of hemoglobin can combine with one molecule of oxygen to form oxyhemoglobin (HbO_2). The iron (found in the heme portion) must be in the reduced (ferrous) state to enable the hemoglobin to combine with oxygen. See also carboxyhemoglobin.

Oxyhemoglobin is available commercially as a brownish red powder or crystals; soluble in water. It is used in medicine, and is usually called hemoglobin.

hemp. Soft, white fibers, 3-6 ft long, obtained from the stems of *Cannabis sativa*. It is coarser than flax but stronger, more glossy, and more durable than cotton.

Sources: Central Asia, Italy, Russia, U.S.

Uses: Blended with cotton or flax in toweling and heavy fabrics; twine; cordage; packing.

hemp, Canadian. See apocynum.

hemp oil. See hempseed oil.

hempseed oil (hemp oil).

Properties: Light green, fixed, non-drying liquid; becomes brownish-yellow on standing. Soluble in ether, benzene and carbon disulfide. Sp. gr. 0.9255-0.9280; saponification value 172-192; Maumené number 97; iodine number 148.

Derivation: From hempseed *Cannabis sativa*, by pressing or extraction.

Grades: Technical.

Containers: Tins; iron drums.

Uses: Soft soap; paints; varnishes.

henbane. See hyoscyamus.

hendecane. See undecane.

hendecanoic acid. See undecanoic acid.

1-hendecanol. See 1-undecanol.

2-hendecanol. See 2-undecanol.

10-hendecen-1-al. See undecylenic aldehyde.

10-hendecenyl acetate. See undecylenyl acetate.

heneicosane $C_{21}H_{44}$ or $CH_3(CH_2)_{19}CH_3$.

Properties: Crystals; sp. gr. 0.778 ($40^{\circ}C$); b. p. $215^{\circ}C$ (15 mm), m. p. $40^{\circ}C$.

n-heneicosanoic acid $CH_3(CH_2)_{19}COOH$. A saturated fatty acid not normally found in natural fats or waxes. White crystalline solid; m. p. $74.3^{\circ}C$. Synthetic product available for organic synthesis; 99% purity.

henequen. Hard, strong, reddish fibers obtained from the leaves of *Agave fourcroydes*. It is similar to sisal but coarser and stiffer.

Source: Mexico, Cuba.

Use: Binder twine; rope.

henna (Egyptian privet; *lawsonia alba*; flower of paradise).

Derivation: Leaves of *Lawsonia alba*.

Habitat: Orient; Mediterranean region; southern Asia and Australia.

Grades: Technical.

Containers: Bags.

Uses: Medicine; hair dye.

Shipping regulations: None.*

"Hennig Purifier." ¹⁷⁷ Trademark for a preparation having a soda-ash base and other materials. Produced as walnut-sized briquettes. Packed in 100-lb paper bags. Used as a ladle addition to produce cleaner steel by aiding in removal of dissolved oxides and silicates and fluxing non-metallic inclusions to slag.

Henry's law. When a liquid and a gas are kept in contact with one another for a period of time the weight of the gas that dissolves

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

in a given quantity of liquid is proportional to the pressure of the gas above the liquid. Thus if ordinary air is kept in contact with water at ordinary atmospheric pressure, each kilogram of water dissolves 0.017 grams of oxygen at 20°C., while if this pressure is halved by doing the experiment at high altitude where the pressure is only half an atmosphere the water dissolves only 0.0085 grams of oxygen. The law holds true only for equilibrium conditions, i. e., when enough time has elapsed so that the quantity of gas dissolved is no longer increasing or decreasing.

hentriacontane (n-hentriacontane) $C_{31}H_{64}$ or $CH_3(CH_2)_{29}CH_3$.

Properties: Crystals; sp. gr. 0.781 (68°C); b. p. 302°C (15 mm); m. p. 68°C.

1-hentriacontanol (formerly confused with 1-triacontanol as myricyl or melissyl alcohol) $CH_3(CH_2)_{29}CH_2OH$. Possibly one of the constituents of beeswax.

HEOD. Abbreviation for hexachloroepoxyoctahydrodimethanonaphthalene. See dieldrin.

hepar calcis. See calcium sulfide and lime, sulfurated.

heparin. See heparin, sodium.

heparin sodium (heparin). The sodium salt of a complex organic acid present in mammalian tissues and having the properties of prolonging the clotting time of blood. Heparin appears to be a dextrorotatory polysaccharide built up from hexosamine and hexuronic acid units containing sulfuric acid ester groups; it has the properties of a polymer.

Properties: White or pale-colored, amorphous powder; nearly odorless, hygroscopic; soluble in water; insoluble in alcohol, benzene, acetone, chloroform, and ether; pH of one in 100 solution 6.0 to 7.5.

Derivation: Animal livers or lungs.

Grade: U. S. P. XVI.

Use: Medicine.

hepar sulfuris. See potassium sulfide.

heptabarbital (5-[1-cyclohepten-1-yl]-5-ethylbarbituric acid, 5-ethyl-5-cycloheptan-ylbarbituric acid) $C_{13}H_{18}N_2O_3$.

Properties: White, odorless crystalline powder, slightly bitter taste. M. p. 174°C. Very sparingly soluble in water, slightly soluble in alcohol; soluble in alkaline solutions. Forms water-soluble sodium, magnesium and calcium salts.

Grade: N. N. D.

Use: Medicine.

heptachlor $C_{10}H_7Cl_7$. 1,4,5,6,7,8,8-Heptachloro-3a,4,7,7a-tetrahydro-4,7-methanoindene. An insecticide similar to chlordan (q. v.).

Properties: White to light tan, waxy solid; m. p. 95-96°C; sp. gr. 1.57-1.59. Insoluble in water; soluble in xylene.

Containers: Drums.

Warning! May be fatal if swallowed. Avoid

contamination of feed and foodstuffs. MCA warning label.

heptacosane $C_{27}H_{56}$ or $CH_3(CH_2)_{25}CH_3$.

Properties: Crystals; soluble in alcohol; insoluble in water; sp. gr. 0.804; b. p. 270°C (15 mm); m. p. 59.5°C.

heptadecane $C_{17}H_{36}$ or $CH_3(CH_2)_{15}CH_3$.

Properties: Leaflets; soluble in alcohol; insoluble in water; sp. gr. 0.778; b. p. 303°C; m. p. 22.5°C.

n-heptadecanoic acid (margaric acid)

$CH_3(CH_2)_{15}COOH$. A saturated fatty acid not normally found in natural fats or waxes.

Properties: Colorless crystals; m. p. 61°C; sp. gr. 0.8355 (90.6/4°C); b. p. 363.8°C (760 mm), 230.7°C (16 mm); refractive index 1.4324 (70°C). Soluble in alcohol and ether; insoluble in water. Available as a 99% pure synthetic product; used in organic synthesis.

heptadecanol. Any saturated C_{17} alcohol. See, for example, n-heptadecanol and 3,9-diethyl-6-tridecanol.

n-heptadecanol $C_{17}H_{35}OH$.

Properties: Colorless liquid. Slightly soluble in water; sp. gr. 0.8475 (20/20°C); b. p. 308.5°C (760 mm); vapor pressure <0.01 mm (20°C); flash point 310°F; wt/gal 7.1 lbs (20°C).

Grades: Technical.

Containers: 1-gal cans; 5-, 55-gal drums.

Net content 7.0, 35, 380 lbs.

Uses: Organic synthesis, plasticizer; intermediates; perfume fixatives. For soap and cosmetic preparations, base for manufacture of wetting agents and detergents.

2-heptadecylglyoxalidine (2-heptadecylimidazoline) $C_{20}H_{40}N_2$ or $C_{17}H_{35}C_3H_5N_2$.

Properties: Waxy solid; m. p. 85°C; b. p. 200°C (2 mm), slightly soluble in water; soluble in alcohol, benzene; hydrolyzes on standing to form N-2-aminoethyl stearamide.

Derivation: Prepared by reacting stearic acid with ethylene diamine.

Use: Fungicide.

2-heptadecylglyoxalidine acetate. See glyodin.

2-heptadecylimidazoline. See 2-heptadecylglyoxalidine.

2-heptadecyl 2-imidazoline acetate. See glyodin.

heptafluorobutyric acid (perfluorobutyric acid) C_3F_7COOH .

Properties: Colorless hygroscopic liquid with sharp odor. B. p. 120°C (735 mm); f. p. -17.5°C; sp. gr. 1.641 (25°C), refractive index (n_D²⁵) 1.290; surface tension 15.8 dynes/cm (30°C). Miscible with water, acetone, ether, and petroleum ether; soluble in benzene and carbon tetrachloride; insoluble in carbon disulfide and mineral oil.

Derivation: By electrolysis of a solution of butyric acid in hydrogen fluoride.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Grades: Technical.

Containers: 1-, 3-, 10-lb bottles.

Uses: Intermediate; surfactant; acidulant.

"Heptagran." ¹⁴⁷ Brand name for a granular insecticide containing 2 1/2, 10, or 25% heptachlor.

Containers: 50-lb bags.

Use: In preparation of insecticide-fertilizer combination.

heptaldehyde. See heptanal.

heptalin acetate. See methylcyclohexanol acetate.

heptamethylene. See cycloheptane.

heptanal (heptaldehyde; oenanthic aldehyde; oenanthal; aldehyde C-7) $C_6H_{13}CHO$.

Properties: Oily, colorless liquid, with a penetrating fruity odor. Keep well stoppered. Soluble in 3 volumes of 60% alcohol; slightly soluble in water, soluble in ether. Sp. gr. 0.814-0.819; refractive index 1.42; m. p. 43°C; b. p. 153°C.

Derivation: Castor oil, from decomposition of the ricinoleic acid glyceride.

Method of purification: Distillation.

Grades: Technical.

Containers: Up to 55-gal drums.

Uses: Manufacture of 1-heptanol, organic synthesis; perfumery; pharmaceuticals; rubber products.

heptane (dipropylmethane) $CH_3(CH_2)_5CH_3$.

Properties: Volatile, colorless liquid; highly flammable; freezing point -90.595°C, b. p. 98.428°C; refractive index (n 20/D) 1.38764; sp. gr. 0.68368 (20°C), flash point -1°C. Soluble in alcohol, ether, chloroform; insoluble in water.

Typical specifications for commercial grade normal heptane: Distillation range 200-210°F; vapor pressure 2.0 psi absolute (100°F) (max); color, Saybolt +30 (min); maximum sulfur content 0.01 wt %, corrosion, passes ASTM D 130-30 test, doctor test, sweet; principal diluent is methylcyclohexane with small amounts of other naphthenes, isoheptanes, isooctanes, toluenes.

Derivation: Fractional distillation of petroleum. Purified by rectification. Also from the oleoresin of *Pinus sabiniana*.

Grades: Commercial; 99%, spectro; ASTM; research.

Containers: Bottles; drums; tank cars.

Uses: Standard for octane rating and determinations, anesthetic, solvent; organic synthesis; preparation of laboratory reagents.

Fire hazard: Dangerous.

Shipping regulations: Flammable liquid.

Red label.*

1,7-heptane-dicarboxylic acid. See azelaic acid.

heptanedioic acid. See pimelic acid.

n-heptanoic acid (enanthic acid; oenanthic acid; n-heptylic acid; heptoic acid)
 $CH_3(CH_2)_5COOH$.

Properties: Clear, oily liquid, unpleasant

odor. Soluble in alcohol and ether; insoluble in water. Sp. gr. 0.9181 (20/4°C); m. p. -7.0°C; b. p. 221.9°C (760 mm); refractive index 1.4229.

Derivation: By oxidizing heptaldehyde with potassium dichromate and sulfuric acid.

Method of purification: Distillation.

Grades: Technical.

Containers: Iron drums.

Use: Organic synthesis; production of special lubricants for aircraft and brake fluids.

Shipping regulations: None.*

1-heptanol (heptyl alcohol; alcohol C-7)
 $C_7H_{15}OH$.

Properties: Colorless fragrant liquid; m. p. -34.6°C; b. p. 175°C (765 mm); sp. gr. 0.824 (20/4°C), refractive index (n 20/D) 1.4233.

Typical specifications: Sp. gr. 0.822-0.825 (20/4°C); m. p. -34 to -36°C; b. p. 173-175°C (765 mm), refractive index (n 20/D) 1.4225-1.4250. Soluble in water, alcohol and ether.

Derivation: From heptaldehyde by reduction.

Containers: Glass bottles; 1-, 5- and 10-gal cans, 55-gal lined drums.

Uses: Organic intermediate, solvent, cosmetic formulations.

Shipping regulations: None.*

2-heptanol. See methyl amyl carbinol.

3-heptanol $CH_3CH_2CH(OH)C_4H_9$.

Properties: Liquid; sp. gr. (20°C) 0.8224; m. p. -70°C; b. p. 156.2°C; flash point 140°F; slightly soluble in water.

Containers: Cans, drums, tank cars.

Uses: Flotation frother; solvent and diluent in coatings, intermediates.

2-heptanone. See methyl n-amyl ketone.

3-heptanone. See ethyl butyl ketone.

4-heptanone. See dipropyl ketone.

"Hepteen Base." ²⁴⁸ Trademark for a heptaldehyde-aniline reaction product.

Properties: A dark-brown, free-flowing liquid; sp. gr. 0.93; soluble in acetone, benzol, and ethylene dichloride, moderately soluble in gasoline; insoluble in water.

Uses: Accelerator for pure gum, inner tube, white tire sidewall, air-cured footwear.

1-heptene (1-heptylene) C_7H_{14} or $CH_3(CH_2)_4CH=CH_2$.

Properties: Colorless liquid; sp. gr. 0.6968 (20/4°C); b. p. 93.3°C; m. p. -119.2°C; refractive index (n 20/D) 1.3994; soluble in alcôhol, acetone, ether, petroleum, coal-tar solvents; insoluble in water.

Typical specifications: Sp. gr. 0.6955-0.6980 (20/4°C); b. p. 93-94°C; refractive index (n 20/D) 1.3987-1.4005.

Grades: 95% purity.

Use: Organic synthesis of flavors, perfumes, medicines, dyes, resins.

2-heptene (2-heptylene) $CH_3(CH_2)_3CH=CHCH_3$.

Both cis and trans isomers are known.

Properties: Colorless liquid; sp. gr. cis 0.708, trans 0.704, commercial 0.7010-0.7050 (20/4°C); b. p. trans 98.0°C, cis 98.5°C, commercial 97-99°C; refractive

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

index (n 20/D), cis and trans 1.406; flash point -4°C ; soluble in alcohol, acetone, ether, petroleum, coal-tar solvents; insoluble in water.

Grades: 95%.

Containers: Bottles.

Use: Organic synthesis.

Shipping regulations: Flammable liquid. Red label.*

3-heptene (3-heptylene) C_7H_{14} or $\text{C}_3\text{H}_7\text{CH}:\text{CHC}_2\text{H}_5$.

Properties (mixed cis and trans isomers):

Colorless liquid; b. p. 95°C ; sp. gr. (60/60 $^{\circ}\text{F}$) 0.705; refractive index (20/D) 1.405; flash point -6°C .

Grades: 95%.

Containers: Bottles.

Shipping regulations: Flammable liquid, red label.*

heptenes C_7H_{14} .

Properties: Liquid. Sp. gr. (15.56/15.56 $^{\circ}\text{C}$) 0.711; b. p. 189.5°C .

Derivation: Olefin fraction produced by catalytic polymerization of propylene and butylene.

Containers: Up to tank cars.

Uses: Lubricant additive; catalyst, surfactants.

heptic acid. See heptanoic acid.

"Heptuna Plus." ²⁹⁹ Trademark for a preparation containing hematopoietic factors, vitamins, and minerals. Used in medicine.

heptyl acetate $\text{C}_7\text{H}_{15}\text{OOCCH}_3$. A liquid with fruity odor.

Use: Preparation of fruit essences.

heptyl alcohol. See 1-heptanol.

heptylamine $\text{C}_7\text{H}_{15}\text{NH}_2$.

Properties: Colorless liquid; sp. gr. 0.777 (20/4 $^{\circ}\text{C}$); m. p. -23°C , b. p. 155°C ; slightly soluble in water; soluble in alcohol or ether.

n-heptyl carbinol. See 1-n-octanol.

heptylene. See heptene.

heptyl formate $\text{HCOOC}_7\text{H}_{15}$.

Properties: A colorless liquid with fruity odor, b. p. 176.7°C ; sp. gr. 0.894 (0 $^{\circ}\text{C}$).

Use: Artificial fruit essences.

heptyl heptoate.

Properties: A colorless liquid with fruity odor, sp. gr. 0.865 (19 $^{\circ}\text{C}$), b. p. $273-274^{\circ}\text{C}$ (754 mm).

Use: Fruit essences.

heptyne carboxylic acid methyl ester. See "Folione."

herbicides (weed-killers). A term used to describe a group of materials, chemical in nature, which are used to destroy plant life. These may be used in contact with the seed, stem or leaf of a plant and kill all plant life without regard to species (non-selective herbicides) or kill only certain species (selective herbicides). Since the plants normally destroyed by application of chemicals are weeds in

relation to the crop desired, the term weed-killer has been commonly used. The non-selective herbicides have been used for many years, and are generally inorganic in nature. Sodium arsenite, sodium chlorate, ammonium thiocyanate and sodium chloride are typical examples. These are used in areas where barren or sterile soil is desired such as railways, canals and roadways. The selective herbicides are generally organic compounds which kill only selected species in relation to the general plant life in the area. Recent developments, especially with means of removal of broad-leaf weeds from cereal crops has expanded the demand for the materials about the home and on the farm. The prime development came with the application of the aryloxy and related compounds; e. g., 2,4-dichlorophenoxyacetic acid; and developments of other selective herbicides such as the carbamates and urea derivatives; chlorinated acids and phenols, dinitro compounds and many others. The compounds generally function as plant hormones and disturb the physiological processes of the susceptible plants.

"Hercoflex." ²⁶⁶ Trademark for liquid plasticizers for vinyl resins and other film-formers.

"Hercolyn." ²⁶⁶ Trademark for a pale, viscous liquid, hydrogenated methyl ester of rosin; acid number 8 max; sp. gr. 1.03 at 25/25 $^{\circ}\text{C}$.
Uses: Plasticizer for resins and for lacquers; softener and plasticizer in adhesives, floor tile, and other plastic and asphaltic compositions, wax modifier, low-cost transparentizer of paper, pigment-grinding medium for inks.

"Heresite." ¹⁷ Trademark for a series of pure phenol-formaldehyde resinous coatings and related products of the thermosetting type, and also some synthetic rubber coatings. Applied by spraying, dipping, or brushing, followed by baking or air drying.
Uses: Anticorrosive lining for machinery and equipment for chemical, food, drug, and petroleum industries, tank cars and containers.

"Herkolite." ²⁴⁵ Trademark for electrical insulation comprising sheet material united by an adhesive binder.

heroin. See diacetylmorphine.

"Herpoco." ²⁶⁶ Trademark for a fertilizer grade of ammonium nitrate, technical grade of ammonium nitrate.

herring oil.

Properties: 'Pale yellow to dark red liquid. Soluble in ether, chloroform, solvent naphtha and carbon disulfide.

• Constants: Sp. gr. 0.9202-0.932; saponification value 179-194; iodine value 130-142; refractive index 1.478.

Derivation: By boiling and pressing herring. Method of purification: Filtration.

Grades: No. 1; No. 2; No. 2, brown; winter pressed.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: Wooden barrels, steel drums.
Uses: Soap; leather dressing; currying and finishing; lubricating special machinery.
Shipping regulations: None.*

hesperidin $C_{28}H_{34}O_{15}$. A naturally occurring product, a bioflavonoid, related to rutin and the vitamin P group.

Properties: Fine needles. M. p. 258–262°C; soluble in dilute alkalis, pyridine; very slightly soluble in water, acetone, benzene, and chloroform.

Derivation: Extraction from orange peel or other citrus fruits.

Uses: Medicine; food supplement. Usually administered as the methyl chalcone. See next entry.

hesperidin methyl chalcone. A bioflavonoid. Produced by methylation of hesperidin in an alkaline solution.

Uses: Medicine; food supplements.

Hess's law. The heat evolved or absorbed in a chemical process is the same whether the process takes place in one or in several steps; also known as the law of constant heat summation.

"Het" Acid. ³⁰⁶ Trademark for chlorendic acid.

"Het" Diol. ³⁰⁶ Trademark for $C_6H_2Cl_4(\text{endo } CCl_2)(CH_2OH)_2$.

Properties: White, odorless solid; m. p. 204°C; soluble in most organic solvents.

Use: Organic intermediate.

hetero-. A prefix meaning other or different. For example, heterocyclic refers to compounds in which more than one kind of atom is joined in a ring.

heteroauxin. See 3-indoleacetic acid.

heterogeneous reactor. See nuclear reactor.

heterolysis. The unsymmetrical breakdown of a covalent electron bond.

See homolysis.

heteromolybdates (heteropolymolybdates).

A large group of complex molybdenum salts and acids in which the anion contains oxygen atoms and from two to eighteen hexavalent molybdenum atoms as well as one or more other metal or nonmetal atoms such as phosphorus, arsenic, iron and tellurium. The latter are referred to as hetero atoms and any one of about 35 elements may be present in this manner.

Example: $Na_3PMo_{12}O_{40}$, sodium phospho-12-molybdate.

Properties: The molecular weights of these compounds range up to 3000. The acids and most of the salts are very soluble in water, and the acids and some salts are soluble in organic solvents such as ethers, alcohols and ketones. Salts of metals of high atomic weight (cesium, silver, mercury, lead) are of low solubility in water, and a few alkali metal salts are insoluble. Amine and alkaloid salts are usually insoluble.

The acids and salts are commonly highly hydrated, and many are highly colored.

Some compounds are strong oxidizing agents, their reduced forms being of an intense blue color. The acids are fairly strong ($pK\ 10^{-1}$ to 10^{-3}). There are usually several replaceable hydrogens and acid salts are common. The addition of strong bases converts the heteropoly derivatives into simple molybdates and oxygenated forms of the hetero atom (thus phosphorus appears as PO_4 and iron as $Fe(OH)_3$).

Uses: Phosphomolybdates and phosphotungstates are used as precipitants for basic dyes to form lakes and toners. The phospho- and silicomolybdate groups are of key importance in the functioning of certain enzymes. There are many uses in analytical chemistry.

heteropolymolybdates. See heteromolybdates.

HETP.

1. Abbreviation for hexaethyl tetraphosphate.
2. Abbreviation for height equivalent to a theoretical plate. It is the height of a distillation or fractionating column which gives a separation equivalent to that of a theoretical plate in the physical separation process involved. A theoretical plate may be defined as the one which produces the same difference in composition as exists at equilibrium between two phases.

"Hetrazan". ⁵⁷ Trade name for diethylcarbamazine(1-diethylcarbamyl-4-methylpiperazine dihydrogen citrate) $N_3OC_{10}H_{21}O_7C_4H_8$.

Properties: White, slightly hygroscopic powder; m. p. 135–138°C; very soluble in aqueous solution; soluble in alcohol; insoluble in organic solvents; pH (1% solution) 4.0; indefinitely stable at room temperature.

Use: Medicine.

"Hetron". ⁶² Trademark for a line of polyester resins for use in laminates and molding. Usually compounded with fillers of glass or textile fibers or fabric, or paper. The base resins are available in various grades and forms such as:

Rigid, with high fire retardance, high heat distortion point, low viscosity, low shrinkage. Used for machine housings, electrical insulating board, radomes, structural panels, tanks and ducts.

Chemically resistant, also have high heat resistance, high distortion point.

Light stabilized, with superior weathering resistance, for skylights, explosion windows, industrial glazing where flame resistance is required.

Boat resins, low viscosity pre-accelerated thixotropic resin for hand layup. For all types of contact molding, boats, machine housing, deep draft parts.

Spray gun type, low viscosity thixotropic resin for use in resin/fiberglass 2-component spray-type guns. Used for boat hull construction, other large parts.

Semi-rigid, superior in tensile strength and elongation, gives laminates with resistance

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

to impact or rapid cure cracks. Structural panels and members, boat hulls, machine housing.

High impact at low temperatures, for gel coating by hand layup, piping, boat covering.

heulandite $\text{H}_4\text{CaAl}_2(\text{SiO}_3)_6 \cdot 3\text{H}_2\text{O}$. A mineral, one of the zeolites (q.v.).

Properties: White to red, gray or brown, white streak; vitreous or pearly luster; sp. gr. 2.18-2.22; hardness 3.5-4.

Occurrence: India, Europe, United States, Nova Scotia.

"Heviwater." ²³³ Trademark for a solution of calcium and zinc chlorides for use in oil wells.

"Hexa-Betalin." ¹⁰⁰ Trademark for pyridoxine hydrochloride, U. S. P.

hexabromoethane C_2Br_6 .

Properties: Yellowish-white, rhombic needles. Slightly soluble in water, alcohol.

Constants: M. p. 210-215°C. (decomposes with separation of bromine).

Derivation: Action of bromine on diiodoacetylene.

Grade: Technical.

Use: Organic synthesis.

hexacalcium phytate. See calcium phytate.

hexachlorobenzene (perchlorobenzene) C_6Cl_6 .

Properties: White needles. Soluble in benzene and boiling alcohol; insoluble in water.

Constants: M. p. 229°C, b. p. 326°C.

Derivation: By heating hexyl iodide with iodine chloride.

Method of purification: Crystallization.

Grade: Technical.

Containers: Up to 150-lb drums.

Use: Organic synthesis, seed treatment.

Shipping regulations: None.*

hexachlorobutadiene C_4Cl_6 , or

$\text{Cl}_2\text{C}:\text{CClCCl}:\text{CCl}_2$.

Typical specifications: Clear colorless liquid with mild characteristic odor; melting range -19 to -22°C, boiling range 210-220°C; refractive index (n_D²⁰/D) 1.552 (±.001), flash point, none, sp. gr. 1.675 (15.5/15.5°C); 13.97 lbs/gal (15.5°C); purity 98% (min); vapor pressure 22 mm (100°C), 500 mm (200°C); viscosity (100°F) 2.447 cps; 1.479 centistokes; (210°F) 1.131 cps; 0.724 centistokes; insoluble in water; compatible with numerous resins and plastics; soluble in alcohol and ether.

Containers: Glass bottles; tins; 55-gal steel drums.

Uses: Solvent for natural rubber, synthetic rubber and other polymeric substances; high-boiling nonflammable solvent; nonflammable heat-transfer liquid; transformer fluid and hydraulic fluid; clarifying mash before centrifuging; wash liquor for removing C_4 and higher hydrocarbons.

Shipping regulations: None.*

1,2,3,4,5,6-hexachlorocyclohexane (BHC; HCCl; HCH; TBH; benzene hexachloride)

$\text{C}_6\text{H}_6\text{Cl}_6$. The technical material, which is formed by the chlorination of benzene in actinic light, is a mixture of at least five of the nine possible isomers. Some isomers are without appreciable activity. The gamma isomer (lindane) is most active biologically and technical material is therefore graded according to its gamma content.

Properties: White or yellowish powder or flakes; color, odor, melting point and other properties vary with the isomeric composition. Vapor pressure about 0.5 mm Hg (60°C); stable toward moderate heat but decomposed by alkaline substances. Melting points of the pure isomers are: (alpha-trans) 157-158°C; (beta-cis) 297°C (sublimes); (gamma) 112.5°C; (delta) 138-139°C; (epsilon) 217-219°C.

Method of purification: Fractional crystallization. The technical material may run 10-15% gamma isomer, but can be brought up to 99% (at this point it is usually called lindane (q.v.)).

Containers: Bags, fiber drums.

Warning! Harmful if swallowed. May cause irritation of skin and eyes. May be absorbed through skin. MCA warning label.

Uses: As a component of insecticides toxic to flies, cockroaches, aphids, grasshoppers, wire worms, and boll weevils.

hexachlorocyclopentadiene (perchlorocyclopentadiene) C_5Cl_6 .

Properties: Pale yellow liquid having a pungent odor. B. p. 239°C; freezing point 9.6°C; sp. gr. 1.717 (15/15°C); wt/gal 14.30 lb (15.5°C); refractive index (n_D²⁵/D) 1.563; flash point, none. Toxic.

Grade: Technical.

Containers: 55-gal drums; tank cars.

Uses: Intermediate for non-flammable resins, dyes, pesticides, fungicides, pharmaceuticals.

Shipping regulations: None.*

hexachlorodiphenyl oxide $\text{C}_{12}\text{H}_4\text{Cl}_6\text{O}$.

Properties: Light yellow, very viscous liquid. B. p. 230-260°C (8 mm); sp. gr. 1.60 (20/60°C); lbs/gal 13.12 at 25°C; refractive index 1.621 (25°C); flash point, none. Soluble in methanol, ether. Very slightly soluble in water.

Use: Solvent; intermediate.

hexachloroendomethylenetetrahydrophthalic acid. See chlorendic acid.

hexachloroendomethylenetetrahydrophthalic anhydride. See chlorendic anhydride.

1,2,3,4,10,10-hexachloro-6,7-epoxy-1,4,4a,5,6,7,8,8a-octahydro-1,4-endo,endo-5,8-dimethanonaphthalene. See endrin and the endo,exo isomer dieldrin.

1,2,3,4,10,10-hexachloro-6,7-epoxy-1,4,4a,5,6,7,8,8a-octahydro-1,4-endo,exo-5,8-dimethanonaphthalene. See dieldrin and the endo,endo isomer endrin.

hexachloroethane (perchloroethane; carbon trichloride; carbon hexachloride) $\text{Cl}_3\text{CClCl}_3$.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Properties: Colorless crystals; camphor-like odor; sp. gr. 2.091; m. p. 185°C; b. p. sublimates at 185°C. Soluble in alcohol and ether; insoluble in water.

Method of purification: Crystallization.
Grades: Technical.

Containers: 100-, 250-, 500-lb barrels.
Uses: Organic synthesis, retarding agent in fermentation; camphor substitute in "Celluloid" manufacture; rubber accelerator, pyrotechnics and smoke devices; solvent, explosives, medicine.

Shipping regulations: None.*

1, 2, 3, 4, 10, 10-hexachloro-1, 4, 4a, 5, 8, 8a-hexahydro-1, 4, 5, 8-endo, exo-dimethanonaphthalene. See aldrin.

hexachloromethylcarbonate (triphosgene) $(\text{OCCl}_2)_2\text{CO}$. A lachrymator.

Properties: White crystals. Odor similar to that of phosgene. Decomposed by hot water and alkali hydroxides. Only slowly acted upon by cold water. Soluble in alcohol, benzene, ether.

Constants: Sp. gr. 2 (approx), b. p. 205-206°C (partial decomposition), m. p. 78-79°C.

Derivation: (a) By-product in making trichloromethylchloroformate from impure methylchloroformate. (b) Chlorination of dimethyl carbonate exposed to direct sunlight.

hexachloromethyl ether $\text{O}(\text{CCl}_2)_2$.

Properties: Liquid. Phosgene-like odor.

Caution! Very irritant!

Constants: Sp. gr. 1.538 (18°C), b. p. 98°C (partial decomposition).

Derivation. Chlorination of dichloromethyl ether.

hexachloronaphthalene. See chloronaphthalenes.

hexachlorophene (2,2'-methylene bis-(3,4,6-trichlorophenol), bis-(3,5,6-trichloro-2-hydroxyphenyl)methane, 2,2'-dihydroxy-3,5,6,3',5',6'-hexachlorodiphenyl methane) $(\text{C}_6\text{HCl}_3\text{OH})_2\text{CH}_2$.

Properties: White, free-flowing powder, essentially odorless, m. p. 160.5°C min; mol wt 406.92. Freely soluble in acetone, alcohol and ether, soluble in chloroform, insoluble in water.

Derivation: Condensation of 3,4,5-trichlorophenol with formaldehyde in the presence of sulfuric acid.

Grades: Pure, U. S. P. XVI.

Containers: Cans, drums.

Uses: Bactericidal and bacteriostatic agent; finds application in antiseptic (and surgical) soaps, deodorant products including soaps, various cosmetics, dermatologicals.

Hazards: None, except those associated with inhalation of fine powders.

Shipping regulations: None.*

hexachloropropene. See hexachloropropylene.

hexachloropropylene (hexachloropropene; perchloropropylene) $\text{CCl}_3\text{CCl}:\text{CCl}_2$.

Properties: Water white liquid; b. p. 210°C; insoluble in water; miscible with alcohol,

ether, chlorinated compounds.

Uses: Solvent; plasticizer; hydraulic fluid.

hexacontane $\text{C}_{60}\text{H}_{122}$. High molecular weight hydrocarbon.

Properties: Solid. M. p. 101°C.

hexacosanoic acid. See cerotic acid.

hexadecafluoro-1-nonanol. See fluoroalcohols.

n-hexadecane (cetane) $\text{C}_{16}\text{H}_{34}$.

Properties: Colorless liquid; sp. gr. 0.77335 (20/4°C); b. p. 286.5°C; m. p. 18.14°C; refractive index (n 20/D) 1.43435. Soluble in alcohol, acetone, ether; insoluble in water.

Typical specifications: Sp. gr. 0.7720-0.7743 (20°C); b. p. 170-174°C (30 mm); m. p. 17-18.2°C, refractive index (n 20/D) 1.4340-1.4360.

Grades: Technical, ASTM.

Uses: Solvents, organic intermediates; standardized hydrocarbons.

hexadecanoic acid. See palmitic acid.

1-hexadecanol. See cetyl alcohol.

hexadecanoyl chloride. See palmitoyl chloride.

1-hexadecene (cetene, alpha-hexadecylene)

Properties: Colorless liquid, m. p. 4°C, b. p. 274°C, sp. gr. 0.784 (15/4°C), refractive index (n 20/D) 1.4441; insoluble in water, soluble in alcohol, ether, petroleum, coal-tar solvents.

Derivation. Treatment of cetyl alcohol with phosphorus pentoxide.

Grade: 95% purity.

Use: Organic synthesis in flavors, perfumes, medicines, dyes, resins.

cis-9-hexadecenoic acid. See palmitoleic acid.

hexadecen-6-olide. See ambrettolide.

n-hexadecyl alcohol, primary. See cetyl alcohol.

alpha-hexadecylene. See 1-hexadecene.

hexadecyl mercaptan. See cetyl mercaptan.

tert-hexadecyl mercaptan $\text{C}_{16}\text{H}_{33}\text{SH}$.

Properties: Colorless liquid, boiling range (5 mm) 121 to 149°C, sp. gr. (60/60°F) 0.874, refractive index (n 20/D) 1.474; flash point 135°C.

Containers: Drums and tank cars.

Uses: Polymer modification.

Shipping regulations: None.*

hexadecyltrichlorosilane $\text{C}_{16}\text{H}_{33}\text{SiCl}_3$.

Properties: Colorless to yellow liquid. B. p. 269°C, sp. gr. 0.996 (25/25°C), refractive index (n 25/D) 1.4568; flash point (Cleveland open cup) 295°F. Readily hydrolyzed by moisture, with the liberation of hydrochloric acid.

Derivation: By Grignard reaction of silicon tetrachloride and hexadecylmagnesium chloride.

Grades: Technical.

Uses: Intermediate for silicones.

Shipping regulations: Corrosive liquid.

White label.*

*See "I. C. C Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

hexadecyltrimethylammonium bromide. See cetyltrimethylammonium bromide.

2,4-hexadiene (bipropenyl; dipropenyl; di-propylene) C_6H_{10} or $CH_3CH:CHCH:CHCH_3$. Properties: Colorless liquid. Insoluble in water. Constants: Sp. gr. 0.718; b. p. $82^\circ C$; aniline equivalent 29.

2,4-hexadienoic acid. See sorbic acid.

1,5-hexadiyne. See dipropargyl.

"**Hexadow.**"²³³ Brand name for proprietary insecticide formulations containing benzene hexachloride. Available as a concentrate for preparing dust mixtures and as a wettable powder.

hexa-2-ethylbutoxydisiloxane

Properties: Colorless oil; b. p. $195^\circ C$ (0.2 mm).

Derivation: Reaction of silicon tetrachloride, 2-ethylbutanol and water.

Uses Aircraft hydraulic fluid.

hexaethyl tetraphosphate (HETP) (so-called).

Properties: Very toxic! Yellow liquid.

Sp. gr. 1.26-1.28 ($25/4^\circ C$); m. p. $-90^\circ C$, refractive index 1.427, decomposes at high temperatures; soluble or miscible in water and many organic solvents, not soluble in kerosene, hydrolyzes in low concentrations in water, hygroscopic.

Containers: 55-gal drums.

Uses: Contact insecticide for control of aphids, thrips, spider-mites, soft scale and various other insects.

Shipping regulations: Solid or liquid form, poison, class B. Poison label.*

hexafluorophosphoric acid. See fluophosphoric acids.

hexafluoropropylene C_3F_6 .

Shipping regulations: Nonflammable gas. Green label.*

hexaglycerine. See trimethylol propane.

"**Hexagon.**"³¹⁹ Trademark for a specially fractionated grain-sprout, highly refined ethyl alcohol.

hexahydric alcohols. See mannitol, sorbitol, and dulcitol.

hexahydroaniline. See cyclohexylamine.

hexahydrobenzene. See cyclohexane.

hexahydrobenzoic acid (cyclohexane carboxylic acid) $C_6H_{11}COOH$. One of the naphthenic acids.

Properties: Colorless monoclinic prisms, m. p. $31^\circ C$; b. p. $233^\circ C$; sp. gr. 1.048 ($15/4^\circ C$); refractive index 1.4561 ($33.8^\circ C$); slightly soluble in water, soluble in alcohol and ether.

Uses: Manufacture of paint and varnish driers, dry-cleaning soaps, lubricating oils, stabilizer for rubber.

hexahydrocresol. See methylcyclohexanol.

hexahydromethylphenol. See methylcyclohexanol.

hexahydrophenol. See cyclohexanol.

hexahydrophthalic anhydride (1,2-cyclohexane-dicarboxylic anhydride) $C_6H_{10}(CO)_2O$.

Properties: Clear, colorless, viscous liquid which freezes to a glossy solid; solidifying point $35-36^\circ C$; b. p. $158^\circ C$ (17 mm); sp. gr. ($40^\circ C$) 1.19; miscible with benzene, toluene, acetone, carbon tetrachloride, chloroform, ethanol and ethyl acetate; only slightly soluble in petroleum ether.

Containers: 5-gal tins; 55-gal drums.

Uses: Chemical intermediate for alkyds, plasticizers, insect repellents and rust inhibitors.

hexahydropyridine. See piperidine.

hexahydrothymol. See menthol.

hexahydrotoluene. See methylcyclohexane.

hexahydro-1,3,5-trinitro-sym-triazine. See cyclonite.

hexahydroxycyclohexane. See inositol.

hexahydroxylene. See dimethylcyclohexane.

n-hexaldehyde (caproic aldehyde)

Properties: Colorless liquid. Sharp, aldehyde odor.

Constants: Sp. gr. 0.8156 ($20/20^\circ C$); b. p. $128.6^\circ C$ (760 mm); vapor pressure 10.5 mm ($20^\circ C$), flash point $90^\circ F$; wt/gal 6.9 lbs ($20^\circ C$); f. p. $-56.3^\circ C$.

Typical specifications: Sp. gr. 0.820-0.826 ($20/20^\circ C$); boiling range $90-150^\circ C$, acidity not more than 2.00% (as butyric).

Grades: Technical.

Containers: 1-gal cans; 5-, 55-gal drums.

Uses: Organic synthesis; starting point in making plasticizers, rubber chemicals, dyes, synthetic resins, insecticides.

"**Hexalin.**"²⁸ Trademark for cyclohexanol (usually shipped with 2.25% methanol as anti-freeze).

Containers: 55-gal drums, 8000- and 10000-gal tank cars; tank trucks.

Uses: Solvent in lacquers, shellacs and varnishes; homogenizer and stabilizer in soap, dry cleaning and textile industries; intermediate for chemicals, plasticizers, and lubricating oil additives.

hexamethonium bromide

Properties: White, tasteless, crystalline material with faintly aromatic odor. Freely soluble in methanol and water; soluble in alcohol; insoluble in ether.

Use: Medicine.

hexamethonium chloride

Properties: White, crystalline, hygroscopic powder with faint odor. M. p. $289-292^\circ C$ (dec); very soluble in water; soluble in alcohol, methanol and n-propanol; insoluble in chloroform and ether. Available commercially as unhydrated form or as dihydrate.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Grade: N. N. D.

Use: Medicine.

hexamethylbenzene $C_{12}H_{18}$ or $C_6(CH_3)_6$.

Properties: Colorless plates; soluble in alcohol; insoluble in water.

Constants: B. p. 265°C; m. p. 165.5°C.

hexamethyldiaminoisopropanol diiodide. See propiodal.

hexamethylene. See cyclohexane.

hexamethyleneamine. Incorrect term for hexamethylenetetramine (q. v.).

hexamethylenediamine (1,6-diaminohexane) $H_2N(CH_2)_6NH_2$.

Properties: Colorless leaflets, m. p. 39-42°C, b. p. 205°C, somewhat soluble in water, ethyl alcohol, and ether.

Use: Formation of high polymers, especially nylon.

Shipping regulations: (solutions) Corrosive liquid. White label. *

hexamethylenetetramine (methenamine; ammonioformaldehyde, aminoform; hexamine; erroneously "hexamethyleneamine") $(CH_2)_6N_4$.

Properties: White crystalline powder, or colorless, lustrous crystals, practically odorless; sp. gr. 1.27 (25°C), has irritating action on the skin, soluble in water, alcohol, and chloroform; insoluble in ether; m. p. 280°C, but sublimates at 260-263°C, partly decomposing. Burns with smokeless flame. Flash point 482°F.

Derivation: By the action of ammonia on formaldehyde.

Method of purification: Recrystallization.

Grades: Technical, N. F. XI (as methenamine).

Containers: 25- to 150-lb drums, 100-lb bags; 200-lb barrels.

Uses: In resins and plastics, largely as a curing agent, pharmaceuticals, rubber accelerator; explosives; fungicide for citrus fruits; corrosion inhibitor, insolubilizing agent for proteins; shrink-proofing textiles and adding elasticity to cellulosic fibers. Many compounds of the substance are on the market.

Shipping regulations: None. *

hexamethylenetetramine acetylsalicylate

$(CH_2)_6N_4 \cdot COOHC_6H_4OOCCH_3$.

Properties: White crystalline powder or colorless crystals. Insipid taste. Soluble in water, and alcohol. M. p. 118-119°C.

Derivation: By the action of salicylic acid upon hexamethylenetetramine in the presence of alcohol, and acetylating.

hexamethylenetetramine mandelate (methenamine mandelate)

$C_6H_{12}N_4 \cdot C_6H_5CHOHCOOH$.

Properties: A white crystalline powder with, sour taste; practically no odor; m. p. 127-130°C; very soluble in water; pH solutions 4; soluble in alcohol.

Grade: U. S. P. XVI (as methenamine mandelate).

Use: Medicine.

hexamethylenetetramine salicylate (methenamine salicylate) $(CH_2)_6N_4 \cdot C_6H_4OHCOOH$.

Properties: White crystalline powder; pleasant acidulous taste; soluble in alcohol and water.

Use: Medicine.

Shipping regulations: None. *

hexamethylenetetramine tannin

$(CH_2)_6N_4(C_{14}H_{10}O_9)_3$.

Properties: Light brown, odorless, tasteless powder. Contains 87 parts tannic acid, 13 parts hexamethylenetetramine.

hexamethylethane (2,2,3,3-tetramethylbutane, tert-butyltrimethylmethane) C_8H_{18} or $CH_3C(CH_3)_2C(CH_3)_2CH_3$.

Constants: B. p. 106.8°C, m. p. 104°C.

Insoluble in water.

hexamethylphosphoric triamide $[N(CH_3)_2]_3PO$.

Pale, water-soluble liquid, used as an ultraviolet inhibitor in polyvinyl chloride.

hexamethyltetracosahexene. See squalene.

hexamethyltetracosane. See squalane.

"Hexamic Acid." ³ Trademark for cyclohexylsulfamic acid, $C_6H_{11}NHSO_3H$.

Properties: Odorless, white crystalline solid with a sweet-sour taste, m. p. 178-181°C. It is a strong, stable acid, soluble in water and alcohol, insoluble in oils.

Uses: As an acidulant and flavoring adjunct for pharmaceuticals.

See also its salts, known as calcium and sodium cyclamate.

hexamine. See hexamethylenetetramine.

hexanaphthene. See cyclohexane.

n-hexane C_6H_{14} or $CH_3(CH_2)_4CH_3$.

Properties: Colorless, volatile liquid; faint, peculiar odor, highly flammable, sp. gr. 0.65937 (20/4°C), b. p. 68.742°C; m. p. -95°C; refractive index (n_D 20) 1.37486; flash point -23°C. Soluble in alcohol, acetone and ether, insoluble in water.

Derivation: By fractional distillation from petroleum.

Containers: Bottles; drums; tank cars, according to grade.

Grades: 85%, 95%, 99%, spectro, and research.

Uses: Solvent, especially extraction solvent for vegetable oils; liquid in low temperature thermometers, calibrations.

Fire hazard: Dangerous.

Shipping regulations: Flammable liquid. Red label. *

hexanedioic acid. See adipic acid.

hexanedione-2,5. See acetyl acetone.

1,2,6-hexanetriol

$HOCH_2CH(OH)CH_2CH_2CH_2CH_2OH$.

Properties: A water-white liquid, sp. gr. 1.1063; sets to glass below -20°C; b. p. at 5 mm 178°C; flash point 380°F; miscible with water.

Containers: Cans.

Uses: Alkyd and polyester resin intermediate; softener, moistening agent, and solvent.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

hexanitrodiphenyl amine (hexil, hexyl, hexite, dipicrylamine) $(\text{NO}_2)_3\text{C}_6\text{H}_2\text{NHC}_6\text{H}_2(\text{NO}_2)_3$.

Properties: Yellow explosive solid; m. p. 238–244°C; decomposes at higher temperatures; insoluble in water, ether, benzene, chloroform, and alcohol; slightly soluble in acetone, acetic acid; soluble in alkalis and warm acetic or nitric acid.

Derivation: Nitration of diphenylamine.

Uses: Explosives; also in analysis for potassium.

hexanitromannite. See mannitol hexanitrate.

hexanoic acid. See caproic acid. Hexanoic acid is the term preferred by the International Union of Chemistry.

1-hexanol (hexyl alcohol, caproyl alcohol, amyl carbinol) $\text{CH}_3(\text{CH}_2)_4\text{CH}_2\text{OH}$.

Properties: Colorless liquid; sp. gr. 0.8186, m. p. –51.6°C, b. p. 157.2°C, wt/gal 6.8 lbs (20°C); refractive index 1.4169 (25°C). Insoluble in water, soluble in alcohol and ether.

Derivation: (a) By reduction of ethyl caproate, (b) from olefins by the Oxo process.

Method of purification: Vacuum distillation of technical grade.

Grades: Technical (90–99%), purified (99.8%).

Typical specifications: Purity 98.9%; sp. gr. 0.820 (20/20°C); distillation, initial 150°C, dry point 156°C; flash point 144°F (TOC).

Containers: 1-, 5-gal cans, 55-gal drums (non-returnable), tank cars.

Uses: Organic synthesis (introduction of the hexyl group into detergents, hypnotics, antiseptics, perfume esters and other pharmaceuticals), raw material for flotation agents, lubricant additives (zinc dihexyl dithiophosphate), solvents, brake fluids and agricultural chemicals.

Shipping regulations: None.*

hexanoyl chloride (also confusingly called caproyl chloride) $\text{CH}_3(\text{CH}_2)_4\text{COCl}$.

Properties: Colorless liquid, b. p. 151–153°C, refractive index 1.4867 (n 20/D); decomposed by water and alcohol, soluble in ether and chloroform.

Containers: Bottles, carboys, steel drums.

Use: Chemical intermediate.

hexaphenyldisilane $[(\text{C}_6\text{H}_5)_2\text{Si}]_2$.

Properties: White powder; m. p. 352°C.

Derivation: Sodium condensation of triphenylchlorosilane.

Use: High-temperature applications.

"**Hexaphos.**"⁵⁵ Brand name for a glassy phosphate of high molecular weight having superior water-softening properties (sodium hexametaphosphate.)

Properties: Powder, granules, flakes or plates, odorless, glassy hygroscopic salt.

Sequestering Power: Ca 16.3, Mg 2.9, Fe 0.03 (g/100 g. "Hexaphos") determined with initial pH of 10.

Grades: Adjusted; unadjusted.

Containers: 100 lb paper bags.

Uses: Water-softening; boiler-scale control, component of cleansers; laundry mixes.

dishwashing compounds, pitch control in pulp industry, prevention of lime soap deposits in textile operations.

Shipping regulations: None.*

hexatriacontane $\text{C}_{36}\text{H}_{74}$.

Properties: Crystals; sp. gr. 0.797.

1-hexene (hexylene) $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}=\text{CH}_2$.

Properties: Colorless liquid; sp. gr. 0.6734 (20/4°C); b. p. 63.55°C; m. p. –139.8°C; refractive index (n 20/D) 1.3876; flash point –26°C.

Grades: 95%, 99%, research.

Containers: Bottles.

Uses: Synthesis of flavors, perfumes, medicines, dyes, resins.

Shipping regulations: Flammable liquid. Red label.*

2-hexene $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}=\text{CHCH}_3$.

Properties (of mixed cis and trans isomers): Colorless liquid; b. p. 68°C; refractive index (20/D) 1.3948; sp. gr. (60/60°F) 0.686; flash point –20°C.

Grades: 95%.

Containers: Bottles.

Shipping regulations: Flammable liquid. Red label.*

hexenol $\text{C}_6\text{H}_{11}\text{OH}$. Naturally occurring green note found in grass, etc. Fine perfume ingredient for imparting natural green freshness in perfumes.

hexestrol $\text{HOC}_6\text{H}_4\text{CH}(\text{C}_2\text{H}_5)\text{CH}(\text{C}_2\text{H}_5)\text{C}_6\text{H}_4\text{OH}$. para, para'-(1, 2-Diethylethylene)diphenol. A non-steroid synthetic estrogen.

Properties: Odorless, white, crystalline powder, m. p. 185–188°C. Freely soluble in ether, soluble in acetone, alcohol, and methanol; slightly soluble in benzene and chloroform, practically insoluble in water and dilute mineral acids. Dissolves in vegetable oils and in dilute sodium or potassium hydroxide. Sensitive to light.

Derivation: From anethole; by reaction of diacetyl peroxide on para-methoxy-n-propylbenzene.

Grade: N. F. XI.

Use: Medicine.

hexetidine $\text{C}_{21}\text{H}_{45}\text{N}_3$. 5-amino-1,3-bis (beta-ethylhexyl)-5-methylhexahydropyrimidine.

Grade: N. N. D.

Use: Medicine.

hexil. See hexanitrodiphenyl amine.

hexite. See hexanitrodiphenyl amine.

hexobarbital (N-methyl-5-cyclohexenyl-5-methylbarbituric acid) $\text{C}_{12}\text{H}_{16}\text{N}_2\text{O}_3$.

Properties: White crystals; m. p. 145–147°C.

Use: Medicine.

hexobarbital sodium $\text{C}_{12}\text{H}_{15}\text{N}_2\text{NaO}_3$. (Sodium 5-(1-cyclohexenyl)-1,5-dimethylbarbiturate).

Properties: White, crystalline, odorless hygroscopic powder with slightly bitter taste, discolors on exposure to air. Very soluble in water; freely soluble in alcohol; practically insoluble in ether. Aqueous solutions are alkaline to litmus, and

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

decompose on standing; pH (10% solution) 11-12.

Grade: N. F. XI.

Use: Medicine.

hexocyclium methylsulfate $C_{20}H_{33}N_2O \cdot CH_3SO_4$.
N-(beta-Cyclohexyl-beta-hydroxy-beta-phenylethyl)-N'-methylpiperazine methosulfate.

Properties: White, crystalline solid melting between 200° and 210°C. Freely soluble in water, slightly soluble in chloroform, insoluble in ether.

Grade: N. N. D.

Use: Medicine.

"Hexogen," ²³⁰ Trademark for a series of paint driers made with odorless solvents, essentially solutions of metallic salts of 2-ethyl hexoic acid. Supplied in a variety of high metal concentrations.

hexoic acid. See caproic acid.

hexone. See methyl isobutyl ketone.

hexokinase. An enzyme which catalyzes the formation of adenosine diphosphate and hexose-6-phosphate from adenosine triphosphate, and glucose or fructose.

Use: Biochemical research.

hexyl. The straight-chain radical C_6H_{13} .

hexyl. See hexanitrodiphenyl amine.

hexyl acetate $CH_3COOC_6H_{13}$.

Properties: Colorless liquid, sp. gr. 0.8902 (0/0°C), b. p. 169.2°C, insoluble in water, very soluble in alcohol or ether.

Derivation. Commercial product is made from sec-hexyl alcohol.

Use: Solvent for cellulose esters and resins.

hexyl alcohol. See 1-hexanol.

pseudo-hexyl alcohol. See 2-ethyl butyl alcohol.

n-hexylamine $CH_3(CH_2)_5NH_2$.

Properties: Water-white, amine odor, boiling range 126-132°C; sp. gr. 0.767 (20/20°C); refractive index 1.419 (20°C), flash point 105°F.

n-hexyl bromide (1-bromohexane)
 $CH_3(CH_2)_5Br$.

Properties: Colorless to slightly yellow liquid, sp. gr. 1.165 (20/20°C); b. p. 155.5°C, soluble in alcohol, esters, ethers, insoluble in water.

Grade: 96-98% pure.

Use: Intermediate, for introduction of hexyl group.

hexylcalne hydrochloride

$C_6H_5COOCH(CH_3)CH_2NH(C_6H_{11}) \cdot HCl$.
1-Cyclohexylamino-2-propyl benzoate hydrochloride.

Properties: White, bitter powder with slight aromatic odor. M. p. 182-184°C. Freely soluble in alcohol and chloroform, practically insoluble in ether; fairly soluble in water; pH (5% solution) 4.0-6.0.

Grade: N. F. XI.

Use: Medicine.

Shipping regulations: None.*

n-hexyl "Carbitol." ²¹⁴ $C_6H_{13}OC_2H_4OC_2H_4OH$.

Trademark for diethylene glycol monoethyl ether (q. v.).

n-hexyl "Cellosolve." ²¹⁴ Trademark for ethylene glycol monoethyl ether
 $C_6H_{13}OCH_2CH_2OH$ (q. v.).

hexylene. See 1-hexene.

hexylene glycol (4-methyl-2,4-pentanediol)
 $(CH_3)_2COHCH_2CHOHCH_3$. Colorless, nearly odorless liquid; sp. gr. 0.9216 (20/4°C), b. p. 198.3°C; refractive index (n_D 20) 1.4276; flash point (open cup) 230°F; wt./gal 7.69 lbs. Miscible with water.

Containers: 5-, 55-gal drums; tank cars.

Uses: Hydraulic brake fluids, printing inks; coupling agent and penetrant for textiles; fuel and lubricant additive; emulsifying agent.

n-hexyl ether $C_6H_{13}OC_6H_{13}$.

Properties: Practically colorless liquid with characteristic odor. Very slightly soluble in water, sp. gr. 0.7942 (20/20°C), 6.6 lbs/gal (20°C), f. p. -43.0°C; viscosity 1.68 cps (20°C), flash point 170°F.

Uses. Extraction processes, and in the manufacture of collodion, photographic film, and smokeless powder.

hexylic acid. See caproic acid.

hexyl mercaptan $C_6H_{13}SH$.

Properties: B. p. 149-150°C (768 mm); sp. gr. 0.8450 (20/4°C), refractive index 1.4492 (n_D 20).

Grades: 95% min purity.

Uses. Intermediates, synthetic rubber processing.

hexyl methacrylate $C_6H_{13}OOC(CH_3)CH_2$.

Polymerizable monomer for plastics, molding powder, solvent coatings, adhesives, oil additives; emulsions for textile, leather, and paper finishing.

Containers: Drums.

para-tert-hexylphenol $C_6H_{13}C_6H_4OH$.

Properties: Sp. gr. 0.986 (20/20°C); boiling range 155-165°C, refractive index 1.520 (20°C), flash point 285°F, water-white; faint phenol odor.

Uses. For synthesis of other organic compounds and for the preparation of resinous condensation products.

hexylresorcinol (1,3-dihydroxy-4-hexylbenzene) $C_6H_{13}C_6H_3(OH)_2$.

Properties: White to yellowish-white needle-shaped crystals with a faint, fatty odor and sharp, astringent taste which produces a sensation of numbness when placed on the tongue; slightly soluble in water; freely soluble in alcohol, methanol, glycerin, ether, chloroform, benzene and vegetable oils; m. p. 62-67°C, b. p. 178-180°C (8 mm).

Grades: U.S.P. XVI.

Caution! Irritating to respiratory tract and skin. Alcohol solutions are vesicant.

Containers: Bottles; fiber drums.

Use: Medicine.

Shipping regulations: None.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

hexyl trichlorosilane $C_6H_{13}SiCl_3$.

Shipping regulations: Corrosive liquid.
White label. *

1-hexyne (butyl acetylene) $C_4H_9C\equiv CH$.

Properties: Water-white with characteristic odor. Sp. gr. 0.7152 (20/4°C), refractive index 1.3990 (20°C); b. p. 71.4°C (760 mm); f. p. -132°C.

hexynol (1-hexyn-3-ol) $CH_3(CH_2)_2CHOHC\equiv CH$.

Properties: Light yellow liquid with slightly piercing odor; b. p. 142°C, sp. gr. (20/20°C) 0.882; slightly soluble in water, and miscible with most hydrocarbons, chlorinated solvents, ketones, alcohols and glycols.

Containers: 7-, 35- and 380-lb drums.

Uses: Corrosion inhibitor for mineral acids, high temperature oil well acidizing inhibitor.

Hf. Symbol for hafnium.

"HF Alkylation Process." ⁴¹⁶ See "Alkylation Process, HF."

Hg. Symbol for mercury (Latin: hydrargyrum).

HGF. See glucagon.

HG-factor. See glucagon.

HHDN. Abbreviation for hexachlorohexahydro-dimethanonaphthalene. See aldrin.

"Hibitane." ²⁰⁷ Trademark for chlorohexidine (bis-para-chlorophenyldiguanidohexane). The diacetate and dihydrochloride are used as antibacterial agents.

"Hiblak." ¹³³ Brand name for a series of aqueous carbon black dispersions designed for darkening concrete and mortar. Available ⁴⁵

"Hiblak." 25% regular color impingement carbon black, 75% water and DA.

"Hiblak" AE. 25% regular color impingement carbon black, 75% water and DA. Also contains air entraining agent.

"Hi Calcium Phosphate." ¹⁷² Trade name for a special, crystalline, monocalcium phosphate with a high calcium content. Containers: 100-lb paper bags. Use: Manufacture of calcium-enriched flour.

"Hicolor F." ³⁷ An established grade of wood cellulose. Properties: Cellulose-alpha 93%, beta 3.2%, gamma 3.8%. 10% potassium hydroxide solution solubility 16.7%.

Uses: Production of viscose rayon yarns of high quality; manufacture of plastics, vulcanized fiber, saturating papers, and allied products.

"Hicolor G." ³⁷ A wood cellulose used extensively for the manufacture of continuous filament viscose rayon and staple fiber.

Hi-D. ³¹⁹ Ammonium nitrate fertilizer, in granular, dense form.

hiddenite. See spodumene.

"Hi-fax." ²⁶⁶ Trademark for several grades of high-density polyethylene product in two different densities, 0.945 and 0.960.

Properties: Natural or colored molding powder pellets.

Uses: Flexible plastic pipe, tubing; sheet, industrial moldings; wire and cable coatings; blown structures; blow molding and injection molding.

high alumina brick. See brick, alumina.

high-alumina cement. See aluminous cement.

high boiling phenols. A mixture containing predominantly meta-substituted alkyl phenols.

Typical specifications: Average molecular weight 150; sp. gr. (20°C) 1.033, b. p. 238-288°C; vapor pressure (20°C) 0.01 mm, sets to glass below -30°C, flash point 250°C, slightly soluble in water.

Use: Phenolic resins; solvents, fuel oil sludge inhibitor; germicides; rubber chemicals.

high cranberry. See viburnum opulus.

high energy fuels. Fuels for jets and rockets which have a higher performance rate than the common hydrocarbon fuels (kerosine, JP-6). The term has also been used to refer specifically to those jet and rocket fuels based on boron hydrides. See rocket propellants, and jet fuels.

"High-K." ⁶⁷ Trademark for potassium chloride.

"High Speed." ²⁸ Trademark for tinning flux based on zinc chloride and ammonium chloride.

Properties. Colorless water solution; sp. gr. 1.526, f. p. below -50°F.

Containers: 165-lb carboys, 670-lb drums. Use: As fluxing solutions in the manufacture of tin plate,terne plate, tin strips, dairy equipment, refrigerator shelves, automobile radiators, and wire goods.

high vacuum distillation. See molecular distillation.

"Hi-Level." ¹⁰⁸ Trademark for a white, free-flowing granular dish-machine compound designed for high-speed, heavy soil installations using soft or moderately soft water. Containers: 125- and 350-lb drums.

hindered isocyanate. See isocyanate generator.

Hi-N-Dri. ³¹⁹ Ammonium nitrate fertilizer. Granular form, denser than any other ammonium nitrate, with 25% less bulk.

"Hyperco." ³⁰⁸ Trademark for an alloy of cobalt and iron with varying percentages of cobalt, 27%, 35%, 50%, with the highest magnetic saturation of any known commercial alloy. Permeability above 100 oersteds is far superior to iron and the electrical sheet steels. It is used as a core material for motors, generators, and transformers where minimum weight and size are prime requisites.

"Hipernik." ³⁰⁸ Trademark for an alloy of approximately equal proportions of iron and nickel having high initial and maximum

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

permeability and extremely low losses. Used in audio and instrument transformers, relays, magnetic bridges, shields for electronic tubes, etc. "Hipernik V" is a highly oriented alloy possessing a very high remanence accompanied by a low coercive force, and is especially suitable for saturable reactors and magnetic amplifiers.

"**Hippuran**," ³²⁹ Trademark for brand of iodohippurate sodium, a water-soluble, x-ray contrast medium.

hippuric acid, (benzaminoacetic acid, benzolaminoacetic acid, benzoylglycocol; benzoylglycin) $C_6H_5CONHCH_2COOH$.

Properties: Colorless crystals, sp. gr. 1.371 (20°C), m. p. 188°C; decomposes on further heating; soluble in hot water, alcohol or ether.

Uses: Organic synthesis and medicine.

"**Hi-Ratio Silicate**," ²⁴⁴ Trademark for an anhydrous homogeneous combination of caustic alkali and sodium silicate. Uniform flake, soluble in water with evolution of heat.

Containers: 450-lb net non-returnable open head steel drums.

Uses: Highly alkaline silicate for metal cleaning, laundering, and other applications.

"**Hi-Sil**," ¹⁷⁷ Trademark for a hydrated silica pigment, used in producing exceptional tear and abrasion resistance in natural rubber; in the production of high concentrate insecticide powders, and as an anticaking and conditioning agent in powdered or granular materials.

"Hi-Sil" 101. Pigment of extremely fine particle size (0.025 micron). Packed in 50-lb paper bags.

"Hi-Sil" 233. Slightly finer and less alkaline than "Hi-Sil" 101, and also more reinforcing in all elastomers, particularly neoprene and nitriles. Packed in 50-lb paper bags.

"Hi-Sil" X303. Designed especially for silicone rubber to provide easy compounding, a high level of physical properties, and extremely low water absorption. Packed in 25-lb paper bags.

"**Histadyl**," ¹⁰⁰ Trade name for thenylpyramine hydrochloride [N,N-dimethyl-N'-(2-thenyl)-N'-(2-pyridyl)-ethylenediamine hydrochloride]; also known as methapyrilene hydrochloride, U. S. P.

Properties: White crystalline powder; bitter taste; m. p. 159-161°C, nonhygroscopic; soluble in water; requires protection from freezing.

Use: Medicine.

"**Histalog**," ¹⁰⁰ Trademark for betazole.

histaminase. An enzyme occurring in the animal digestive system, that converts histidine to histamine.

histamine (4-aminoethylglyoxaline; 4-imidazole ethylamine) $NH_2CH_2CH_2C_3H_3N_2$.

Properties: White crystals; m. p. 83-84°C;

b. p. 209-210°C (18 mm); soluble in water; slightly soluble in alcohol.

A product of the degradation of histidine, histamine occurs in animal and human body tissues and is liberated by injury to the tissue. It is found whenever a protein is decomposed by putrefactive bacteria. In the form of histamine hydrochloride or phosphate, it is used in medicine.

histamine phosphate $C_6H_9N_3 \cdot 2H_3PO_4$.

Properties: Colorless, odorless, long prismatic crystals; m. p. 140°C; soluble in water. Stable in air but affected by light. Solutions acid to litmus paper.

Grades: U. S. P. XVI.

Use: Medicine.

histidine (alpha-amino-beta-imidazolepropionic acid) $HOOCCH(NH_2)CH_2C_3H_3N_2$. An amino acid essential for rats. It is found naturally in the L(-) form.

Properties: Colorless crystals; soluble in water; insoluble in alcohol and ether; shows optical activity.

DL-histidine, m. p. 285-6°C with decomposition.

D(+)-histidine, m. p. 287-8°C.

L(-)-histidine, m. p. 277°C with decomposition.

Derivation: Hydrolysis of protein; organic synthesis.

Uses: Medicine; feed additive, biochemical studies.

Available commercially as L(+)-histidine hydrochloride, and as the free base.

L(+)-histidine monohydrochloride.

(a) $C_6H_9N_3O_2 \cdot HCl \cdot H_2O$;

(b) $C_6H_9N_3O_2 \cdot HCl$.

Properties: Small colorless crystals, nearly odorless; salty taste, m. p. (a) 80°C, (b) 140°C; fairly soluble in water; insoluble in alcohol or ether.

Use: Medicine, intermediate.

histochemistry. The chemistry of animal tissues and fluids.

"**Hitec**" **Heat Transfer Salt**, ²⁸ Trademark for a eutectic mixture of inorganic salts consisting of 53% potassium nitrate, 40% sodium nitrite and 7% sodium nitrate.

Properties: F. p. 288°F, slow thermal decomposition 800-1000°F; rapid decomposition 1500°F, density 1.933 (400°F), 1.698 (1000°F).

Containers: 25-lb wooden boxes; 150-, 400-lb fiber drums.

Use: Heat transfer in industrial applications involving heating and/or cooling in the 800-1000°F temperature range.

Hazard: Oxidizing material.

Shipping regulations: Oxidizing material. Yellow label.*

"**Hi-Test Alkali**," ²⁴⁴ Trademark for a compound available in two grades of fusion products of caustic soda with modifying alkaline salts. Rapidly soluble highly alkaline flakes; free rinsing.

Uses: Bottle washing, cleaning of dairy and food plant equipment.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Hi-Time." ¹⁰⁸ Trademark for a free-flowing, white, dust-free granular dish-machine compound designed for high-speed, heavy soil installations in hard water areas.
Containers: 125- and 350-lb drums.

"Hi-Tri." ²³³ Trademark for trichloroethylene (q. v.).

"Hi-White" Clay. ²⁸⁵ Proprietary brand name for a group of hydrous aluminum silicates (sedimentary kaolins) from Georgia.
Properties: Sp. gr. 2.60; bulk density, aerated, 18-20 lbs/cu ft; packed, 35-40 lbs/cu ft; creamy white; pH 6.0-7.0; air-floated; particle size 62-68% minus 2 microns; color brightness (G. E.) 75-82.
Containers: 50-lb multiwall bags or bulk.
Uses: A low-cost high-brightness, minimum abrasion filler clay for paper; also used in rubber, paint, certain ceramic applications, and in roofing granules.

HMF black. Abbreviation for high modulus furnace black. See furnace black.

HNM. Abbreviation for hexanitromannite.
See mannitol hexanitrate.

Ho. Symbol for holmium.

hoarhound. See marrubium.

Hofmann's reaction. Reaction used for preparation of a primary amine from an amide by treatment with a halogen (bromine, usually) and caustic soda. The resulting amine has one less carbon atom than the amide used.

hog's bean. See hyoscyamus.

hogweed. See scoparius.

hole. A vacant place where there should normally be an electron or an atom in the orderly arrangement of electrons or atoms in a crystal or solid. Such a hole arises from the presence of an impurity, or is due to an imperfection in the crystal formation. See semiconductors.

holmia. Holmium oxide. See rare earths.

holmium Ho. Atomic number 67; group III of the periodic table; one of the rare-earth elements of the yttrium subgroup.

Properties: A solid with metallic luster; sp. gr. 8.764; m. p. 1475-1525°C; b. p. approx 2300°C. Reacts slowly with water; soluble in dilute acids.

Derivation: Reduction of the fluoride by calcium.

Grade: Regular high purity (lumps, ingots).

holmium chloride $\text{HoCl}_3 \cdot x\text{H}_2\text{O}$. Available as 45% Ho_2O_3 ; up to 99.9% Ho salts.

Containers: Glass bottles; fiber drums.

holmium fluoride $\text{HoF}_3 \cdot 2\text{H}_2\text{O}$. Available as 77% Ho_2O_3 ; up to 99.9% Ho salts.

Containers: Glass bottles; fiber drums.

holmium nitrate $\text{Ho}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$. Available as 42% Ho_2O_3 ; up to 99.9% Ho salts.

Containers: Glass bottles; fiber drums.

holmium oxide (holmia) Ho_2O_3 .

Properties: Light yellow solid; slightly hygroscopic.

Grades: 98-99%.

Containers: Glass bottles; fiber drums.

Uses: Refractories; special catalyst.

holmium sulfate $\text{Ho}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$. Available as 46% Ho_2O_3 , up to 99.9% Ho salts.

Containers: Glass bottles; fiber drums.

"Holocaln" Hydrochloride. ¹⁶² Trademark for phenacaine hydrochloride.

holystones. A variety of sandstone used in blocks for rubbing down rough surfaces, particularly on ships.

"Holzon." ²⁰⁵ A plasticized rubber-based paint for coating floors and swimming pools in color.

homatropine $\text{C}_{16}\text{H}_{21}\text{NO}_3$. An alkaloid.

Properties: White crystals; poisonous!

Slightly soluble in water; m. p. 95.5°C.

Derivation: Condensation of tropine and mandelic acid.

Containers: Vials.

Use: Medicine (usually used in the form of its salts).

Shipping regulations: None.*

homatropine hydrobromide $\text{C}_{16}\text{H}_{21}\text{NO}_3 \cdot \text{HBr}$.

Properties: White crystals or white crystalline powder; poisonous! Affected by light.

M. p. 212°C with partial decomposition. Soluble in water and alcohol and chloroform; insoluble in ether.

Derivation: By the action of hydrobromic acid on homatropine.

Method of purification: Crystallization.

Grades: Technical; U. S. P. XVI.

Containers: Bottles.

Use: Medicine.

Shipping regulations: None.*

homatropine methylbromide

$\text{C}_{16}\text{H}_{21}\text{NO}_3 \cdot \text{CH}_3\text{Br}$.

Properties: Odorless, white, crystalline powder with bitter taste. M. p. 190-198°C; affected by light. Very soluble in water; freely soluble in alcohol, almost insoluble in ether and acetone, soluble in acetone containing 20% water; solutions practically neutral to litmus.

Grade: U. S. P. XVI.

Containers: Bottles.

Use: Medicine.

homo-. A prefix meaning the same or similar, usually designating a homolog of a compound, differing in formula from the latter by an increase of CH_2 .

homogeneous reactor. See nuclear reactor.

homologous series. A series of organic compounds that are all exactly alike except that each successive member has one more CH_2 group in its molecule than the next preceding member. For instance CH_3OH methanol, $\text{C}_2\text{H}_5\text{OH}$ ethanol, $\text{C}_3\text{H}_7\text{OH}$ propanol, $\text{C}_4\text{H}_9\text{OH}$ butanol, etc., form a homologous series.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

homolysis. The symmetrical breakdown of a covalent electron bond,
 $A:B \rightarrow A\cdot + B\cdot$. See heterolysis.

homomorphs. Molecules similar in size and shape. They need have no other characteristics in common. Many properties of several homomorphs can be predicted by knowing properties of one homomorph.

homophthalic acid $C_6H_4(CH_2COOH)COOH$.
 Light tan powder, used as an intermediate.

homoquinine $C_{20}H_{24}O_2N_2 \cdot C_{19}H_{22}O_2N_2 \cdot 1, 2$, or $4H_2O$. A molecular combination of quinine and cupreine obtained from cuprea bark (*Remijia perdunculata*). It was at one time thought to be an entirely new alkaloid.
 M. p. 177° (dry).

ortho-homosalicic acid. See cresotic acid.

4-homosulfanilamide hydrochloride. See maphenide hydrochloride.

homoveratric acid (3,4-dimethoxyphenylacetic acid) $(CH_3O)_2C_6H_3CH_2COOH$. Crystals, m. p. $94-101^\circ C$, very slightly soluble in water; soluble in most organic solvents.

homoveratronicitrile $(CH_3O)_2C_6H_3CH_2CN$. A white, crystalline powder, m. p. $62-67^\circ C$.

homoveratrylamine (3,4-dimethoxyphenylethylamine) $(CH_3O)_2C_6H_3(CH_2)_2NH_2$. A colorless to pale yellow liquid with slight vanilla odor, sp. gr. 1.09 ($25/25^\circ C$), solidifies $15^\circ C$; b. p. $295^\circ C$ (with decomposition); refractive index 1.5442-1.5452 ($25^\circ C$).

hoof and horn meals. The hoofs and horns of animals not needed for more valuable purposes are slightly cooked until they become friable and are then ground to a fine powder for use as fertilizer. They run from 4 to 6% water and 17-18% ammonia.

Shipping regulations: None.*

hoof oil. See neats-foot oil.

Hooker cell. A diaphragm-type electrolytic cell (see diaphragm cell) for the production of chlorine and caustic soda from sodium chloride. It consists of three major parts: (1) a bottom section carrying the vertical graphite anode blades, (2) a middle section bearing the cathode fingers, which are formed of heavy wire screen and fit between the anodes when the cell is assembled, and (3) the top section, which has a brine inlet and chlorine outlet. The top and bottom sections are made of rather massive concrete for thermal insulation. An asbestos diaphragm is formed on the surface of the cathode fingers before assembly of the cell. The cell operates at $85-95^\circ C$ and produces 6-8 lbs of chlorine per day per square foot of floor space.

Hooke's law. When a load is applied to any elastic body so that the body is deformed or strained, then the resulting stress (the tendency of the body to resume its normal condition) is proportional to the strain.

Stress is measured in units of force per unit area, strain is the extent of the deformation. For example when a bar of metal is subjected to a stretching load, the extent of the increase in length of the bar is directly proportional to the force per unit area, i. e., to the stretching load or stress. In general Hooke's law applies only up to a certain stress called the yield strength.

Hoope's process. An electrolytic method of purifying commercial aluminum to 99.99% aluminum content. A bath of fused cryolite, aluminum fluoride and barium fluoride of definite density is used. A heavy layer of molten aluminum-copper alloy at the bottom of the cell acts as the anode. A layer of lighter pure aluminum metal floating on top of the bath serves as the cathode. Pure aluminum from the aluminum-copper alloy collects at the cathode on passage of current through the cell.

hopcalite. A mixture of oxides of copper, cobalt, manganese and silver, used in gas masks as a catalyzer converting carbon monoxide to carbon dioxide. Not safe when nitroparaffin vapors are present.

hops. See humulus.

hops oil.

Properties. A brownish-yellow essential oil, strong penetrating odor. Soluble in alcohol, ether, and chloroform. Insoluble in water.

Chief known constituents: Humulene, geraniol and terpenes.

Constants: Sp. gr. 0.855 to 0.880, refractive index ($n_{20/D}$) 1.4775.

Derivation: Distilled from the strobiles of *Humulus lupulus*.

Method of purification: Rectification.

Grades: Technical.

Containers: Glass bottles; drums.

Use: Aromatizing beer and tobacco.

Shipping regulations: None.*

hordenine (anhaline) $(CH_3)_2N(CH_2)_2C_6H_4OH$. para-Hydroxyphenylethyldimethylamine. An alkaloid from barley.

Properties: Colorless crystals, m. p. $117-118^\circ C$, sublimes $140-150^\circ C$, soluble in alcohol, chloroform, and ether, slightly soluble in water, benzene, toluene, and xylene.

Use: Medicine.

horehound. See marrubium.

"Horizo." ²⁴⁴ Trademark for a double salt of hydrated trisodium phosphate and sodium hypochlorite. Rapidly soluble alkaline powder yielding 3.25% min. available chlorine calculated as NaOCl.

Uses: Sanitizer; deodorant.

"Hormodin." ¹²³ Trade name for a formulation of indolebutyric acid.

hormones. Complex organic compounds which are formed by one organ and which act in a specific manner on the function of another organ or organs. Hormones are produced by the internal secretion of the ductless or

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

endocrine glands and co-ordinate the functions of organs by circulation in the bloodstream. Many of the hormones are steroids (see androgen, corticoid hormones, estrogens, steroids). See, of the non-steroid type, epinephrine, thyroxine; insulin.

See also plant hormones.

"Hornglaze." ²⁰⁵ A liquid emulsion of carnauba wax formulated to produce a self-polishing tough, hard, water-resistant finish over linoleum, rubber tile, asphalt tile, or hardwood floors.

"Hornlux." ²⁰⁵ A liquid which, by means of its composition, allows the penetration of a phenolformaldehyde condensation product down into a newly completed terrazzo or colored concrete floor. Applied with a rag; then surface excess is wiped off. Used to seal the porosity, densify, harden, and develop the color of concrete or new terrazzo floors.

horn silver. See cerargyrite.

"Hornstone." ²⁰⁵ Magnesium fluosilicate and zinc fluosilicate in powder form. Applied to a concrete floor surface, it reacts to form new binding materials and new and harder compounds. Available in liquid as well as crystal form.

"Horse Head." ²⁶⁸ Trademark for a line of zinc metals and alloys, zinc and titanium pigments, metal powders.

"Horse Head" Cadmium Metal Sticks. A proprietary product cast in stick form containing 99.99% metallic Cd. Used for electroplating and alloys.

"Horse Head" C. P. Zinc Metal. Proprietary product supplied in sticks. Used for chemical applications and for precious metal alloys.

"Horse Head" Lehigh Slab Zinc. A proprietary prime western slab zinc. Shipped in 45-lb slabs. Used for galvanizing, for making French process zinc oxide for brass and other alloys.

"Horse Head" Rolled Zinc. A proprietary product used for boiler plates; spinning; drawing.

"Horse Head" Slab Zinc. A product of retort distillation which exceeds the A. S. T. M. specifications for high-grade slab zinc. Used for galvanizing, brass and other alloys; dry cells; and manufacture of rolled zinc products.

"Horse Head" Special Slab Zinc. 99.99+% pure zinc slabs produced by a patented pyrometallurgical process; meets A. S. T. M. specifications for special high-grade zinc. Used for diecastings, mold castings, zinc plating, and galvanizing.

"Horse Head" Spiegeleisen. A proprietary product cast in pigs. Used in steel, grey iron, malleable iron.

"Horse Head" Titanium Dioxide. Brand name for a group of anatase and rutile white hiding pigments. Shipped in 50-lb bags. Used in interior and exterior paints, rubber, paper coatings.

"Horse Head" Zinc Anodes. "Horse Head" Special Slab Zinc to which minimum aluminum has been added. Cast in special molds; used for electrogalvanizing and cathodic protection of steel.

"Horse Head" Zinc Oxide. Brand name for several grades of zinc oxide.

"Horse Head" Metal Powders. For the powder metallurgy process for making small metal parts. Available in brass, bronze, copper, nickel, silver. Also available as metallic zinc powder for metal spraying, hearing-aid batteries, chemical refining, brazing, and brake linings.

"Horse Head Zamak." ²⁶⁸ ("Zamak"). Proprietary zinc alloy for die casting consisting of high purity zinc, aluminum, magnesium, and other alloying ingredients. Supplied in 19-lb ingots.

Uses: For zinc alloy die castings with excellent resistance to corrosion, retention of dimensions, and impact strength.

"Horse Head Zilloy." ²⁶⁸ ("Zilloy"). A proprietary rolled zinc alloy. Stiffer, stronger, and with greater creep strength or resistance to plastic flow than ordinary commercial grades of rolled zinc, but possessing the same corrosion-resisting characteristics as rolled zinc and fabricated and finished by similar methods. Furnished in flat sheets, coils, plates.

Uses: Particularly suitable for screen frames, screen guides, splines, weather strips, corner beadings, moldings, and stampings. Corrugated form for lightweight, low cost, permanent roofing and siding.

horsemint oil (monarda oil).

Properties: A yellowish-red or brownish-red essential oil; strong thyme-like odor. Soluble in alcohol, ether, and chloroform. Sp. gr. 0.920-0.936.

Derivation: Distilled from the herb *Monarda punctata*.

Method of purification: Rectification.

Constituents: Thymol, cymene.

Grades: Technical.

Containers: Glass bottles.

Use: Preparation of liniments.

Shipping regulations: None.*

horseradish root. See *armoraciae radix*.

horseweed oil. See *erigeron oil*.

hot cell (cave) The name given to the space and facilities used for the manipulation of highly radioactive material. A hot cell is usually a room with a floor area of 30 to 100 square feet inside with concrete walls 3 to 6 feet thick, and with appropriately weighty ceiling and floor. Hot cell sizes are usually quoted as the number of curies or kilocuries of radioactive material they may contain and still allow operation by personnel on the outside without excessive exposure to radiation.

Such a cell is usually equipped with some form of remote handling device, or

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"mechanical hands", and with utilities such as electric power, compressed air, steam, etc., all under remote control, and all carried through the shielding in offset holes in the concrete so that no direct beam of radiation may reach the outside. Viewing of the internal operation of a cell may be done through periscopes, television, or through windows of high density glass or zinc bromide solution. Typical operations carried out in a hot cell are chemical processing, machining, inspection, and physical testing.

hot dip process. See galvanized iron.

"#20 Hot Galvanizing Flux." ⁷² Brand name for a flux for hot galvanizing consisting of zinc ammonium chloride and organic additions.

Houdry process. Catalytic cracking process in which oil vapor is passed through a fixed catalyst bed consisting of activated hydrosilicate of alumina in molded form. When catalyst is fouled, the vapor stream is diverted to a second catalyst chamber while the first is cleaned by burning off the deposited coke with air. Used for producing higher octane gasoline from heavy distillate.

HPC black. Abbreviation for hard processing channel black. See channel black.

HS. Abbreviation for hydroxylamine sulfate.

"HSM." ⁶⁵ Trademark for hemisulfur mustard used in medicine.

ht. Abbreviation for heat.

"H. T." ⁵⁸ Trademark for monocalcium phosphate. Free-flowing beads.

HT-1. A type of nylon from phenylenediamine and iso- or terephthalic acid, intended for high temperature uses.

"HT-44." ²¹² Trademark for product containing a standardized mixture of amylolytic and proteolytic enzymes.

Properties: Dry, white powder containing buffer salts; nonhazardous; nonflammable. Optimum pH 6.8-7.0; optimum temperature 158°F.

Grade: Food.

Containers: All quantities; bulk, 300-lb drums.

Uses: Desizing of textile fabrics prior to finishing. For starch modification at higher temperatures; in food and other industries.

"HTH." ⁸⁴ Brand name of a proprietary high test calcium hypochlorite product commercially available as a stable, water-soluble material in both granular and tablet form, containing a minimum of 70% available chlorine as calcium hypochlorite.

Uses: Bleaching; sterilizing; oxidizing.

"HTH-15." ⁸⁴ Trademark for an all purpose germicide, disinfectant and stain remover. "HTH-15" contains 15% of available chlorine and yields sodium hypochlorite

solutions directly when added to water.

Uses: Dairy and poultry farm sanitation; for sterilizing glasses and food utensils, and for general sanitation. It has also proved invaluable as a china dip for removing stains from dishes in restaurants, cafeterias, etc.

HTU. Abbreviation for height of a transfer unit. It is the height of a distillation column or fractionating tower in which unit separation is achieved by transfer from liquid to vapor or vice versa, of the materials being separated. Unit separation is defined by the differential equation that takes into account the varying concentrations along the column. HTU is also applied to extraction and other countercurrent separation processes.

huanuco bark. See cinchona bark, loxa.

Huber's reagent. Used for detecting free mineral acid. An aqueous solution of ammonium molybdate and potassium ferrocyanide. With the exception of boric acid and arsenic trioxide, free mineral acids produce a reddish-brown precipitate, or a turbidity with the reagent.

Hubl's reagent.

(a) 50 grams iodine dissolved in 1 liter of 95% alcohol.

(b) 60 grams mercuric chloride dissolved in 1 liter alcohol.

(c) Make up an iodine monochloride solution from (a) and (b). Add in excess to a known weight of the fat or oil dissolved in chloroform. The excess of iodine chloride can be estimated by the potassium iodide and thiosulfate method. By running a blank test, the amount of iodide absorbed can be estimated.

Use: Determination of iodine value of oils and fats.

huebnerite. See wolframite.

"Humatin." ³³⁰ Trademark for paromomycin sulfate (q. v.).

humectant. A term denoting affinity for water, with stabilizing action on the water content of an article, thus, a humectant keeps within a narrow range the moisture content fluctuations caused by wide-range humidity fluctuations. Example: glycerol.

humic acid. An acid substance found in humus and obtained as a by-product in making montan wax from lignite.

Properties: Chocolate-brown, dust-like powder; slightly soluble in water; dissolves in hot concentrated nitric acid to give a dark red color.

Use: In drilling muds.

humidity, absolute. The pounds of water vapor per pound of dry air in an air-water vapor mixture.

humidity indicators. Certain cobalt salts (e. g. cobaltous chloride) that change color as the humidity of their environment changes. Cobaltous compounds are

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

pink when hydrated and greenish-blue when anhydrous.

humidity, relative. The percentage relation that the actual amount of water vapor present in a given volume of air at a definite temperature bears to the maximum amount of water vapor that would be present if the air were saturated with water vapor at that temperature.

humins. Any black amorphous solid material obtained in acid digestions of organic materials.

humulin. See lupulin.

humulon. An antibiotic constituent of hops (see lupulin). $C_{21}H_{39}O_5$. A complex derivative of benzene.

Properties: Crystallizes from ether, m. p. 66°C ; bitter taste; decomposes slowly in air; soluble in most organic solvents, slightly soluble in boiling water.

humulus (hops). Carefully dried strobiles of *Humulus lupulus*.

Habitat: Europe and North America.

Containers: Bags.

Uses: Medicine (aromatic bitter), brewing beer and beer substitutes.

Shipping regulations: None. *

humus. A black or brown substance formed by the decay of vegetable matter. Contains carbon, oxygen, and nitrogen in the soluble portion. A slight amount of acid known as humic acid is present also. Humus increases the soil's capacity for absorbing and retaining water, reduces its tenacity, and is the cause of a more rapid and thorough absorption of the sun's rays.

humus, sour. Humus which contains humic and related acids due to decomposition under excess of moisture and lack of air.

"HX" (HPC). ²⁸⁵ Proprietary brand name for hard processing channel carbon black.

Properties: Sp. gr. 1.77; free-flowing pellets, also available in fluffy, unpeletted form as "HX-U". Bulk density 25 lbs/cu ft, particle diameter 25 microns; pH 4.1-4.5; ash 0.05% max, 99.9% through 325 mesh screen; color (Nigrometer) 82.5-83.5.

Containers: 50-lb paper bags or bulk.

Uses: As a reinforcing ingredient for compounding in natural and most synthetic rubbers, contributing to abrasion resistance, good tensile and tear strength, as a black coloring agent in rubber, etc.

hyacinthin. See phenyl acetaldehyde.

hyaluronic acid. A polymer of acetylglucosamine and glucuronic acid, occurring as alternate units, with a molecular weight of 200,000 to 400,000. Found in vitreous humor, synovial fluid, pathologic joints, group A and C hemolytic streptococci and skin, which probably contains the largest store of this substance. Hyaluronic acid appears to bind water in the interstitial spaces, forming a gel-like substance which

holds the cells together. Its solutions are highly viscous. It is probably present in the body as a salt with inorganic bases.

hyaluronidase. An enzyme that breaks down the polymeric structure of the gel-form of hyaluronic acid, thus dissolving the gel which acts as the cementing mucoid of connective tissue and increasing the permeability of tissue to the diffusion of substances accompanying the enzyme. The enzyme occurs in poison glands of some snakes, in insects, pathogenic bacteria and in sperm cells; it also is believed to have possibilities in combating sterility and the spread of disease within the body.

Properties: Hyaluronidase for injection is a white amorphous solid. Solutions are colorless and odorless.

Grades: U. S. P. XVI.

Uses: Medicine.

"Hyamine." ²³ Trademark for quaternary-ammonium-type bactericides, algicides, and fungicides, supplied as water-soluble crystals or aqueous solutions. Non-irritating, low toxicity compounds.

Use: Restaurant and dairy sanitizing, general bactericidal applications, mildew-proofing of textiles, swimming pool algicide.

"Hycar." ¹¹⁹ Trade name for various types of synthetic rubber.

"Hycar" Nitrile Rubbers: Copolymers of butadiene and acrylonitrile, divided into groups on the basis of acrylonitrile content. High acrylonitriles are characterized by their superior resistance to oil and solvents. Polymers of lower acrylonitrile content have a relatively lower oil and solvent resistance, but better resilience and low temperature flexibility.

Properties:

(high acrylonitrile): Sp. gr. (Polymer) 1.00; tensile strength (psi) 1500-3000, elongation 100-800%; hardness (Durometer A) 10-100; flexibility (lowest temp.) -30 to -50°F ; resilience 20-50% recovery (Lupke Rebound); maximum service temperature $250-300^\circ\text{F}$.

(medium acrylonitrile): Sp. gr. (Polymer) 0.98; tensile strength (psi) 1000-3000; elongation 100-700%, hardness (Durometer A) 10-100, flexibility (lowest temperature) -50 to -70°F , resilience 30-60% recovery (Lupke Rebound), maximum service temperature $250-300^\circ\text{F}$.

(low acrylonitrile): Sp. gr. (Polymer) 0.95; tensile strength (psi) 1000-2500; elongation 100-700%, hardness (Durometer A) 10-100; flexibility (lowest temperature) -70 to -85°F , resilience 40-70% recovery (Lupke Rebound); maximum service temperature $250-300^\circ\text{F}$.

• Uses: (high acrylonitrile): Oil well parts, fuel cell liners, fuel hose, gaskets, packing, oil seals, and other applications requiring highest resistance to aromatic fuels, oils, and solvents.

(medium acrylonitrile): General purpose oil resistant applications, shoe soles, kitchen

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

mats, sink topping, and printing rolls. (low acrylonitrile): Gaskets, grommets, and O-rings where flexibility at very low temperatures is critical.

"Hycar" Polyacrylic Rubbers: Polymers of an acrylic acid ester. Useful in applications where oil and solvent resistance at high temperatures (to 425°F) is required. Polyacrylics are not recommended for use where flexibility below -10°F or high resistance to water and steam are important, but they possess outstanding resistance to heat, ultraviolet light, and flexural failure.

Properties: Sp. gr. (Polymer) 1.09, tensile strength (psi) 1000-2000; elongation 100-300%; hardness (Durometer A) 40-90, flexibility (lowest temperature) -10 to -20°F, resilience 20-40% recovery (Lupke Rebound), maximum service temperature 300-425°F.

Uses: Oil and gasoline hose, packings, automatic transmission gaskets, and conveyor belts.

"Hycar" Brominated Butyl Rubber: A butyl rubber modified by the addition of bromine in the polymer chain. The typical butyl properties of exceptionally low gas permeability, and excellent resistance to the effects of ozone, heat, and light are retained, while most of the shortcomings of butyl rubber are eliminated. Brominated butyl cures at a considerably faster rate, with more consistent results, and has the ability to cure when blended or in contact with other rubbers. In addition, it exhibits excellent adhesion to other rubbers and metals.

Uses: Inner tubes, steam hose, curing bags, and as a modifying component in blends with GR-S and crude rubbers.

"Hycar" Styrene Rubber: Polymer of styrene and butadiene. Oil soluble, primarily a binder for abrasive wheels, with some application in the manufacture of adhesives.

"Hycar" Latexes: Nitrile, acrylic, and styrene polymers are all available as water emulsion with total solids ranging from 38-52%. They are compatible with a wide range of compounding ingredients, and are characterized by adhesion to natural and synthetic fibers. Principal applications include saturation and impregnation of paper to improve strength, density, and resistance to oil, water, and solvents, leather finishing, in which the ability to bind pigments is important; textile processing for resistance to abrasion, improved seam strength, and color fastness, in the manufacture of adhesives where compatibility of the latexes with phenolic resins, vinyls, and casein allow flexibility in compounding to meet various requirements.

"Hycryl." ²² Trade name for a series of thickening agents. Available as:

"Hycryl" A-1000 - modified ammonium polyacrylate (water solution).

Properties: Straw colored, jelly like material, pH 8.0-8.5; sp. gr. (25°C) 1.01; viscosity (25°) 18,000-30,000 cps,

solids 6.2-6.8, water resistant when dry.

"Hycryl" A-2000 - Latex dispersion which can be converted to ammonium polyacrylate solution through the addition of ammonia.

Properties: Milky white emulsion, solids 35%, pH 3.5-5.5. Initial viscosity - water thin; converted viscosity over 200,000 cps.

Uses: Anti-settling stabilizer for water dispersions of pigments, compounding rubber latexes, thickener for alcoholic nylon coating solutions.

"Hydan." ²⁸ Trademark for methionine hydroxy analogue calcium 90%.

Use: A source of methionine (an essential amino acid) for poultry, dog and livestock feeds.

Containers: 50-lb bags.

hydantoin (glycolylurea) NHCONHCOCH_2 .

Properties: White, odorless solid crystallizing in needles. Slightly soluble in water, ether; soluble in alcohols and solutions of alkali hydroxides. M. p. 220°C.

Grades: Technical.

Uses: Intermediate in the synthesis of pharmaceuticals, synthetic resins, textile lubricants and softeners.

"Hydeal" Process. ⁴¹⁶ Patented process for catalytic hydrodealkylation of alkylbenzenes to benzene of high purity. Reaction occurs in the presence of hydrogen over a bed of solid catalyst of undisclosed nature, the products being benzene, the hydrocarbon corresponding to the dealkylated alkyl group, and unreacted hydrogen. Benzene yield from demethylation of toluene is 90-95% of theoretical, from xylenes, approximately 85-90% of theoretical. Also may be applied to the dealkylation of alkyl-naphthalenes.

hydnocarpic acid $\text{CH}_2\text{CH}_2\text{CH}(\text{CH}(\text{CH}_2)_{10}\text{COOH})$.
A cyclic fatty acid.

Properties: Plates, m. p. 59-60°C, soluble in chloroform, slightly soluble in organic solvents.

Source: Chaulmoogra oil.

Use: Medicine.

hydnocarpus oil. See chaulmoogra oil.

hydnocarpyl acetic acid. See chaulmoogric acid.

hydrabamine penicillin V. See penicillin.

hydrabamine phenoxymethylpenicillin. See penicillin.

hydracatin. See acetylphenylhydrazine.

"Hydratine" Clay. ²⁸⁵ Proprietary brand name for chemically treated hydrous aluminum silicate (sedimentary kaolin) from Georgia. Properties: Sp. gr. 2.60, brightness 86-87 G. E., pH 6.5-6.8, particle size 90-94% minus 2 microns (as contrasted with 70-80% range of intermediate coating grades - see "Hydratex," "Hydrasperse").

Containers: 50-lb multiwall bags or bulk.

Uses: A premium type, extra fine particle size waterwashed coating clay for specialty paper and boxboard applications, paint and ink.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"**Hydralase**." ⁷⁸ Trademark for a series of fungal enzymes used principally in the food industries for conversion of starches or dextrins to dextrose and of proteins to amino acids.

hydralazine hydrochloride (1-hydrazinophthalazine hydrochloride)

$C_8H_5N_2NHNH_2 \cdot HCl$.

Properties: White, odorless, crystalline powder. M. p. 270-280°C (dec); very slightly soluble in ether and alcohol, slightly soluble in water; pH (2% solution) 3.5-4.5.

Grade: N. F. XI.

Use: Medicine.

"**Hydraphtal**." ²⁸ Trademark for a light yellow liquid combining solvent and scouring properties.

Use: For heavy duty degreasing of textiles and leather.

hydrargol (mercuric succinimide, mercury imidosuccinate) $Hg[(CH_2CO)_2N]_2$.

Properties: White crystalline powder. Moderately soluble in water.

Derivation: By heating together succinic acid, ammonia, carbon dioxide and mercuric oxide.

Containers: Glass bottles, fiber cans.

hydrargyrum. Latin name for mercury.

"**Hydrar**" **Process**. ⁴¹⁶ Patented process for the catalytic hydrogenation of benzene to cyclohexane, or higher aromatics to their corresponding cycloparaffins. The hydrogenation of benzene is virtually stoichiometric. The purity of the cyclohexane product is a function of the purity of the benzene feed.

hydrase. See hydrolase.

"**Hydrasperse**" **Clay**. ²⁸⁵ Proprietary brand name for chemically treated hydrous aluminum silicate (sedimentary kaolin) from Georgia.

Properties: Sp. gr. 2.60, brightness 84.5-85.5 G. E., pH 6.0-7.0; particle size 77-80% minus 2 microns, contains water-dispersing agent; water-washed, spray dried.

Containers: 50-lb multiwall bags or bulk.

Use: A spray-dried intermediate type of paper coating clay; low viscosity, high brightness; with dispersant already added. Saves "make-down" time and assures thorough dispersion in practically any equipment.

hydrastina. See hydrastine.

hydrastine (hydrastina) $C_{21}H_{21}NO_6$.

Properties: White pulverulent poisonous alkaloid. Slightly soluble in water, alcohol and ether. Soluble in acetone and benzene. M. p. 132°C.

Derivation: By extraction of the root of *Hydrastis canadensis*, with subsequent crystallization.

Use: Medicine (usually used in the form of the hydrochloride, sulfate, tartrate, etc.).

Shipping regulations: None.*

hydrastine hydrochloride $C_{21}H_{21}NO_6 \cdot HCl$.

Properties: White crystals; poisonous!

Hygroscopic. Soluble in water and alcohol; slightly soluble in ether. M. p. 116°C.

Derivation: By the action of hydrochloric acid on hydrastine.

Use: Medicine.

hydrastinine $C_{11}H_{13}NO_3$.

Properties: White crystalline alkaloid; poisonous! Soluble in alcohol and ether; slightly soluble in warm water. M. p. 116-117°C.

Derivation: By extraction of the root of *Hydrastis canadensis*, with subsequent crystallization. The salts are obtained by the action of the respective acid on the alkaloid.

Grades: Technical.

Use: Medicine.

hydrastis (golden seal; orange root, yellow root; yellow puccoon, turmeric root; Indian turmeric). Dried rhizomes and roots of *Hydrastis canadensis*.

Chief constituents: Alkaloids, berberine, canadine, hydrastine and hydrastinine.

Habitat: North America.

Grades: Technical.

Containers: Bales.

Use: Medicine (source of its alkaloids).

Shipping regulations: None.*

hydrate. A compound formed by the combination of water with some other substance, in which the water supposedly retains its molecular state as H_2O . The water combines in a definite weight ratio and the hydrate may be represented by a chemical formula. Most hydrates are decomposed by gentle heating. See, for example, gas hydrates.

See also complex compound.

hydrated alumina. See alumina trihydrate.

hydrated aluminum oxide. See alumina trihydrate.

hydrated silica. See silicic acid.

"**Hydratex**" **Clay**. ²⁸⁵ Proprietary brand name for a group of hydrous aluminum silicates (sedimentary kaolins) from Georgia.

Properties: Sp. gr. 2.60; brightness 83.5-85.0 G. E.; pH 4.5-5.0, particle size 71-73% minus 2 microns, water-washed, lump or pulverized.

Containers: 50-lb multiwall bags or bulk.

Uses: An intermediate paper coating clay with excellent covering power and flow characteristics for certain coating methods. Also used in special applications as a filler for paper and paint.

hydration. The process of absorption or combination of water with another substance. The term may apply both to processes involving chemical reaction and to those involving mere absorption. It is not usually applied in cases where a liquid solution results. In the paper industry it refers to a prolonged treatment in the beater whereby

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

a viscous pulp is produced that gives water-resistance and crackle to the finished paper.

hydraulic cement. A cement that hardens under water, Portland cement being the prime example.

hydraulic lime. See lime, hydraulic.

hydrazine (hydrazine base; hydrazine, anhydrous; diamine) H_2NNH_2 .

Properties: Colorless, fuming, corrosive, hygroscopic liquid; m. p. 2.0°C ; b. p. 113.5°C , sp. gr. 1.004 ($25/4^\circ\text{C}$); wt/gal 8.38 lbs; flash point (open cup) 126°F . Miscible with water and alcohol; insoluble in chloroform and ether. Strong reducing agent and diacidic base.

Derivation: From hydrazine hydrate, either by (a) various dehydration processes, (b) solvent extraction with ethylene glycol, or by action of anhydrous ammonia on hydrazine salts. The nuclear fission of ammonia will yield hydrazine and may prove feasible.

Grades: To 99% pure.

Containers: Glass carboys; steel drums.

Uses: Jet and rocket fuels, intermediate for agricultural chemicals, antioxidants, textile chemicals, explosives, photographic developers, blowing agents; scavenger for chlorine in hydrogen chloride, anhydrous, corrosion inhibitor and scavenger for oxygen.

Caution: Vapor explosive and toxic; especially dangerous to the eyes.

Shipping regulations: Corrosive liquid. White label.*

hydrazine, anhydrous. See hydrazine.

hydrazine base. See hydrazine.

hydrazine hydrate (diamide hydrate).

$\text{H}_2\text{NNH}_2 \cdot \text{H}_2\text{O}$.

Properties: Colorless, fuming liquid; m. p. -51.7°C , b. p. 119.4°C , sp. gr. 1.032; wt/gal 8.61 lbs; flash point (open cup) 163°F . Miscible with water and alcohol, insoluble in chloroform and ether. Strong reducing agent; weak base.

Derivation: (a) Sodium hydroxide, chlorine, and ammonia react in aqueous solution to form a dilute solution of hydrazine (Raschig process). Sodium chloride is a by-product. (b) Oxidation of urea by sodium hypochlorite, as in the Raschig process.

Method of purification: Fractional distillation; concentration by flash distillation, conversion to the slightly soluble sulfate, and treatment of the latter with concentrated sodium hydroxide solution.

Grades: 85%, 100% (based on hydrate); also weaker solutions.

Containers: Glass carboys; steel drums.

Uses: See hydrazine, scavenger for oxygen in boiler feed water.

Caution: Vapor explosive and toxic, especially dangerous to the eyes.

Shipping regulations (if containing 50% or less of water):

Corrosive liquid. White label.*

hydrazine monobromide $\text{N}_2\text{H}_4 \cdot \text{HBr}$.

Properties: White, crystalline flakes; m. p. $81-87^\circ\text{C}$; decomposes at about 190°C ; soluble in water and lower alcohols; insoluble in most organic solvents.

Grade: 95%.

Use: Soldering flux.

hydrazine monochloride $\text{N}_2\text{H}_4 \cdot \text{HCl}$.

Properties: White crystalline flakes; m. p. $87-92^\circ\text{C}$, decomposes at about 240°C , soluble in water (37g/100g H_2O at 20°C); somewhat soluble in lower alcohols; insoluble in most organic solvents.

hydrazine sulfate (diamine sulfate; diamidogen sulfate) $\text{NH}_2\text{NH}_2 \cdot \text{H}_2\text{SO}_4$.

Properties: White crystalline powder; very soluble in hot water; soluble 1 part in 33 cold water, insoluble in alcohol; stable in storage but contact with alkalis and oxidizing agents should be avoided.

Typical specifications: Purity 99.8-100%, sp. gr. 1.37; m. p. 254°C ; impurities: no ferrous oxide, no chloride; non-volatile matter 0.05% (max), ash 0.01% (max).

Grades: C. P.; technical.

Containers: Bottles; 25- to 125-lb fiber drums; multiwall paper sacks.

Uses: Strong reducing agent; manufacture of chemicals; condensation reactions; catalyst in making acetate fibers. Also used in tests of blood; analysis of minerals, slags and fluxes, determination of arsenic in metals; separation of polonium from tellurium; as fungicide, germicide, in adhesives.

Shipping regulations: None.*

hydrazinophthalazine hydrochloride. See hydrazalazine hydrochloride.

hydrazobenzene (N, N' -diphenylhydrazine) $\text{C}_6\text{H}_5\text{NHNHC}_6\text{H}_5$.

Properties: M. p. (min) 126°C ; soluble in alcohol; nearly insoluble in water.

Grade: 95%.

Use: Synthesis.

"Hydrholac." ²³ Trademark for plasticized nitrocellulose lacquer emulsions, including clear finishes, binders and colors. Produce flexible, lacquer-type, cleanable leather finishes from aqueous systems.

Use: Finishes on glove, garment, handbag and shoe leather.

hydrindene. See indan.

hydriodic acid (hydrogen iodide) HI .

Properties: Clear colorless or pale yellow liquid, an aqueous solution of hydrogen iodide, which is a gas at ordinary temperatures. A constant boiling solution is formed of sp. gr. 1.7 containing 57% hydrogen iodide. Hydriodic acid is a strong acid and an active reducing agent, highly corrosive. For anhydrous hydrogen iodide:

sp. gr. 4.3737; m. p. -51.3°C ; b. p. -35.6°C .

Derivation: (a) In gaseous form by decomposition of phosphoric iodide with a minimum amount of water. (b) By passing

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

hydrogen with iodine vapor over warm platinum sponge which acts as a catalyzer, and absorption in water. (c) By the action of iodine on a solution of hydrogen sulfide. Grades: Technical, 47%; N. F. XI, diluted, 10%.

Containers: 150-lb carboys.

Uses: Medicinal, preparation of iodine salts; organic preparations; analytical reagent; disinfectant; pharmaceuticals.

Shipping regulations: Corrosive liquid. White label. *

hydroabietyl alcohol. See dihydroabietyl alcohol.

ortho-hydrobenzoic acid. See salicylic acid.

"**Hydrobreak**." ²⁴⁴ Trademark for a compound consisting of a balanced blend of buffered alkalies and a surface active agent.

Properties: White, granular, dedusted mechanical mix; soluble in water.

Uses: A general laundry and dairy cleaner for use in areas of medium hard water.

Containers: 125-lb plywood drums; 325-lb wooden barrels.

hydrobromic acid (hydrogen bromide) HBr in aqueous solution. See also hydrogen bromide, anhydrous.

Properties: Clear, colorless or faintly yellow liquid consisting of an aqueous solution of hydrogen bromide, which is a gas at ordinary temperatures. A constant boiling solution is formed, of sp. gr. 1.49, containing 48% hydrogen bromide. Hydrobromic acid is a strong acid and highly corrosive; sensitive to light. Sp. gr. (hydrogen bromide gas) 2.71 referred to air, m. p. -86.13°C ; b. p. -68.7°C . Sp. gr. (48% solution) 1.488 ($20/4^{\circ}\text{C}$).

Derivation: Gas: by passing hydrogen with bromine vapor over warm platinum sponge which acts as a catalyzer. The solution: by dissolving the gas in water, or by distilling from a mixture of sodium bromide and 50% sulfuric acid.

Impurities: Sulfuric acid, heavy metals, hydrochloric acid, hydriodic acid.

Grades: Technical 40%; medicinal 48%, 62%.

Containers: Glass bottles; carboys.

Uses: Medicine; analytical chemistry; organic preparations.

Shipping regulations: Corrosive liquid. White label. *

"**Hydrocarb**." ²³⁶ Brand name for a proprietary product. A soluble sodium humate compound for thinning or emulsifying drilling muds.

Containers: Multiwall polyethylene lined paper bags containing 50 lbs.

hydrocarbon. A compound which consists solely of the elements carbon and hydrogen.

hydrocarbon, acetylene. A hydrocarbon which contains at least one pair of triple bonded carbon atoms in its structure. It satisfies the general formula $\text{C}_n\text{H}_{2n-2}$. Also known under the family name of alkyne.

hydrocarbon, aromatic. A hydrocarbon characterized by a molecular structure involving one or more six-carbon-atom rings, and having properties similar to those of benzene which is the simplest member of this group. Toluene, xylene, naphthalene, anthracene, and phenanthrene are other key members of this series.

hydrocarbon, branched chain. A non-aromatic hydrocarbon in which not all the carbon atoms of the molecule are in a single chain. The simplest is isobutane, $(\text{CH}_3)_2\text{CHCH}_3$.

hydrocarbon C-2, C-3, etc. A hydrocarbon containing 2, 3, etc. carbon atoms per molecule.

hydrocarbon, olefin. Any hydrocarbon which contains at least one pair of double bonded carbon atoms in its structure. With a single double bond, it satisfies the general formula C_nH_{2n} . Also known under the family name of alkene. Ethylene and propylene are typical examples.

hydrocarbon, paraffin. A hydrocarbon in which the proportion of hydrogen to carbon is such as to satisfy the general formula $\text{C}_n\text{H}_{2n+2}$, e. g. methane CH_4 , ethane C_2H_6 , octane C_8H_{18} , etc. These are also known as saturated hydrocarbons. Their family name is alkane.

hydrocarbon, saturated. See hydrocarbon, paraffin.

hydrocarbon, straight chain. A hydrocarbon in which all the carbon atoms of the molecule are in a single unbranched chain. Such hydrocarbons are also designated as normal hydrocarbons, e. g. n-hexane $(\text{H}_3\text{CCH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_3)$.

hydrocellulose. See cellulose, hydrated.

hydrochloric acid (muriatic acid; chlorohydric acid; hydrogen chloride) HCl in aqueous solution. See also hydrogen chloride, anhydrous.

Properties: Clear, colorless or slightly yellow, fuming, pungent liquid, poisonous! A constant-boiling acid containing 20% hydrogen chloride is formed. Hydrochloric acid is a strong, highly corrosive acid.

Gas: M. p. -111°C ; b. p. -83.1°C . One liter of gas weighs 1.6392 g at 0°C . The commercial "concentrated" or fuming acid contains 38% of hydrogen chloride and has a sp. gr. 1.19. Soluble in water, alcohol and ether.

Derivation: (a) By-product from the chlorination of benzene and other hydrocarbons; (b) by the action of sulfuric acid on common salt; (c) by burning hydrogen, methane, or water gas in an atmosphere of chlorine; (d) Hargreaves process (q. v.).

Method of purification: Rectification (to remove arsenic); sometimes fractional distillation over ferrous chloride.

Impurities: Iron and arsenic.

Grades: U. S. P. XVI (35-38%); N. F. XI diluted (10%); technical (usually 18° , 20° ,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

or 22° B \acute{e} .); white; C. P.

Containers: Glass bottles; carboys (5, 6.5, 13 gals); rubber-lined steel drums; rubber-lined tank cars.

Uses (in approximate order of volume):

Acidizing (activation) of petroleum wells; chemical intermediates; ore reduction (manganese, radium, vanadium, tantalum, tin, tungsten); food processing (corn syrup, sodium glutamate), pickling and metal cleaning; industrial acidizing and general cleaning.

Warning! Causes burns; avoid contact with skin or eyes. MCA warning label.

Shipping regulations: Corrosive liquid. White label. *

hydrochlorothiazide (3,4-dihydrochlorothiazide)

$C_7H_8ClN_3O_4S_2$. 6-Chloro-7-sulfamyl-3,4-dihydro-1,2,4-benzothiadiazine-1,1-dioxide.

Properties: Crystals; m. p. 273-275°C.

Practically insoluble in water; soluble in dilute ammonia or sodium hydroxide, in methanol, ethanol and acetone.

Use: Medicine.

hydrocinnamic acid $C_6H_5CH_2CH_2COOH$.

Properties: Crystals with hyacinth-rose odor. M. p. 46°C.

Derivation: Reduction of cinnamic acid with sodium amalgam.

Use: Fixative for perfumes.

Shipping regulations: None. *

hydrocinnamic alcohol. See phenyl propyl alcohol.

hydrocinnamic aldehyde. See phenyl propyl aldehyde.

hydrocinnamyl acetate. See phenyl propyl acetate.

hydrocortisone (17-hydroxycorticosterone, cortisol, hydrocortisone alcohol, compound F) $C_{21}H_{30}O_5$. One of the adrenal cortical steroid hormones. More active than cortisone (q. v.) as an anti-inflammatory agent.

Properties: White, odorless, crystalline powder; sensitive to light, bitter taste, m. p. 217-220°C with some decomposition. Freely soluble in dioxane and methanol, insoluble in ether and water; slightly soluble in alcohol, chloroform and acetone.

Derivation: Isolation from extracts of adrenal glands; synthesis from other steroids.

Grade: U. S. P. XVI.

Use: Medicine (also used as the acetate salt).

hydrocortisone acetate $C_{23}H_{32}O_6$. The acetate salt of hydrocortisone.

Properties: White, odorless crystalline powder; m. p. 216-223°C (dec). Very slightly soluble in ether; practically insoluble in water; slightly soluble in alcohol and chloroform. Sensitive to light.

Grade: U. S. P. XVI.

Containers: Bottles.

Use: Medicine.

hydrocortisone alcohol. See hydrocortisone.

hydrocortisone sodium succinate $C_{25}H_{33}NaO_8$.

Properties: White, odorless, hygroscopic, amorphous solid. Very soluble in water and alcohol; insoluble in chloroform; very slightly soluble in acetone.

Grade: U. S. P. XVI.

Use: Medicine.

"Hydrocortone." ¹²³ Trademark for hydrocortisone (q. v.).

hydrocotarnine $C_{12}H_{15}NO_3 \cdot \frac{1}{2}H_2O$.

Properties: White crystalline alkaloid; poisonous! Soluble in alcohol and ether. Insoluble in water.

Constants: M. p. 50-55°C; decomposes at 100°C.

Derivation: From opium.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None. *

hydrocracking. The cracking of petroleum or its products in the presence of hydrogen. Special catalysts are used as, for example, platinum on a solid base of mixed silica and alumina.

hydrocyanic acid (prussic acid, hydrogen cyanide, formonitrile) HCN.

Properties: Water-white liquid at temperatures below 26.5°C, faint odor of bitter almonds, usual commercial material is 96-99.5% pure, vapors intensely poisonous, sp. gr. (liquid) 0.6970 (gas) 0.9348, b. p. 25.6°C, freezing point -13.3°C, flash point 0°F; soluble in water. The solution is weakly acidic, sensitive to light. When not absolutely pure or stabilized, it polymerizes spontaneously with explosive violence. Miscible in all proportions with water, alcohol, soluble in ether.

Derivation: (a) By treating a cyanide with dilute sulfuric acid. (b) By catalytically reacting ammonia and air with methane or natural gas. (c) By recovery from coke oven gases. (d) Decomposition of formamide. (e) From ammonia and hydrocarbons by electrofluid reactor.

Grades: Technical (96-98%); 2, 5 and 10% solutions. All grades usually contain a stabilizer, usually 0.05% phosphoric acid, to prevent explosive polymerization.

Containers: Bottles; steel cylinders; tank cars.

Uses: Manufacture of acrylonitrile, acrylates, adiponitrile, cyanide salts, dyes, fumigants, chelates; military poison gas; rubbers and plastics.

Fire Hazard: The liquid burns like alcohol; gas is not flammable in ordinary fumigation concentrations. Danger! Poison gas. Flammable. MCA warning label.

Shipping regulations: Hydrocyanic acid (prussic), liquid stabilized: poison, class A. Poison gas label by freight; not accepted by express. Hydrocyanic acid solutions: poison, class B. Poison label. Hydrocyanic acid, unstabilized: not accepted by common carrier. *

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Hydrotarco" ⁸⁹ Trademark for activated carbons used in municipal and industrial water purification.

hydrodealkylation. Hydrodealkylation is a petroleum refining process by which hydrogen under pressure is used to convert hydrocarbons in heavy reformates, naphthenic crudes or catalytic cracking recycle stocks. The process also converts organic sulfur compounds into hydrogen sulfide. Catalysts used may be calcined alkalinized chromia-alumina or cobalt molybdenum oxides, but some versions of the process do not use a catalyst.

hydrodisodium phosphate. Sodium phosphate, dibasic.

hydrofining. Process for high pressure catalytic hydrogenation of low-grade petroleum fractions to produce material having more desirable properties. Used for up-grading of charging stock such as heavy crudes and refinery residues, most frequently to produce improved lubricants.

"Hydroflo." ⁴¹³ Trademark for a trinitrotoluene base explosive with free flowing characteristics.

Uses: For seismic prospecting; open pit mining.

Containers: 12½ lb and 25-lb multiwall paper bags in 50-lb. shipping cases.

Fire hazard: Dangerous.

Shipping regulations. Explosives. Red label.*

hydroflumethiazide (trifluoromethylhydrothiazide) $C_8H_8F_3N_3O_4S_2$. 3,4-Dihydro-6-(trifluoromethyl)-2H-1,2,4-benzothiadiazine-7-sulfonamide-1,1-dioxide.

Properties: White, crystalline, odorless solid; m.p. 260-275°C. Insoluble in water and acid, soluble in dilute alkali but unstable in alkaline solutions.

Grade: Pharmaceutical.

Use: Medicine.

hydrofluoric acid (hydrogen fluoride) HF in aqueous solution. See also hydrogen fluoride, anhydrous.

Properties: Colorless, fuming, mobile, corrosive liquid. Poisonous, dangerous; produces terrible sores when allowed to touch the skin. Only a moderately strong acid, but unlike other acids will attack glass and any silica-containing material.

Derivation: Hydrogen fluoride gas is distilled from a mixture of calcium fluoride (fluorspar) and sulfuric acid. The gas is absorbed in water.

Grades: C. P., technical; various strengths to 70%.

Containers: Wax bottles, lead jars; lead carboys; steel drums, steel tank cars.

Uses: Polishing, etching and frosting of glass, pickling copper, brass, stainless and other alloy steels; electropolishing of metals; cleaning stone and brick, purification of filter paper and graphite; acidizing oil wells; control of fermentation; dissolving ores, laundry sour; cleaning castings.

See also under hydrogen fluoride, anhydrous.

Danger! Hazardous liquid and vapor. Causes severe burns which may not be immediately painful or visible. MCA warning label.

Shipping regulations: Corrosive liquid.

White label.*

hydrofluorosilicic acid. See fluosilic acid.

hydrofluosilicic acid. See fluosilic acid.*

"Hydrofol." ²²¹ Trademark for a line of hydrogenated fatty acids and glycerides. Available in a variety of grades for specific applications in industrial chemicals, soaps, textile sizings and softeners, packing compounds, adhesives, lubricants, polishing compounds, paper coatings, textile and leather chemicals, waxes, printing inks, plasticizers, cosmetics and electrical insulations.

hydroforming process. Process for dehydrogenation and conversion of paraffinic hydrocarbons into cyclic and aromatic hydrocarbons by the use of heat, pressure, and catalysts in the presence of hydrogen. Used in producing motor fuels of high octane rating from ordinary or low-grade products, such as straight-run gasolines or light naphthas. In some cases the processes are operated to recover technical benzene, toluene, and xylene from petroleum.

hydrofuramide (furfuramide)

$OC_4H_3CH(NCHC_4H_3O)_2$.

Properties: Light brown to white powder.

Constants: M.p. 117°C, boils about 250°C with decomposition. Insoluble in cold water; soluble in alcohol and ether.

Derivation: Treatment of furfural with ammonia in the cold.

Containers: 25-, 50-, and 100-lb drums.

Uses: Accelerator; hardening agent for resins, in fungicides.

hydrogen H. Element of atomic number 1. The lightest element.

Properties: Colorless gas; highly flammable.

Sp. gr. 0.0694 referred to air; sp. volume 193 cu ft/lb (70°F); m.p. -259°C; b.p. -252°C. Very slightly soluble in water; alcohol, ether.

Derivation: (a) By the action of steam on natural gas at high temperatures, and subsequent purification, (b) by treatment of water gas with steam and absorption of the carbon dioxide; (c) dissociation of ammonia; (d) thermal decomposition of hydrocarbons or catalytic reforming of petroleum; (e) by reaction of iron and steam; (f) catalytic reaction of methanol and steam; (g) by electrolysis of water.

Grades: Technical; pure, from an electrolytic grade of 99.8% to ultra pure, with less than 10 ppm impurities. See also para-hydrogen.

Containers: Steel cylinders; tank cars of cylinders.

Uses: Production of synthetic ammonia and synthetic methanol; hydrogenation of

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

organic materials such as naphthalene, phenol, oils; reducing agent for organic synthesis and reduction of metallic ores; reducing atmospheres to prevent oxidation; as oxyhydrogen flame for high temperatures; atomic-hydrogen welding, small balloons (no longer used for dirigibles or passenger-carrying balloons); making hydrochloric and hydrobromic acids; rocket fuel.

Shipping regulations: Gas: Flammable gas. Red gas label. Liquid: Not accepted by common carrier. *

ortho-hydrogen. See para-hydrogen.

para-hydrogen. Type of molecular hydrogen preferred for rocket fuels. Molecular hydrogen (H_2) exists in two varieties, ortho and para, named according to their nuclear spin types. Ortho-hydrogen molecules have a parallel spin; para- an antiparallel spin. By cooling to liquid air temperature and use of a catalyst, the normal equilibrium of 3 ortho- to 1 para- is displaced and para-hydrogen may be isolated. It is being produced with less than 5 ppm impurities.

hydrogen 2. See deuterium.

hydrogen 3. See tritium.

hydrogenated oils (hardened oils). Oils treated with hydrogen in presence of a catalyst, usually nickel, thereby converting all or part of the oleic acid or olein (unsaturated) into stearic acid or stearin (saturated). The oils thus treated are rendered suitable for the manufacture of hard soaps (where previously they could only be used for making soft soaps) and for making lubricants. Hydrogenated oils are also used for making lard substitutes for foods, tanner's greases, varnishes, etc.

hydrogenation. Combination of hydrogen with another substance, usually an unsaturated organic compound, and usually under the influence of temperature, pressure, and catalysts (usually nickel). Thus unsaturated components of cottonseed oil and other oils are hydrogenated to produce solid fats.

hydrogen, atomic. See atomic-hydrogen welding.

hydrogen bomb. See nuclear fusion.

hydrogen bromide. See hydrobromic acid, hydrogen bromide, anhydrous.

hydrogen bromide, anhydrous HBr.

Properties and derivation: See hydrobromic acid. The gas is liquefied under a pressure of 350 psi at 25°C.

Grades: Up to 99.8% min purity.

Containers: 15- and 150-lb cylinders.

Uses: As an agent in pharmaceutical synthesis, makes (1) bromides by direct reaction with alcohols, (2) intermediates for barbiturate manufacture, (3) acts as intermediate in the manufacture of synthetic

hormones. In the petroleum industry, hydrogen bromide is used as an alkylation catalyst.

Shipping regulations: Nonflammable gas. Green label. *

hydrogen carboxylic acid. See formic acid

hydrogen chloride. See hydrochloric acid; hydrogen chloride, anhydrous.

hydrogen chloride, anhydrous HCl.

Properties and derivation: See hydrochloric acid. Pure HCl is a colorless gas, and on liquefaction gives a colorless liquid.

Method of Purification: Solvent extraction is one method.

Containers: Cylinders.

Uses: In reactions where aqueous hydrochloric acid is not suitable, such as production of vinyl chloride from acetylene and alkyl chlorides from olefins. Also in polymerization, isomerization, alkylation, and nitration reactions.

Danger: Hazardous liquid and gas under pressure. Causes burns. Extremely irritating. MCA warning label.

Shipping regulations. Nonflammable gas. Green label. *

hydrogen cyanide. See hydrocyanic acid.

hydrogen dioxide. See hydrogen peroxide.

hydrogen electrode. See electrode, hydrogen.

hydrogen fluoride. See hydrofluoric acid; hydrogen fluoride, anhydrous.

hydrogen fluoride, anhydrous (hydrogen fluoride) HF. See hydrofluoric acid.

Properties: Colorless, fuming, mobile, corrosive liquid, or colorless corrosive gas, soluble in water. Poisonous, dangerous, produces severe burns which do not heal easily. The liquid and gas consist of associated molecules; the vapor density corresponds to HF only at high temperatures. F. p. -83°C, b. p. 19.5°C; sp. gr. liquid 0.988.

Derivation: Distillation from the reaction of calcium fluoride and sulfuric acid.

Grade: To 99.9% min purity.

Containers: Cylinders, tank cars.

Uses: Catalyst in alkylation, isomerization, condensation, dehydration, and polymerization reactions; fluorinating agent in organic and inorganic reactions; production of fluorine and aluminum fluoride; preparation of aqueous hydrofluoric acid; production of synthetic cryolite, of fluorides, fluoborates, fluosilicates, fluorocarbons; additive in liquid rocket propellants; refining of uranium.

Danger! Extremely hazardous liquid and vapor. Causes severe burns which may not be immediately painful or visible. MCA warning label.

Shipping regulations: Corrosive liquid. White label. *

hydrogen iodide. See hydriodic acid.

hydrogen ion concentration. See pH.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

hydrogenolysis. The cleavage of a bond in an organic compound with simultaneous addition of a hydrogen atom to each fragment.

hydrogen oxide. See water.

hydrogen peroxide (hydrogen dioxide; peroxide) H_2O_2 .

Properties: A colorless, heavy liquid, usually sold in aqueous solution of various strengths. Anhydrous hydrogen peroxide has sp. gr. 1.46; m. p. -2°C ; b. p. 158°C ; is soluble in water and alcohol. It is fundamentally unstable; the decomposition is slow with pure material but catalyzed by many impurities, especially metallic impurities. The commercial solutions commonly contain a preservative, such as acetophenetidin or acetanilide. Contact with the more concentrated solutions should be avoided. Hydrogen peroxide is an active oxidizing agent. The concentrated material may react explosively with combustible materials.

Derivation: (a) By the electrolytic oxidation of sulfuric acid or a sulfate to persulfuric acid or a persalt with subsequent hydrolysis and distillation of the hydrogen peroxide formed; (b) by decomposition of barium peroxide with sulfuric or phosphoric acids, (c) hydrogen reduction of 2-ethylanthraquinone followed by oxidation with air to regenerate the quinone and produce hydrogen peroxide, (d) electrical discharge through a mixture of hydrogen, oxygen, and water vapor.

Grades: U. S. P. XVI (3%), technical (3%, 6%, 27.5%, 30%, 35%, 50%, and 90%).

Most common commercial strengths are 27.5%, 35%, 50%, and 70%.

Containers: Amber glass bottles, carboys; aluminum drums; tank trucks and tank cars.

Uses: Bleaching of textiles, wood pulp, hair, fur, straw, glue, gelatin, waxes, soap, etc; source or organic and inorganic peroxides; rocket fuel oxidizer and torpedo propellant; production of foam rubber and other porous materials; antichlor; dyeing; electroplating, antiseptic; laboratory reagent, blowing agent; epoxidation; hydroxylation, oxidation and reduction; viscosity control for starch and cellulose derivatives.

Caution! Strong oxidant. Avoid contact with skin or eyes. Fire and explosion hazard with concentrations greater than 65%. MCA warning label.

Shipping regulations: Corrosive liquid. White label, for solutions containing over 8% hydrogen peroxide (H_2O_2) strength by weight.*

hydrogen phosphide. See phosphine.

hydrogen, phosphoretted. See phosphine.

hydrogen sulfate. See sulfuric acid.

hydrogen sulfide (sulfuretted hydrogen) H_2S .

Properties: Colorless, flammable gas; offensive odor; sweetish taste; dangerously poisonous! Soluble in water and alcohol,

sp. gr. 1.1895; m. p. -83.8°C ; b. p. -60.2°C .

Derivation: (a) By the action of dilute sulfuric acid on a sulfide, usually iron sulfide; (b) by direct union of hydrogen and sulfur vapor at a definite temperature and pressure; (c) by heating sulfur with paraffin wax; (d) as a by-product of petroleum refining.

Containers: Usually prepared as wanted; also shipped in steel cylinders.

Grades: Technical 98.5%; purified 99.5% min.

Uses: Purification of hydrochloric and sulfuric acids; precipitating sulfides of metals; reagent in analytical chemistry; manufacture of elementary sulfur.

Danger: Poison liquid and gas under pressure. Flammable. MCA warning label.

Shipping regulations: Flammable gas. Red gas label.*

hydrogen tellurate. See telluric acid.

"Hydrogum." ³⁶ Ester gum made with hydrogenated rosin.

Properties: Color WW to WG (U. S. Department of Agriculture rosin standards); acid number 4 to 6, melting range 120 to 132°F (capillary tube method). Insoluble in alcohol; soluble cold in acetates, coal-tar solvents, turpentine, and drying oils. Imparts fair resistance to abrasion, water, and weather.

Uses: Varnishes; oleoresinous vehicles; adhesives; chewing gum; etc.

hydrohydrastinine $\text{C}_{11}\text{H}_{13}\text{NO}_2$.

Properties: White crystalline alkaloid; poisonous! Soluble in alcohol and water. M. p. 66°C , b. p. 303°C .

Derivation: By extraction of Hydrastis canadensis and subsequent crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

hydrol. See tetramethyldiaminobenzhydrol.

hydrolase (hydrase). An enzyme which catalyzes the removal of water from the substrate.

"Hydrolin." ⁴¹³ Trademark for an ammonium nitrate base blasting agent which requires specially constructed primers for detonation.

Containers: Tin cans, $4\frac{1}{2}$ " and $5\frac{1}{2}$ " diameters; $16\frac{2}{3}$ -lb., 25-lb, 40-lb and 50-lb. weights; $4\frac{1}{2}$ " and $5\frac{1}{2}$ " sizes packed in 50-lb. shipping cases.

Use: For seismic prospecting at sea.

Fire Hazard: Dangerous.

Shipping regulations: Oxidizing material. Yellow label.*

hydrolubes. Water-glycol base, non-flammable hydraulic fluids.

"Hydrolux." ⁴² Proprietary product. Stabilized reducing agent.

Properties: Colorless, syrupy liquid. Completely soluble in water.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: 55-gal steel drums.

Uses: Assistant in vat and sulfur color dyeing and printing. Used in yarn dyeing on same types of colors, as extender and stabilizer for reducing agents.

hydrolysis. A chemical reaction in which water acts upon another substance to form one or more entirely new substances. Examples are the conversion of starch to glucose by water in the presence of suitable catalysts; the conversion of sucrose (cane sugar) to glucose and fructose by reaction with water, again in the presence of an enzyme or acid catalyst; the conversion of natural fats into fatty acids and glycerin by reaction with water in one process of soap manufacture; and the reaction of the ions of a dissolved salt to form various products, such as acids, complex ions, etc.

"**Hydromagma.**" ¹²³ Trademark for magnesium hydroxide paste.

"**Hydron.**" ³⁰⁷ Sulfide blues derived from carbazole.

hydrophilic. Having an affinity for water; capable of uniting with or dissolving in water.

hydrophobic. Having an antagonism to water; not capable of uniting or mixing with water.

"**Hydropol.**" ³⁰³ Trade name for a partially hydrogenated polybutadiene. This rubbery polymer, when properly compounded with vulcanizing ingredients, has its major use in gaskets, O-rings, etc., for use in rockets. Such compounds have shown good resistance to unsymmetrical dimethylhydrazine and hydrazine rocket fuels. Another application for Hydropol compounds is as a material for bonding polyethylene to rubber, brass, or brass-plated metals.

hydroponics. Cultivation of plants using solutions of inorganic salts instead of earth. See nutrient solution.

"**Hydro-Pruf.**" ³⁰⁰ Trademark for a silicone water repellent for fabrics. Applied with a catalyst at high curing temperatures.

hydroquinine hydrochloride

$C_{20}H_{26}O_2N_2 \cdot HCl \cdot 2H_2O$.

Properties: White, crystalline, alkaloid salt; m. p. 235°C (anhydrous). Soluble in alcohol and water.

Derivation: Extraction from Cinchona.

Uses: Medicine; raw material for manufacture of cinchona alkaloids.

Shipping regulations: None.*

hydroquinol. See hydroquinone.

hydroquinone (quinol; hydroquinol; para-dihydroxybenzene) $C_6H_4(OH)_2$.

Properties: White crystals; soluble in water, alcohol and ether, Sp. gr. 1.330; m. p. 170°C; b. p. 285°C.

Derivation: Aniline is oxidized to quinone by manganese dioxide and is then reduced

to hydroquinone.

Method of purification: Crystallization.

Grades: Technical; photographic.

Containers: Glass bottles; multiwall paper sacks; fiber drums.

Uses: Photographic developer; dye intermediate, medicine; antioxidant, inhibitor; stabilizer in decorating ceramic ware, in coating compounds for rubber, stone, and textiles, and in paints and varnishes, motor fuels and oils; antioxidant for fats and oils; inhibitor of polymerization.

Shipping regulations: None.*

hydroquinone, benzyl ethers. Monobenzyl ether of hydroquinone ($C_6H_5CH_2OC_6H_4OH$); dibenzyl ether of hydroquinone ($C_6H_5CH_2OC_6H_4OCH_2C_6H_5$).

Typical specifications:

Monobenzyl ether: Tan powder; m. p. 110°C (min); purity 90% (min); sp. gr. 1.26; ash 0.25% (max).

Dibenzyl ether: Tan powder; m. p. 119°C (min); purity 90% (min).

Insoluble in water; soluble in acetone, benzene, and chlorobenzene.

Grade: Commercial.

Uses:

Monobenzyl ether: Stabilizer, antioxidant, polymerization inhibitor and in organic synthesis.

Dibenzyl ether: Solvent and in perfumes, soap, plastics and pharmaceuticals.

Handle with caution!

hydroquinone di-n-butyl ether (1,4-dibutoxybenzene) $C_6H_4[O(CH_2)_3CH_3]_2$.

Typical specifications: White flakes with no appreciable odor; melting point 45-46°C, b. p. 124°C (1.3 mm), 158°C (15.0 mm), insoluble in water; soluble in benzene, acetone, ethyl acetate, and alcohol.

hydroquinone diethyl ether (1,4-diethoxybenzene) $C_6H_4(OC_2H_5)_2$.

Properties: White, granular solid with anise-like odor; b. p. 246°C; neither boiling caustic nor acid solution cause any hydrolysis, ability to absorb ultraviolet light; insoluble in water; soluble in benzene, acetone, ethyl acetate, and alcohol.

Typical specifications: Melting point 70-71°C, b. p. 234°C.

hydroquinone, di(beta-hydroxyethyl) ether (para-di-[2-hydroxyethoxy]benzene) $C_6H_4(OC_2H_4OH)_2$.

Properties: White solid. M. p. 94-96°C, b. p. 185-200°C (0.3 mm). Slightly soluble in water and most organic solvents; miscible with water at 80°C.

Uses: Reactant in preparation of polyesters, polyolefins, polyurethanes; reactant in preparation of hard waxy resins; raw material in organic synthesis.

hydroquinone dimethyl ether (1,4-dimethoxybenzene, dimethyl hydroquinone) $C_6H_4(OCH_3)_2$.

Properties: White flakes with sweet clover odor; b. p. 213°C; m. p. 56°C; density 1.0293 g/ml (65°C); viscosity 1.04 cps (65°C); dielectric constant 2.8; absorbs

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ultraviolet light in range 2800-3100 Å.
Insoluble in water; soluble in benzene and alcohol.

Containers: Glass bottles; fiber drums.

Uses: Weathering agent in paints and plastics; fixative in perfumes; dyes; resin intermediate; cosmetics, especially sun-tan preparations.

hydroquinone glucose. See arbutin.

hydroquinone mono-n-butyl ether

$\text{CH}_3(\text{CH}_2)_3\text{OC}_6\text{H}_4\text{OH}$.

Typical specifications: White flakes; m. p. 64-65°C; b. p. 115°C (1.4 mm); insoluble in water; soluble in benzene, acetone, ethyl acetate, and alcohol.

hydroquinone monoethyl ether (4-ethoxyphenol) $\text{C}_2\text{H}_5\text{OC}_6\text{H}_4\text{OH}$.

Typical specifications: White solid; m. p. 63-65°C; b. p. 246-247°C; slightly soluble in water; soluble in benzene, acetone, ethyl acetate, and alcohol.

Uses: See hydroquinone monomethyl ether.

hydroquinone monomethyl ether (4-methoxyphenol, para-hydroxyanisole) $\text{CH}_3\text{OC}_6\text{H}_4\text{OH}$.

Properties: White to tan flakes; m. p. 52.5°C; b. p. 243°C; sp. gr. (20/20°C) 1.55. Slightly soluble in water; readily soluble in benzene, acetone, ethyl alcohol, and ethyl acetate.

Containers: Glass bottles; fiber drums.

Uses: Manufacture of antioxidants, pharmaceuticals, plasticizers, dyestuffs; and inorganic synthesis, stabilizer for chlorinated hydrocarbons and ethyl cellulose; inhibitor for acrylic monomers and acrylonitriles; ultraviolet inhibitor.

hydrosilicofluoric acid. See fluosilicic acid.

"Hydrosol." ²³² Brand name for a proprietary product of the hydrosulfite class for wool bleaching.

hydrosulfite. This term refers to a sodium hydrosulfite (q. v.).

hydrosulfite-formaldehyde compounds. This term usually refers to mixtures of sodium formaldehyde hydrosulfite and sodium formaldehyde bisulfite, used as discharges and stripping or reducing agents in dyeing and other textile operations. In some cases the zinc derivatives are used. Derivation is by the action of formaldehyde on aqueous sodium hydrosulfite, or from zinc, formaldehyde, sulfur dioxide and sodium hydroxide.

"Hydrotan." ²³⁶ Brand name for a proprietary product. A soluble caustic-tannin compound containing one part caustic soda and two parts tannin for the alkaline tannate treatment of drilling muds. Allows greater accuracy and economy in treatment and eliminates the hazards of handling raw caustic soda.

"Hydrotex." ³⁵⁴ A highly concentrated paraffin emulsion, stable to hard water, acids, and salts. Used for waterproofing textiles.

cardboard, leather, etc. in one-bath processes.

"Hydro-T-Metal." ¹³⁵ An alloy containing 0.2-0.7% copper, 0.08-0.160% titanium, 0.002-0.010% manganese, 0.003-0.020% chromium, the remainder being zinc. Properties: M. p. 792°F; tensile strength 24,000 psi (min); specific heat 0.096 Btu/lb/°F; density 0.258 lb/cu. in. Derivation: From high grade slab zinc. Grades: Hydro-T-Metal 100 and 200. Containers: Boxes, crates and skids. Uses: Hydro-T-Metal 100: Flashings; roofing, coping covers, cavity walls, bay windows, gutters, gravel stops, roof aprons, water table, termite shields, sidings, shingles, corrugated sheet etc. Hydro-T-Metal 200: Industrial application where a non-rusting, easily soldered metal required; can be spun, drawn and formed.

hydrotropes (hydrotrophes). Chemicals which have the property of increasing the aqueous solubility of various slightly soluble organic chemicals. Used especially in the formulation of liquid detergents.

hydrotrophes. See hydrotropes.

hydrous. This term is commonly and loosely used of materials to indicate the presence of an indefinite amount of water. In the case of certain minerals and some other compounds, it is used to mean the presence of a definite proportion of combined water. Thus certain hydroxides regularly are referred to as hydrous oxides by mineralogists, and minerals containing water of hydration are referred to as hydrous forms. The term hydrous oxide is also used to refer to oxides of aluminum, iron, etc. as they are precipitated, with indefinite amounts of water, from their aqueous solutions. In any case the term hydrous should be used and interpreted with caution.

hydrox fuel cell. See fuel cells.

hydroxocobalamin. See vitamin B₁₂.

hydroxy-acetal. The complete chemical name is hydroxycitronellal dimethyl acetal. This is an aromatic chemical used in the perfume industry. It produces a lily-like odor and can also be used in lilac, orange flower and many other compositions for the toilet-goods trade. It has the advantage of holding up in the presence of alkalis and does not cause any stinging or smarting when used in cold creams, lipsticks, or other toilet preparations.

para-hydroxyacetanilide. See para-acetylamino-phenol.

hydroxyacetic acid. See glycolic acid.

hydroxyacetic acid, technical (70%)
 HOCH_2COOH . For the pure acid, see glycolic acid.

Properties: Light straw-colored liquid containing approximately 70% hydroxyacetic

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

acid with traces of other organic acids.

Odor like burnt sugar; sp. gr. 1.27; m. p. 10°C; soluble in water, methanol, acetone, acetic acid; insoluble in hydrocarbons, ethers, esters, higher ketones.

Containers: 50-gal wooden barrels; 6000- and 10,000-gal tank cars.

Uses: In leather dyeing and tanning; textile dyeing; manufacture of cleaning, polishing, and soldering compounds; copper pickling; adhesives; in electroplating; breaking of petroleum emulsions; preparation of adhesive emulsions; with citric acid as a chelating agent for iron.

hydroxyacetone. See acetol.

ortho-hydroxyacetophenone $C_6H_4(OH)COCH_3$.

Properties: Greenish-yellow liquid with minty odor; sp. gr. (20.8°C) 1.1307, b. p. (717 mm) 213°C; refractive index (n_D 20/D) 1.5580; slightly soluble in water.

2-hydroxyadipaldehyde

$OHCCCH_2CH_2CH_2CHOHCHO$.

Properties: (25% aqueous solution): Sp. gr. (20°C) 1.066; b. p. 37°C (50 mm), vapor pressure (20°C) 17 mm; f. p. -3.5°C; pH approx 3.0.

Containers: 55-gal drums.

Uses: Intermediate, insolubilizing agent for proteins and polyhydroxy materials; crosslinking agent for polyvinyl compounds; shrinkage control agent (textiles).

beta-hydroxyalanine. See serine.

5-hydroxy-3-(beta-aminoethyl) indole. See serotonin.

hydroxyamphetamine [para-(2-aminopropyl) phenol] $HOC_6H_4CH_2CHNH_2CH_3$.

Properties: Crystals with m. p. 125-126°C. Soluble in water, alcohol, chloroform, and ethyl acetate.

Derivation: From para-nitrobenzyl chloride and a salt of nitroethane or from anisaldehyde and nitroethane.

Use: Medicine.

hydroxyamphetamine hydrobromide (para-(2-aminopropyl) phenol hydrobromide) $HOC_6H_4CH_2CH(CH_3)NH_2 \cdot HBr$.

Properties: White, crystalline solid with faint odor. M. p. 189-192°C. Very soluble in water; freely soluble in alcohol; practically insoluble in benzene and ether, pH (2% solution) 4.5-5.5.

Grade: U. S. P. XVI.

Use: Medicine.

hydroxyanilines. See aminophenols.

ortho-hydroxyanisole. See guaiacol.

para-hydroxyanisole. See hydroquinone monomethyl ether.

9-hydroxyanthracene. See anthranol.

hydroxyapatite. See apatite.

para-hydroxyazobenzene-para-sulfonic acid. $HOC_6H_4N=N(C_6H_4SO_3H)$.

Properties: Orange red crystals; very soluble in water.

Uses: Analytical reagent; precipitant for

numerous organic bases.

meta-hydroxybenzaldehyde HOC_6H_4CHO .

Properties: Orange pink crystals; m. p. 101.5°C; slightly soluble in cold water; very soluble in hot water and aromatic hydrocarbons.

Uses: Intermediate for dyes, plastics, pharmaceuticals and bactericides; color reagent for Schiff's reagent; sensitizing agent in photographic emulsions.

ortho-hydroxybenzaldehyde. See salicylaldehyde.

para-hydroxybenzaldehyde HOC_6H_4CHO .

Properties: Colorless needles; soluble in alcohol, ether, or water; sp. gr. 1.129; m. p. 116°C (sublimes).

Use: Pharmaceuticals.

ortho-hydroxybenzamide. See salicylamide.

hydroxybenzene. See phenol.

ortho-hydroxybenzoic acid. See salicylic acid.

meta-hydroxybenzoic acid $C_6H_4(OH)COOH$.

Properties: White powder, m. p. 200°C. Soluble in water and hot alcohol.

Uses: Intermediate for plasticizers; resins; light stabilizers; petroleum additives; pharmaceuticals.

para-hydroxybenzoic acid $C_6H_4(OH)COOH \cdot H_2O$.

Properties: Colorless crystals, soluble in alcohol, water, and in ether. M. p. 210°C.

Derivation: By the interaction of para-aminobenzoic acid and nitrous acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Drums.

Uses: Intermediates, synthetic drugs.

Shipping regulations: None. *

2-(4-hydroxybenzoyl) benzoic acid

$C_6H_4(COOH)COC_6H_4OH$. Off-white or slightly yellow crystalline powder; m. p. 209-216°C. Used as an intermediate.

ortho-hydroxybenzyl alcohol. See salicyl alcohol.

hydroxybrasilin. See hematoxylin.

3-hydroxy-2-butanone. See acetyl methylcarbinol.

beta-hydroxybutyraldehyde. See aldol.

beta-hydroxybutyric acid

$CH_3CH(OH)CH_2COOH$.

Properties: Viscid, yellow mass, m. p. 48-50°C; b. p. 130°C (12 mm); very soluble in water, alcohol, and ether.

Derivation: By the interaction of acetoacetic acid and sodium amalgam.

Grades: Technical; reagent.

Containers: Wooden kegs.

Use: Intermediates.

Shipping regulations: None. *

hydroxy-beta-carotene. See cryptoxanthin.

1-hydroxy-4-chloro-2-nitrobenzene.

See 4-chloro-2-nitrophenol.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

hydroxychloroquine sulfate $C_{18}H_{26}ClN_3O \cdot H_2SO_4$.
7-Chloro-4-[4-{ethyl(2-hydroxyethyl)-amino}-1-methylbutylamino] quinoline sulfate.

Properties: White, crystalline, odorless powder. Bitter taste; pH of solutions 4.5. Freely soluble in water. Insoluble in alcohol, chloroform, ether. Exists in two forms: m. p. usual form 240°C; m. p. other form 198°C.

Grade: U. S. P. XVI.

Use: Medicine.

3-β-hydroxycholestane. See dihydrocholesterol.

hydroxycinchonine. See cupreine.

hydroxycitronellal (citronellal hydrate; 3,7-dimethyl-7-hydroxyoctanal; synthetic muguet) $C_{10}H_{20}O_2$.

Properties: Viscous, colorless or faintly yellow liquid, sweet lily-type odor; sp. gr. 0.925-0.930 (15°C); refractive index (n_D²⁰) 1.448-1.450; optical rotation (Java type) +9 to +10.5°; (Eucalyptus citriodora type) +0.5 to -0.5°; boiling range 94-96°C (1 mm). Soluble in alcohol (50%), fixed oils, slightly soluble in water, glycerol, and mineral oil.

Derivation: Hydration of citronellal (Java citronella or Eucalyptus citriodora).

Containers: Cans.

Uses: Perfumery (fixative, muguet odor). See also "Laurine."

hydroxycitronellal dimethyl acetal. See hydroxy-acetal.

hydroxycitronellal methyl anthranilate Schiff base. See "Aurantol."

17-hydroxycorticosterone. See hydrocortisone.

2-hydroxy-para-cymene. See carvacrol.

3-hydroxy-para-cymene. See thymol.

1-hydroxy-2,4-diamylbenzene. See diamyl phenol.

2-hydroxydibenzofuran $HOC_{12}H_7O$.

Properties: Powder, m. p. 128-134°C.

Grade: Technical.

Use: Synthesis.

2-hydroxydibenzofuran-3-carboxylic acid

$HOC_{12}H_6OCOOH$.

Properties: Powder; m. p. 268°C.

Grade: Technical.

Use: Synthesis.

14-hydroxydihydromorphinone. See oxymorphone.

hydroxydimethylbenzene. See xylene.

7-hydroxy-3,7-dimethyloctan-1-al. See "Laurine."

2'-hydroxy-5,9-dimethyl-2-(2-phenethyl)-6,7-benzomorphan hydrobromide.
See phenazocine.

hydroxydione sodium (hydroxydione sodium succinate) $C_{25}H_{35}NaO_6$. Sodium 21-hydroxy-pregnane-3,20-dione succinate. A steroid compound; white powder; m. p. 193°C with decomposition. Soluble in slightly alkaline

solutions; in acetone and chloroform.

Grade: N. N. D.

Use: Medicine.

hydroxydiphenyl. See phenylphenol.

para-hydroxydiphenylamine (anilinophenol) $C_6H_5NHC_6H_4OH$.

Typical specifications: Gray solid leaflets; m. p. 50°C (approx); purity 98% (min); distillation range 155-210°C (3 mm); insoluble in water; soluble in alcohol, ether, acetone, chloroform, alkali, and benzene. Handle with caution!

hydroxydiphenylmethanes. See benzylphenols.

ortho-(2-hydroxy-3,6-disulfo-1-naphthylazo)-benzenearsonic acid (thorin)

$HOC_{10}H_4(SO_3H)_2NNC_6H_4AsO_3H_2$. A reagent for the colorimetric determination of microgram quantities of thorium.

2-hydroxyethanesulfonic acid. See isethionic acid.

hydroxyethylacetamide. See N-acetyl ethanolamine.

2-hydroxyethylamine. See ethanolamine.

hydroxyethylcellulose. See also "Cellosize."

Properties: Nonionic, water soluble ether of cellulose. Stable in concentrated salt solutions; grease and oil resistant.

Containers: Fiber drums.

Uses: Thickening and suspending agent; stabilizer for vinyl polymerization.

hydroxyethylethylenediamine (aminoethyl-ethanol amine) $NH_2CH_2CH_2NHCH_2CH_2OH$.

Properties: Hygroscopic liquid. Mild, ammoniacal odor. Soluble in water. Sp. gr. 1.0304 (20/20°C); b. p. 243.7°C (760 mm); vapor pressure 0.01 mm (20°C); flash point 275°F; wt/gal 8.6 lbs (20°C).

Grades: Technical.

Containers: 1-gal glass jugs, 5-, 55-gal drums.

Use: Raw material for textile compounds, including antifuming agents, dyestuffs, resins, rubber products, insecticides, and certain medicinals.

hydroxyethylethylenediaminetriacetic acid

$HOOCCH_2N(CH_2CH_2OH)CH_2CH_2N(CH_2COOH)_2$.

Properties: Soluble in water and methanol.

Grades: Technical.

Use: Chelating compound.

beta-hydroxyethylhydrazine (ethanolhydrazine) $HOCH_2CH_2NHNH_2$.

Properties: Colorless, slightly viscous liquid; sp. gr. (20°C) 1.11; m. p. -70°C; boiling range (25 mm Hg) 145-153°C; flash point 224°F; completely miscible with water; soluble in lower alcohols; slightly soluble in ether.

Grade: 70%.

Use: Intermediate.

N-hydroxyethylmorpholine. See N-morpholine ethanol.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

N-hydroxyethyl piperazine

Properties: Liquid; sp. gr. 1.0614 (20/20°C); b. p. 246.3°C; f. p. -10°C; flash point 255°F. Miscible with water.

Uses: Intermediate for pharmaceuticals, anthelmintics, surface active agents, and synthetic fibers.

N-2-hydroxyethylpiperidine. See 2-piperidino-ethanol.

hydroxyethyltrimethylammonium bicarbonate

$(\text{CH}_3)_3\text{NCH}_2\text{CH}_2\text{OH} \cdot \text{HCO}_3$. A quaternary ammonium compound. Sp. gr. 1.0965 (25/4°C); 9.15 lbs/gal (68°F); b. p., decomposes. Miscible with water.

Uses: Catalyst; intermediate.

beta-hydroxyethyltrimethylammonium hydroxide. See choline.

1-hydroxyfenchane. See fenchyl alcohol.

alpha-hydroxyisobutyronitrile. See acetone cyanhydrin.

4-hydroxy-2-keto-4-methylpentane. See diacetone alcohol.

hydroxylamine (oxammonium) NH_2OH . The free base is unstable.

Properties: Colorless crystals; decomposes when heated and explodes at 130°C. Soluble in alcohol, acids and cold water. Sp. gr. 1.227; m. p. 33°C; b. p. 70°C.

Derivation: By decomposing hydroxylamine hydrochloride or sulfate with a base and distilling in vacuo.

Method of purification: Redistillation.

Containers: Lead-lined steel drums.

Uses: Reducing agent; organic synthesis.

Shipping regulations: None.*

hydroxylamine acid sulfate (hydroxylammonium acid sulfate; HAS) $\text{NH}_2\text{OH} \cdot \text{H}_2\text{SO}_4$.

Properties: White to brown crystalline solid, commercial grade is wet with free sulfuric acid; soluble in water and methanol; slightly soluble in alcohol. Wt/gal 15-16 lbs (20°C); m. p. indefinite; pH of 0.1 M aqueous solution 1.6.

Containers: 5-, 15-gal drums; 1-gal cans.

Uses: Unhairing agent; photographic developer, purification agent for aldehydes and ketones; synthesis of dyes, pharmaceuticals; rubber chemicals; analytical reagent.

hydroxylamine hydrochloride (hydroxylammonium chloride) $\text{NH}_2\text{OH} \cdot \text{HCl}$.

Properties: Colorless hygroscopic crystals, soluble in water, glycerol and alcohol; insoluble in ether. M. p. 155°C; b. p., decomposes; pH of 0.1 M aqueous solution 3.4.

Derivation: Reduction of ammonium chloride, frequently by electrolysis.

Method of purification: Crystallization.

Grades: Technical; C. P.

Containers: Glass bottles; 1-gal cans; 25-, 100-lb fiber drums.

Uses: Organic synthesis; photographic developer; medicine; controlled reduction reactions.

hydroxylamine sulfate (HS; hydroxylammonium sulfate) $(\text{NH}_2\text{OH})_2 \cdot \text{H}_2\text{SO}_4$.

Properties: Colorless crystals; solution has a corrosive action on the skin; m. p. 172°C dec; soluble in water; slightly soluble in alcohol.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles; 1-gal cans; 40-, 100-, 400-lb fiber drums.

Uses: Unhairing agent; photographic developer; purification agent for aldehydes and ketones; chemical synthesis; reducing agent; textile chemical; oxidation inhibitor for fatty acids; catalyst; biological and biochemical research; making oximes for paints and varnishes; aid in rustproofing.

Shipping regulations: None.*

hydroxylammonium acid sulfate. See hydroxylamine acid sulfate.

hydroxylammonium chloride. See hydroxylamine hydrochloride.

hydroxylammonium sulfate. See hydroxylamine sulfate.

hydroxymercurichlorophenol (2-chloro-4-(hydroxymercuri) phenol)

$\text{C}_6\text{H}_3\text{Cl}(\text{HgOH})(\text{OH})$. Insoluble in water and common organic solvents. Soluble in solutions of acids and alkalis with the formation of salts.

Use: A seed disinfectant.

Warning: Poisonous if inhaled or swallowed. May cause skin irritation. MCA warning label.

hydroxymercuricresol. A pesticide.

Warning! Poisonous if inhaled or swallowed. May cause skin irritation. MCA warning label.

ortho-[(3-hydroxymercuri-2-methoxypropyl) carbamyl]-phenoxyacetic acid, sodium salt.

See mersalyl.

hydroxymercurinitrophenol. A pesticide.

Warning! Poisonous if inhaled or swallowed. May cause skin irritation. MCA warning label.

alpha-hydroxy-beta-methylaminopropylbenzene. See ephedrine.

3-hydroxy-3-methylbutanone-2

$\text{CH}_3\text{COH}(\text{CH}_3)\text{C}(\text{O})\text{CH}_3$. Colorless liquid; sp. gr. 0.95 (25/25°C). Used as an intermediate.

7-hydroxy-4-methylcoumarin. See beta-methyl umbelliferone.

hydroxymethylethylene carbonate. See glycerin carbonate.

dl-alpha-hydroxy-gamma-methylmercaptobutyric acid, calcium salt (2-hydroxy-4-methylthiobutyric acid, calcium salt) $(\text{CH}_3\text{SCH}_2\text{CH}_2\text{CHOHCOO})_2\text{Ca}$.

Properties: A free flowing light tan powder; soluble in water; insoluble in common organic solvents.

Uses: Animal feed; synthesis of pharmaceuticals.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

2-hydroxymethyl-5-norbornene "Cyclol"; bicyclo (2, 2, 1)-hept-5-ene-2-methylol. $C_8H_{12}O$.

Properties: Stable, colorless liquid; a high-boiling solvent; miscible with most common solvents.

Containers: 55-gal drums.

Uses: Modification of condensation and addition polymers for coatings.

4-hydroxy-4-methylpentanone-2. See diacetone alcohol.

2-hydroxy-4-methylthiobutyric acid, calcium salt. See dl-alpha-hydroxy-gamma-methyl-mercaptobutyric acid, calcium salt.

hydroxynaphthalene. See naphthol.

3-hydroxy-2-naphthoic acid (beta-hydroxy-naphthoic acid, 3-naphthol-2-carboxylic acid; beta-oxynaphthoic acid) $C_{10}H_8O_3$.

Properties: Yellow rhombic leaflets; soluble in alcohol and ether. M. p. 217.5-219°C.

Derivation: By treating sodium 2-naphtholate with carbon dioxide under pressure.

Containers: Fiber drums.

Use: Dyes.

Shipping regulations: None.*

beta-hydroxynaphthoic acid. See 3-hydroxy-2-naphthoic acid.

beta-hydroxynaphthoic anilide (naphthol AS) $C_{10}H_8OHCONHC_6H_5$.

Properties: Cream-colored crystals.

Sodium salt is soluble in water; m. p. 246.0°C.

Derivation: Condensation of beta-hydroxy-naphthoic acid and aniline.

Method of purification: Recrystallized through sodium salt.

Use: Dyes.

2-hydroxy-1,4-naphthoquinone $C_{10}H_6O_2(OH)$.

Properties: Yellow to orange-yellow needles or powder; m. p. 192-195°C (dec.). Redox potential 0.362 volts; dissociation constant 1.05×10^{-4} , soluble in glacial acetic acid, alcohol, and ether; slightly soluble in cold water, benzene, carbon tetrachloride and petroleum ether.

Uses: Intermediate for pharmaceuticals, henna hair and wool dye, bactericides; seed disinfectant.

3-(2-hydroxy-1-naphthylmethyl)salicylic acid. See epicarin.

4-hydroxy-3-nitrobenzenearsonic acid $HOC_6H_3(NO_2)AsO(OH)_2$.

Properties: Pale-yellow crystals.

Derivation: Treating para-hydroxyphenyl arsonate with nitric and sulfuric acids.

Use: Growth stimulator for chicks.

cis-12-hydroxyoctadec-9-enoic acid. See ricinoleic acid.

12-hydroxyoleic acid. See ricinoleic acid.

15-hydroxypentadecanoic acid lactone. See "Thibetolide."

3-hydroxyphenol. See resorcinol.

beta-para-hydroxyphenylalanine. See tyrosine.

para-hydroxyphenylglycine (glycine[photographic]; photo-glycin) $HOC_6H_4NHCH_2COOH$.

Properties: White to buff crystals or amorphous powder; m. p. 240°C (with decomposition); slightly soluble in water; soluble in alkaline solutions.

Derivation: By condensation of para-aminophenol with chloroacetic acid.

Method of purification: Recrystallization.

Grades: Technical; photographic.

Containers: Barrels; bottles.

Uses: Photographic developer; cellulose and nitrocellulose acetate lacquers and varnishes.

Shipping regulations: None.*

2-hydroxyphenylmercuric chloride (chloromercuriphenol) HOC_6H_4HgCl .

Properties: White to faint pink, fine crystals; 0.1 parts in 100 soluble in water (25°C); soluble in hot water, alkali, and alcohol. M. p. 152°C.

Containers: Fiber drums; bottles.

Uses: Antiseptic; fungicide.

Caution! Dust or strong solution causes blistering of the skin unless washed off immediately.

1-(hydroxyphenyl)-2-methylaminoethanol hydrochloride. See phenylephrine hydrochloride.

11-alpha-hydroxyprogesterone $C_{21}H_{30}O_3$.

Properties: White crystalline powder; m. p. 163°C approx; specific rotation +179°; insoluble in water; soluble in alcohol.

Derivation: From progesterone by microbiological oxidation.

Use: A steroid intermediate.

17-alpha-hydroxyprogesterone acetate.

Grade: N. N. D.

Use: Medicine.

hydroxyprogesterone caproate (17-alpha-hydroxyprogesterone hexanoate)

Properties: White powder; m. p. 118-120°C; insoluble in water. Optical rotation 25°C/D +59° (1% in chloroform).

Grade: N. N. D.

Use: Medicine.

17-alpha-hydroxyprogesterone hexanoate.

See hydroxyprogesterone caproate.

hydroxyproline HOC_4H_7NCOOH . (gamma Hydroxy-alpha-pyrrolidine carboxylic acid, 4-hydroxy-2-pyrrolidine carboxylic acid.)

Properties: Colorless crystals; very soluble in water; slightly soluble in alcohol; insoluble in ether; optically active.

DL-hydroxyproline, m. p. 261-262°C with decomposition.

L-hydroxyproline, m. p. 270°C (naturally occurring).

D-hydroxyproline, m. p. 274°C.

Derivation: Hydrolysis of protein (gelatin);

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

organic synthesis.

Use: Biochemical and nutrition investigations. Available commercially as L-hydroxyproline.

2-hydroxy-1, 2, 3-propane-tricarboxylic acid.

See citric acid.

alpha-hydroxypropionic acid. See lactic acid.

alpha-hydroxypropionitrile. See lactonitrile.

beta-hydroxypropionitrile. See ethylene cyanohydrin.

hydroxypropylglycerin.

Properties: Pale straw-colored liquid; sp. gr. 1.084 (25/25°C); refractive index 1.459 (25°C); flash point 380°F; pour point -23°C; soluble in water and methanol.

Uses: Intermediate to alkyd resins and polyesters; plasticizer for cellulose, glue, starch and many resins.

hydroxypropyl methylcellulose (methyl cellulose, propylene glycol ether).

Properties: White fibrous or granular powder. Swells in water producing clear to opalescent, viscous, colloidal solution. Insoluble in anhydrous alcohol, in ether, and in chloroform.

Grade: N. F. XI.

Use: Medicine (suspending agent).

2-(alpha-hydroxypropyl) piperidine. See conhydrine.

N-beta-hydroxypropyl-ortho-toluidine

Typical specifications: Color, amber; distillation range, 170-180°C (20 mm), sp. gr. 1.035-1.045 (20/20°C); refractive index 1.540-1.550 (20°C).

Grade: Technical.

Containers: Fiber drums, 250-lbs net.

Use: Dye intermediate.

2-hydroxypyridine-N-oxide. Bactericidal agent related to aspergill acid; made from pyridine-N-oxide.

8-hydroxyquinoline (8-quinolinol; oxyquinoline; oxine) $\text{C}_9\text{H}_6\text{NOH}$.

Properties: White crystals or powder, darkens when exposed to light; technical material usually tan, almost insoluble in water; soluble in alcohol, acetone, chloroform, benzene, also in formic, acetic, hydrochloric and sulfuric acids, and in alkalis, phenolic odor; m. p. 73-75°C; b. p. 267°C.

Grades: C. P.; technical.

Uses: For precipitating and separating metals; preparation of fungicides.

8-hydroxyquinoline benzoate

8-hydroxyquinoline sulfate (8-quinolinol sulfate; oxyquinoline sulfate)

Properties: Pale yellow powder; slight saffron odor; burning taste. Soluble in water; slightly soluble in alcohol; insoluble in ether.

Use: Antiseptic, antiperspirant, deodorant.

8-hydroxyquinoline-5-sulfonic acid

Properties: Pale yellow, needlelike crystals or powder; soluble in water; slightly soluble in organic solvents; m. p. 213°C with decomposition.

4-hydroxysalicylic acid. See beta-resorcylic acid.

12-hydroxystearic acid

Containers: 100-lb bags.

Uses: Lithium greases; chemical intermediates.

1, 12-hydroxystearyl alcohol (1, 12-octadecanediol). A long-chain fatty alcohol made by reduction of 12-hydroxystearic acid by replacing the -COOH group with a - CH_2OH . Typical specifications: M. p. 69°C; boiling range 315-335°C.

Impurities: Stearyl alcohol.

Derivation: Hydrogenated castor oil.

Uses: Chemical intermediate; synthetic fibers; organic synthesis; pharmaceuticals; surface-active agents; plastics and resins; protective coatings.

hydroxystilbamidine isethionate (2-hydroxy-4, 4'-stilbenedicarboxamidine diisethionate) $\text{C}_{20}\text{H}_{28}\text{N}_4\text{O}_6\text{S}_2$.

Properties: Fine, yellow, crystalline powder. Odorless; stable in air but affected by light, pH of 1 in 100 solution 3.3-5.3; m. p. 280°C; soluble in water; slightly soluble in alcohol; insoluble in ether.

Grade: U. S. P. XVI.

Use: Medicine.

2-hydroxy-4, 4'-stilbenedicarboxamidine diisethionate. See hydroxystilbamidine isethionate.

hydroxysuccinic acid. See malic acid.

hydroxytitanium stearate

Properties: Waxy solid; m. p., decomposes.

Derivation: Reaction of titanium esters with stearic acid.

Uses: Dispersant; cross-linking agent; water repellent.

alpha-hydroxytoluene. See benzyl alcohol.

hydroxytoluic acid. See cresotic acid.

5-hydroxytryptamine. See serotonin.

hydroxyzine hydrochloride

Properties: Occurs as white, odorless powder. Very soluble in water; freely soluble in acetone and alcohol; fairly soluble in chloroform, and practically insoluble in ether; melting range 196-204°C (dec.).

Grade: N. F. XI.

Use: Medicine.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Hydrozin." ⁷⁸ Trademark for normal zinc formaldehyde sulfoxylate used for discharge printing on acetate grounds and for stripping wool, acetates and nylon. Also used as a catalyst for polymerization of vinyl monomers.

hydrozincite (zinc bloom) $\text{Zn}_5(\text{OH})_6(\text{CO}_3)_2$.

A natural basic carbonate of zinc, found in the upper zones of zinc deposits.

Properties: Color white to gray or yellowish; luster dull to silky; fluorescent in ultraviolet light; sp. gr. 3.5-4.0; hardness 2.0-2.5.

Occurrence: Missouri, Pennsylvania, Utah, California, Nevada; Europe.

Use: An ore of zinc.

"Hyfac." ²⁴² Trademark for a line of products including hydrogenated fish and tallow fatty acids, hydrogenated fish oil, hydrogenated castor oil, hydrogenated tallow, and 12-hydroxystearic acid.

"Hyform" Emulsions. ⁵⁷ Trademark for water emulsions of pure paraffin wax, microcrystalline wax, or a modification of one of these waxes.

Uses: In the ceramic field these emulsions are used as binders for pressed pieces, lubricants for die or mold release, and plasticizers during mold forming.

"Hylene." ²⁸ Trademark for a line of organic isocyanates.

"Hylene" M. Methylene bis(4-phenyl isocyanate) $(\text{C}_6\text{H}_4\text{NCO})_2\text{CH}_2$. Pale yellow lumps; sp. gr. 1.20.

Containers: 45- and 500-lb drums.

Use: For making urethane adhesives and polymers.

"Hylene" M-50. Methylene bis(4-phenyl isocyanate) $(\text{C}_6\text{H}_4\text{NCO})_2\text{CH}_2$; 50% solution in monochlorobenzene; dark brown liquid; sp. gr. 1.16.

Containers: 45- and 500-lb drums.

Use: In elastomer based adhesives.

"Hylene" MP. Bis phenol adduct of methylene bis(4-phenyl isocyanate).

Properties: Grayish white powder; water stable.

Containers: 125-lb drums.

Use: A bonding agent and adhesive assistant for adhering "Dacron" polyester fiber to rubber compositions in water emulsion or latex systems.

"Hylene" T. Toluene-2,4-diisocyanate $\text{CH}_3\text{C}_6\text{H}_3(\text{NCO})_2$.

Properties: Water white to pale yellow liquid; sp. gr. 1.22.

Containers: 45- and 500-lb drums; tank trailers and tank cars.

Uses: In manufacture of urethane foam, finishes, adhesives and rubbers.

"Hylene" TM. Mixture of 80% toluene-2,4-diisocyanate and 20% toluene-2,6-diisocyanate $\text{CH}_3\text{C}_6\text{H}_3(\text{NCO})_2$.

Properties: Sp. gr. 1.22; water white to pale yellow liquid.

Containers: 45- and 500-lb drums; tank trailers; tank cars.

Uses: In manufacture of urethane foam,

finishes, adhesives and rubbers.

"Hylene" TM-65. Mixtures of 65% toluene 2,4-diisocyanate, and 35% toluene 2,6-diisocyanate (see "Hylene" TM).

Properties: Sp. gr. 1.22; water white to pale yellow liquid.

Containers: 45- and 500-lb drums; tank trailers; tank cars.

Uses: In manufacture of urethane foam, finishes, adhesives and rubber.

"Hyonic." ³⁰⁹ Trademark for a line of liquid detergents, including various detergent bases, synergists, and wetting agents.

hyoscine (l-scopolamine) $\text{C}_{17}\text{H}_{21}\text{NO}_4$.

Properties: Thick, colorless, syrupy liquid alkaloid, poisonous! Soluble in water, alcohol, and ether. M. p. 50-59°C.

Derivation: By extraction of various Solanaceae, hyoscyamus, belladonna, etc.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine (in form of hydrobromide U. S. P. XVI, hydrochloride, hydroiodide, sulfate, etc.).

hyoscine hydrobromide (scopolamine hydrobromide) $\text{C}_{17}\text{H}_{21}\text{NO}_4 \cdot \text{HBr} \cdot 3\text{H}_2\text{O}$.

Properties: White crystals or white, granular powder; odorless; poisonous! Soluble in water and alcohol, insoluble in ether; slightly soluble in chloroform. M. p. 191°C.

Derivation: By the action of hydrobromic acid on hyoscine.

Method of purification: Crystallization.

Grades: Technical; U. S. P. XVI.

Containers: 5-, 15-grain vials; glass bottles.

Use: Medicine.

hyoscine sulfate

$(\text{C}_{17}\text{H}_{21}\text{NO}_4)_2 \cdot \text{H}_2\text{SO}_4 \cdot 2\text{H}_2\text{O}$.

Properties: White crystals; poisonous! Soluble in water and alcohol.

hyoscyamine $\text{C}_{17}\text{H}_{23}\text{O}_3\text{N}$ (isomeric with atropine).

Properties: White crystalline alkaloid, poisonous! Slightly soluble in water; soluble in alcohol, ether, and dilute acids. M. p. 108.5°C.

Derivation: By extraction of belladonna or scopolia roots, and subsequent crystallization.

Use: Medicine (in form of hydrobromide, hydrochloride or sulfate).

hyoscyamine hydrobromide $\text{C}_{17}\text{H}_{23}\text{NO}_3 \cdot \text{HBr}$.

Properties: White odorless crystals or crystalline powder; poisonous; affected by light. M. p. 149-152°C, specific rotation (25°C) not less than -24°. Soluble in water and alcohol.

Derivation: By the action of hydrobromic acid on hyoscyamine.

Method of purification: Crystallization.

Grades: Technical, N. F. XI.

Containers: Vials; bottles.

Use: Medicine.

hyoscyamine hydrochloride $\text{C}_{17}\text{H}_{23}\text{NO}_3 \cdot \text{HCl}$.

Properties: White crystals, poisonous!

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Soluble in water and alcohol; m. p. 149-151°C.

Derivation: By the action of hydrochloric acid on hyoscyamine.

Containers: Vials.

Use: Medicine.

Shipping regulations: None.*

hyoscyamine sulfate $(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot 2H_2O$.

Properties: White, odorless crystals or crystalline powder; deliquescent; affected by light. Soluble in water and alcohol.

Caution! Hyoscyamine sulfate is extremely poisonous.

Constants: M. p. not less than 200°C; specific rotation (25°C) not less than -24°.

Grades: Technical; N. F. XI.

Containers: Vials; bottles.

Use: Medicine.

hyoscyamus (henbane; hog's bean; insane root, poison tobacco; black henbane). Dried leaves and flowering tops of *Hyoscyamus niger*.

Chief constituents: Alkaloids hyoscyamine and hyoscyne.

Habitat: Europe, Asia; United States, cultivated in England.

Grades: Technical; N. F. XI.

Containers: Bags, bales.

Uses: Medicine (similar to belladonna); source of alkaloids.

Shipping regulations: None.*

"Hypalon" 20. ²⁸ Trademark for chlorosulfonated polyethylene.

Properties: White chips; sp. gr. 1.10.

Containers: 50-lb bags or boxes.

Use: An elastomer giving products which are oil resistant, unattacked by ozone, have excellent color stability and resistance to heat, weather and chemicals.

"Hypalon" 30. ²⁸ Trademark for chlorosulfonated polyethylene.

Properties: White chips, sp. gr. 1.28.

Containers: 50-lb boxes.

Uses: A solution type elastomer designed for protective and decorative coatings, a paint base. Coatings are resistant to weathering, ozone, many oils and chemicals.

"Hypalon" 40. ²⁸ Trademark for a chlorosulfonated polyethylene.

Properties: White chips, sp. gr. 1.18.

Use: An elastomer designed for ease in processing.

"Hypaque" Sodium. ¹⁶² Trademark for diatrizoate sodium.

hyperglycemic-glycogenolytic factor. See glucagon.

hypergolic fuels. Rocket fuels or propellants which consist of combinations of fuels and oxidizers, which ignite spontaneously on contact. Examples are: hydrazine hydrate, methanol and hydrogen peroxide, aniline and nitric acid.

hypernic extract. See brasilin.

hyperon. The name of a group of fundamental particles (q. v.). A hyperon is a

fundamental particle with a mass greater than the mass of a nucleon.

hypersorption. Process in which activated carbon selectively adsorbs less volatile components from a gaseous mixture, while the more volatile components pass on unaffected. Particularly applicable to separations of low-boiling mixtures such as hydrogen and methane, ethane from natural gas, ethylene from refinery gas, etc.

hypertensin. See angiotensin.

hyphylline (dyphylline)

$C_7H_7N_4O_2CH_2CH(OH)CH_2OH$. 7-(2,3-Dihydroxypropyl) theophylline. A derivative of theophylline.

Properties: White, almost odorless, extremely bitter, amorphous solid. M. p. 155-160°C. Freely soluble in water; practically insoluble in ether, slightly soluble in alcohol and chloroform. pH (1% solution) 6.5-7.0.

Use: Medicine.

hypnal. See chloral hydrate antipyrine.

hypnone. See acetophenone.

hypo. See sodium thiosulfate.

hypochlorous acid HOCl. An unstable, weak acid, existing only in solution. It is formed, together with hydrochloric acid, when chlorine is dissolved in water, and is responsible for the bleaching action of such solutions. Its salts are bleaching agents. See calcium and sodium hypochlorite.

alpha-hypophamine. See oxytocin.

beta-hypophamine. See vasopressin.

hypophosphorous acid H_3PO_2 .

Properties: Clear, colorless or slight yellow liquid, sour odor. Soluble in water. Sp. gr. 1.439, m. p. 26.5°C. A strong monobasic acid and strong reducing agent, sold in solution.

Derivation: Heating concentrated baryta water with white phosphorus and decomposing the barium hypophosphite with sulfuric acid, filtering the liquid and concentrating under reduced pressure.

Method of purification: Distillation.

Grades: Technical; N. F. XI (30-32% solution, sp. gr. 1.13), 50% purified.

Containers: Bottles, carboys.

Uses: Preparation of hypophosphites.

Shipping regulations: None.*

"Hyporice." ³²⁹ Trademark for a highly improved form of sodium thiosulfate, having very uniform rice-sized crystals.

hypoxanthine $C_5H_4N_4O$. An intermediate in the metabolism of animal purines; also widely distributed in the vegetable kingdom.

Properties: White to cream powder; decomposes at 150°C; almost insoluble in cold water, slightly soluble in boiling water; soluble in dilute acids and alkalis.

Derivation: Deamination of adenine; reduction of uric acid.

Use: Biochemical research; biological media.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

hypoxanthine riboside. See inosine.

hypoxanthine riboside-5-phosphoric acid.

See inosinic acid.

"Hyprin" GP30. ²³³ Trademark for hydroxypropylglycerin (q. v.).

"Hyprose" SP80. ²³³ Trademark for octakis-(2-hydroxypropyl)sucrose (q. v.).

"Hyros." ⁷⁹ Trademark of a special "FF" wood rosin, containing no lime or other inorganic chemicals, which is distinguished by its high melting point, high viscosity and excellent solubility. M. p. (capillary tube) 64°C, (ball and ring) 85°C; acid number 121; unsaponifiable matter 20%; color "FF".

Containers: Non-returnable 18-gauge black-iron drums of about 500 lbs gross wt. Tare 14-16 lb.

Uses: Adhesive tape; artificial Burgundy pitch; battery wax; belt dressings; box toes; branding paint; brewers' pitch; core oil, dry core binders; fireworks; linoleum cement, matches; pitch, printing ink, rock wool, roofing cement; rubber cement; smoking molds; synthetic rosin oil; tree banding; Venice turpentine; wire-coating compounds.

hyssop (ysop, isop). An aromatic mint (*Hyssopus officinalis*) from Europe, handled as leaves or as the dried herb. Contains a volatile oil with camphor-like taste. Used in medicine.

hyssop oil.

Properties: A colorless, liquid, essential oil, sensitive to light, soluble in alcohol, ether, chloroform, and benzene. Insoluble in water. Sp. gr. 0.932.

Derivation: Distilled from the herb *Hyssopus officinalis*.

Method of purification: Rectification.

Grades: Technical.

Containers: Glass bottles.

Uses: Medicine; preparation of liqueurs.

Shipping regulations: None.*

hysteresis. A lag or delay between a changing force and its resulting effect, so that if the causing force is first increased and then decreased, the effect will continue to increase for a period of time after the causing force has started to decrease and vice versa. As a consequence the effect will continue to be noticeable for a period of time after the cause has disappeared. Another consequence is that the magnitude of the effect will be different for a particular value of the causing force, depending on whether the latter is increasing or decreasing and even depending on the rate of increase or decrease. Thus the exact

nature of the effect in any specific case will depend upon the previous history of cause and effect for that cause.

The most common example is with respect to the magnetization of iron by changing an electric current. Other examples arise in the viscosity or resistance to flow of certain colloids when subjected to deforming forces.

"Hytakerol." ¹⁶² Trademark for dihydro-tachysterol.

"Hy-ten-sl." ¹¹¹ Trade name for a type of bronze made in five grades of hardness and consisting of 60-68% copper, 20-24% zinc, 3-7% aluminum, 2.5-5% manganese, 2-4% iron.

Properties: Silvery yellow color; close homogeneous grain; non-corrosive; good wear resistance; high tensile strength and hardness; resistant to high fluid pressures.

Forms available: Castings; rods and bars; forgings.

Uses: Heavy duty gears, bearings, nuts, valves, worm wheels, tracks and rollers.

"Hytrol" O. ²⁸ Trademark for cyclohexanone ($C_6H_{10}O$). Colorless liquid; b. p. 156.7°C; f. p. -47°C.

Containers: 55-gal drums; 8,000- and 10,000-gal tank cars.

Uses: As a solvent in the textile, paint and varnish industries, especially for vinyls, as a chemical intermediate; lube oil additive.

"Hywax 122 and 123." ⁴⁰³ Trademark for self-emulsifiable sperm waxes. They are made up largely of fatty alcohol esters of fatty acids in the C_{14} to C_{20} range, plus a small percentage of chemically reacted nitrogen compound which acts as an emulsifier.

Properties:	"Hywax 122"	"Hywax 123"
m. p.	49-50°C.	49-50°C.
iodine number	5.0 max.	5.0 max.
saponification number	95-110	95-110
viscosity (210°F) SSU	56	51
flash point	440°F.	400°F.

Containers: Polyethylene-lined, fiber drums; tank cars.

Uses: Automobile polishes and cleaners; broaching oils; buffing and polishing compounds, floor and furniture waxes; leather stuffing, lubricating grease stabilizer; metal drawing compounds, anti-blocking agent for plastic films; plastic lubricants and stabilizers; rubber processing aid; rust inhibitors; shaving creams; textile lubricants and softeners, etc.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

I. Symbol for iodine.

IA. Abbreviation for 3-indoleacetic acid.

IAA. Another abbreviation for 3-indoleacetic acid.

IBP. Abbreviation for initial boiling point; used when a range of boiling temperatures is given. See also DP.

ICC. Abbreviation for ignition control compound.

Iceland moss. See cetraria.

Iceland spar. See calcite.

ice stone. See cryolite, natural.

ichthammol (ammonium ichthosulfonate, ammonium sulfoichthyolate)

Properties: Brownish-black, syrupy liquid, burning taste, characteristic empyreumatic odor. Incompatible with acids, alkaloids, carbonates, hydroxides, mercuric chloride. Soluble in water, alcohol-ether or alcohol-ether-water mixtures; partially soluble in alcohol and ether. Miscible with glycerol and fixed oils.

Derivation: An aqueous solution of sulfonated ammonium compounds derived from the action of sulfuric acid upon distillates from certain bituminous shales.

Grades: N. F. XI.

Containers: Drums.

Use: Medicine.

Shipping regulations: None.*

"Ichthymall." ³²⁹ Trademark for a brand of ichthammol, ammonium ichthosulfonate,

ichthyocolla. See isinglass.

ICSH. See interstitial-cell-stimulating hormone.

"Icyl." ²⁰⁶ Brand name of proprietary line of dyestuffs specially prepared for the dyeing of viscose rayon. They tend to cover the irregularities occasioned by varying batches of rayon.

I.D. Abbreviation for inside diameter. Used in describing apparatus.

ideal gas. A gas whose behavior can be predicted by Boyle's law, Charles' law, or the ideal gas equation through all ranges of temperature and pressure.

ideal solution. A solution which shows no change of internal energy on mixing, no attractive force between components, and follows Raoult's law over all ranges of temperature and concentration.

idocrase. See vesuvianite.

"Idonyx." ³²⁸ A free-flowing, yellow powder containing iodide-iodate salts, nonionic detergent, and complex phosphates. It provides 16% iodine when compounded with surface active agents and acid for the preparation of liquid and powdered type iodine germicides (iodophors).

idryl. See fluoranthene.

"Igenal." ³⁰⁷ Trademark of a line of dyestuffs for the coloring of chrome-tanned leather. Characterized by unusual tinctorial power on chrome leather.

"Igepal." ³⁰⁷ Trademark for a series of nonionic surfactants which are used as detergents, dispersants, emulsifiers and wetting agents. They are alkylphenoxy poly(ethyleneoxy)-ethanols, arising from the combination of an alkylphenol with ethylene oxide. The general formula is $RC_6H_4O(CH_2CH_2O)_nCH_2CH_2OH$, in which R may be C_8H_{17} or a high homolog.

"Igepon." ³⁰⁷ Trademark for a series of anionic surfactants used as detergents, wetting agents, emulsifiers, dispersants and foaming agents. The "Igepon" T and C types are sulfo-amides derived from N-methyltaurine or N-cyclohexyltaurine and fatty acids and have the general formula $RCON(R')CH_2CH_2SO_3Na$. "Igepon" A types are sulfo-esters derived from isethionic acid and a fatty acid and have the general formula $RCOOCH_2CH_2SO_3Na$. R and R' are alkyl groups.

Igewesky's reagent. An etching agent used in the microanalysis of carbon steels. It consists of a 5% solution of picric acid in absolute alcohol.

ignition control compound. A substance such as dimethylxyllyl phosphate, methylphenyl phosphate, or trimethyl phosphate which is added to gasoline motor fuels to control spark plug fouling, surface ignition, and motor rumble. See "Ethyl."

ignition point. The minimum temperature at which ignition will occur and burning will continue without further heating or application of flame.

ignotine. See carnosine.

"Iletin." ¹⁰⁰ Trademark for insulin injection U. S. P.

"Ildar" Phosphate. ¹⁹⁰ Trademark for a brand of azapetine phosphate (q. v.) used in medicine.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

illinium. One of the names assigned to element of atomic number 61, based on spectroscopic evidence of the existence of the element reported in certain fractions from a complex fractional crystallization procedure. Element no. 61 is now promethium (q. v.).

illite. See clay.

"Illum." ³¹⁴ Alloys composed of 56% nickel, 22.5% chromium, 6.5% iron, 6.5% copper, 6.4% molybdenum and small amounts of aluminum, manganese, silicon, and carbon to improve castability.

Properties: Tensile strength 60-73,000 lbs./sq. in (72°F), 24-33,000 lbs./sq. in (1000°F); Brinell hardness 160-210; sp. gr. 8.31; m. p. 1300°C; resistant to heat and to corrosion by sulfuric, nitric, phosphoric and some mixed acids and salt solutions.

Use: Used in acid-pump parts, tanks, agitators, bearings, fittings, valves, heat-resistant thermometers, spray nozzles.

illuminants. Hydrocarbons other than methane present in carburetted water gas or similar gases. They include chiefly ethylene and the lower olefin and aromatic hydrocarbons, as well as ethane and higher paraffin hydrocarbons, and usually any acetylene, diolefins or other hydrocarbons soluble in fuming sulfuric acid as used in absorption gas-analysis procedures.

ilmenite (menaccanite, titanite iron ore) $\text{FeO} \cdot \text{TiO}_2$. Sometimes with some replacement of iron by magnesium or manganese. Iron-black mineral; black to brownish-red streak; submetallic luster. Resembles magnetite in appearance but is readily distinguished by feeble magnetic character.

Constants: Sp. gr. 4.5-5, hardness 5-6. Occurrence: New York, Florida, North Carolina, Virginia, California, Wyoming, Arkansas; Canada; Sweden; U. S. S. R., India. Also made synthetically.

Uses: Titanium paints and enamel, source of titanium metal, welding rods, titanium alloys, ceramics.

"Ilosone." ¹⁰⁰ Trademark for propionyl erythromycin ester lauryl sulfate. See erythromycin propionate lauryl sulfate.

"Ilotycin." ¹⁰⁰ Trademark for erythromycin, U. S. P.

"Ilotycin" Ethyl Carbonate. ¹⁰⁰ Trademark for erythromycin ethyl carbonate, U. S. P.

"Ilotycin" Glucoheptonate. ¹⁰⁰ Trademark for erythromycin for injection, U. S. P.

Imhoff sludge. See sewage sludge.

imidazole (glyoxaline) HNCHNCH . A di-nitrogen ring compound. Colorless crystals, m. p. 90°C; b. p. 257°. Soluble in water, alcohol and ether. Base of many new compounds.

4,5-imidazoledicarboxamide. See glycarbylamide.

4-imidazole ethylamine. See histamine.

imidazo(4,5-d)pyrimidine. See purine.

3,3'-iminobispropylamine (dipropylene triamine; 3,3'-diaminodipropylamine) $\text{H}_2\text{NC}_3\text{H}_6\text{NHC}_3\text{H}_6\text{NH}_2$.

Properties: Liquid; sp. gr. 0.9307 (20/20°C); b. p. 240.6°C; f. p. -6.1°C; flash point 235°F; soluble in water.

Containers: 55-gal drums.

Uses: Intermediate for soaps, dyestuffs, rubber chemicals, emulsifying agents, petroleum specialties, insecticides, and pharmaceuticals.

Shipping regulations: Poison, class B, Poison label.*

iminourea. See guanidine.

imitation ultramarine blue. See ultramarine blue.

"Immedial." ³⁰⁷ Brand name of a line of sulfur dyestuffs. Used for the dyeing of cotton and rayon. Characterized by very good fastness to light and good fastness to washing and perspiration.

immune serum globulin. A sterile solution of globulins which contains those antibodies normally present in adult blood. Not less than 90% of the total protein is globulin. It is a transparent, nearly colorless, nearly odorless liquid. Must be kept refrigerated.

Derivation: From a plasma or serum pool of venous or placental blood from 1000 or more individuals.

Grade: U. S. P. XVI.

Use: Medicine.

"Impedex." Trademark for sodium propionate.

imperial green. See copper acetoarsenite.

imperial red. See iron oxide reds.

"Impermex." ²³⁶ Brand name for a water-dispersible organic colloid, developed for the purpose of decreasing the water loss of drilling muds, even in muds highly contaminated with salt, salt water, cement, or any other water-soluble electrolyte.

"Implex." ²³ Trademark for thermoplastic, high-impact acrylic molding powder, supplied in natural and colored forms. Maximum toughness, gloss, stain- and heat-resistant grades.

Use: Shoe heels, business-machine and musical instrument keys, housings, automotive parts, knobs, metallized parts, and other industrial and commercial products.

impramine $\text{C}_{15}\text{H}_{24}\text{N}_2 \cdot \text{HCl}$. 5-(3-Dimethylamino-propyl)-10,11-dihydro-5H-dibenz [b,f] azepine hydrochloride. Colorless crystals; m. p. 175°C, soluble in water. Used in medicine.

"Impranil." ⁴²² Trade name for isocyanate-based adhesives used for textile finishes, including flock application.

"Impregnole." ⁴² Proprietary products. Aqueous dispersions of waxes and metallic salts.

Properties: Milk white emulsions. Disperse

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

readily in water above 50°C.

Containers: 50-gal steel drums.

Uses: Water repellent and spot proofing for textile fabrics.

impression resins. See contact resins.

"**Impruvol.**" ¹¹ Trademark for fuel and oil antioxidants.

"Impruvol" 33. An antioxidant for motor and aviation gasolines and jet fuels. Consists of 33 1/3 weight % solution of "dbpc" in toluene. Retards formation of gum, protects against induction system and engine deposits, does not impart color to gasoline.

"Impruvol" 20. An antioxidant for transformer and circuit breaker oils consisting of "dbpc," 20% by weight, dissolved in transformer oil.

imposonite. A variety of asphaltic pyrobitumen (q. v.) similar to albertite, black in color, with a black streak, sp. gr. 1.10-1.25, and fixed carbon 50-90%.

Occurrence: Oklahoma, Arkansas, Michigan, Nevada; South America.

In. Symbol for indium.

INAH. Abbreviation for isonicotinic acid hydrazide. See isoniazid.

"**Inceloid.**" ¹⁷⁶ Trade name for a line of waterproof adhesives for rubber and resins.

incendiary gels.

1. Mixtures of thermite (aluminum powder and iron oxide) suspended in oil set to a jelly with a small amount of soap, which undergoes spontaneous ignition on contact with air. Another type may contain magnesium in jellied oil.

2. Jellied gasoline combined with thickening agents such as "Napalm" or finely divided magnesium.

inclusion complexes. Crystalline mixtures, not true compounds, in which the molecules of one of the components are contained within the crystal lattice framework of the other component. The framework may be in the form of channels, cages or layers. The two compounds are present in constant but not stoichiometric proportions. The phenomenon depends upon the molecular dimensions of both components. Quite diverse substances can be combined, as argon in hydroquinone, or benzene in nickel cyanide-ammonia complex. The complexes are stable at ordinary temperatures. Melting or dissolving the crystals allows the entrapped component to escape. Inclusion complexes are also called adducts, or occlusion complexes.

Clathrate compounds are inclusion complexes in which molecules of one substance are completely caged within the other, as argon is caged within the hydroquinone crystals. Urea adducts are inclusion complexes of the channel type. In these, the complexing urea crystals wrap around the molecule of the other substance, usually a straight chain unbranched aliphatic hydrocarbon. Similar complexes are formed

with thiourea.

The formation of inclusion complexes offers a means of separating chemically similar but physically different molecules. For example, the nickel cyanide-ammonia complex will remove benzene from hydrocarbon impurities and release it 99.992% pure. Similarly, normal alkanes or olefins may be separated from petroleum fractions by contact with saturated aqueous solutions of urea. The nature of the inclusion complexes also permits the isolation and handling of gases and liquids in a solid form.

Among materials which form such complexes are deoxycholic acid (choleic acids), dinitrophenyl, dextrin, zeolites and clay minerals, hydroquinone, and certain nitrogen compounds and basic organic zinc salts.

"**Incoloy.**" ²⁸³ Trademark for an alloy containing approximately 32% nickel, 21% chromium and 46% iron. Used in high temperature applications because of its resistance to oxidation and carburization. Also useful in many corrosive environments. Made in both cast and wrought forms.

"**Inconel.**" ²⁸³ Trademark for an alloy containing approximately 76% nickel, 16% chromium and 6% iron. Has high tarnish resistance, and is used extensively at high temperatures. Made in both cast and wrought forms.

"**Inconel X.**" ²⁸³ Trademark for an age-hardenable wrought alloy containing approximately 73% nickel, 15% chromium, 0.8% aluminum, 2.5% titanium, and 0.85% columbium. Designed to have high stress-rupture strength and low creep rates under high stresses at temperatures up to 1500°F, as well as good resistance to corrosion and oxidation. Widely used in aircraft engines and structures and for high temperature springs.

"**Incremin.**" ⁵⁷ Trademark for lysine-vitamins.

"**Indalone.**" ⁵⁵ (n-butyl mesityl oxide oxalate). A proprietary product. A repellent applied directly on the skin principally for the biting stable and dog flies, also used for mosquitoes. A repellent used by the Armed Forces, 6-2-2 mixture, was a combination of 60% dimethyl phthalate, 20% 2-ethyl-hexanediol-1,3 and 20% "Indalone."

indan (hydrindene; 2,3-dihydroindene)

Properties: Colorless liquid, b. p. 176.5°C; m. p. -51.4°C; refractive index 1.5388 (16.4°C); sp. gr. 0.965 (20/4°C), insoluble in water; soluble in alcohol and ether.

Derivation: From coal tar.

Use: Base of interesting new derivatives.

indanthrene (indanthrone) $\text{C}_{28}\text{H}_{14}\text{O}_4\text{N}_2$. A blue vat dye or pigment, Colour Index No. 1106. The molecule consists of two anthraquinone nuclei linked through two NH groups.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Excellent durability and light-fastness, not decomposed by heating to 250°C. Soluble in dilute alkaline solutions.

Derivation: By fusion of beta-aminoanthraquinone with caustic potash in the presence of potassium nitrate.

Uses: Dyeing unmordanted cotton; as a pigment in quality paints and enamels.

"Indanthrene." ³⁰⁷ Brand name of vat dyestuffs. Used for the dyeing and printing of cotton, rayon, and silk. Characterized by excellent fastness to light, washing, chlorine, etc.

indanthrene yellow. See flavanthrene.

indanthrone. See indanthrene.

indene $\text{CHCHCHCHCHCHCHCHCH}_2$.

Properties: Colorless liquid, sp. gr. 1.006 (20/4°C), m. p. -3.5°C, b. p. 182°C, refractive index 1.5726 (n_D²⁵), flash point 173°F. Insoluble in water, soluble in most organic solvents, rapidly absorbs oxygen from the air, forms polymers by exposure to air and sunlight.

Derivation: Contained in the fraction of crude coal tar distillates which boils from 176 to 182°C.

Use: Preparation of synthetic resins (see coumarone-indene resins), interesting intermediate.

Indian apple. See podophyllum.

Indian arrow-wood. See euonymus.

Indian balsam. See Peru balsam.

Indian cannabis. See cannabis.

Indian grass oil. See palmarosa oil.

Indian gum. A series of gums obtained from trees found in the forests of India and Ceylon. It includes ghatti and karaya gums, as well as less well-known gums, gathered intermittently and not of uniform quality.

Indian hemp. See cannabis.

Indian laburnum. See cassia fistula.

Indian physic. See apocynum.

Indian pink. See spigelia.

Indian poke. See veratrum viride.

Indian red (iron saffron). A red (maroon) pigment formerly consisting of a variety of hematite imported from the East but now made artificially by calcining copperas to obtain the red ferric oxide pigment. There is no pigment, with possibly the exception of lithopone and artificial barium sulfate, which will approach Indian red in fineness of grain. It is also used for polishing gold, silver and other metals. See also iron oxide reds.

Indian rhubarb. See rhubarb.

Indian saffron. See curcuma.

Indian squill. See squill. *

Indian tobacco. See lobelia.

Indian tragacanth. See karaya gum.

Indian turmeric. See hydrastis.

Indian wood oil. See gurgun balsam oil.

Indian yellow.

1. (aureolin). A yellow pigment distinguished from other yellow pigments by being unaffected by hydrogen sulfide. It is durable, without action upon other pigments and is permanent in oils and water color. It consists of a double nitrite of cobalt and potassium and is prepared by adding excess of potassium nitrite solution to a solution of cobalt nitrate acidified with acetic acid. See cobalt potassium nitrite.
2. Also sometimes used for the yellow synthetic dye primuline.

India rubber. See rubber, natural.

indicator. A substance which by its color or other easily observable property indicates the presence or absence or concentration of some other substance, or the degree of reaction between two or more other substances.

The most common example is the use of acid-base indicators such as litmus, phenolphthalein, and methyl orange to indicate the presence or absence of acids and bases, or the approximate concentration of hydrogen ion in a solution. Typical examples are listed in the table.

Acid Base Indicators For Various pH Ranges

pH Range	
1.3- 3.0	Tropeoline OO A: red. B: yellow.
1.2- 2.8	Thymol blue A: red. B: yellow.
2.9- 4.0	Methyl yellow A: red. B: yellow.
3.1- 4.4	Methyl orange A: red. B: yellow-orange
3.0- 4.6	Bromophenol blue A: yellow. B: purple.
3.8- 5.4	Bromocresol green A: yellow. B: blue.
4.2- 6.2	Methyl red A: red. B: yellow.
4.8- 6.4	Chlorphenol red A: yellow. B: red.
6.0- 7.6	Bromthymol blue A: yellow. B: blue.
6.4- 8.0	Phenol red A: yellow. B: red.
6.8- 8.0	Neutral red A: red. B: yellow-brown.
7.4- 9.0	Cresol purple A: yellow. B: purple.
8.0- 9.6	Thymol blue A: yellow. B: blue.
8.0- 9.8	Phenolphthalein A: colorless. B: red-violet.
9.3-10.5	Thymolphthalein A: colorless. B: blue.
10.11-12.0	Alizarine yellow R A: yellow. B: violet.

A = acid color, B = basic color.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Other common types of indicators are adsorption indicators, oxidation-reduction indicators and humidity indicators (see separate entries). Some highly colored substances serve as their own indicators (i.e., iodine, potassium permanganate, ceric sulfate, which change from their own characteristic colors in solution to colorless compounds). Other indicators are not easily classified (i.e., the blue color of starch and iodine and the red color formed by the action of ferric compounds on thiocyanates).

indicolite. A dark blue gem stone variety of tourmaline (q. v.).

indigo (indigotin; synthetic indigo blue)

$C_{16}H_{10}N_2O_2$. C. I. No. 1177.

Properties: Dark blue, crystalline powder; bronze luster; sp. gr. 1.35; sublimes at 300°C (decomposes), soluble in aniline, nitrobenzene, chloroform, glacial acetic acid and concentrated sulfuric acid; insoluble in water, ether, and alcohol.

Derivation: Natural: by fermentation of the cut twigs and leaves of various species of *Indigofera* with water to decompose the glucoside, indican. The solution is oxidized to precipitate the indigo. This process is of historical interest only.

Synthetic: By fusing phenyl glycine with alkali and sodium amide.

Grades: Technical, pure.

Containers: Tins, fiber drums.

Uses: Textile dyeing and printing inks, manufacture of indigo derivatives, ingredient of tobacco fertilizers; paints, laundering; analytical reagents.

Shipping regulations: None.*

indigo carmine (soluble indigo, indigo extract, sodium indigotindisulfonate; sodium coeruleinsulfate) $C_{16}H_8N_2O_2(SO_3Na)_2$. C. I. No. 1180.

Properties: Blue powder or granules, slightly soluble in water (solutions are blue); very slightly soluble in alcohol.

Derivation: Indigotindisulfonic acid treated with soda.

Method of purification: Recrystallization.

Grades: Technical, U. S. P. XVI.

Containers: Wooden kegs, fiber drums.

Uses: Dyeing, medicine, analytical tests.

Shipping regulations: None.*

indigo extract. See indigo carmine.

indigoid dyes. Dyes whose molecular structure involves the indigo $C_{16}H_{10}N_2O_2$, or thioindigo, $C_{16}H_8S_2O_2$, groupings. Colour Index numbers are 73, 000-73, 999 (new edition). These are vat dyes and are applied principally on cotton. An example is indigo. This is used on cotton and rayon, and to a limited extent on silk. See also dyes.

"Indigolite," ⁷⁸ Trademark for a combination of sodium formaldehyde sulfoxylate and a sulfonated quaternary base used to give a discharge on indigo-dyed grounds and discharge printing of vat dyestuffs.

indigo, soluble. See indigo carmine.

indigo, synthetic. See indigo.

indigotin. See indigo.

indirect dye. A mordant dye (q. v.).

indium In. Element of atomic number 49, of Group III of the periodic system.

Properties: Ductile, shiny, silver-white metal; softer than lead. Soluble in acids. Insoluble in alkalis. Sp. gr. 7.362; m. p. 156°C; b. p. 1450°C.

Occurrence: Not found native, but in a variety of zinc blende, the indium content is generally very low, sometimes to the extent of 0.1%. Sample ores of pegmatite in western Utah indicate this to be one of the largest indium-bearing ore deposits in the world.

Derivation: From certain zinc ores by chemical and electrolytic methods.

Forms available: Small ingots or bars, shot, pencils, wire, sheets, powder.

Purity: Technical; high purity (less than 10 ppm impurities).

Containers: Boxes; glass bottles.

Uses: In precious-metal alloys for jewelry and dental work; low-melting alloys; glass-sealing alloys, solders; lubricants, bearing metals; neutron indicator in atomic piles; semiconductors. With silver it forms a tarnish-resistant coating.

Shipping regulations: None.*

indium acetylacetonate $In(C_5H_7O_2)_3$. M. p. 186°C. Used as a catalyst.

indium chloride (indium trichloride) $InCl_3$.

Properties: White powder, hygroscopic, soluble in alcohol and water. Sp. gr. 4.

Derivation: Direct union of the elements or by the action of hydrochloric acid on the metal.

Grades: Technical.

indium compounds. Indium arsenide (InAs), antimonide (InSb), and phosphide (InP) are used as high purity binary semiconductors.

indium oxide (indium sesquioxide, indium trioxide) In_2O_3 .

Properties: White to light yellow powder; soluble in acids (hot); insoluble in water; sp. gr. 7.179.

Derivation: By burning the metal in air or heating the hydroxide, nitrate, or carbonate.

Grades: Technical.

indium sesquioxide. See indium oxide.

indium-sulfate $In_2(SO_4)_3$.

Properties: Grayish powder; deliquescent; soluble in water, sp. gr. 3.438; decomposed by heat.

Grades: Technical.

indium trichloride. See indium chloride.

indium trioxide. See indium oxide.

"Indo Carbon," ³⁰⁷ Trademark for sulfur dye-stuffs. Used for the dyeing and printing of cotton and rayon. Characterized by very good fastness to light, washing, chlorine, etc; do not cause tendering of the fiber.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Indofast." ⁴³⁸ Trademark for vat dyestuff pigments, including carbazole dioxazine violet. Used in paints, printing inks, and plastics.

indole (2,3-benzopyrrole)

Properties: White to yellowish scales, turning red on exposure to light and air; odor unpleasant in high concentration but should not show a fecal quality. Is carcinogenic. Soluble in alcohol, ether, hot water, and fixed oils, insoluble in mineral oil and glycerol. M.p. 52°C; b.p. 254°C.

Derivation: By heating ortho-nitrocinnamic acid with potassium hydroxide and iron filings, from indigo, and by numerous syntheses. Also can be produced from 220 to 260° fraction from coal tar.

Method of purification: Recrystallization.

Grades: Technical, C.P.

Containers: Tins; glass bottles.

Uses: Chemical reagent; perfumery, medicine.

Shipping regulations: None.*

3-indoleacetic acid (IA, IAA; beta-indoleacetic acid; heteroauxin) $\text{C}_8\text{H}_6\text{NCH}_2\text{COOH}$. One of the plant hormones, see auxin.

Properties: Crystals; m.p. 168-170°C.

The natural material is levorotatory, specific rotation 20/D is -3.8° in alcohol. Insoluble in water; soluble in alcohol and ether.

Use: To promote growth and rooting in plants.

beta-indoleacetic acid. See 3-indoleacetic acid.

indole-alpha-aminopropionic acid. See tryptophan.

3-indolebutyric acid $\text{C}_8\text{H}_6\text{N}(\text{CH}_2)_3\text{COOH}$.

Properties: White or off-white powder, essentially odorless. m.p. 123°C. Insoluble in water; soluble in alcohols and ketones.

Containers: Glass bottles, fiber drums.

Uses: Plant hormone, especially used in rooting plants.

"Indopol." ²¹⁶ Trademark for synthetic monolefin polymers of relatively high molecular weight used in caulking compounds, industrial sealants, adhesives, electrical insulation, surgical tapes, and also as a chemical intermediate.

"Indulin AT." ²²⁹ Trademark for an alkali lignin from the manufacture of paper pulp by the sulfate process.

Properties: Brown, free-flowing powder; insoluble in water and acids; soluble in aqueous alkali; sp. gr. 1.3; bulk density 25-30 lbs/cu ft; 2-6% moisture; pH 3.5-5.5. Composition, dry basis: ash, 0.5% max, sulfur, 1.0-1.4%; methoxyl, 13.5-14.5%; total hydroxyl 8-10%; phenolic hydroxyl 2.0-2.1%. Unit combining weight with metals, 840. Reacts to form salts, ethers, esters, and other condensation products. Can be halogenated, nitrated, sulfited and sulfonated.

Containers: Packed in 50-lb net MWP bags.

Uses: Emulsion stabilization; storage battery plates; foam stabilization; protein precipitation; dyeing; electroplating; rubber reinforcing; rubber masterbatch production; ceramics deflocculation, ceramics binding; dispersing; drilling muds, and others.

"Indulin B" and "Indulin C." ²²⁹ Trademarks for sodium derivatives of Indulin AT.

Properties: Brown, free-flowing powders; soluble in water; will precipitate lignin in acids; sp. gr. 1.35, 1.46, bulk density 30-35 pounds/cu ft; 2-8% moisture; pH 8-9, 9-10. Composition, dry basis: ash 8-12%, 18-22%; sulfur 1.2-1.6%, 1.4-1.8%; methoxyl, 12.5-13.5%, 10-12%. Same reactions as Indulin AT but have the difference of not requiring alkali for water solubility.

Containers: 50-lb MWP bags.

Uses: Same as Indulin AT.

"Indusoil." ²²⁸ Trademark for distilled or fractionated tall oils and tall oil products. Suffix used to further describe products. Typical examples are:

"Indusoil M-28."

Typical analysis: Acid number 190; rosin acids 28%, fatty acids 71%; unsaponifiables 2%, color (Gardner) 6.

"Indusoil L-3."

Typical analysis: Acid number 190, rosin acids 3%, fatty acids 96%; unsaponifiables 2%, color (Gardner) 6.

"Indusoil JC-11." A product particularly designed for use as an emulsifier in the manufacture of synthetic rubber.

Uses: "Indusoil" products are used in many applications, such as adhesives, binders, cements, flotation, leather, paint and varnish, soaps, rubber and sanitary chemicals. Being a free fatty and/or rosin acid, with double bonds present, it will undergo saponification, esterification, ethylene oxide condensation, decarboxylation, sulfonation, sulfurization, polymerization, and hydrogenation.

"Indusoil H-90." ²²⁸ Trademark for a tall oil rosin product.

Properties: A solid rosin product having similar properties to gum and wood rosin.

Uses: May be used in adhesives, binders, cements, ester gums, resins, soap, and rubber. Will undergo reactions common to rosin.

infrared. The region of the electromagnetic spectrum including wave lengths from 0.78 micron to about 300 microns (i.e., longer than visible light and shorter than microwave).

"Infrax." ²⁸⁰ Trademark for a refractory insulation, available only in brick form.

* Properties: Suitable for use at temperatures up to 2700°F; high strength; thermal conductivity 2.5 Btu/sq ft/ inch thickness/°F temperature difference/hr; the weight of a standard 9 in. brick is 3 lbs.

Uses: Primary linings of electric furnaces

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

and kilns. Should be used as primary linings of fuel-fired furnaces only when protected by a cement facing.

infusions. Aqueous solutions obtained by treating drugs with hot or cold water, without boiling. Generally prepared by pouring boiling water upon the vegetable substance and macerating the mixture in a tightly closed vessel until the liquid cools. When not otherwise specified, they are of 5% strength, by weight.

infusorial earth. See diatomite.

ingot iron. Highly refined steel made by the basic open-hearth process with a maximum of 0.15% impurity. Due to high purity it has excellent ductility and resistance to rusting.

ingrain dyes. Insoluble dyes developed by impregnating any fabric with one or more of the intermediates and then producing the dye by reaction with another intermediate.

"Inhibisol." ³³ Trade name for specially purified grade of "Penolene 643" (q. v.) to which a corrosion inhibitor has been added to make it safe for use on all metals, including aluminum.

inhibitor. General term for compounds or materials that have the effect of slowing down or stopping an undesired chemical change such as corrosion, oxidation or polymerization.

inks. See printing inks.

inosine (hypoxanthine riboside) $C_{10}H_{12}N_4O_5$. An important intermediate in animal purine metabolism. Also available as its barium salt.

Properties: (dihydrate) Crystallizes in needles from water, m. p. 90°C . Levorotatory in solution. Slightly soluble in water.

Derivation: By deamination of adenosine.
Use: Biochemical research.

inosinic acid (hypoxanthine riboside-5-phosphoric acid) $C_{10}H_{13}N_4O_8\text{P}$. An important intermediate in the synthesis and metabolism of animal purines.

Properties: Syrup with agreeable sour taste. Freely soluble in water and formic acid; very sparingly soluble in alcohol and ether.

Derivation: From meat extract or by enzymatic deamination of muscle adenylic acid.
Use: Biochemical research.

inositol (hexahydroxycyclohexane) $C_6H_6(\text{OH})_6 \cdot 2\text{H}_2\text{O}$. A constituent of body tissue. There are 9 isomeric forms of inositol, of which i-inositol (myo-inositol or meso-inositol or specifically the cis-1, 2, 3, 5-trans-4, 6-hexahydroxycyclohexane) is the one having vitamin activity. It appears to prevent alopecia, promote growth, have lipotropic activity, influence gastro-intestinal motility, and to prevent the deposit of cholesterol in the liver.

Properties: White crystals; odorless; m. p. $224\text{--}227^{\circ}\text{C}$; sweet taste; soluble in water; insoluble in absolute alcohol and ether; stable to heat, strong acid and alkali; becomes anhydrous at 100°C ; sp. gr. 1.524, 1.752 when anhydrous.

Source: Food source: Vegetables, citrus fruits, cereal grains, liver, kidney, heart and other meats. Commercial source: From corn steep liquor by precipitation and hydrolysis of crude phytate.

Units: Amounts are expressed in milligrams of inositol.

Grades: N. F. XI.

Containers: Bottles; cans; drums.

Uses: Medicine, nutrition; intermediate.

i-inositol. An optically inactive inositol isomer also referred to as myo-inositol in the literature.

inositol hexaphosphoric acid. See phytic acid.

INPC. Abbreviation for isopropyl N-phenylcarbamate. See IPC.

insane-root. See hyoscyamus.

insecticides. Chemical compounds which are used to control insects which are harmful, directly or indirectly, to man. The application of insecticides and subsequent control of the insect is achieved in several ways: (1) stomach poisons for insects which eat plant leaves or cloth fabric; (2) contact poisons which are applied directly to the body of the insect either by treating the material with which the insect comes in contact, or by introducing the toxic agent as a fumigant into the air the insect breathes, or (3) systemic insecticides in which the toxic agent is made a component of the plant itself. Examples of the stomach poisons are inorganic chemicals such as lead arsenate, sodium fluoride or sodium fluosilicates. Examples of contact poisons are natural plant extracts such as pyrethrum, organic chlorinated compounds such as DDT, chlordane and the like, or many organic phosphates such as parathion. Examples of fumigants are hydrocyanic acid gas, para-dichlorobenzene and methyl bromide. Octamethylphosphoramide is a systemic insecticide, i. e., it is more toxic to insects after it has been absorbed into the leaves of the plants than it is as a direct poison.

"Insecti-sol." ²⁵ Brand name for a proprietary highly purified odorless solvent exceeding CSMA minimum requirements for an insecticide base. This deodorized hydrocarbon distillate is water white and has a 170°F (min.) flash point, a $465\text{--}480^{\circ}\text{F}$ distillation end point, and a 98% unsulfonatable residue. Also useful in food processing and cosmetic manufacture.

insect wax. See Chinese wax.

"Insidol." ³⁰⁰ Trademark for a wetting agent useful in textile processing where instantaneous penetration is required. A sulfo-dicarboxylic acid ester composition.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

"Instant-Dri." ¹⁰⁸ A solid form rinsing agent. Reduces surface tension of water. Containers: 2 3/4 oz. bars; 1-oz Pak.

"Instantreat." ¹⁰⁸ Trademark for a high purity specially processed powdered complex phosphate. Contains enough chlorinated ingredient to disinfect feed solution and feed equipment.

Containers: 6-lb cans; 100-lb drums.

Uses: Controls corrosion, lime scale and red water trouble in homes, hotels, restaurants and small industrial water systems.

insulating oils (electrical oils). Oils used as insulators and cooling medium in transformers, circuit-breakers, switches or other electric apparatus.

insulin. An important polypeptide hormone which originates normally in the beta cells of the isles of Langerhans situated in the pancreas. It is made up of 16 amino acids and small amounts of the heavy metals zinc, nickel, cobalt or cadmium. It regulates carbohydrate metabolism in the body by decreasing the blood glucose level. A systemic deficiency of insulin leads to diabetes, and the isolation of insulin has made it possible to control this disease.

Properties: White powder or hexagonal-shaped crystals, readily soluble in dilute acids and alkalies, soluble in water.

Derivation: Extraction of minced pancreas with acidified dilute alcohol, followed by precipitation with absolute alcohol.

Grades: U. S. P. XVI, in various solutions or suspensions, which include insulin injection; globin zinc insulin injection, isophane insulin suspension, protamine zinc insulin suspension, insulin zinc suspension.

Containers: Glass bottles, ampules, vials. Use: Medicine.

insulin injection. See insulin.

insulin zinc suspension. See insulin.

"Insul-Mastic." ⁴²³ Trademark for a series of corrosion and insulation coatings based on asphalt-gilsonite.

"Insuloxide." ³³⁷ Trade name for zirconium oxide containing 95% ZrO₂ and 3-5% SiO₂. Cream colored powder with sp. gr. 5.4, average particle size 45 to 50 microns. Used as a thermal insulator and refractory where a prefused material is not required. Also used as a raw material in the production of super-refractories, and as a component in ceramic colors. See "Opax."

"Insurok." ⁶³ A series of laminated and molding plastics characterized by durability, light-weight, resistance to many chemicals, and high dielectric strength. These plastics have use as a replacement for cast aluminum in airplane parts, and for electric uses as switches, distributors; commutators, etc.

"Intalox." ³²⁶ Trademark for particular shape of tower filling materials

available in ceramic and carbon.

Intarvin (glyceryl margarate; glyceryl heptadecanoate) (C₁₆H₃₃COO)₃C₃H₅. White lumpy masses; odor and taste of tallow; insoluble in water; freely soluble in chloroform or ether.

intermediate. A chemical produced because it is a necessary intermediate stage in the manufacture of one or usually more ultimate end-products such as dyes, drugs, etc.

interstitial-cell-stimulating hormone (ICSH)

A gonadotropic hormone found in the pituitary gland. It is a glycoprotein and has been isolated from sheep pituitaries. ICSH stimulates the follicles of the ovary to develop into corpora lutea and stimulates the interstitial cells of the testis to secrete testosterone. It is commercially available in combination with follicle-stimulating hormone.

Properties: White powder; soluble in water. Destroyed by dilute acids and alkalies and by heating above 50°C.

Use: Medicine.

"Intocostirin." ⁴¹² Trademark for Chondodendron tomentosum extract (q. v.).

"Intracol." ⁸³ Trade name for a series of long chain fatty acid amides and their acid salts; used as emulsifiers, dispersing agents and textile lubricants.

intrinsic angular momentum. See spin.

intumescence. The foaming and swelling of a plastic or other material when exposed to high surface temperatures or flames. Used with respect to polyurethane base coating materials for rocket reentry application.

Inulin (alant starch) (C₆H₁₀O₅)_n.

Properties: Horny, colorless, amorphous lumps or white powder; hygroscopic, sp. gr. 1.35. Soluble in hot water.

Derivation: A carbohydrate from the bulbs of *Dahlia variabilis*.

Grades: Technical.

Containers: Wooden barrels; fiber drums.

Uses: Diabetic bread; manufacture of fructose; diagnostic reagent.

Shipping regulations: None. *

in vacuo. Taking place in a vacuum, actually at a low pressure.

"Invermul." ²³⁶ Trademark for a basic emulsifier in the preparation of water in oil-type emulsion drilling muds for oil wells.

Containers. 50-lb multiwall paper bags.

invertase (sucrase; invertin). Enzyme produced by yeast and by the lining of the intestines. It is a white powder, soluble in water. It catalyzes the conversion of sucrose (ordinary sugar) to glucose and levulose (fructose) during fermentation of sugars.

Uses: Production of invert sugar for syrups and candy; analytical reagent for sucrose.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

invertin. See invertase.

invert sugar. A mixture of 50% glucose and 50% fructose obtained by the hydrolysis of sucrose. It absorbs water readily, and is usually only handled as a syrup. Because of its fructose content, invert sugar is levorotatory in solution, and sweeter than sucrose. Invert sugar is often incorporated in products where loss of water must be avoided. Commercially it is obtained from the inversion of a 96% cane sugar solution.
Use: Food industry; brewing industry, medicine.

"**Invin.**"³⁰⁴ Trademark for a series of organic vinyl stabilizers: Available as:

"**Invin 85.**" Barium-cadmium-zinc compound. Properties: Clear light yellow liquid, sp. gr. 1.03, refractive index 1.48.

Containers: Metal drums containing 40 and 450 lbs.

Uses: Plastisol and organosol stabilizer. Provides excellent heat and light stability. Low viscosity. Excellent air release.

"**Invin 91.**" Barium-cadmium compound.

Properties: Clear yellow liquid, sp. gr. 1.03, refractive index 1.48.

Containers: Metal drums containing 40 and 450 lbs.

Uses: Heat and light stabilizer for all types of clear and translucent film, sheeting and extrusions. Good resistance to yellowing and plate-out.

in vitro. A condition in which a reaction is carried out, or a process occurs, in a glass container, as a test tube or beaker.

in vivo. A condition in which a reaction is carried out, or a process occurs, in a living system, i.e., cells or tissues.

"**Ioclide.**"²³⁹ A water-soluble form of iodine, containing a nonionic detergent as a surface active agent. Contains 15.8% polyethoxypolypropoxypolyethoxyethanol-iodine complex, 15.2% nonylphenoxypolyethoxyethanol-iodine complex (provides 3.1% available iodine), and 0.2% hydrogen chloride, remainder water and other inert ingredients. Used as a germicide.

iodargyrite (iodyrityte) AgI. A natural silver iodide. Color yellow or yellowish green, luster resinous to adamantine, streak shining yellow; hardness 1.5, sp. gr. 5.69. Occurrence: Nevada, New Mexico, Arizona, Australia; Chile.
See also cerargyrite.

iodemboilite. A variety of embolite (q. v.) containing iodine.

iodosin (tetraiodofluorescein) $C_{20}H_8I_4O_5$. Properties: Red powder; soluble in dilute alkalis; slightly soluble in alcohol and ether; insoluble in water.
Derivation: By the interaction of fluorescein and iodine in presence of iodic acid.
Grades: Technical.
Containers: Glass bottles.

Use: Indicator in analytical chemistry.

Shipping regulations: None.*

iodic acid HIO_3 .

Properties: Colorless, rhombic crystals or white, crystalline powder. A moderately strong acid. Soluble in cold and hot water. Sp. gr. 4.629; m. p. 110°C (decomposes).

Derivation: By adding sulfuric acid to a solution of barium iodate and subsequent filtration and crystallization.

Method of purification: Crystallization.

Containers: 1-lb bottles; tins.

Grades: Technical.

Uses: Analytical chemistry; medicine.

iodic acid anhydride (iodic acid anhydrous; iodine pentoxide) I_2O_5 .

Properties: White, crystalline powder.

Soluble in dilute alcohol and water; insoluble in absolute alcohol, chloroform, ether, carbon disulfide. Sp. gr. 4.799; m. p. 300°C (decomposes).

Grades: Technical.

Uses: Oxidizing agent, organic synthesis.

iodic acid anhydrous. See iodic acid anhydride.

iodine I. Element of atomic number 53, group VII of the periodic table; the least reactive of the halogens.

Properties: Heavy, grayish-black plates or granules, having a metallic luster and characteristic odor. Readily sublimed, having a violet vapor. Poisonous, corrosive! Sp. gr. 4.98, m. p. 114.2°C; b. p. 184°C. Soluble in alcohol, carbon disulfide, chloroform, ether, carbon tetrachloride, glycerol, and alkaline iodide solutions; insoluble in water.

Derivation: (a) From oil-well brines, by oxidation with chlorine and absorption in sulfurous acid. (b) From the ashes of seaweeds or mother liquors of Chile saltpeter by the addition of sodium bisulfite solution.

Method of purification: Sublimation.

Grades: Technical, C. P., U. S. P. XVI.

Containers: Bottles, 100- and 200-lb kegs, drums.

Uses: Medicine (germicide, antiseptic); organic compounds, dyes (aniline dyes, phthalein dyes), catalyst in intermediate manufacture, iodides; iodates, pharmaceuticals, leather manufacture; testing paper; process engraving and lithography; special soaps, analytical reagent, suggested for use in tungsten filament lamps.

Shipping regulations: None.*

iodine 131. Radioactive iodine of mass number 131.

Properties: Half-life 8 days, radiation, beta and gamma; radiotoxicity, moderately hazardous.

Derivation: By pile irradiation of tellurium and from the fission products of nuclear reactor fuels.

Forms available: As elemental iodine and in a weakly basic solution of sodium iodide in sodium sulfite; iodine 131 is also available in tagged compounds such

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

as dithymol diiodide, potassium iodate, diiodofluorescein, insulin, ACTH, etc.

Grade: N. N. D., as radio-iodinated serum albumin, and as sodium radio-iodide.

Uses: Diagnosis and treatment of goiter hyperthyroidism, and other thyroid disorders; iodine 131 is also used for internal radiation therapy; for locating brain tumors; in film gauges to measure film thicknesses of the order of one micron, for detecting leaks in water lines; as a source of radiation in oil field tests, as a tracer in chemical analysis; as a tracer in studying diet iodine for cattle, the functions of the thyroid gland, the efficiency of mixing pulp fibers, the thermal stability of potassium iodate in bread dough, chemical reaction mechanisms, etc.

Shipping regulations: Class D poison, radioactive material. Red label.*

iodine bisulfide. See sulfur iodine.

iodine bromide. See iodine monobromide.

iodine chloride. See iodine monochloride and iodine trichloride.

iodine cyanide. See cyanogen iodide.

iodine disulfide. See sulfur iodine.

iodine monobromide (bromine iodide) IBr.

Properties: Crystalline, purplish-black mass. Soluble in water with decomposition, alcohol, and ether. M. p. 42°C; b. p. 116°C (dec); sp. gr. 4.41.

Derivation: By the interaction of iodine and bromine.

Grades: Technical.

Containers: Glass bottles; metal boxes.

Use: Organic synthesis.

Shipping regulations: None.*

iodine monochloride ICl.

Properties: Reddish-brown, oily liquid; two solid forms, alpha and beta. Soluble in alcohol, water (with decomposition), and dilute hydrochloric acid.

Constants: M. p. (alpha) 27°C, (beta) 14°C; b. p. 101°C (dec); sp. gr. 3.78.

Derivation: By the action of dry chlorine on iodine.

Grades: Technical.

Containers: Glass bottles.

Uses: Analytical chemistry; organic synthesis.

Shipping regulations: Corrosive liquid. White label.*

iodine number (iodine value). The percentage of iodine that will be absorbed by a chemically unsaturated substance (vegetable oils, rubber, etc.) in a given time under arbitrary conditions. A measure of unsaturation.

iodine pentafluoride IF₅.

Properties: Fuming liquid; b. p. 100.5°C, m. p. 9.4°C; sp. gr. (liquid) 3.189 (25°C). Reacts violently with water; attacks glass.

Available in cylinders at 98.0% min purity.

iodine pentoxide. See iodic acid, anhydride.

iodine solution, strong. See Lugol's solution.

iodine tincture. A solution of iodine and potassium iodide or sodium iodide in alcohol; a reddish-brown liquid having the odors of iodine and alcohol; contains from 44-50% by volume of alcohol and 2 g of iodine per 100 cc.

Grades: U. S. P. XVI.

iodine trichloride ICl₃.

Properties: Orange-yellow, deliquescent, crystalline powder, pungent, irritating odor; poisonous! Soluble in water with decomposition, alcohol and benzene.

Constants: M. p. 33°C; sp. gr. 3.11.

Derivation: By interaction of iodine and chlorine.

Grades: Technical.

Containers: Amber glass bottles.

Use: Medicine; agent for introducing iodine and chlorine in organic synthesis.

Shipping regulations: None.*

iodine value. See iodine number.

iodipamide (CH₂)₄(CONHC₆H₄COOH)₂.

3,3'-(Adipoyldiimino) bis(2,4,6-triiodobenzoic acid).

Properties: White, nearly odorless, crystalline powder, very slightly soluble in alcohol chloroform, ether, and water; pH of saturated solution is between 3.5 and 3.9.

Grade: N. F. XI.

Use: Medicine.

iodipamide bis(N-methylglucamine) salt. See methylglucamine iodipamide.

iodisan. See propiodal.

iodival (2-iodoisovalerylurea)

(CH₃)₂HCCHICOHNCONH₂.

Properties: White powder containing 47% iodine. Soluble in alcohol, hot water; insoluble in cold water.

Constants: M. p. 180°C with decomposition.

Use: Medicine.

Shipping regulations: None.*

iodized oil. An iodine addition product of vegetable oil or oils containing 38-42% organically combined iodine.

Properties: Thick, viscous, oily liquid. Alliacious odor. Oleaginous taste.

Affected by air and light. Soluble in solvent naphtha.

Grade: U. S. P. XVI.

Use: Medicine (radiopaque medium).

alpha-iodoacetophenone C₆H₅COCH₂I.

Properties: Crystals. Soluble in alcohol, benzene, ether; insoluble in water.

Constants: B. p. 170°C (30 mm), m. p. 29.5 to 30°C.

Derivation: Interaction of chloroacetophenone and sodium iodide in presence of ethyl alcohol.

iodoalphonic acid

C₆H₅CH(COOH)CH₂C₆H₄I₂OH. beta-(4-Hydroxy-3,5-diiodophenyl)-alpha-phenylpropionic acid.

Properties: White crystals or as white or faintly yellowish powder, having a faint

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

characteristic odor and taste. M.p. 160-164°C (with decomposition). Stable in air but slightly discolored on prolonged exposure to light. Insoluble in water; readily soluble in alcohol and ether; slightly soluble in benzene and chloroform; soluble in both alkali carbonate and hydroxide solutions.

Grade: N. F. XI.

Use: Medicine.

iodobrassid. See ethyl diiodobrassidate.

iodochlorhydroxyquin. U. S. P. XVI name for iodochlorohydroxyquinoline.

iodochlorohydroxyquinoline (5-chloro-7-iodo-8-quinolinol, iodochlorhydroxyquin, iodochloroxyquinoline) C_9H_6ClINO .

Properties: Voluminous, spongy, brownish-yellow powder, with a slight, characteristic odor; m. p. 172°C, nearly insoluble in water and in alcohol; soluble in hot ethyl acetate and in hot glacial acetic acid.

Grade: U. S. P. XVI (as iodochlorhydroxyquin).

Containers: Drums.

Use: Medicine.

iodochloroxyquinoline. See iodochlorohydroxyquinoline.

iodoethane. See ethyl iodide.

iodoethylene. See tetraiodoethylene.

iodoform (triiodomethane) CHI_3 .

Properties: Small, greenish yellow or lustrous crystals or powder, characteristic, penetrating odor. Soluble in alcohol, glycerol, chloroform, carbon disulfide and ether; insoluble in water.

Constants: Sp. gr. 4.08, m. p. 115°C.

Derivation: (a) By heating acetone or methyl alcohol with iodine in presence of an alkali or alkaline carbonate. (b) Electrolytically, by passing a current through a solution containing potassium iodide, alcohol and sodium carbonate.

Grades: Technical, N. F. XI.

Containers: Bottles, 100-, 300-lb drums.

Use: Medicine (external).

Shipping regulations: None.*

iodoformin (iodoformohexamethylenetetramine) $CHI_3 \cdot (CH_2)_6N_4$. Do not confuse with iodoformine, which is hexamethylene-tetramine tetraiodide.

Properties: White crystalline powder, faint iodoform odor. Decomposes in wounds and boiling water liberating 75% free iodoform. Insoluble in water, alcohol, and ether. M. p. 178°C.

Derivation: Action of alcoholic iodoform solution on hexamethylenetetramine.

Use: Medicine.

Shipping regulations: None.*

iodoformohexamethylenetetramine. See iodoformin.

iodhippurate sodium $C_9H_7INaNO_3 \cdot 2H_2O$. Sodium ortho-iodohippurate dihydrate. Prepared as a white, crystalline powder

which is very soluble in water. Aqueous solutions are clear and practically colorless. A 5% solution has pH 7.3-7.8. The free acid melts at 173-176°C.

Use: Medicinal.

7-iodo-8-hydroxyquinoline-5-sulfonic acid. See loretin.

2-iodoisovalerylurea. See iodival.

iodole (pyrrole tetraiodide; tetraiodopyrrole) C_4I_4NH .

Properties: Light grayish-brown or yellowish-gray crystalline powder; odorless, tasteless; decomposes 140-150°C; soluble in ether, alcohol, chloroform, fixed oils; difficultly soluble in water.

Derivation: Pyrrole (obtained from bone oil) is subjected to the action of a solution of iodine in potassium iodide. The precipitated iodole is dissolved in hot alcohol and precipitated by adding water.

Use: Medicine.

Shipping regulations: None.*

iodomethane. See methyl iodide.

iodopanoic acid. See iopanoic acid.

iodophor.

1. A complex of iodine with certain types of surface active agents that have detergent properties.

2. More generally, any carrier of iodine.

iodophosphonium. See phosphonium iodide.

iodophthalein (tetraiodophenolphthalein, nosophen) $C_{20}H_{10}I_4O_4$.

Properties: Pale yellow, odorless, tasteless powder. Decomposes about 200°C. Soluble in chloroform, ether, and solutions of alkalis, slightly soluble in alcohol, insoluble in water.

Use: Medicine.

iodophthalein sodium (TIPPS; tetraiodophenolphthalein sodium, nosophen sodium, soluble iodophthalein) $C_{20}H_8I_4O_4Na_2 \cdot 3H_2O$.

Properties: Pale blue to violet, odorless, hygroscopic crystals. Salty taste. Soluble in water, slightly soluble in alcohol.

Gradually absorbs carbon dioxide from the air, becoming insoluble.

Grade: N. F. XI. (not less than 85% tetraiodophenolphthalein).

Use: Medicine.

2-iodopropane. See isopropyl iodide.

iodopyracet (3,5-diiodo-4-pyridone-N-acetic acid, diethanolamine salt)

$C_5H_2I_2NOCH_2COONH_2(CH_2CH_2OH)_2$. A sterile water solution is listed in N. F. XI.

Use: Medicine (radio-opaque iodine compound).

iodosuccinimide (succinodimide) $C_4H_4INO_2$.

Properties: Colorless crystals; m. p. 200-201°C; soluble in acetone, methanol; insoluble in carbon tetrachloride and ether. Decomposes in water.

Containers: Glass bottles.

Use: Iodinating agent in synthetic organic chemistry.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

iodothymol. See thymol iodide.

iodyrite. See iodargyrite.

"Ioflow." ³²⁹ Trademark for a potassium iodide mixture with 0.5% magnesium carbonate added to produce a free-flowing salt.

"Iokel." ²⁴⁴ Trade name for a phosphoric acid solution of a polyoxyethanol alkyl phenol condensate complex of elemental iodine.
Properties: Viscous, dark liquid with acidic reaction. Miscible in all proportions with water.
Uses: Detergent sanitizer, milk stone remover.

"Iomag." ³²⁹ Trademark for a potassium iodide mixture containing 90% potassium iodide and made free-flowing with 8% magnesium carbonate and 2% potassium hydroxide.

ion.

1. In solutions: an electrically charged atom or group of atoms.
2. In gases: electrically charged molecules. Ions may be either positively or negatively charged, indicating that an atom has either lost or gained one electron.

"Ionac." ²¹⁰ Trademark for a line of cation and anion exchangers.

"Ionac" A-260. A quaternary amine type resin anion exchanger.

"Ionac" A-300. Tertiary amine, moderately basic type anion exchanger.

"Ionac" A-315. Weakly basic, polystyrene base, polyamine type resin anion exchanger.

"Ionac" A-540. Trimethylamine, strongly basic polystyrene quaternary amine type resin anion exchanger.

"Ionac" A-550. Strongly basic, dimethylethanolamine type resin anion exchanger.

"Ionac" A-580. Highly porous, medium basic, high capacity resin type anion exchanger.

"Ionac" A-590. Highly porous, medium basic, high capacity resin type anion exchanger.

"Ionac" C-50. Processed glauconite (naturally occurring greensand) cation exchanger.

"Ionac" C-100. Precipitated gel-type sodium aluminosilicate cation exchanger.

"Ionac" C-101. Treated precipitated gel-type sodium aluminosilicate cation exchanger employed for ammonia determination.

"Ionac" C-102. Treated precipitated potassium aluminosilicate cation exchanger.

"Ionac" C-150. Sulfonated coal type, acid resistant, cation exchanger.

"Ionac" C-240. High capacity, sulfonated, acid resistant, styrene type resin cation exchanger.

"Ionac" C-244. Cation exchanger in hydrogen form for use as a catalyst in place of strong acids.

"Ionac" C-245. High capacity ammonium cation exchanger.

"Ionac" C-250, C-255, C-260. Higher cross-linked forms of C-240.

"Ionac" C-270. Carboxylic cation exchanger containing only weakly acidic groups.

"Ionac" D-75 (ASMIT). Specially prepared decolorizing resin; prepared from bone char.

"Ionac" M-50. Permanganate-regenerated glauconite cation exchanger.

"Ionac" M-610. Mixed bed resin for demineralizing.

"Ionac" MA-3148, MA-3228. Anion exchange membranes for use in electrodialysis.

"Ionac" MC-3142, MC-3227. Cation exchange membranes for use in electrodialysis.

"Ionac" P-50. Hard, granular fast-wetting activated carbon.

"Ionac" R-50. A granular calcite employed for increasing the pH of water.

ion exchange. A reversible chemical reaction between a solid (ion exchanger) and a fluid mixture (usually an aqueous solution) by means of which ions may be interchanged. The superficial physical structure of the ion exchanger solid is not affected. The customary procedure is to pass the fluid through a bed of the solid, which is granular and porous, and has only a limited capacity for exchange. The process is essentially a batch type in which the ion exchanger, upon nearing exhaustion, is regenerated by the use of inexpensive brines, carbonate solutions, etc. (See zeolites).

The process was first used in water softening, but now has a much broader application. Ion exchange reactions are of four types: (1) base or cation exchange, as in the water-softening process, (2) hydrogen exchange, a special case of the first type, in which metal ions are replaced by hydrogen ion with the aid of a hydrogen zeolite, or resin, (3) anion exchange, as for instance the change of streptomycin sulfate to the chloride, and (4) acid removal, a special case of the third type, in which both hydrogen ion and the anion are removed by an amine resin (see ion exchange resins). Some specific uses: Water softening, milk softening (substitution of sodium ions for calcium ions in milk); removal of iron from wine (substitution of hydrogen ions), recovery of chromate from plating solutions, uranium from acid solutions, streptomycin from broths; removal of formic acid from formaldehyde solutions, demineralization of sugar solutions; recovery of valuable metals from wastes, recovery of nicotine from tobacco-dryer gases; catalysis of reaction between butyl alcohol and fatty acids, recovery and separation of radioactive isotopes from atomic fission; analytical methods; desalting of water.

ion exchange, liquid. A misleading term for processes which involve chelation reactions rather than ion exchange. Liquid ion exchange is sometimes used to refer to the extraction of metals into a solution containing ethylenediaminetetraacetic acid (EDTA) or similar reagents that cause complex formation with metal ions.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ion exchange resins. Synthetic resins containing active groups (usually sulfonic, carboxylic, phenol, or substituted amino groups) that give the resin the property of combining with or exchanging ions between the resin and a solution. Thus a resin with active sulfonic groups can be converted to the sodium form and will then exchange its sodium ions with the calcium ions present in hard water. "Amberlite" resins are of this type. See also zeolites.

ion exclusion. The process in which a synthetic resin of the ion exchange type absorbs non-ionized solutes such as glycerine or sugar while it does not absorb ionized solutes that are also present in a solution in contact with the resin. Thus sodium chloride and glycerine can be separated by passage of their aqueous solution through a bed of particles of an ion exclusion resin.

ionic detergents. See detergents, synthetic.

"Ionite." ²⁷¹ Trademark for a lignite-type material used for oil well drilling muds, as a low density filler in dark colored rubber, as an organic base filler for fertilizers, and as a source of humic acid.

ionization. The separation or dissociation of a molecule into atoms or groups of atoms that are of opposite electrical sign. This occurs spontaneously in many salts when they are dissolved in water, or when the salts are melted. Thus sodium chloride gives positive sodium ions and negative chloride ions. Molecules or atoms of gases are ionized by passage of an electric current through the gas. In this case electrons are removed from the molecule or atom, leaving it with a positive charge.

ionizing radiations. High speed or high energy particles or electromagnetic waves from radioactive sources, such as radium, or fission products, or from nuclear reactions of atomic or hydrogen bombs, nuclear piles, and accelerators or cyclotrons, and betatrons. The high speed high energy particles may be electrons, protons, neutrons, deuterons, or alpha particles with enough energy to ionize, i. e., remove electrons from ordinary atoms upon collision. The electromagnetic wave ionizing radiations are x-rays or gamma rays.

"Ionol." ¹²⁵ Trademark for 2,6-di-tert-butyl-4-methylphenol, a sterically hindered phenol with unusually good antioxidant properties. Unlike most phenols, "Ionol" is nonirritating to the skin and has a comparatively inert, non-acidic hydroxyl group. Properties: M. p. 70°C; b. p. 265°C, sp. gr. (20/4°C) 1.048, sp. gr. (80/4°C) 0.899; flash point, Tag open cup, 260°C; soluble in methanol, ethanol, isopentane, benzene, toluene, methyl ketone, and linseed oil; insoluble in water and 10% sodium hydroxide.

Containers: 20-gal and 51-gal non-returnable fiber drums.

Uses: Antioxidant for such petroleum products as aviation gasoline, motor gasoline, transformer oils; turbine oils; hydraulic oils, refrigerator and similar industrial oils; for light colored natural or synthetic rubber compounds; stabilizer for neoprene and certain plastics.

Hazard: None.

Shipping regulations: None. *

"Ionol" CP. ¹²⁵ Trademark for a highly purified 2,6-di-tert-butyl-4-methylphenol (butylated hydroxytoluene) meeting rigid specifications as an antioxidant acceptable (subject to quantitative limitations) to the Food and Drug Administration and the Bureau of Animal Industry.

Properties: White crystalline solid soluble in fats and oils. Commercial product is 99 mol. % pure (min); f. p. 69.41°C min.

Containers: 20-gal non-returnable fiber drums with polyethylene liner.

Uses: To retard rancidification and extend shelf life of edible fats and oils from animal and vegetable sources, and of fat-containing foodstuffs in general.

Shipping regulations: None. *

ionone [alpha- or beta-cyclocitrylideneacetone; (alpha)4-(2,6,6-trimethyl-2(in beta-form is 1)-cyclohexenyl)buten-3-one-2] C₁₃H₂₀O. See also "Irisone."

Properties: Light yellow to colorless liquid, having violet-orris type odor. Soluble in alcohol; b. p. 126-128°C at 12 mm; sp. gr. 0.935 (25/25°C); refractive index 1.506 (20°C).

Grades: Alpha, beta, and mixtures of varying proportions.

Containers: Cans.

Derivation: Condensation of citronellal from lemon-grass oil with acetone.

Uses: Perfumery, synthesis of intermediates of vitamin A.

ion retardation. A process based on amphoteric (bifunctional) ion exchange resins containing both anion and cation adsorption sites. These sites will associate with mobile anions and cations in solution and thus remove both kinds of ions from solutions. These ions may be eluted by rinsing with water. Process can make clean separations of ionic-nonionic mixtures. Has also been suggested for demineralization of salt solutions.

iodopanoic acid (iodopanoic acid, 3-(3-amino-2,4,6-triiodophenyl)-2-ethylpropanoic acid) C₆H₃NH₂CH₂CH(COOH)C₂H₅.

Properties: Cream-colored, tasteless powder with faintly aromatic odor; m. p. 152-158°C (dec); darkens on exposure to light; soluble in acetone, ether, alcohol, chloroform and dilute alkalis; insoluble in water.

Grade: U. S. P. XVI.

Use: Medicine.

iophendylate

IC₆H₄CH(CH₃)CH₂(CH₂)₇COOCH₂CH₃.

A mixture of isomers of ethyl

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

iodophenylundecylate in uniform, but unknown proportions.

Properties: Colorless to pale yellow, odorless, viscous liquid; color darkens on long exposure to air; sp. gr. 1.248-1.257 (25/25°C); refractive index 1.5235-1.5255 (25°C); freely soluble in alcohol, benzene, chloroform, and ether; very slightly soluble in water.

Grade: U. S. P. XVI.

Use: Medicine.

iofenoxic acid $I_3(OH)C_6HCH_2CH(C_2H_5)COOH$.
alpha-Ethyl-beta-(2,4,6-triiodo-3-hydroxyphenyl)propionic acid; alpha-ethyl-3-hydroxy-2,4,6-triiodohydrocinnamic acid.

Properties: White or creamy white crystalline powder with faint odor and characteristic taste. M. p. 146-149°C, very slightly soluble in water; soluble in alcohol, ether, alkaline solutions.

Grade: U. S. P. XVI (98-102%).

Use: Medicine (radiopaque medium).

"Iosan." ²⁸⁴ Trademark for a cleaner-sanitizer-disinfectant particularly formulated for use in the dairy field. Contains non-ionic iodine complexes. Claimed to be non toxic, non irritating, non staining when used as directed.

"Iosol." ²⁴³ Trademark for solvent soluble dyes for plastics and lacquers.

iothiouracil sodium $CHNC(SNa)NC(OH)Cl$.
(sodium 5-iodo-2-thiouracil).

Properties: Odorless, white to light yellow crystalline powder, m. p. 235-240°C (dec); slightly soluble in alcohol and water, practically insoluble in acids. Usually obtained as dihydrate which is reasonably stable to moisture and sunlight at room temperature; pH 8.5-9.5 (2% solution).

Grade: N. N. D.

Use: Medicine.

IPA. Abbreviation for isopropyl alcohol.

ipado. See coca.

IPAE. See isopropylaminoethanols.

IPC (INPC; isopropyl N-phenylcarbamate)
 $C_6H_5NHCOOCH(CH_3)_2$.

Properties: White to gray crystalline needles, odorless when pure; m. p. 84°C (technical material); soluble in alcohol, acetone, isopropyl alcohol; slightly soluble in water.

Containers: Bottles, fiber drums.

Uses: Pre-emergence herbicide.

Caution: Harmful if swallowed. MCA warning label.

IPC, chloro-. See chloro-IPC.

ipecac (ipecacuanha; cephaelis). Dried root of *Cephaelis ipecacuanha*.

Habitat: Brazil and Bolivia; cultivated in India.

Grades: Technical, U. S. P. XVI.

Containers: Whole root: bags; powdered: boxes, barrels.

Uses: Medicine; tanning agent; manufacture of sweetmeats.

Shipping regulations: None.*

ipecacuanha. See ipecac.

ipomea (Mexican scammony root; jalap, orizaba). Dried root of *Ipomoea orizabensis*.

Grades: N. F. XI.

Containers: Bags.

Use: Medicine.

Shipping regulations: None.*

ipomea resin (Mexican scammony resin).

A resin obtained by extraction with diluted alcohol from ipomea.

Properties: Brown or yellowish-orange translucent masses, odor characteristic; taste acrid, soluble in alcohol and chloroform.

Grade: N. F. XI.

Use: Medicine.

"Ipral." ⁴¹² Trademark for probarbital sodium (q. v.).

iproniazid phosphate (1-isonicotinyl-2-isopropylhydrazine phosphate)
 $C_9H_{13}N_3O \cdot H_3PO_4$.

Properties: M. p. 175.5-179°. Soluble in water; slightly soluble in alcohol; insoluble in chloroform and ether.

Grade: N. N. D.

Use: Medicine.

Ir. Symbol for iridium.

"Irgasan BS-200." ²¹⁹ Trademark for 3,5,3',4'-tetrachlorosalicylanilide (TCSA).

Properties: White, free flowing non-hygroscopic powder, m. p. 161-3°C. Soluble in alkali and in most organic solvents, can be solubilized in soap and detergent formulations. Fluoresces when activated by ultraviolet light. Substantive to fabrics, for example cotton, nylon and wool.

Uses: Bacteriostat - fungistat, exhibiting activity against a broad spectrum of bacteria and fungi. Used in soaps, detergents, cosmetics, deodorants, cutting oils, plastics, cleaning compounds.

iridic bromide (iridium bromide, iridium tetrabromide) $IrBr_4$.

Properties: Hygroscopic powder. Soluble in alcohol, water.

Grades: Technical.

iridic chloride (iridium chloride, iridium tetrachloride) $IrCl_4$.

Properties: Brownish-black mass. Hygroscopic. Soluble in water, and alcohol.

Grades: Technical.

Uses: Analysis (testing for nitric acid in the presence of nitrous acid); in microscopical work.

iridium Ir. Element of atomic number 77, one of the platinum metals, group VIII of the periodic classification.

Properties: Silver-white metal. Limited ductility. Does not tarnish in air. On heating strongly a slightly volatile oxide is formed. Insoluble in acids, slowly soluble in aqua regia and in fused alkalis.

Constants: Sp. gr. 22.4, m. p. 2454°C;

Brinell hardness (cast) 218.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: Occurs with platinum; remains insoluble when the crude platinum is treated with aqua regia; occurs as iridosmine.

Containers: Boxes.

Uses: As an alloy with platinum for jewelry, for electric contacts and thermocouples, commercial electrodes, and resistance wires, used for tipping pens when alloyed with osmium.

iridium 192. Radioactive iridium of mass number 192.

Properties: Half-life, 75 days; radiation, beta and gamma.

Derivation: Pile irradiation of iridium metal slugs.

Forms available: Iridium metal, or potassium or sodium chloroiridate in hydrochloric acid solution.

Uses: Radiography of light castings; treatment of cancer.

Shipping regulations: Poison, class D, radioactive material. Red label.*

iridium bromide. See iridic bromide.

iridium chloride. See iridic chloride.

iridium-potassium chloride (potassium chloroiridate; potassium-iridium chloride, potassium iridochloride) $\text{IrCl}_4 \cdot 2\text{KCl}$.

Properties: Dark-red crystals. Soluble in water (hot).

Grades: Technical.

Use: Black pigment (porcelain decoration).

iridium sesquioxide Ir_2O_3 .

Properties: Black powder. Slightly soluble in hydrochloric acid (conc), insoluble in water.

Grades: Technical.

Use: Ceramics (porcelain decoration).

iridium-sodium chloride (sodium-iridium chloride) $\text{IrCl}_4 \cdot 2\text{NaCl} \cdot 6\text{H}_2\text{O}$.

Properties: Brownish-black crystals. Soluble in water.

iridium tetrabromide. See iridic bromide.

iridium tetrachloride. See iridic chloride.

iridosmine (osmiridium). A natural alloy of iridium and osmium containing some platinum, rhodium, ruthenium, iron, copper, palladium. Tin-white to light steel gray in color; streak, same, metallic luster. Composition is variable ranging from 10.0-77.2% iridium, 17.2-80.0% osmium, 0-10.1% platinum, 0-17.2% rhodium, 0-8.9% ruthenium, 0-1.5% iron, 0-0.9% copper, trace, palladium. Unattacked by aqua regia.

Constants: Sp. gr. 18.8-21.12, hardness 6-7.

Occurrence: United States (California, Oregon); Russia; Japan; Borneo, Australia, Tasmania, New Zealand, Canada; West Indies; Brazil; South Africa.

Uses: Very hard and resistant to corrosion. Fountain-pen point tips, surgical needles, watch pivots; compass bearings; hardening platinum (standard weights, jewelry); source of iridium and osmium.

iris. See orris.

Irish broom. See scoparius.

Irish moss. See chondrus.

"Irisol." ³⁰⁷ A fast alizarine direct violet.

"Irisone." ²²⁷ Trademark for a series of compounds consisting of alpha- and beta-ionones. Light yellow to colorless liquids, having floral odors, primarily violet.

Ionone Coeur is a refined mixture of alpha- and beta-ionone.

Ionone Pure, used in less expensive compounds, is also a mixture of alpha- and beta-ionone.

Ionone Beta Pure is a purified beta-ionone used in pharmaceuticals and for chemical synthesis.

Ionone Bis is used in soap compositions.

iron (ferrum) Fe. Element of atomic number 26, of group VIII of the periodic system.

Properties: Silvery-white, tenacious, lustrous, malleable, ductile metal, rarely found native except in meteorites. The only metal which can be tempered, i. e., hardened by heating and sudden cooling, heating and slow cooling make it very pliable. It is magnetic and can be magnetized, but soon loses its magnetism (steel retains it). It rapidly oxidizes (rusts) in damp or salty air and is corroded or dissolved by acids. It reacts with steam when hot to yield hydrogen and iron oxides. It is very brittle at very low temperatures, softens at red-heat, and can be welded at white-heat.

Pure iron has a specific gravity of 7.85 and melts at 1530°C. It is difficult to purify and the pure metal is rarely encountered. Practically all commercial forms are impure in one way or another. The impurities are costly to remove or else are added to achieve desirable properties. Probably the purest form of iron available is powdered iron obtained by decomposition of iron pentacarbonyl (see carbonyl iron powder).

Major iron ores: Hematite, limonite; magnetite, siderite, and recently, taconite.

Derivation: By smelting the ores with limestone and coke in blast furnaces. The product is pig iron, which is treated further to produce the following common commercial forms.

Forms available. Pig iron, cast iron, wrought iron; steel, powdered iron, wire, filings, etc. (See iron, pig; iron, cast, iron, wrought, iron, ductile; steel; also various alloys of iron under ferro-).

Grades: N. F. XI (wire, filings, powder); powdered (electrolytic 99.9%, atomized, sponge, carbonyl, hydrogen reduced, electronic, milled pulverized).

iron 55. Radioactive iron of mass number 55.

Properties: Half-life 2.91 years; decays through K capture; radiotoxicity, very hazardous.

iron 59. Radioactive iron of mass number 59.

Properties: Half-life 46.3 days; radiation, beta and gamma; radiotoxicity, moderately

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

hazardous.

Derivation: Pile irradiation of iron metal, giving a product which contains iron 55 impurity. Both iron 55 and iron 59 are produced pure in the cyclotron. (See iron 55). Enriched samples of each are also available.

Forms available: Ferric chloride in hydrochloric acid solution; metallic iron; iron 59 is also available in tagged compounds such as hemoglobin, ferrous gluconate, ferrous ascorbate, etc., and in other forms by service irradiation.

Uses: For studies on the distribution of alloying elements in welds, the mechanism of corrosion by organic acids, engine friction wear, the lubricating qualities of engine oils, the chemistry of iron in sea water, mineral supplements in animal nutrition, liver functions and anemia, etc.

Shipping regulations: Poison, class D, radioactive material. Red label. *

iron acetate. See ferric acetate, basic, ferrous acetate.

iron acetate, basic. See ferric acetate, basic.

iron acetate liquor (iron liquor, black liquor, black mordant; iron pyrolignite).

Properties: Intensely black liquor, sometimes containing copperas or tannin. Absorbs oxygen from the air. Sp. gr. 1.09-1.115, containing 5-5.5% iron.

Derivation: (a) By the action of pyroligneous acid on iron filings; (b) double decomposition of ferrous sulfate with calcium pyrolignite.

Grades: According to specific gravity.

Containers: Wooden barrels.

Uses: Mordant, especially for alizarine and nitroso dyes, and for dyeing and printing logwood.

iron alginate. See ferric alginate.

iron alum. See ferric-potassium sulfate.

iron-ammonium citrate. See ferric-ammonium citrate.

iron-ammonium oxalate. See ferric-ammonium oxalate.

iron-ammonium sulfate. See ferric-ammonium sulfate and ferrous-ammonium sulfate.

iron-ammonium tartrate. See ferric-ammonium tartrate.

iron arsenate. See ferrous arsenate.

iron benzoate. See ferric benzoate.

iron black.

Properties: Fine black powder.

Derivation: By the action of zinc upon an acid solution of an antimony salt, a black antimony being precipitated as a fine powder.

Uses: Imparting the appearance of polished steel to papier maché and plaster of Paris.

Shipping regulations: None. *

iron blues. The iron blues are prepared by precipitating a ferrous ferrocyanide from

a soluble ferrocyanide and ferrous sulfate. Subsequent oxidation produces a complex ferriferrocyanide whose shade and pigment properties are dependent upon the oxidizing agent, reactant concentrations, pH, temperature, size of batch and other conditions of manufacture. Common oxidants are nitric acid, sulfuric acid, potassium dichromate and sulfuric acid, perchlorates, and peroxides.

Properties: Semi-transparent pigment of powerful tinctorial strength. Insoluble in water, oils, alcohol, hot paraffin, organic solvents, and unaffected by dilute acids. Unstable to alkalis of all concentrations or reducing media. Resistance to light and ordinary baking temperatures allows it to be used for permanent industrial finishes and automobile finishes. Varying shades can be produced ranging from green to red tint with the mass tone from a reddish blue to a jet blue depending on oxidant and other conditions.

Containers: Barrels, carloads.

Uses: Paint and printing ink pigment, artist colors, laundry blue, paper dyeing, fertilizer ingredient.

Note: These blue pigments are known variously as Bronze blue, Milori blue, Chinese blue, Prussian blue, etc. Since the final shade is dependent on manufacturing conditions, purchasing is generally based on duplication of a shade rather than by a named pigment.

iron bromide. See ferric bromide and ferrous bromide.

iron buff (Nankin yellow). Ferric hydroxide dyed on cotton or cotton goods by steeping the latter in a solution of ferrous sulfate, basic ferric sulfate or ferric nitrate and precipitating the hydroxide on the fiber by means of calcium hydroxide solution, sodium hydroxide solution or soda ash.

iron carbonate, precipitated. See iron oxide, brown.

iron carbonyl. See iron pentacarbonyl.

iron, cast. Any iron-carbon alloy that contains more than 1.7% carbon, and usually between 2 and 4.0%. Such iron usually also contains 0.1 or 0.2% sulfur, 0.5 to 3% silicon, 0.5 to 1% manganese and up to 1% phosphorus. Cannot be shaped by hammering, rolling, or pressing.

cast iron, alloy. Cast iron containing chromium, copper, molybdenum, nickel, or other steel-alloying elements in amounts from 0.1 to 5% for the purpose of improving strength and wear, corrosion, or scaling resistance.

cast iron, gray. Cast iron with gray fracture and with its carbon largely in the uncombined state. The most common form of cast iron, easily melted and machined, relatively soft and tough. Properties depend upon composition, rate of cooling, and heat treatment.

cast iron, malleable. White cast iron that has been annealed after solidification in

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

order to reduce carbon content and produce a product similar in many ways to mild steel.

cast iron, white. A cast iron with silvery surfaces where broken, low silicon content, and all its carbon chemically combined with iron, produced by sudden chilling of the molten iron. Very hard, brittle, and cannot be machined. Produced as an intermediate stage in making malleable cast iron and as a thin outer layer on the surface of gray cast iron.

iron chloride. See ferric chloride anhydrous and ferrous chloride.

iron choline citrate chelate. See ferro-cholinate.

iron chromate. See ferric chromate.

iron citrate. See ferric citrate.

iron "cyanide." See ferric ferrocyanide.

iron dichloride. See ferrous chloride.

iron dichromate. See ferric dichromate.

iron, ductile. A malleable cast iron produced by the addition of sufficient magnesium and/or cerium to the melt to cause graphite to precipitate as spherulites rather than flakes. It has superior strength, ductility, toughness, machinability and corrosion resistance as compared to gray cast iron and has better castability, finish, and machinability than cast steel.

irone. See methylionone.

iron ethlops. See iron oxide, black.

iron ferrocyanide. See ferric ferrocyanide.

iron fluoride. See ferrous fluoride, ferric fluoride.

iron gallotannate. See ferric tannate.

iron, galvanized. See galvanized iron.

iron glance. Specular iron ore. See hematite, red.

iron gluconate. See ferrous gluconate.

iron glycerophosphate. See ferric glycerophosphate.

iron hydrate. See ferric hydroxide.

iron hydroxide. See ferric hydroxide.

iron hypophosphite. See ferric hypophosphite.

iron iodide. See ferrous iodide.

iron lactate. See ferrous lactate.

iron liquor. See iron acetate liquor.

iron-magnesium sulfate. See ferrous-magnesium sulfate.

iron malate. See ferric malate.

iron-manganese sulfate. See ferrous-manganese sulfate.

iron metavanadate. See ferric vanadate.

iron molybdate. See ferrimolybdate.

iron monosulfide. See ferrous sulfide.

iron monoxide. See ferrous oxide.

iron-nickel alloys (nickel-iron alloys).

Alloys of iron and nickel which are entirely austenitic in character at room temperature are properly called "iron-nickel alloys," otherwise they are considered nickel-steels. All alloys containing over 34% nickel are austenitic at all temperatures. With lower nickel content the heat treatment helps determine classification as an "alloy" or a steel.

The iron-nickel system has a peculiar range of properties of thermal expansion, thermoelasticity, and magnetic characteristics.

The alloy containing 36% nickel has a coefficient of thermal expansion of practically zero, with increases as the nickel content is raised or lowered. Within the 30-60% nickel range, practically any desired coefficient of expansion can be obtained and matched to any desired material so as to provide strainless junctions between the iron-nickel alloy and the second material at any temperature, or to permit controlled differential expansion as in bimetal thermostats.

Most metals lose stiffness with increasing temperature but iron-nickel alloys from 27-44% nickel have a positive thermal coefficient of elastic modulus, with a maximum coefficient at about 36% nickel. This property is useful in temperature-compensating devices, where the increased stiffness of the nickel counteracts the loss in stiffness of the other element. Thus springs can be constructed of steel and 36% nickel-iron alloy which maintain constant stiffness regardless of temperature. Substitution of 8-12% chromium for iron in the 36% nickel-iron alloy gives a metal with a thermal coefficient or "stiffness" of zero, that is, a constant modulus of elasticity, useful in watchsprings, tuning forks, bourdon tubes, etc.

Tremendous variations in magnetic properties are possible. Iron-nickel alloys (austenitic) of nickel content below 30% are non-magnetic at ordinary and at high temperatures. For the alloy with 30% nickel, room temperature is the magnetic transformation temperature, and alloys in this composition range show permeability varying with temperature, making possible temperature-compensating shunts in wattmeters and other electric instruments. From compositions of 35-90% nickel, the iron-nickel alloys show high permeability and low hysteresis loss. Small amounts of other alloying elements vary the magnetic properties greatly and permit "tailoring" of alloys to suit special requirements.

The iron-nickel alloys are not heat-hardenable, but addition of aluminum and titanium develops tempering characteristics.

See also nickel steels.

iron-nickel-chromium alloys. Ferrous alloys in which nickel exceeds chromium.

iron nitrate. See ferric nitrate.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

iron oleate. See ferric oleate.

iron ore, bog. See limonite.

iron ore, brown. See limonite.

iron-ore cement. Cements in which ferric oxide replaces a large part of the alumina. There must be some alumina present, however. Iron-ore cement is rather slow setting and hardening, but is more resistant to sea water than is Portland cement. It is light to chocolate brown in color and has a specific gravity about 3.31, higher than Portland cement.

iron ore, chrome. See chromite.

iron ore, kidney. Red hematite (q. v.) exhibiting a fibrous or columnar structure and a nodular surface.

iron ore, magnetic. See magnetite.

iron ore, red. See hematite, red.

iron ore, spathic. See siderite.

iron ore, specular. See hematite, red.

iron ore, titanite. See ilmenite.

iron oxalate. See ferrous oxalate.

iron oxide. Ferrous oxide; ferric oxide; iron oxide, black. See also iron oxide pigments; iron oxide reds.

iron oxide, black (ferrosoferric oxide, ferroferric oxide, iron oxide, magnetic; iron ethiops; black rouge) $\text{FeO} \cdot \text{Fe}_2\text{O}_3$ or Fe_3O_4 . See also the mineral form, magnetite.

Properties: Reddish or bluish black amorphous powder, sp. gr. 4.96; soluble in acids; insoluble in water, alcohol and ether.

Derivation: (a) Action of air, steam or carbon dioxide on iron. (b) Specially pure grade by precipitating hydrated ferric oxide from a solution of iron salts, dehydrating and reducing with hydrogen. (c) Occurs in nature as the mineral magnetite (q. v.).

Grades: Technical; pure (96% min.).

Containers: Wooden kegs; fiber drums, multiwall paper sacks, carloads.

Uses: Pigment; polishing compound; metallurgy; medicine; specially pure grades in magnetic inks and in ferrites for electronic industry.

iron oxide, brown (iron subcarbonate; iron carbonate, precipitated)

Properties: Reddish-brown powder, containing ferric carbonate with ferric hydroxide $\text{Fe}(\text{OH})_3$, and ferrous hydroxide $\text{Fe}(\text{OH})_2$ in varying quantities. Not a true oxide. Soluble in acids; insoluble in water and alcohol.

Derivation: By the interaction of solution of ferrous sulfate and sodium carbonate.

Grades: Technical.

Containers: Wooden barrels; fiber drums; multiwall paper sacks, carloads.

Use: Paint pigment.

Shipping regulations: None. *

iron oxide, hydrated. See ferric hydroxide.

iron oxide, magnetic. See iron oxide, black.

iron oxide pigments. The basic colors of these pigments are determined by chemical composition. Reds are ferric oxide, Fe_2O_3 ; yellows are hydrated ferric oxide, $\text{Fe}_2\text{O}_3 \cdot \text{H}_2\text{O}$, and blacks are ferroferric oxide, Fe_3O_4 . The synthetic oxides are up to 96-99.5% pure. The natural oxides show a wide range of iron oxide content, and vary in color through red, yellow and brown. They include ochers, umbers, siennas, metallic browns, and red oxides. See iron oxide, black; iron oxide, brown; iron oxide reds; iron oxide yellows.

iron oxide process. A process for the removal of sulfides from a gas by passing the gas through a mixture of iron oxide, Fe_2O_3 , and wood shavings. The iron oxide is converted to iron sulfide and can be regenerated by allowing the iron sulfide to contact air.

iron oxide reds (crocus martis adstringens; polishing crocus; purple oxide; red oxide; red stone; jeweler's rouge; rubigo; Indian red; red bole; bole; Armenian bole; caput mortuum; English red; angel red; chemical red; Pompeian red; Persian red; raddle; reddle; red rudd, red ochre; red chalk; red earth; Prussian red; Italian red; terra di Sienna; mineral rouge; blood red; pale oxide of iron; iron saffron; imperial red; Nuremberg red; scarlet red, Prague red Sinapis; Van Dyck red; Spanish oxide; Turkey red; Mars red, rouge de Mars, Pompey red; Venetian red). Pigments composed mainly of ferric oxide, Fe_2O_3 . See also ferric oxide for a description of the pure material.

Some of these synonyms apply to relatively impure materials used as pigments; some apply to naturally occurring hematite (q. v.) of various degrees of purity, and before or after purification, heating or other treatment; others refer to synthetic materials prepared by various special methods. In most cases the terms are used loosely. When available, additional information is given under separate entries.

Grades: Sold usually on basis of iron oxide content and covering properties.

Containers: Fiber drums; multiwall paper bags (carloads).

Uses: Heavy-duty pigments, as in railway finishes, marine paints, metal primers; polishing compounds; pigment in rubber products; theatrical rouge; grease paints. Shipping regulations: None. *

iron oxide, synthetic. See rouge.

iron oxide yellows. Hydrated ferric oxide, $\text{Fe}_2\text{O}_3 \cdot \text{H}_2\text{O}$. Precipitated pigments of much finer particle size and much greater tintorial strength than the naturally occurring oxides such as ochre (q. v.). They have very low cost and are very useful for producing cream and buff-colored tints where the brightness of chrome yellows is not required. They have excellent light fastness

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

and resistance to alkali.

Containers: Fiber drums, multiwall paper bags.

iron pentacarbonyl (iron carbonyl) $\text{Fe}(\text{CO})_5$.

Properties: Mobile yellow liquid. Decomposes on exposure to air or to light; poisonous! Soluble in nickel tetracarbonyl and most organic solvents; soluble with decomposition in acids and alkalis; insoluble in water. Sp. gr. 1.466 (18°C), b. p. 102.8°C (749 mm); decomposes at 200°C; m. p. -21°C.

Derivation: Finely divided iron is treated with carbon monoxide, in the presence of a catalyst such as ammonia.

Uses: Organic synthesis, anti-knock agent, source of pure iron powder. See carbonyl iron powder.

Shipping regulations: None.*

iron peptonate. See iron, peptonized.

iron peptonized (iron peptonate).

Properties: Dark brown granules or powder.

Derivation: Combination of iron oxide and peptone rendered soluble and sequestered (nonionic) by the presence of sodium citrate.

iron perchloride. See ferric chloride, anhydrous.

iron persulfate. See ferric sulfate.

iron phosphate. See ferric phosphate.

iron phosphide. See ferrous phosphide.

iron, pig. The impure iron produced by reduction of iron ore with limestone, coke and air in a blast furnace. This is the industrial source of all forms of iron and steel. See iron, cast, for approximate composition.

iron-potassium citrate. See ferric-potassium citrate.

iron-potassium sulfate. See ferric-potassium sulfate.

iron-potassium tartrate (tartrated iron, tartar, chalybeated, ferric-potassium tartrate) $\text{Fe}_2(\text{C}_4\text{H}_4\text{O}_6)_3 \cdot \text{K}_2\text{C}_4\text{H}_4\text{O}_6 \cdot \text{H}_2\text{O}$.

Properties: Thin, transparent scales, deep garnet color; sweetish taste; astringent, arsenic limit 5 parts per million. Soluble in water, sparingly in alcohol.

Derivation: By submitting ferric oxide to the action of acid potassium tartrate for 24 hours, gently heating the product, adding distilled water, filtering, evaporating slowly to a syrup and drying.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

iron, powdered. See iron (under Grades), iron, reduced; carbonyl iron powder.

iron protochloride. See ferrous chloride.

iron protolodide. See ferrous iodide.

iron protosulfide. See ferrous sulfide.

iron pyrites. See pyrite.

iron pyrites, white. See marcasite.

iron pyrolignite. See iron acetate liquor.

iron pyrophosphate. See ferric pyrophosphate.

iron-quinine citrate. See ferrous-quinine citrate.

iron red. A name given to red varieties of ferric oxide that are used as pigments. See iron oxide reds.

iron, reduced (ferrum reductum). Elementary iron obtained by chemical process in powdered form.

Properties: Grayish-black, amorphous, fine granular powder with no more than a slight luster. Stable in dry air.

Derivation: (a) By reducing ferric oxide, heated to a dull redness, in a stream of dry hydrogen; (b) by the decomposition of iron pentacarbonyl (see carbonyl iron powder) or (c) electrolytically.

Containers: 1-lb bottles; 1-, 5-, 25-, and 50-lb cans.

Uses: Medicine; organic synthesis; feed additive.

iron resinate. See ferric resinate.

iron saffron. See Indian red.

iron salicylate. See ferric salicylate.

iron salts. See ferric and ferrous salts.

iron sesquichloride. See ferric chloride, anhydrous.

iron sesquioxide. See ferric oxide.

iron sesquisulfate. See ferric sulfate.

iron, sherardized. See sherardizing.

iron silicate. See ferric silicate.

iron-sodium citrate. See ferric-sodium citrate.

iron-sodium oxalate. See ferric-sodium oxalate.

iron sponge. Finely divided porous form of iron made by reducing an iron oxide at such low temperatures that melting does not occur, usually by mixing iron oxide and coke and applying limited increase in temperature.

Uses: For precipitating copper or lead from solutions of their salts, removing sulfur compounds from coke-oven gas, and in electric-furnace steel operations.

Shipping regulations: When spent, or not properly oxidized: flammable solid. Yellow label by freight. Not accepted by express.*

irons, stainless. Alloys containing 3 to 28% chromium, with or without traces of nickel; essentially magnetic and ferritic in character. High chromium irons are brittle after welding. Most popular composition for fabrication is 15-18% chromium, 0.1% carbon (max.).

See ferritic stainless steel, under steel.

iron stearate. See ferric stearate.

ironstone clay. See argillaceous hematite and hematite, red.

ironstone clay, brown. See limonite.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

iron subcarbonate. See iron oxide, brown.

iron subsulfate. See ferric sulfate, basic.

iron succinate. See ferric succinate.

iron sulfate. See ferric sulfate and ferrous sulfate.

iron sulfate, basic. See ferric sulfate, basic.

iron sulfide. See ferrous sulfide.

iron sulfuret. See ferrous sulfide.

iron tannate. See ferric tannate.

iron, tartrated. See iron-potassium tartrate.

iron tersulfate. See ferric sulfate.

iron tribromide. See ferric bromide.

iron trichloride. See ferric chloride, anhydrous.

iron trioxide. See ferric oxide.

iron vanadate. See ferric vanadate.

iron vitriol. See ferrous sulfate.

iron, wrought. Highly purified iron that has been uniformly admixed with a small proportion of slag, the mixing occurring while the iron is in a pasty stage somewhat below its melting point. This was the normal product of early iron forges because of the relatively low temperatures reached in such equipment. Wrought iron is now made from pig iron by special purification and mixing procedures referred to as "puddling" and "shotting."

A typical composition is carbon 0.1%, manganese 0.1%, phosphorus 0.08 to 0.16% (about half of this is in the slag), up to 0.035% sulfur, and 0.1 to 0.2% silicon (all in the slag, which itself is from 1 to 4% of the whole). Higher percentages of carbon and manganese generally indicate contamination with steel.

Wrought iron is relatively soft and malleable, has a fibrous structure due to the admixed slag, and shows great resistance to progressive corrosion.

"Irrathene." ²⁴⁵ Trademark for a thermosetting form of polyethylene (q. v.) formed by irradiation of polyethylene with high energy cathode rays (electrons). The product does not melt (up to 250°C) but oxidizes rapidly at elevated temperatures unless protected by an inhibitor. Its resistance to acids, alkalies, and solvents is superior to that of polyethylene and it has excellent electrical properties even at 200°C. It is available in films and tapes used for packaging and electrical insulation.

"Iron." ¹⁶⁹ Trademark for 8-quinolinol-7-iodo-5-sulfonic acid used in the colorimetric determination of iron.

"IRS-2000 Latices." ⁵² Trademark for a series of latices containing emulsion copolymers of butadiene and styrene. Made by reacting a 50/50 ratio of monomers to a high degree of conversion in a hot emulsion recipe with

a rosin soap as an emulsifier. Solids contents range from 40 to over 60%; viscosities range from 100 to 28,000 cps. Used in adhesives, chewing gum bases, mastic cements, carpet backing, fabric combining.

isanolic acid (erythrogonic acid). An 18-carbon fatty acid with acetylene triple bonds at the 9 and 11 positions and having also an ethylene bond but no hydroxyl substituent. Occurs in isano oil along with closely related bolekinic acid which is a hydroxy acid. Similar acids are found in onguekoa seeds. Useful in modifying epoxy resin formulations.

isano oil. Fatty oil from an African tree of same name. When the oil is heated to 200°C, it polymerizes rapidly and may explode spontaneously. See isanolic acid.

isatic acid anhydride. See isatin.

isatic acid lactime. See isatin.

isatin (ortho-aminophenylglyoxalic lactime; ortho-aminobenzoylformic acid; isatic acid anhydride; isatic acid lactime) $C_6H_4COC(OH)N$ (bicyclic).

Properties: Yellowish-red or orange crystals, bitter taste. Soluble in water, alcohol, and ether. M. p. 200–203°C.

Derivation: From indigo by oxidation.

Grades: Technical, reagent.

Uses: Dyestuffs; pharmaceuticals; analytical reagent.

Shipping regulations: None. *

isatoic anhydride $C_6H_3NO_3$. Tan powder.

Grade: Technical, 96% min

Use: Intermediate for flavors and agricultural chemicals.

isethionic acid (2-hydroxyethanesulfonic acid) $HOCH_2CH_2SO_3H$.

Properties: Liquid, b. p. 100°C (dec); very soluble in water; insoluble in alcohol.

Uses: Detergents; surfactants; synthesis.

isinglass.

1. (Ichthyocolla). A pure white, odorless, tasteless gelatin prepared from the inner skins of the swimming bladders of fish, usually the sturgeon. Used as an adhesive and clarifying agent.

2. Mica.

isinglass, Bengal. See agar-agar.

isinglass, Ceylon. See agar-agar.

isinglass, Chinese. See agar-agar.

isinglass, Japanese. See agar-agar.

"Ismelin." ³⁰⁵ Trademark for guanethidine. Use: Medicine.

Iso-. A prefix denoting an isomer of a compound; specifically, denoting an isomer having a single, simple branching at the end of a straight chain. Iso- compounds will be found under I in this dictionary.

isoalloxazine (flavin) $C_{10}H_6N_4O_2$. An isomer of alloxazine. Derivatives of isoalloxazine

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

are widely distributed in plants and animals, usually as yellow pigments. See also riboflavin and flavin enzymes.

isoamyl acetate $\text{CH}_3\text{COOCH}_2\text{CH}_2\text{CH}(\text{CH}_3)_2$.

Properties: Colorless liquid; b. p. 142°C ; m. p. -78.5°C ; sp. gr. ($15/4^\circ\text{C}$) 0.876; wt/gal (15°C) 7.30 lbs; flash point (closed cup) 92°F . Slightly soluble in water; miscible with alcohol and ether.

Derivation: Rectification of commercial amyl acetate.

Grades: Reagent; technical.

Uses: Flavoring; perfumes; solvent.

Caution! Avoid prolonged breathing of vapor, or prolonged or repeated contact with skin. Use with adequate ventilation. Keep away from heat and open flame. MCA warning label.

See also amyl acetate.

isoamyl alcohol, primary (3-methyl-1-butanol; isobutyl carbinol) $(\text{CH}_3)_2\text{CHCH}_2\text{CH}_2\text{OH}$.

See also fusel oil.

Properties: Colorless liquid; pungent taste; disagreeable odor. B. p. 132.0°C ; m. p. -117.2°C , sp. gr. 0.813 ($15/4^\circ\text{C}$), wt/gal 6.79 lb; refractive index ($n_{20/D}$) 1.4075; flash point (closed cup) 114°F . Slightly soluble in water, miscible with alcohol and ether.

Derivation: Distillation of fusel oil or the mixed alcohols resulting from the chlorination and hydrolysis of pentane.

Grades: Technical.

Containers: 1-, 5-, 55-gal drums; tank cars.

Uses: Photographic chemical, organic synthesis; pharmaceutical products; medicine; solvent, for determination of fat in milk, in microscopy.

Shipping regulations: None.*

isoamyl benzoate (amyl benzoate)

$\text{C}_6\text{H}_5\text{COOC}_5\text{H}_{11}$.

Properties: Colorless liquid, with fruity odor. Sp. gr. 0.986 to 0.989, refractive index 1.493, b. p. 260°C . Soluble in 2 vols. of 80% alcohol, insoluble in water.

Use: Perfumery, flavors.

isoamyl benzyl ether (benzyl isoamyl ether)

$\text{C}_5\text{H}_{11}\text{OCH}_2\text{C}_6\text{H}_5$.

Properties: Colorless liquid, fruity odor; sp. gr. 0.904-0.908, refractive index 1.481-1.485, soluble in 4 parts of 80% alcohol.

Grades: Technical.

Use: Soap perfumes.

isoamyl butyrate $\text{C}_5\text{H}_{11}\text{OOCCH}_2\text{CH}_3$.

Properties: Practically water white. Sp. gr. 0.866 to 0.868 (15.5°C); boiling range 150 to 180°C . Soluble in alcohol and ether; very slightly soluble in water.

Derivation: By treating isoamyl alcohol with butyric acid.

Method of purification: Distillation.

Grades: Commercial, 95 to 100% ester content.

Containers: Glass carboys; tin-lined drums.

Uses: Flavoring extracts; solvent and plasticizer for cellulose acetate.

Shipping regulations: None.*

isoamyl chloride $\text{C}_5\text{H}_{11}\text{Cl}$. Any of several compounds or mixtures thereof may be referred to by this name, since numerous isomers are possible, the most common of which is the following: 1-chloro-3-methylbutane $(\text{CH}_3)_2\text{CH}(\text{CH}_2)_2\text{Cl}$.

Properties: Colorless or slightly yellow liquid; b. p. 99.7°C (758 mm); sp. gr. 0.893; refractive index 1.410; insoluble in water; soluble in alcohol and ether.

Typical specifications: Assay 90%, sp. gr. 0.8725 to 0.8760 at $25/25^\circ\text{C}$.

Derivation: Isoamyl alcohol and hydrogen chloride, or chlorination of isopentane.

Containers: Glass bottles; carboys; tins.

Uses: (Mixtures, usually also containing normal amyl chloride) solvent (nitrocellulose, varnishes, lacquers, neoprene); in rotogravure inks, and for soil fumigation; also for organic compounds.

Shipping regulations: None.*

isoamyl dichloroarsine $\text{C}_5\text{H}_{11}\text{AsCl}_2$.

Properties: Oily liquid. Somewhat agreeable odor. Decomposed by water. Caution! Very irritant! B. p. 88.5 to 91.5°C (15 mm).

Derivation: Interaction of phosphorus trichloride and isoamylarsenic acid.

alpha-isoamylene. See 3-methyl-1-butene.

beta-isoamylene. See 3-methyl-2-butene.

isoamylenes. Mixture containing high proportion of branched chain five-carbon olefins. Extracted from a low boiling gasoline fraction with sulfuric acid and recovered in high purity by distillation from the acid. Used largely for conversion to isoprene by dehydrogenation.

isoamyl furoate $\text{C}_4\text{H}_3\text{OCO}_2\text{C}_5\text{H}_{11}$.

Properties: Colorless liquid, becoming brown in light. Insoluble in water; soluble in alcohol and ether. Sp. gr. 1.0335 ($20/4^\circ\text{C}$), b. p. 232 to 234°C , 135 - 137°C (25 mm), refractive index 1.4720.

isoamyl isovalerate. See isoamyl valerate.

isoamyl nitrite. See amyl nitrite.

isoamyl salicylate (amyl salicylate, orchidae)

$\text{C}_6\text{H}_4\text{OHCOOC}_5\text{H}_{11}$.

Properties: A water-white liquid sometimes having a faint yellow tinge which should not be pink or red. Has a flowery orchid-like odor. Should not give a red ring when superimposed on a layer of sulfuric acid (indicating free amyl alcohol), sp. gr. 1.053-1.059 (15°C); refractive index ($n_{20/D}$) 1.5050-1.5080; optical rotation 0 to $+2.30^\circ$; b. p. 280°C . Soluble in alcohol, ether; insoluble in water and glycerol.

Derivation: By esterifying salicylic acid with amyl alcohol. The ordinary article of commerce is the isoamyl ester.

Method of purification: Distillation.

Grades: A pure grade of at least 99% ester content which should not exceed 100% on analysis (indicating lower esters).

Containers: Carboys.

Uses: As an ingredient in perfumes and in

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

perfuming soap. Formerly used medicinally.

Shipping regulations: None.*

isoamyl valerate ("apple essence"; "apple oil"; isoamyl isovalerate; amyl valerate) $C_4H_9CO_2C_5H_{11}$.

Properties: Clear liquid; odor of apples when diluted with alcohol; sp. gr. 0.8812; b. p. 203.7°C; soluble in alcohol and ether; slightly soluble in water.

Derivation: By adding sulfuric acid to a mixture of amyl alcohol and valeric acid.

Subsequent recovery by distillation.

Method of purification: Rectification.

Grades: Technical.

Containers: Iron drums; glass bottles.

Uses: Medicine; fruit essences.

Shipping regulations: None.*

isoascorbic acid. See erythorbic acid.

isobaric spin. See isotopic spin.

isobars.

1. Lines on a weather map connecting points with the same atmospheric pressure. Constant pressure lines on any type of graph.

2. Nuclides having the same mass number but different atomic numbers, in contrast to isotopes which have the same atomic number but different mass numbers.

C-14 and N-14 are isobars.

isoborneol $C_{10}H_{17}OH$. A geometrical isomer of borneol.

Properties: White solid with camphor odor, m. p. 216°C (sublimes). More soluble in most solvents than borneol.

Derivation: By reduction of camphor.

Containers: Cans.

Uses: Perfumery, chemical esters.

isobornyl acetate $C_{10}H_{17}OOCCH_3$.

Properties: Colorless liquid. Pine-needle odor. Sp. gr. 0.978 ± 0.001 (20°C), b. p. 220 to 224°C.

Derivation: By heating camphene (50 to 60°C) with glacial acetic acid and sulfuric acid and separating by adding water.

Grades: Technical.

Containers: Cans.

Uses: Compounding pine-needle odors, toilet waters; bath preparations, antiseptics, theater sprays; soaps, making synthetic camphor.

isobornyl salicylate.

Properties: Viscous, colorless oil. Sweet odor. Ester content 96%.

Grades: Technical.

Uses: Perfumery (fixative); cosmetics (filter for suntan preparations).

isobornyl thiocynoacetate $C_{13}H_{19}NO_2S$. The technical grade contains 82% or more of isobornyl thiocynoacetate, also other terpenes and derivatives.

Properties: Yellow, oily liquid; terpene-like odor. Sp. gr. (25/4°) 1.1465; refractive index (25/D) 1.512; acid number 1.19. Very soluble in alcohol, benzene, chloroform, and ether; practically insoluble

in water.

Derivation: By treating isoborneol with chloroacetyl chloride and potassium thiocyanate.

Uses: Insecticide; medicine.

isobornyl valerate $(CH_3)_2CHCH_2COOC_{10}H_{17}$.

Properties: Colorless, neutral liquid, oily taste, peculiar aromatic odor. Does not irritate the stomach. Soluble in alcohol, ether, sparingly soluble in water.

Constants: B. p. 132-138°C (12 mm); sp. gr. 0.954.

Use: Medicine.

Shipping regulations: None.*

isobutane (2-methylpropane; trimethylmethane) $(CH_3)_2CHCH_3$.

Properties: Colorless gas; characteristic natural gas odor; stable, does not react with water; has no corrosive action on metals; b. p. -11.73°C; f. p. -159.60°C; sp. gr. 0.5572 (20°C, at saturation pressure), flash point -83°C.

Typical specifications for a technical grade are as follows: Distillation range 9-15°F; sp. gr. of liquid 0.564 (60/60°F); API gravity 119.4 (60°F) (calculated); density of liquid (60°F) 4.70 lb/gal (calculated); vapor pressure 45.4 psi (70°F); purity not less than 95 mole % isobutane; principal impurity approximately 4% normal butane; sulfur content not to exceed 0.010 wt %, probably less than 0.005 wt %.

Derivation: An important component of natural gasoline, refinery gases, wet natural gas; also obtained by isomerization of butane.

Grades: Technical; also available as 99 mole % (pure grade), 99.96 mole % (research grade), and other high purity grades.

Containers: 16-gal pressure cylinders (net contents 68 lbs); 28-gal pressure cylinders; tank cars (10,000 gal).

Uses: Organic synthesis; refrigerant; fuel; starting material for liquid fuel synthesis, aerosol propellant.

Shipping regulations: Flammable gas. Red gas label.*

isobutane hydrate. See gas hydrates.

isobutanol. See isobutyl alcohol.

isobutanolamine. See 2-amino-2-methyl-1-propanol.

isobutene (2-methylpropene; isobutylene) $(CH_3)_2C=CH_2$.

Properties: Colorless very volatile liquid or easily liquefied gas, b. p. -6.9°C; m. p. -139°C; flash point -76°C; sp. gr. 0.6 (20°C), soluble in organic solvents. Polymerizes easily and also reacts easily with numerous materials.

Derivation: Gas mixtures containing considerable isobutene are obtained by fractionation of refinery gases resulting from cracking of petroleum.

Containers: Tank cars; cylinders.

Uses: Production of isooctane, polymer gasoline, butyl rubber, polyisobutene resins, tert-butyl chloride, tert-butanol

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

and other derivatives, copolymer resins with butadiene, acrylonitrile, etc.
Shipping regulations: Flammable gas, Red gas label.*

isobutyl acetate $C_4H_9OOCCH_3$.

Properties: Colorless, neutral liquid; fruit-like odor. Soluble in alcohols, ether, and hydrocarbons; immiscible with water. B. p. 116–117°C; flash point 18°C; sp. gr. 0.8685 (15°C); refractive index 1.392 (approx.); wt/gal 7.23 lbs; m. p. –99°C.
Derivation: Treating isobutyl alcohol with acetic acid in the presence of catalysts.
Grades: Technical; solvent; perfume.
Containers: 55-gal drums; tank cars.
Use: Solvent for nitrocellulose and lacquers; perfumery.

isobutyl alcohol (isopropylcarbinol; isobutanol, 2-methylpropanol-1) $(CH_3)_2CHCH_2OH$.

Properties: Clear liquid; flammable. Soluble in water, alcohol, and ether. Sp. gr. 0.806 (15°C); b. p. 107°C, flash point 82°F, m. p. –108°C; refractive index 1.397 (15°C).
Derivation: Byproduct of synthetic methanol production, purified by rectification.
Containers: 55-gal drums, tank cars and trucks.
Uses: Manufacturing fruit essences; perfumes; organic synthesis; solvent; paint removers; fluorometric determinations; in liquid chromatography.
Precaution: Keep away from heat and open flames. Use adequate ventilation.

isobutyl aldehyde. See isobutyraldehyde.**isobutylamine** $(CH_3)_2CHCH_2NH_2$.

Properties: Colorless liquid; amine odor; strongly caustic. Soluble in water, alcohol, ether, and hydrocarbons. Sp. gr. 0.731 (20°C), boiling range 66–69°C; flash point less than 20°F.
Containers: 55-gal drums; tank cars.
Uses: Organic synthesis; insecticides.
Shipping regulations: Flammable liquid. Red label.*

isobutyl-para-aminobenzoate (cycloform) $NH_2C_6H_4COOCH_2CH(CH_3)_2$.

Properties: White crystalline scales; m. p. 64–65°C. Almost insoluble in water; soluble in alcohol and vegetable oils.
Use: Medicine.

2-isobutylaminoethyl meta-aminobenzoate hydrochloride. See metabutethamine hydrochloride.**isobutyl benzoate** $C_6H_5CO_2CH_2CH(CH_3)_2$.

Properties: Colorless liquid; characteristic odor; sp. gr. 1.002; b. p. 237°C; insoluble in water; miscible with alcohol and ether.
Uses: Perfumes; flavors.

isobutyl carbinol. See isoamyl alcohol, primary.

isobutyl cinnamate $C_{15}H_{16}O$. Colorless oil, amber fragrance. Sp. gr. 1.001 to 1.004; refractive index 1.541. Soluble in 2 vols. of 70% alcohol.
Use: Perfumery.

isobutylene. See isobutene.

isobutylene dibromide (1,2-dibromoisobutane) $(CH_3)_2CBrCH_2Br$.

Properties: Yellowish liquid; soluble in alcohol and ether; insoluble in water. Sp. gr. 1.798; b. p. 149°C.

Derivation: By the action of bromine on isobutene.

isobutyl furoate $C_4H_9OCO_2C_4H_9$.

Properties: Colorless liquid becoming brown in light. Insoluble in water; soluble in alcohol and ether. Sp. gr. 1.0383 (27.5/4°C); b. p. 221–223°C (corr.); refractive index 1.4676 (27.5°C).

N-isobutylhendecenamide. See N-isobutylundecylenamide.**isobutyl isobutyrate** $(CH_3)_2CHCOOCH_2CH(CH_3)_2$.

Properties: Colorless liquid; sp. gr. 0.875 (0/4°C); m. p. –80.7°C; b. p. 148.7°C; refractive index (n_D 20/D) 1.3999; insoluble in water, soluble in alcohol and ether.
Containers: Drums.

isobutyl lactate $CH_3CHOHCOOCH_2CH(CH_3)_2$.

Properties: Liquid, sp. gr. 0.964.

isobutyl mercaptan (2-methyl-1-propanethiol) $(CH_3)_2CHCH_2SH$.

Properties: Liquid, boiling 85–95°C; sp. gr. 0.8363 (60/60°F); flash point –10°C.
Grades: 95%.

Containers: Tank cars.

Shipping regulations: Flammable liquid. Red label.*

isobutyl propionate $CH_3CH_2COOCH_2CH(CH_3)_2$.

Properties: Water-white liquid; sp. gr. 0.86–0.8635 (20/20°C), b. p. 138°C; f. p. –71.4°C; refractive index 1.3975 (20°C); insoluble in water; very soluble in alcohol and ether.

Grades: Technical.

Containers: 55-gal drums, 10,000-gal tank cars.

Use: Paint, varnish, and lacquer solvent.

isobutyl salicylate $HOC_6H_4COOCH_2CH(CH_3)_2$.

Properties: Sp. gr. 1.064–1.065 (25°C); clear liquid, may have slightly yellowish tinge; b. p. 259°C. Soluble in alcohol; insoluble in water.

Use: Perfumery.

N-isobutylundecylenamide (N-isobutylhendecenamide) $CH_3(CH_2)_7CH:CHCONHC_4H_9$. A synergist for pyrethrum and used in insecticides.

isobutyl vinyl ether. See vinyl isobutyl ether.

isobutyraldehyde (isobutyl aldehyde)

$(CH_3)_2CHCHO$.

Properties: Transparent, colorless, highly refractive liquid; pungent odor. Sp. gr. 0.794 (20/4°C); b. p. 64°C; m. p. –66°C; refractive index (n_D 20/D) 1.3730; flash point (closed cup) –40°F, (open cup) –11°F. Soluble in alcohol; insoluble in water.

Derivation: (a) Oxo process reaction of propylene with carbon monoxide and hydrogen; (b) dehydrogenation of isobutyl alcohol.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Method of Purification: Distillation.

Containers: 55-gal drums; tank cars.

Uses: Intermediate for rubber antioxidants and accelerators, for neopentyl glycol; organic synthesis.

Warning! Flammable. Use with adequate ventilation. Avoid prolonged or repeated contact with skin. MCA warning label.

Shipping regulations: Flammable liquid.

Red label.*

isobutyric acid $(\text{CH}_3)_2\text{CHCOOH}$.

Properties: Colorless liquid, soluble in water, alcohol, and ether. Sp. gr. 0.946 to 0.950 (20/20°C); b. p. 154.4°C; f. p. -47°C; refractive index (n_D 20/D) 1.3930.

Grades: Technical.

Containers: Glass carboys; special steel and aluminum drums; tank cars and trucks.

Uses: In the manufacture of esters for solvents, flavors and perfume bases, as a disinfecting agent; in varnish, for deliming hides; as a tanning agent.

isobutyric anhydride $[(\text{CH}_3)_2\text{CHCO}]_2\text{O}$.

Liquid with boiling range 180 to 187°C, sp. gr. 0.951-0.956 (20/20°C).

Typical specification: Assay 98%.

Containers: 55-gal drums, tank trucks, tank cars.

Use: Intermediate.

isobutyronitrile (2-methylpropanenitrile, isopropyl cyanide) $(\text{CH}_3)_2\text{CHCN}$.

Properties: Colorless liquid; sp. gr. 0.773 (20/20°C), b. p. 107°C; m. p. -75°C, slightly soluble in water, very soluble in alcohol and ether.

Containers: Tank cars.

Uses: Chemical intermediate for insecticides and other applications.

isobutyryl chloride (isobutyryl chloride; 2-methylpropanoyl chloride) $(\text{CH}_3)_2\text{CHCOCl}$.

Colorless liquid; refractive index 1.4079, density 1.017 (20/4°C); m. p. -90°C; b. p. 92°C; soluble in ether; reacts with water and alcohol.

isobutyryl chloride. See isobutyryl chloride.

isocarboxazid $\text{C}_{12}\text{H}_{13}\text{N}_3\text{O}_2$. 1-Benzyl-2-(5-methyl-3-isoxazolylcarbonyl)hydrazine.

Properties: M. p. 105-107°C. Very slightly soluble in water; soluble in alcohol and chloroform; sparingly soluble in ether.

Use: Medicine.

isocetyl laurate $\text{C}_{11}\text{H}_{23}\text{COOC}_{16}\text{H}_{33}$.

Properties: Oily liquid with practically no odor; sp. gr. 0.858; f. p. below -65°C, viscosity 19.6 cp. at 25°C, insoluble in water; soluble in most organic solvents.

Uses: In cosmetics and pharmaceuticals as emollient, lubricant, fixative and solvent; plasticizer; mold release agent; textile softener.

isocetyl myristate $\text{C}_{13}\text{H}_{27}\text{COOC}_{16}\text{H}_{33}$.

Properties: Oily liquid with practically no odor; sp. gr. 0.857; f. p. -39°C; viscosity 25.6 cp at 25°C; insoluble in water; soluble in most organic solvents.

Uses: See isocetyl laurate.

isocetyl oleate $\text{C}_{17}\text{H}_{33}\text{COOC}_{16}\text{H}_{33}$.

Properties: Oily liquid with practically no odor; sp. gr. 0.862; f. p. -57°C; viscosity 29.0 cp at 25°C; insoluble in water; soluble in most organic solvents.

Uses: See isocetyl laurate.

isocetyl stearate $\text{C}_{17}\text{H}_{33}\text{COOC}_{18}\text{H}_{37}$.

Properties: Oily liquid with practically no odor; sp. gr. 0.857; f. p. 0°C; viscosity 32.0 cp at 25°C; insoluble in water; soluble in most organic solvents.

Uses: See isocetyl laurate.

ischolesterol. See lanosterol.

isocinchomeric acid (2,5-pyridinedicarboxylic acid) $\text{HOOC}(\text{C}_5\text{H}_4\text{N})\text{COOH}$.

Properties: Light tan powder, leaflets or prisms; no odor; m. p. 254°C, sublimes as nicotinic acid above this temperature; insoluble in cold water, alcohol, ether, benzene, slightly soluble in boiling water, boiling alcohol; soluble in hot dilute mineral acids.

Use: Intermediate for nicotinic acid, insecticides, polymers, dyestuffs.

isocrotonic acid. See crotonic acid.

isocyanate generator (hindered isocyanate)

An isocyanate derivative that decomposes to produce an isocyanate upon heating. For example in one type phenol is combined with an isocyanate, and the resulting urethane is stable at room temperature, but dissociates at 160° to produce the original phenol and isocyanate. These generators are used commercially in a mixture with a polyester which can be stored indefinitely, but which upon heating produces a polyurethane resin.

isocyanate resins. See polyurethane resins.

isocyanates. Compounds containing the isocyanate radical, -NCO. Monoisocyanates are in use, as in the treatment of cellulose to obtain a cellulose tricarbamate, but the term isocyanates usually refers to the diisocyanates (q.v.).

isocyanuric acid (s-triazine-2,4,6-trione) $\text{O}=\text{C}_6\text{N}_4\text{C}_3=\text{O}$.

The ketone isomer of cyanuric acid (q.v.), which is the triol. Derivatives of isocyanuric acid, as dichloro- and trichloroisocyanuric acid, and potassium and sodium dichloroisocyanurate, are used as bleaches and sanitizers.

isodecaldehydes $\text{C}_{10}\text{H}_{18}\text{CHO}$ (mixed isomers).

Properties: Sp. gr. 0.8290; b. p. 197.0°C; f. p. -80°C, insoluble in water; density 6.9 lb/gal, flash point 185°F.

Uses: Intermediate for pharmaceuticals, dyes, resins.

*isodecane. See 2-methylnonane.

isodecanoic acid $\text{C}_{10}\text{H}_{20}\text{O}_2$ (mixture of branched chain acids, primarily trimethylheptanoic and dimethyloctanoic).

Properties: Liquid; b. p. 254°C (760 mm Hg), 137°C (10 mm Hg); sp. gr. 0.9019 (20/20°C);

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

f. p., glass below -60°C , very slightly soluble in water; viscosity 12.9 cps at 20°C ; refractive index 1.4358 (n 20/D).
Uses: Intermediate for metal salts, ester type lubricants, plasticizers.

Isodecanol $\text{C}_{10}\text{H}_{21}\text{OH}$ (mixed isomers).

Properties: Sp. gr. 0.8395; insoluble in water; flash point 220°F ; b. p. 220°C .

Use: Antifoaming agent in textile processing.

Isodecyl chloride $\text{C}_{10}\text{H}_{21}\text{Cl}$ (mixed isomers).

Properties: Sp. gr. 0.8767; b. p. 210.6°C ; f. p. -180°C (sets to a glass); insoluble in water; flash point 200°F .

Uses: Solvent for oils, fats, greases, resins, gums; extractants, cleaning compounds; intermediates for insecticides, pharmaceuticals, plasticizers, polysulfide rubbers, resins, and cationic surfactants.

Isodecyl octyl adipate.

Properties: Light colored, oily liquid; sp. gr. 0.924 ($20/20^{\circ}\text{C}$); mid-b. p. 227°C (4 mm); refractive index 1.448 (25°C); viscosity 20 cps (20°C).

Use: Plasticizer.

Isodurene (1, 2, 3, 5-tetramethylbenzene)

$(\text{CH}_3)_4\text{C}_6\text{H}_2$.

Properties: Liquid. Soluble in alcohol and ether; insoluble in water. Sp. gr. 0.896, b. p. 197°C ; m. p. -24°C .

Derivation: Occurs in coal tar.

Grades: Technical.

Use: Organic synthesis.

Isoemodin. See aloe-emodin.**Isoeugenol** $(\text{CH}_3\text{CHCH})\text{C}_6\text{H}_3\text{OHOC}_6\text{H}_3$.

1-Hydroxy-2-methoxy-4-propenylbenzene.

Properties: Pale yellow oil, spice-clove type odor. Soluble in alcohol, ether, and other organic solvents; slightly soluble in water. Sp. gr. 1.081-1.084; m. p. 19°C ; b. p. 268°C ; refractive index (n 19/D) 1.5739.

Derivation: From eugenol by isomerization with caustic potash.

Method of purification: Distillation.

Grades: Perfumers' grade.

Containers: 1- and 5-lb glass bottles, 1-, 5-, and 10-gal tins; drums.

Uses: Perfumes; vanillin.

Shipping regulations: None. *

Isoeugenol acetate. See acetylisoeugenol.**Isoeugenol ethyl ether** (1-ethoxy-2-methoxy-4-propenylbenzene)

$\text{C}_3\text{H}_5(\text{CH}_3\text{O})\text{C}_6\text{H}_3\text{OC}_2\text{H}_5$.

Properties: Synthetic white crystalline powder; m. p. 64°C ; insoluble in water; soluble in alcohol, ether, benzene.

Uses: As sweetening agent and odorant fixative.

Isoluorophate. See diisopropyl fluophosphate.**Isoheptanes** C_7H_{16} . A mixture containing predominantly branched-chain heptane hydrocarbons.

Properties: Boiling range $82-93^{\circ}\text{C}$; sp. gr. 0.717 ($60/60^{\circ}\text{F}$); refractive index 1.385 (n 20/D); aniline point 132°F ; flash point

-9°C .

Grades: Commercial.

Containers: Drums and tank cars; also 5- and 54-gal drums.

Uses: Solvent.

Shipping regulations: Flammable liquid.

Red label. *

Isohexadecyl derivatives. See isocetyl derivatives.**Isohexane.** See 2-methylpentane.**Isohexanes** C_6H_{14} . A mixture consisting primarily of branched-chain hexane hydrocarbons.

Properties: Boiling range 54 to 61°C ; sp. gr. 0.671 ($60/60^{\circ}\text{F}$); flash point -32°C .

Grade: Commercial.

Containers: 5-, 54-gal drums.

Uses: Solvent.

Shipping regulations: Flammable liquid.

Red label. *

isolates, odoriferous. Pure chemical compounds derived from an essential oil or other natural perfume substance. Geranial (obtained from palmarosa oil or citronella oil), pinene (from turpentine); anethole (from anise oil).

isoleucine (alpha-amino-beta-methylvaleric acid; 2-amino-3-methylpentanoic acid). $\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)\text{CH}(\text{NH}_2)\text{COOH}$. An essential amino acid, found naturally in the L(+) form.

Properties: Crystalline; slightly soluble in water, nearly insoluble in alcohol; insoluble in ether.

DL-isoleucine: (synthetic form) m. p. 292°C (dec).

L(+)-isoleucine: bitter taste; m. p. $283-284^{\circ}\text{C}$ (dec).

D(-)-allo-isoleucine: m. p. 278°C (dec).

L(+)-allo-isoleucine: sweet taste, m. p. $280-281^{\circ}\text{C}$ (dec).

Derivation: Hydrolysis of protein (zein, edestin), amination of the alpha-bromo-beta-methylvaleric acid.

Use: Medicine; nutrition; biochemical research.

"Isome." ³⁴² Trademark for di-n-propyl 6, 7-methylene-dioxy-3-methyl-1, 2, 3, 4, -tetrahydronaphthalene-1, 2-dicarboxylate. Used in insecticides.

Isomerization. Process for converting hydrocarbons or other organic compounds into compounds whose molecules have a different arrangement of atoms, but the same number and kinds of atoms. A very important example is the conversion of normal butane into isobutane, in connection with the production of isooctane and other high grade motor fuels.

Isomers.

1. Molecules which contain the same number and kind of atoms but which differ in structure. This isomerism may be of several kinds. Butyl alcohol ($\text{C}_4\text{H}_9\text{OH}$ or $\text{C}_4\text{H}_{10}\text{O}$) and ethyl ether ($\text{C}_2\text{H}_5\text{OC}_2\text{H}_5$ or $\text{C}_4\text{H}_{10}\text{O}$) have the same empirical formulas

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

but are entirely different kinds of chemical substances; normal ($\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{OH}$) and isobutyl alcohol ($(\text{CH}_3)_2\text{CHCH}_2\text{OH}$) differ in the shape of the molecules; sec-butyl alcohol ($\text{CH}_3\text{CHOHCH}_2\text{CH}_3$) exists in two forms that differ only as right and left hands differ. See also amyl alcohols; optical isomerism; geometric isomerism. 2. Nuclides (i. e., kinds of atomic nuclei) having the same atomic and mass numbers, but that exist in different energy states. One is always unstable with respect to the other, or both may be unstable with respect to a third. In the latter instance the energy of transformation in the two cases will differ.

isometheptene (2-methylamino-6-methyl-5-heptene) $(\text{CH}_3)_2\text{C}:\text{CHCH}_2\text{CH}_2\text{CH}(\text{NHCH}_3)\text{CH}_3$.

Properties: Colorless or slightly yellow, oily liquid with an amine-like odor. B. p. 175-177°C; sp. gr. 0.794-0.798 (25/25°C); refractive index 1.4428-1.4438 (n_D 25/D). Miscible with dilute mineral acids and most organic solvents; volatile with steam.

Use: Medicine.

Available also as the isometheptene tartrate, the hydrochloride N.N.D., and the mucate N.N.D.

alpha-isomethylionone. See "Cetone Alpha."

"Iso Mist Extra," ⁴⁰⁰ Trade name for isopropyl myristate, double distilled.

Properties: Saponification number 203-211; acidity as myristic acid 0.1% max, iodine number 1.0 (max); ester content 97.5% min.

isomorphism. The condition in which two or more entirely different substances have closely similar crystal structures, lattice dimensions, and chemical composition.

isonandra gutta. See gutta-percha.

isoniazid (N-isonicotinyl hydrazine; INAH, isonicotinic acid hydrazide)
 $\text{C}_5\text{H}_4\text{NCONHNH}_2$.

Properties: Colorless or white crystals or white crystalline powder; odorless; affected by air and light; m. p. 170-173°C, sparingly soluble in alcohol, slightly soluble in benzene and ether, freely soluble in water. Solutions practically neutral to litmus.

Grade: U. S. P. XVI.

Use: Medicine.

isonicotinic acid CHCHNCHCHCOOH .

Properties: White, practically odorless powder; m. p. 314-317°C (sealed capillary); slightly soluble in water; pH of saturated aqueous solution at 20° 3.6.

Containers: Fiber drums.

Use: Synthesis of isoniazid and similar substances.

isonicotinic acid hydrazide. See isoniazid.

isonicotinoyl isopropylhydrazine phosphate. See iproniazid phosphate.

isonipECAINE hydrochloride. See meperidine hydrochloride.

isooctane (2,2,4-trimethylpentane) $(\text{CH}_3)_2\text{CHCH}_2\text{C}(\text{CH}_3)_3$. See also 2-methylheptane.

Properties: Colorless liquid; sp. gr. 0.6919 (20/4°C); m. p. -107.4°C; b. p. 99.2°C (760 mm); refractive index (n_D 20/D) 1.3914. Insoluble in water, slightly soluble in alcohol and ether.

Grades: Technical; pure; research.

Containers: 5-, 54-gal drums.

Uses: Organic synthesis; motor fuel; used with normal heptane to prepare standard mixtures to determine anti-knock property of gasoline. See octane number.

Shipping regulations: Flammable liquid. Red label.*

isooctanes C_8H_{18} . A mixture of hydrocarbons, predominantly isomers of octane.

Properties: Liquid; flash point -11°C.

Containers: Drums; tank cars.

Shipping regulations: Flammable liquid. Red label.*

isooctanol. See isooctyl alcohol.

isooctene. Available commercial grade isooctene is a mixture whose principal components are branched chain heptenes and octenes.

Properties: Typical boiling range 190-200°F; bromine number 137, sp. gr. 0.726 (60/60°F).

Shipping regulations: Flammable liquid. Red label.*

isooctyl adipate. Plasticizer providing low temperature stability. Used in calendering film, sheeting, vinyl dispersions, extrusions.

isooctyl alcohol (isooctanol). General term that might be applied to any of the isomers of the formula $\text{C}_7\text{H}_{15}\text{CH}_2\text{OH}$ in which the eight carbon atoms form a branched chain structural arrangement. For practical purposes the term refers to a mixture of isomers made by the Oxo process. A selected C_7 hydrocarbon fraction is reacted with hydrogen and carbon monoxide gases in the presence of a special catalyst at pressures up to 3000 psi. The crude alcohol is recovered and purified.

Properties: Distillation range 182-195°C; wt/gal 6.95 lbs; sp. gr. (20/20°C) 0.832; flash point (Tag open cup) 180°F.

Containers: 55-gal drums; tank cars.

Uses: Combined with phthalic anhydride, maleic anhydride, adipic acid, sebacic acid, etc., to form plasticizers; intermediate for non-ionic detergents and surfactants; used in preparation of synthetic drying oils, cutting and lubricating oils, hydraulic fluids, resin solvent; emulsifier; antifoaming agent; and as an intermediate for introducing the isooctyl group into other compounds.

Shipping regulations: None.*

isooctyl isodecyl phthalate

$\text{C}_8\text{H}_{17}\text{OOC}\text{C}_6\text{H}_4\text{COOC}\text{C}_{10}\text{H}_{21}$.

Properties: Clear liquid; sp. gr. (20/20°C), 0.976; mild characteristic odor.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Grade: Technical.

Containers: Drums; tank trucks; tank cars.

Use: Plasticizer.

isooctyl palmitate $C_8H_{17}OOC C_{15}H_{31}$.

Properties: (typical specification) Clear liquid; sp. gr. 0.863 (20°C); acidity 0.2% max (palmitic); moisture 0.05% max; m.p. 6-9°C; b. p. 228°C (5 mm).

Uses: Secondary plasticizer for synthetic resins; extrusion aid and rubber plasticizer.

isooctylphenoxypolyoxyethylene ethanol

(isooctylphenylpolyethylene glycol ether)
($CH_3)_3CCH_2C(CH_3)_2$

$C_8H_{17}O(CH_2)_2O(C_2H_4O)_7C_2H_4OH$.

Properties: Slightly viscous pale amber-colored liquid; oily musty odor; m. p. 2-5°C; b. p. 150°C (initial) at 1 micron; density 1.06 g/ml (20°C); flash point 227°C.

Use: Surface active agent.

isooctylphenylpolyethylene glycol ether.

See isooctylphenoxypolyoxyethylene ethanol.

isooctyl thiolglycolate $HSCH_2COOCH_2C_7H_{15}$.

Properties: Water-white liquid with faint fruity odor; b. p. 125°C (17 mm); sp. gr. 0.9736 (25°C), refractive index 1.4606 (21°C); acid no., less than 1.

Grade: 99% (minimum purity).

Containers: Carboy, drum and ton lots.

Uses: Antioxidants, fungicides, oil additives, plasticizers, insecticides, stabilizers, polymerization modifiers.

isop. See hyssop.

isopentanaldehyde C_5H_8CHO . A mixture of 5-carbon aldehydes consisting of valeraldehyde, 2-methyl butyraldehyde, 3-methyl butyraldehyde.

Properties: Water-white liquid with sharp odor; sp. gr. 0.8089 (20/20°C); b. p. 98.6°C, f. p. -95.4°C; water dissolves 0.85% aldehyde at 20°C; water soluble to 2.2% in the aldehyde.

Uses: Possible intermediate for bis-phenols, epoxy and polycarbonate resins, and modified formaldehyde resins.

isopentane (2-methylbutane; ethyldimethylmethane) $(CH_3)_2CHCH_2CH_3$.

Properties: Colorless, mobile, flammable liquid; pleasant odor; f. p. -159.890°C; b. p. 27.854°C; sp. gr. 0.61967 (20°C), soluble in hydrocarbons, oils, ether; very slightly soluble in alcohol; insoluble in water.

Typical specifications for a technical grade are as follows: Distillation range 81-85°F; sp. gr. of liquid 0.625 (60/60°F); API gravity 94.9 (60°C); refractive index (n_D 20/D) 1.354; contains not less than 95 mole% isopentane; principal impurity is normal pentane (4-5%); sulfur content not to exceed 0.005% by wt.

Typical specifications for a commercial grade: Distillation range 75-90°F; vapor pressure (100°F) 21 psia max; sulfur content 0.02 max wt %; doctor test negative; corrosion max 1; color, Saybolt min +30;

non-volatile matter, gm/100 ml max 0.001. Derivation: Fractional distillation from petroleum; purified by rectification.

Grades: Research (99.99%), pure (99%), technical (95%), commercial.

Containers: Pure: quart bottles; gallon bottles; 55-gal drums. Technical and commercial: 5-, 55-gal drums; tank cars (8000 gals).

Uses: Solvent; manufacture of chlorinated derivatives.

Fire hazard: Dangerous.

Shipping regulations: Flammable liquid. Red label.*

isopentanoic acid C_4H_8COOH . A mixture of 5-carbon acids consisting of approximately 55-65% 1-valeric acid, 35-45% 2-methylbutyric acid, and less than 5% 3-methylbutyric acid.

Properties: Water-white liquid with penetrating odor; sp. gr. 0.9388 (20/20°C); b. p. 183.2°C (760 mm Hg); vapor pressure 0.14 mm at 20°C; f. p. -44°C; water dissolves 3.24 wt% of acid at 20°C; acid dissolves 10.4% water at 20°C.

Uses: Possible intermediate for plasticizers, synthetic lubricants, pharmaceuticals, metallic salts, vinyl stabilizers; also possible extractant for mercaptans from hydrocarbons.

isophane insulin suspension. See insulin.

isophorone $COCHC(CH_3)CH_2C(CH_3)_2CH_2$.

Properties: Practically water-white liquid; sp. gr. 0.9229 (20/20°C); 7.7 lbs/gal (20°C); b. p. 215.2°C (760 mm); vapor pressure 0.2mm (20°C); f. p. -8.1°C; viscosity 2.62 cps (20°C); flash point 205°F.

Possesses a high solvent power for vinyl resins and certain other synthetic resins, the cellulose esters and ethers, and many substances soluble with difficulty in other solvents; slightly soluble in water.

Containers: Drums, tank cars.

Use: Same as ethyl butyl ketone.

isophthalic acid (meta-phthalic acid)

$C_6H_4(COOH)_2$.

Properties: Colorless crystals; m. p. 345-348°C; sublimes. Slightly soluble in water; soluble in alcohol, acetic acid; insoluble in benzene and petroleum ether.

Derivation: (a) Oxidation of meta-xylene with nitric acid in the presence of methanol and hydrolysis of the resulting ester; (b) oxidation of meta-xylene with sulfur in the presence of ammonia and water at 200-700°F and hydrolysis of the resulting mixture of amides and ammonium salts; (c) liquid phase oxidation of mixed xylenes; (d) direct oxidation of mixed alkyl aromatics with heavy metal salts and bromine as catalysts.

Containers: Drums; tank cars.

Grades: Technical.

Uses: Polyester and polyurethane resins; plasticizers.

isophthaloyl chloride (meta-phthalyl dichloride)
 $C_6H_4(COCl)_2$.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Crystalline solid; m.p. 41°C; b.p. 276°C; soluble in ether and other organic solvents; reactive with water and alcohol.

Uses: Intermediate; dyes; synthetic fibers; resins; films; protective coatings.

isopral (trichloroisopropyl alcohol)

Properties: Microscopic prisms, camphorous odor, aromatic taste. Absorbed through skin, subcutaneous tissue and the digestive tract. More toxic than chloral hydrate. Soluble in water, alcohol, ether. M.p. 49°C.

Use: Medicine.

Shipping regulations: None.*

isoprene (3-methyl-1,3-butadiene; 2-methyl-1,3-butadiene) $\text{CH}_2:\text{C}(\text{CH}_3)\text{CH}:\text{CH}_2$. The molecular unit of rubber. Building block of "natural" synthetic rubber (cis-1,4-polyisoprene).

Properties: Colorless, volatile liquid; f.p. -146°C; b.p. 34.08°C, refractive index 1.4216 (n_D 20/D); sp. gr. 0.6808 (20/4°C); flash point -48°C, insoluble in water, soluble in alcohol, ether; readily oxidizable and polymerizable.

Derivation: (a) From isoamylene by dehydrogenation; (b) from propylene, by dimerization and cracking; (c) refinery and coal gases and tars; (d) also produced in cracking of natural rubber and turpentine.

Containers: Bottles; drums, tank cars.

Uses: Manufacture of butyl rubber and synthetic natural rubber, also resins and chemicals.

Shipping regulations: Flammable liquid. Red label.*

isopropamide iodide (3-carbamoyl-3,3-diphenylpropyl diisopropyl methyl ammonium iodide) $\text{C}_{23}\text{H}_{33}\text{N}_2\text{O}$. Used in medicine.

isopropanol. See isopropyl alcohol.

isopropanolamine (MIPA) $\text{CH}_3\text{CH}(\text{OH})\text{CH}_2\text{NH}_2$.

Properties: Liquid, slight ammonia odor; sp. gr. 0.9619; m.p. 1.4°C; b.p. 159.9°C; flash point 160°F, soluble in water.

Emulsifying agent; forms soaps that are completely soluble in naphtha, gasoline, and mineral oil.

Containers: 1-gal cans; 5-, 55-gal drums.

Uses: Drycleaning soaps, soluble textile oils; wax removers, metal cutting oils; cosmetics, emulsion paints, plasticizers, insecticides.

isopropenyl acetate $\text{CH}_3\text{COOC}(\text{CH}_3):\text{CH}_2$.

Properties: Water white liquid, sp. gr. 0.9226; b.p. 97.4°C; f.p. -92.9°C; solubility in water 3.25% by weight (20°C); flash point 66°F.

Shipping regulations: Flammable liquid. Red label.*

isopropenylacetylene (2-methyl-1-buten-3-yne) $\text{H}_2\text{C}:\text{C}(\text{CH}_3)\text{C}:\text{CH}$.

Properties: Colorless liquid; b.p. 33-34°C; freezing point -113°C; sp. gr. (20/20°C) 0.695; refractive index (n_D 20/D) 1.4168; flash point (Tag open cup) < 20°F; very

slightly soluble in water and miscible with acetone, alcohol, benzene, carbon tetrachloride and kerosene.

Uses: Specialty fuel; chemical intermediate.

isopropenylchloroformate $\text{ClCOOC}(\text{CH}_3):\text{CH}_2$.

Properties: Liquid. Caution! Odor is very irritating! Sp. gr. 1.103 (20°C); b.p. 93°C (746 mm).

Derivation: Distillation of the reaction products of acetone and phosgene.

para-isopropoxydiphenylamine

Typical specifications: Dark gray flakes; sp. gr. 1.10; set point 78°C (min); purity 92% (min); ash 0.10% (max); insoluble in water; soluble in ethyl alcohol (2B), acetone, benzene and gasoline.

beta-isopropoxypropionitrile (beta-alkoxypropionitrile) $(\text{CH}_3)_2\text{CHO}(\text{CH}_2)_2\text{CN}$.

Properties: Colorless to straw-colored liquid. Combines the chemical and physical properties of ethers and nitriles. M.p. -67°C; b.p. 82-86°C (25 mm Hg), 65-65.5°C (10 mm Hg). Sp. gr. 0.9058 (25°C). Slightly soluble in water; soluble in organic solvents.

isopropoxytitanium stearate. See titanium acylates.

isopropyl acetate $\text{CH}_3\text{COOCH}(\text{CH}_3)_2$.

Properties: Colorless, aromatic liquid. Stable; somewhat toxic; b.p. 89.4°C; sp. gr. 0.877 (15.5°C), 0.8690 (25/4°C); refractive index 1.378 (20°C); sp. ht. 0.46 cal/g, m.p. -73.4°C; heat of vaporization 135 Btu/lb, viscosity 0.49 cps (25°C); solubility in water 2.9 wt %; solubility of water 1.8 wt %; coefficient of expansion 0.00131/°C (approx); flash point 36°F; 7.17 lbs/gal (20°C). Miscible with most of the common organic solvents.

Specifications: Sp. gr. 0.860-0.862 (20/20°C); color water-white; acidity (acetic acid) 0.02% (max); moisture clear with 19 vols of naphtha, distillation initial 83°C (min), dry point 93°C (max); non-volatile matter 2 mg/100 cc; purity 85-88 (wt%); residual odor none.

Derivation: By reacting isopropyl alcohol with acetic acid in the presence of catalysts.

Grades: 95% grade; 85 to 88% grade.

Containers: 1-, 5-gal cans, 55-gal (non-returnable) drums; tank cars 6000, 8000, and 10000 gals.

Uses: Solvent for nitrocellulose, fats, oils, waxes, gums, natural and synthetic resins; artificial leather; artificial silk; dopes; films, lacquers; plastics; synthetic perfumes; organic synthesis.

Warning! Flammable. MCA warning label.

Shipping regulations: Flammable liquid.

Red label.*

isopropyl alcohol (IPA; dimethylcarbinol; sec-propyl alcohol; isopropanol; 2-propanol) $(\text{CH}_3)_2\text{CHOH}$.

Properties: Colorless, clear, mobile liquid; flammable.

Physical properties: B.p. 82.4°C; sp. gr.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

0.7863 (20/20°C); refractive index 1.3756 (20°C); sp. ht. 0.65 cal/g; m. p. -88°C; critical temperature 235°C; critical pressure 53 atmospheres; vapor pressure 33 mm Hg at 20°C; flash point 72°F, heat of combustion 14,346 Btu/lb; heat of vaporization 288 Btu/lb; viscosity 2.1 cps (25°C); coefficient of expansion 0.00107/°C (approx). Soluble in water, alcohol and ether.

Specifications:	91%	99%
Sp. gr. (20/20)	0.8175-0.8190	0.7900 (max)
Acidity (acetic acid) (max)	0.002%	0.002%
Distillation range	79.7-80.7°C	81.5-83°C
Non-volatile matter (mg/100 cc) (max)	2	2
Purity (volume %) (min)	91	99
Residual odor	none	none
Water dilution	clear	clear
Flash point, Tag open cup	80°F	72°F
Lbs/gal (20°C)	6.81	6.57

Derivation: By treatment of propylene with sulfuric acid and hydrolyzing.

Method of purification: Rectification.

Grades: 91%; 95%; 99%; N. F. XI (99%).

Containers: Tins; 55-gal drums; tank trucks up to 2000 gals, tank cars 6000 to 10,000 gals.

Uses: Manufacture of most of the national output of acetone and thus a source of acetic anhydride, diacetone alcohol, methyl isobutyl ketone, and other derivatives, solvent for essential and other oils, alkaloids, gums, resins, organic and inorganic compounds; latent solvent for cellulose derivatives; solvent mixtures, antistalling agent in liquid fuels; deicing agent for liquid fuels; pharmaceuticals; perfumes; lacquers; extraction processes, dehydrating agent; preservative; antifreeze; rocket fuel.

Fire hazard: Dangerous.

Shipping regulations: Flammable liquid.

Red label. Legal label name isopropanol.*

isopropylamine (2-aminopropane)

Properties: Colorless volatile liquid, amine odor; strong alkaline reaction. B. p. 32.4°C; f. p. -95.2°C; sp. gr. (20/20°C) 0.6881; wt/gal (20°C) 5.7 lbs; refractive index (n_D¹⁵) 1.3770; flash point (open cup) below 0°F (values from -35°F to -9°F given by various authorities). Miscible with water, alcohol, and ether.

Derivation: From isopropyl chloride and ammonia under pressure.

Containers: 1-, 5-gal cans; 55-gal drums; tank cars.

Uses: Solvent; intermediate in synthesis of

rubber accelerators, pharmaceuticals, dyes, insecticides, bactericides, textile specialties, and surface-active agents; de-hairing agent; solubilizer for 2,4-D acid. Danger: Extremely flammable. Vapor extremely hazardous. Liquid causes burns. MCA warning label.

Shipping regulations: Flammable liquid.

Red label.*

para-isopropylaminodiphenylamine.

Use: Protecting rubber against ozone attack, flex cracking, and heat.

isopropylaminoethanols. A commercial mixture of approximately 60% isopropylethanolamine, $(\text{CH}_3)_2\text{CHNHCH}_2\text{CH}_2\text{OH}$, and 40% of isopropyl-diethanolamine, $(\text{CH}_3)_2\text{CHN}(\text{CH}_2\text{CH}_2\text{OH})_2$.

Properties: Amber to straw-colored liquid, distillation range 110-265°C; f. p. below -50°C; sp. gr. 0.91-0.94 (20/20°C); flash point 145-155°F (open cup).

Use: Synthesis of emulsifiers.

alpha-(isopropylaminomethyl) protocatechuy alcohol esters. See isoproterenol hydrochloride and sulfate.

5-isopropylamino-1-pentanol

Properties: Light-straw color; faint amine odor; boiling range 225-234°C; flash point 230°F.

para-isopropylaniline. See cumidene.

isopropyl antimonite $[(\text{CH}_3)_2\text{CHO}]_3\text{Sb}$.

Properties: Colorless liquid; b. p. 82°C at 7 mm Hg pressure.

Derivation: Reaction of antimony trichloride with isopropanol.

Uses: Cross-linking agent; flameproofing agent.

isopropylarterenol esters. See isoproterenol hydrochloride and sulfate.

para-isopropylbenzaldehyde. See cuminic aldehyde.

isopropylbenzene. See cumene.

isopropylbenzol. See cumene.

isopropyl bromide $\text{CH}_3\text{CHBrCH}_3$.

Properties: Colorless liquid; sp. gr. 1.304 (25/25°C); b. p. 58.5-60.5°C; f. p. -90°C; refractive index 1.422 (n_D²⁵), flash point none; slightly soluble in water; soluble in methanol, ether.

Uses: Synthesis of pharmaceuticals, dyes, other organics.

isopropyl butyrate $(\text{CH}_3)_2\text{CHOOCC}_4\text{H}_9$.

Properties: Colorless liquid, used in solvent mixtures for cellulose ethers; sp. gr. 0.8652 (13°C); b. p. 128°C.

Grades: Technical.

isopropylcarbinol. See isobutyl alcohol.

isopropyl chloride $\text{CH}_3\text{CHClCH}_3$.

Properties: Colorless liquid; sp. gr. 0.858 (25/25°C); b. p. 34.8°C; f. p. -117.6°C; refractive index 1.374 (n_D²⁵); flash point -45°F; slightly soluble in water; soluble in

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

methanol, ether.

Uses: Solvent; intermediate.

Shipping regulations: Flammable liquid.

Red label.*

isopropyl N-(3-chlorophenyl)-carbamate.

See chloro-IPC.

isopropyl-meta-cresol. See thymol.

isopropyl-ortho-cresol. See carvacrol.

isopropyl cresols. A mixture of di- and mono-isopropyl cresols used as an antioxidant. See MYL, thymol, and carvacrol.

isopropyl cyanide. See isobutyronitrile.

isopropyl diethanolamine. See isopropylamino-ethanols.

2-isopropyl-4 dimethylamino-5-methyl-phenyl-1-piperidine-carboxylate methyl chloride (Amo-1618). A plant tranquilizer or anti-gibberellin, which causes some plants to become dwarfs without affecting their growth or health otherwise.

isopropylethanolamine. See isopropylamino-ethanols.

isopropyl ether (diisopropyl ether) $(\text{CH}_3)_2\text{CHOCH}(\text{CH}_3)_2$.

Properties: Colorless liquid. Ethereal odor. Isopropyl ether is somewhat similar to ethyl ether in properties but does tend to form peroxides more readily than ethyl ether. (See ether). Consequently the presence or absence of peroxides should be determined and if present should be destroyed with sodium sulfite before distillation. B. p. 67.5°C, sp. gr. 0.723 (15.5/4°C); refractive index 1.368, m. p. -88°C; heat of combustion 16250 Btu/lb, heat of vaporization 124 Btu/lb; viscosity 0.32 cps (20°C); solubility in water 0.65% wt (25°C); solubility of water 0.025% wt (25°C), flash point 9°F, 6.05 lbs/gal (60°F). Miscible with most organic solvents and water.

Specifications: Sp. gr. 0.723-0.727 (20/20°C); water-white, acidity (acetic acid) 0.002% (max); moisture, clear with 19 vols of naphtha; distillation, initial b. p. 66°C (min), dry point 70°C (max); peroxides (active oxygen) 12 ppm (max), inhibitor, 5-12 mg/100 cc.

Grades: Technical.

Containers: 1-, 5-gal cans; 55-gal (non-returnable) drums; tank cars 6000, 8000, and 10,000 gal.

Uses: Solvent for animal, vegetable, mineral oils, waxes and resins, mixed with isopropanol may be used for de-waxing oils or de-oiling waxes; extraction of acetic acid from aqueous solutions, solvent for dyes in presence of small amount of alcohol; paint and varnish removers, spotting compositions, rubber cements.

Danger! Extremely flammable. Highly volatile. Tends to form explosive peroxides especially when anhydrous. MCA warning label.

Shipping regulations: Flammable liquid. Red label.*

isopropylethylene. See 3-methyl-1-butene.

isopropyl furoate $\text{C}_4\text{H}_7\text{OCO}_2\text{C}_3\text{H}_7$.

Properties: Colorless liquid, becoming brown in light. Insoluble in water; soluble in alcohol and ether; sp. gr. 1.0655 (23.7/4°C); b. p. 198.6°C (corr); refractive index 1.4682 (23.7°C).

isopropylideneacetone. See mesityl oxide.

para, para'-isopropylidenediphenol. See bis-phenol A.

isopropyl iodide (2-iodopropane) $\text{CH}_3\text{CHICH}_3$.

Properties: Colorless liquid that discolors in air and light; miscible with chloroform, ether, alcohol, and benzene; slightly soluble in water; sp. gr. 1.703; m. p. -90°C; b. p. about 90°C; refractive index (n_D 20/D) 1.5026.

Grades: Pure; technical.

Uses: Organic synthesis; pharmaceuticals.

isopropyl meprobamate. See N-isopropyl-2-methyl-2-propyl-1,3-propanediol dicarbamate.

isopropyl mercaptan $(\text{CH}_3)_2\text{CH}(\text{HS})$.

Properties: Extremely powerful unpleasant odor.

Derivation: Propylene and hydrogen sulfide.

Use: Standard for petroleum analysis.

Shipping regulations: Flammable liquid.

Red label.*

2-isopropyl-5-methylbenzoquinone. See para-thymoquinone.

1-isopropyl-2-methylethylene. See 4-methyl-2-pentene.

N-isopropyl-2-methyl-2-propyl-1,3-propanediol dicarbamate (isopropyl meprobamate)

$(\text{CH}_3)_2\text{CHNHCOOCH}_2\text{C}(\text{CH}_3)(\text{C}_3\text{H}_7)\text{CH}_2\text{COO-NHCH}(\text{CH}_3)_2$.

Properties: Crystals; m. p. 92-93°C.

Sparingly soluble in water; insoluble in vegetable oils; soluble in many common organic solvents. Stable in dilute acids and alkalis.

Use: Medicine.

1-isopropyl-3-methyl-5-pyrazolyl dimethylcarbamate $\text{C}_{10}\text{H}_{17}\text{N}_3\text{O}_2$.

Derivation: By treating 1-isopropyl-3-methyl-5-pyrazolone with dimethylcarbamoyl chloride.

Use: Insecticide.

isopropyl myristate $\text{CH}_3(\text{CH}_2)_{12}\text{CO}_2\text{CH}(\text{CH}_3)_2$.

Properties: Colorless oil; practically odorless, sp. gr. 0.850-0.860, freezing point 3°C, refractive index (20°C) 1.435-1.438. Soluble in most organic solvents, insoluble in water.

Grades: Double-distilled.

Use: Cosmetics.

isopropyl percarbonate. See following entry.

Shipping regulations: Stabilized: Corrosive liquid. White label by freight. Not accepted by express. Unstabilized: Flammable solid. Red label by freight. Not accepted by express.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

isopropyl peroxydicarbonate. A catalyst which makes possible the production of medium density (0.95 sp. gr.) polyethylene by the conventional high pressure process. May also be used in polymerization of vinyl compounds. See preceding entry.

Properties: M. p. 46-50°F; decomposes 65°F; slightly soluble in water; soluble in many organic solvents.

Derivation: Reaction of isopropyl chloroformate with hydrogen peroxide in sodium hydroxide.

ortho-isopropylphenol $(\text{CH}_3)_2\text{CHC}_6\text{H}_4\text{OH}$.

Properties: Light yellow liquid, b. p. 214°C; f. p. 17°C; density 0.995 at 20°C; flash point (open cup) 95°C; insoluble in water; soluble in isopentane, toluene, ethyl alcohol, 10% sodium hydroxide.

Uses: Intermediate for synthetic resins, plasticizers, surface active agents, perfumes.

meta, para-isopropylphenol $(\text{CH}_3)_2\text{CHC}_6\text{H}_4\text{OH}$.

Properties: A solid mixture of the meta and para isomers, completely soluble in 10% sodium hydroxide; f. p. (meta) 25.9°C, (para) 63.2°C; b. p. (meta) 228.6°C, (para) 228.5°C.

isopropyl N-phenylcarbamate. See IPC.

4-isopropylpyridine $\text{C}_5\text{NH}_4\text{C}_3\text{H}_7$.

Properties: B. p. 182.2°C; density 0.9282 at 20°C, refractive index 1.4960 (n_D 20/D), solubility in 100 g of water at 20°C, 1.17 g, solubility of water in 100 g at 20°C, 19.4 g.

isopropyl titanate. See tetraisopropyl titanate.

isopropyltoluene. See cymene.

isopropyltoluol. See cymene.

isopropyltrimethylmethane. See 2,2,3-trimethylbutane.

isoproterenol hydrochloride (isopropylarterenol hydrochloride; alpha-(isopropylaminomethyl)protocatechuyl alcohol hydrochloride; 1-(3',4'-dihydroxyphenyl)-2-isopropylaminoethanol hydrochloride) $(\text{HO})_2\text{C}_6\text{H}_3\text{CH}(\text{OH})\text{CH}_2\text{NHCH}(\text{CH}_3)_2 \cdot \text{HCl}$.

Properties: White, odorless, slightly bitter, nonhygroscopic, crystalline solid, m. p. 167-172°C; affected by air and light. Freely soluble in water, soluble in alcohol, very slightly soluble in benzene; insoluble in chloroform and ether; 1% solution is clear and colorless and has pH 4.5-5.5. Aqueous solutions become pink upon standing.

Grade: U. S. P. XVI.

Use: Medicine.

isoproterenol sulfate (for synonyms, see isoproterenol hydrochloride) $(\text{HO})_2\text{C}_6\text{H}_3\text{CH}(\text{OH})\text{CH}_2\text{NHCH}(\text{CH}_3)_2 \cdot \frac{1}{2}\text{H}_2\text{SO}_4 \cdot 2\text{H}_2\text{O}$.

Properties: White, odorless, slightly bitter, hygroscopic, crystalline solid; m. p. 128° (dec); freely soluble in water, slightly soluble in alcohol, very slightly soluble in benzene and ether. 1% solution is clear and colorless and has pH 3.5-4.5; aqueous

solutions become pink upon standing.

Grade: N. F. XI.

Use: Medicine.

isopulegol $\text{C}_{10}\text{H}_{17}\text{OH}$.

Properties: Water-white liquid. Mint-like odor. Sp. gr. 0.904-0.911; refractive index 1.471-1.474.

Grade: Technical.

Use: Perfumery (geranium and rose compounds).

isopulegol acetate $\text{C}_{10}\text{H}_{17}\text{OOCCH}_3$.

Properties: Water-white liquid. Mint-like odor. Sp. gr. 0.930-0.936.

Grade: Technical.

Use: Perfumery (geranium and rose compounds).

isopurpurin. See anthrapurpurin.

isoquinoline CHCHCHCHCHCHCHNCH .

Properties: Colorless plates or liquid; occurs in coal tar, also prepared synthetically; sp. gr. 1.099 (20°C); m. p. 23°C; b. p. 243°C; insoluble in water, soluble in dilute mineral acids and most organic solvents, refractive index (n_D 25/D) 1.6223.

Containers: Drums.

Grades: Technical (95% min).

Uses: Manufacture of pharmaceuticals (such as nicotinic acid), dyes, insecticides, rubber accelerators, and in organic synthesis.

1,3-isoquinolinediol $\text{C}_9\text{H}_7\text{N}(\text{OH})_2$.

Properties: Cream colored paste; solids, approx. 80%.

Grade: Technical.

Use: Intermediate.

isosafrole $\text{C}_{10}\text{H}_{10}\text{O}_2$.

Properties: Colorless, fragrant liquid; odor of anise; sp. gr. 1.117-1.120, refractive index 1.576; b. p. 253°C. Soluble in alcohol, ether, and benzene.

Derivation: Treatment of safrole with alcoholic potash.

Uses: Manufacture of heliotropin; perfumes; flavors.

Shipping regulations: None.*

isosorbide $\text{OCH}_2\text{CHOHCHCHCHCHOHCH}_2\text{O}$.

A polyol with a hydroxyl group attached to each of two cis-oriented saturated furan rings. Intermediate for pharmaceuticals.

isosorbide dinitrate (1,4,3,6-dianhydrosorbitol-2,5 dinitrate).

Use: Medicine.

isosterism. Similarity in physical properties of elements, ions, or compounds, due to similar or identical external electron arrangements.

isostilbene. See stilbene.

iso-syst. Proposed to designate a condition, experiment, or curve of constant composition.

isotactic. A type of polymer structure in which groups of atoms which are not part of the backbone structure are located either all

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

above or all below the atoms in the backbone chain, when the latter are arranged so as to be all in one plane. See polymer, stereospecific.

"**Isothan Q 15.**" ³²⁸ Trademark for a 20% solution of lauryl isoquinolinium bromide; a deep amber, water-soluble liquid with a pleasant, characteristic odor, used as a fungicide.

isotherm. Constant temperature line used on climatic maps or in graphs of thermodynamic relations, particularly the graph of pressure-volume relations at constant temperature.

isotones. Nuclides (i. e., kinds of atomic nuclei) which have the same excess of neutrons over protons.

isotopes. Varieties of a chemical element that differ in atomic weight, but are very nearly exactly alike in chemical properties. The difference arises because the atoms of the isotopic forms of an element differ in the number of neutrons in the nucleus. Ordinary chlorine is a mixture of isotopes having atomic weights 35 and 37, with the natural mixture having atomic weight about 35.46. Many of the elements similarly exist as mixtures of isotopes, and a great many new isotopes have been produced in the operation of nuclear devices such as the cyclotron.

Uses: Stable isotopes are used as tracers in all kinds of research, as calibration standards for mass spectrometers, as spectrochemical standards, and as standard sources for monochromatic light.

See tracer.

isotopic spin. A term that is introduced in one form of the theory of the atomic nucleus, a kind of quantum number similar to the ordinary spin quantum number, which considers the neutron and proton to be simply two different charge states of the same particle.

"**Isotox.**" ²⁵³ Brand name for a type of insecticide product containing lindane.

isovaleral. See isovaleraldehyde.

isovaleraldehyde (isovaleral; isovaleric aldehyde) $(\text{CH}_3)_2\text{CHCH}_2\text{CHO}$. Occurs in orange, lemon, peppermint and other oils.

Properties: Colorless liquid; apple-like odor; sp. gr. 0.785; m. p. -51°C ; b. p. 92°C , refractive index (n 20/D) 1.390. Soluble in alcohol and ether; slightly soluble in water.

Derivation: By the oxidation of isoamyl alcohol; also by Oxo process from petroleum.

Method of purification: Distillation.

Grade: Technical.

Containers: Iron drums; glass bottles.

Uses: Flavoring compounds; perfumes; pharmaceuticals; synthetic resins; rubber accelerators.

isovaleric acid $(\text{CH}_3)_2\text{CHCH}_2\text{COOH}$. Occurs in valerian, hop oil, tobacco and other plants. Properties: Colorless liquid; disagreeable

taste and odor; sp. gr. 0.931 (20/20°); b. p. 176°C ; refractive index (n 20/D) 1.4043; m. p. -29°C ; slightly soluble in water; soluble in alcohol and ether.

Derivation: With other valeric acids, by distillation from valerian; by oxidation of isoamyl alcohol.

Uses: Medicine; flavors; perfumes.

isovaleric aldehyde. See isovaleraldehyde.

isovaleroyl chloride (3-methylbutanoyl chloride) $(\text{CH}_3)_2\text{CHCH}_2\text{COCl}$.

Properties: Colorless liquid; refractive index (n 24/D) 1.4136; density 0.9854 (24/4°C); b. p. 113°C ; soluble in ether; reacts with water and alcohols.

Use: Intermediate in synthesis.

isovaleryl diethylamide. See valeryl diethylamide.

isovaleryl-para-phenetidine

$\text{C}_2\text{H}_5\text{OC}_6\text{H}_4\text{NHCOCH}_2\text{CH}(\text{CH}_3)_2$.

Properties: White, glistening needles. Almost insoluble in water and ether; soluble in alcohol and chloroform.

Derivation: By heating isovaleric acid with para-phenetidine.

isoxsuprine hydrochloride (1-(para-hydroxyphenyl)-2-(1'-methyl-2'-phenoxyethylamino)propanol-1 hydrochloride)

$\text{HOC}_6\text{H}_4\text{CHOHCH}(\text{CH}_3)\text{NHCH}(\text{CH}_3)_2\text{CH}_2\text{OC}_6\text{H}_5\cdot\text{HCl}$.

Properties: Bitter crystals; m. p. $201\text{--}208^\circ\text{C}$. Sparingly soluble in water, soluble in ethanol.

Use: Medicine.

istle. Short, hard fiber obtained from the leaves of various species of Agave of central Mexico. Jaumave istle is the best variety for brushes, yielding fibers which closely resemble animal bristles. Palma istle yields the lowest quality of fibers, used chiefly in twines and poor brushes, while tula istle is of intermediate quality. Uses: Brushes; buffing wheels; upholstery; twine.

"**Isuprel**" **Hydrochloride.** ¹⁶² Trademark for isoproterenol hydrochloride (q. v.).

itaconic acid $\text{CH}_2\text{:C}(\text{COOH})\text{CH}_2\text{COOH}$.

Properties: White, odorless crystals; m. p. $167\text{--}168^\circ\text{C}$, soluble in water, alcohols and acetone, sparingly soluble in other organic solvents.

Derivation: Submerged fermentation by mold of various carbohydrates.

Grades: Technical, refined.

Containers: Bags, carloads.

Uses: Copolymerizations; resins, plasticizers; lube oil additives, intermediate.

Italian red. See iron oxide reds.

"**Itrumil.**" ³⁰⁵ Trademark for iothiouracil sodium (q. v.).

"**I-Two.**" ³⁴² Trademark for a brand of atomic iodine for industrial sanitizing.

IUPAC. Abbreviation for International Union of Pure and Applied Chemistry.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

IVE. Abbreviation for isobutyl vinyl ether.
See vinyl isobutyl ether.

"**Ivo.**" ¹³³ Trademark for series of bone blacks used in coatings for leather, paint, wall-paper, etc.

Containers: 250-lb drums.

ivory. A hard, white, close-grained substance which constitutes the greater part of the tusks of the elephant, mammoth,

hippopotamus, narwhal and walrus. The best grades are those obtained from the elephant.

ivory, artificial. A substance resembling natural ivory made by mixing gypsum and stearic acid.

ivory black. An animal black produced from ivory. The term is sometimes erroneously applied to other animal blacks. Chief use is as a pigment.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

J

jaborandi. See pilocarpus.

jaborandi oil (pilocarpus oil).

Properties: Bright yellow liquid; penetrating odor. Soluble in alcohol and ether.

Chief known constituents: Pilocarpine, ketones.

Constants: Sp. gr. 0.865-0.895; b. p. 180-200°C.

Derivation: Distilled from the leaves of *Pilocarpus pennatifolius*.

Method of purification: Rectification.

Containers: Glass bottles.

Uses: Medicine; hair tonics.

Shipping regulations: None.*

J acid. See 2-amino-5-naphthol-7-sulfonic acid.

J acid urea. See 5,5-dihydroxy-7,7-disulfonic-2,2-dinaphthylurea.

Jacquemart's reagent. A reagent used in analytical work as a test for ethyl alcohol. It consists of an aqueous solution of mercuric nitrate with nitric acid. On heating the liquid with the reagent, the mercury salt is partially reduced and if ethyl alcohol is present, yields a black precipitate on the addition of ammonia water. Methyl alcohol does not produce this reaction.

jade (jadeite; nephrite). A hard and extremely tough material of varying composition, greenish-white to deep green in color. Part of the so-called jade is jadeite, $\text{NaAlSi}_2\text{O}_6$, essentially a metasilicate of sodium and aluminum. Part is nephrite, essentially a metasilicate of iron, calcium and magnesium, and part is a variety of feldspar. Williamsite, a variety of serpentine, is sometimes mistaken for jade. Occurrence: United States (Massachusetts), China, New Zealand, Philippines. Use: Carved ornaments.

jadeite. See jade.

jalap.

Dried tuberous root of *Exogonium purga*.

Habitat: Mexico; cultivated in India.

Grades: Technical; N. F. XI.

Containers: Bags; barrels.

Use: Medicine.

Shipping regulations: None.*

jalap, orizaba. See ipomea.

jalap resin. Orange to reddish-brown fragments, or yellowish-gray to brown powder; slight odor; somewhat acrid taste; stable in air.

Derivation: Alcoholic extraction of jalap.

Grade: N. F. XI.

Use: Medicine.

Jamaica pepper. See pimenta.

jamesonite (feather ore) $\text{Pb}_4\text{FeSb}_6\text{S}_{14}$. A natural sulfantimonide of lead and iron, sometimes containing small amounts of copper and zinc.

Properties: Color and streak lead gray to gray black; luster metallic; hardness 2-3; sp. gr. 5.5-6.0.

Use: Minor ore of lead.

James' powder. See calcium phosphate, antimoniated.

Jamestown weed. See stramonium.

"Japalac." ⁴⁴⁸ Trade name for alkyd type decorative and interior-exterior protective coatings.

japan. A varnish yielding a hard, glossy, dark-colored film. Japans are usually dried by baking at relatively high temperatures. (ASTM definition, ASTM D16-52).

Japan agar. See agar-agar.

Japanese belladonna. See *scopola*.

Japanese gelatin. See agar-agar.

Japanese isinglass. See agar-agar.

Japan gelatin. See agar-agar.

Japan tallow. See Japan wax.

Japan wax. (Japan tallow; vegetable wax of Japan; sumac wax).

Derivation: From a species of *Rhus* by boiling the fruit in water.

Properties: A pale yellow solid wax; tallow-like rancid odor. Soluble in benzene and naphtha. Insoluble in water and in cold alcohol. Sp. gr. 0.970-0.980; m. p. 53°C.

Grade: Technical.

Containers: Cases.

Uses: Candles; wax matches; furniture polish; leather polishes; special soaps; substitute for beeswax; food packaging.

Shipping regulations: None.*

jasmine aldehyde. See alpha-amylcinnamic aldehyde.

jasmine oil.

Properties: Colorless, light yellow oil; characteristic odor. Soluble in alcohol, ether and chloroform. Sp. gr. 1.007-1.018; optical rotation +2.5° to +3.5°.

Chief known constituents: Benzyl acetate, linalyl acetate, linalol, indole, and jasmone.

Derivation: Alternate layers of the flowers of

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Spanish jasmine, *Jasium grandiflorum*, and cotton saturated with a fixed oil are exposed to the warmth of the sun in a closed vessel until the oil becomes impregnated, when it is expressed from the cotton. Also derived by extraction in petroleum ether or other volatile solvent.

Containers: Glass bottles; copper flasks.

Use: Perfumery.

Shipping regulations: None.*

jasmine, yellow. See gelsemium.

jasnone $C_{11}H_{16}O$. A ketone found in jasmine oil and other flower oils. Odor of jasmine; sp. gr. 0.944 (22°/0°C).

jasper. A finely crystalline form of quartz containing up to 20% impurities (iron oxide, iron hydroxide, clay, etc.). Usually red, yellow, dark green, grayish blue. Similar to flint and chert.

Use: Ornamental stone.

jaundice berry. See barberry.

jaune brilliant. See cadmium sulfide.

Java pepper. See cubeba.

Javelle water (eau de Javelle).

Derivation: A solution of potassium hypochlorite, prepared by adding potassium carbonate to a solution of calcium hypochlorite. (The term is also used for a solution of sodium hypochlorite made from soda ash and calcium hypochlorite).

Containers: Glass bottles, carboys.

Grades: Technical.

Uses: Bleaching agent; disinfectant.

Shipping regulations: None.*

See also Labarraque's solution.

"Javollal." ¹⁸⁸ Trademark for an aromatic concentrate used as a substitute for oil of citronella.

"Jaysol." ²⁹ Trademark for a proprietary ethyl alcohol composition containing an aliphatic solvent, methyl isobutyl ketone, and ethyl acetate.

Typical Properties: Apparent proof (60°F) 190; sp. gr. (20/20°C) 0.8125, (60/60°F) 0.8157; acidity (as acetic acid wt %) 0.002; color (Hazen) 20; non-volatile matter (mg/100 ml) 3; flash point (Tag closed cup) 58°F, approx. wt/gal 6.79 lb.

Containers: 55-gal drums; tank cars.

Shipping Regulations: Flammable liquid. Red label.*

"JC-60." ⁴¹ Trade name for a hot-pour, plastic-based compound with excellent adhesion and root-proof properties used to joint concrete and vitrified clay sewer pipe.

"Jellitac." ¹⁰³ Trade name for a prepared dry wheat paste which is pre-gelatinized over hot rolls to make the starch water-soluble.

jelutong. See pontianak gum.

Jena glass. An early variety of glass of improved resistance to heat and shock, named from the location of its manufacture in Europe.

Jeppel's oil. See bone oil.

Jesuits' balsam. See copaiba resin.

Jesuits' bark. See cinchona bark, calisaya.

jet. A dense black type of coal which takes a good polish.

Occurrence: Colorado, England, Germany, France, Spain.

Use: Jewelry.

jet fuels. These fuels for jet engines are petroleum products similar to kerosene. A number of different types with somewhat different compositions and properties have been used. The important military jet fuels have been or are as follows:

JP-1 The earliest jet fuel. A naphthenic kerosene, obsolete in 1960.

JP-3 A gasoline-kerosene blend used in one-engine Navy aircraft. Superseded by other types.

JP-4 A widely used fuel consisting of approximately 65% gasoline and 35% light petroleum distillate, with rigidly specified properties.

JP-5 A specially refined kerosene having a flash point of 140°F and a freezing point of -40°C. Used by carrier-based aircraft because it can be stored aboard ship.

JP-6 A higher kerosene cut than JP-4, with fewer impurities, and used in advanced engines.

Commercial jet planes use ASTM Type A, A-1, or B. A and A-1 are kerosene types. The A-1 has lower freezing point and is used for long range flights; type A is the large volume fuel for short and medium range flights. Type B is a gasoline-kerosene type similar to JP-4.

"Jet-Milled." ³⁴⁴ Trademark for unusually finely ground mineral pigments.

"Jetron." ¹⁷⁹ Trademark for a series of carbon blacks co-precipitated with synthetic SBR polymer, and dried in a Banbury dryer-mixer. Easier processing than the conventional oven-dried black masterbatches.

jeweler's rouge. See iron oxide reds.

Jews' pitch. See asphalt.

"Jiffix." ³²⁹ Trademark for an acid-hardening, ammonium thiosulfate, fixing bath. It is ready-mixed and rapid-acting.

jimson weed. See stramonium.

jonquil oil (narcissus oil). A colorless, very light, expensive oil from the flowers of *Narcissus jonquilla* which is used in perfumes.

Jordan almond. See almond, sweet.

josephinite. A natural alloy of nickel and iron containing 25.2% iron, 74.2% nickel, and 0.5% cobalt, and found in Oregon.

JP-1, JP-2, etc. These designate various types of military jet fuels. See jet fuels.

Judean pitch. See asphalt.

juniper (juniper berries). Berries, wood and tops of *Juniperus communis*.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Habitat: Northern Europe, Asia, and North America.

Grades: Technical.

Containers: Bags.

Uses: Medicine; gin; cordials; source of juniper oil.

juniper berries. See juniper.

juniper-berry oil (jupiter oil).

Properties: Essential oil. Colorless or faintly greenish-yellow; becomes darker and thicker with age and exposure to air, characteristic somewhat turpentine-like odor, bitter, burning taste.

Chief known constituents: Pinene, cadinene, juniper camphor.

Constants: Sp.gr. 0.865-0.882 (normal oil, 0.867-0.875); optical rotation up to -11° ; refractive index 1.479-1.484; acid value to 3.0; ester value 2-8, after acetylation 18-23.

Solubility in alcohol: 1 vol in 5-10 vols of 90% alcohol (usually clear solutions obtained only with freshly distilled oils).

Derivation: Distilled from the fruit of *Juniperus communis*, L.

Grades: Technical; twice refined.

Containers: Bottles.

Uses: Medicine; veterinary practice, preparation of gin and liqueurs.

Shipping regulations: None.*

juniper gum. See sandarac gum.

juniper tar. See cade oil.

juniper tar oil. See cade oil.

juniper-wood oil. Oil obtained by steam distillation of juniper wood or twigs.

Constants: Sp.gr. 0.8692 (15°C); optical rotation $-21^{\circ}2'$; refractive index 1.47111; acid value 0.9; ester value 6.7.

Solubility in alcohol: In 7 vols and more of 90% alcohol (with slight turbidity).

Containers: Glass bottles; cans.

Uses: Veterinary practice; medicine, (external remedy).

Shipping regulations: None.*

jupiter oil. See juniper-berry oil.

"Jurnapak." ⁵¹ Trademark for a specialized wool yarn lubricant used primarily for packing armature journal boxes. Made with high quality, variegated-color wool yarn of correct length for proper journal box packing.

jute. Bast fibers, 4-10 ft long, obtained from the stems of several species of *Corchorus*, especially *C. capularis*. Contains a higher proportion of lignin and less cellulose than any other commercial vegetable fiber and has relatively poor strength and durability. The fibers are soft and lustrous but lose strength when wet. Among the vegetable fibers, jute is next to cotton in volume of consumption.

Sources: Bengal, Pakistan.

Grades: Technical.

Containers: Bales.

Uses: Burlap; sacking; linoleum; twine; packing; coarse paper.

"JZF." ²⁴⁸ Trademark for N,N'-diphenyl-para-phenylene diamine (q.v.).

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

K

K. Symbol for potassium.

K acid. See 1-amino-8-naphthol-4,6-disulfonic acid.

kadaya gum. See karaya gum.

"Kadox" Zinc Oxides. ²⁶⁸ Brand name for a group of colloidal zinc oxides of extremely fine particle size, manufactured by the Palmerton process, the pigment being made by the combustion of metallic zinc. Grades. Three grades developed especially for the rubber and paint industries. Shipped in 50-lb bags.

Uses: Extensively used in rubber for its extraordinary reinforcing effect and pronounced activating effect. For hardening slow-drying paints and to secure gloss and drying in alkyd vehicles.

kainite $\text{MgSO}_4 \cdot \text{KCl} \cdot 3\text{H}_2\text{O}$. A natural hydrated double salt of potassium and magnesium found in the European potash deposits. Color, white, gray, reddish or colorless, streak, colorless; vitreous luster. Contains 30% potassium chloride.

Constants: Sp. gr. 2.05-2.13; hardness 2.5-3.

Occurrence: Germany. One of the Stassfurt minerals. See potash.

Uses: Chemicals (potassium salts), fertilizer (as such).

kaiser green. See copper acetoarsenite.

"Kalite." ²⁴⁴ Brand name for calcium carbonate, surface coated.

Properties: Density as shipped, 60-65 lbs/cu ft; wt per solid gal, 22.07 lbs; color, light cream white, particle size, 1 micron approx.

Derivation: Precipitated calcium carbonate.

Containers: Multi-wall paper bags, 50-lbs net.

Uses: Rubber, plastics, drawing compounds.

kaliun. Latin name for potassium.

kalsomine. See calcimine.

"Kam." ⁵⁵ Brand name for a bottle-washing compound designed for dairy and beverage plants which are served by a water supply of normal or less hardness. Phosphated caustic soda. Available as white flakes (400-lb drums) or white solid (700-lb drums).

Shipping regulations: None.*

kanamycin sulfate $\text{C}_{18}\text{H}_{36}\text{N}_4\text{O}_{11} \cdot \text{H}_2\text{SO}_4$.

Kanamycin is a wide-spectrum antibiotic.

Its chemical name is 4(6?)-3-deoxy-3-amino-alpha-D-glucopyranosyl-6(4?)-6-

deoxy-6-amino-alpha-D-glucopyranosyl-1,2,3-trideoxy-1,3-diaminoscyllitol.

Properties: Yellowish crystals; decomposes over a wide range above 250°C; soluble in water; practically insoluble in methanol and ethanol.

Use: Medicine.

"Kaolex" Clay. ²⁸⁵ Proprietary brand name for a series of hydrous aluminum silicates (sedimentary kaolins) from Georgia and South Carolina for ceramics and refractories.

Properties: P. C. E. 33-35; sp. gr. 2.60; DMR to 350 psi for casting, jiggering, pressing and extruding. Air-floated or water-washed (lump or pulverized).

Containers: 50-lb multiwall bags or bulk.

"Kaolex" SC. Clean, white burning; low viscosity, moderate plasticity; low shrinkage, for casting slips and pressed bodies.

"Kaolex" D-6. An airfloated, plastic kaolin for jiggering, extrusion or pressing where high green strength and workability are essential. Clean, white burning, fine-grained, marked thixotropic tendencies, but used successfully in moderate amounts in casting slips.

"Kaolex" WW. A water-washed coarse-grained clay with fast casting rate, low viscosity in high gravity slips. Clean, white, open burning, low shrinkage, low reversible thermal expansion properties.

"Kaolex" BR. Airfloated, fine-grained, high suspension properties suitable for mill addition in porcelain enamels and glazes. With complete deflocculation yields slip of low viscosity and good stability.

"Kaolex" SH. Waterwashed, fine-grained, exceptionally white burning in vitrified compositions. Helps impart translucency in fine china, recommended for electrical porcelain.

"Kaolex" AX. Similar to SH, but treated with tetrasodium pyrophosphate; for refractory casting compositions using phosphate type deflocculants.

"Kaolex" 44. Similar to SH, but treated with barium carbonate, used as stabilizer in sanitary ware, in casting slips and some pressing operations to improve apparent plasticity without change in water content.

kaolin (China clay; white bole; bolus alba; argilla; porcelain clay; white clay; terra alba). A white-burning clay, which, due to its great purity, has a high fusion point and is the most refractory of all clays. Both English and domestic kaolins are used. The largest domestic producers

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

are Georgia, the Carolinas, Alabama and Florida.

Composition: Mainly kaolinite (40% alumina, 55% silica, plus impurities and water).

Properties: White to yellowish or grayish fine powder; sp. gr. 1.8-2.6. Insoluble in water and dilute acids. Has high lubricity (slipperiness) giving it good coating qualities.

Grades: Technical; N. F. XI; also graded on basis of color, and particle size.

Containers: Cartons; paper bags; drums, bulk.

Uses: Filler and coatings for paper; rubber; refractories, ceramics (porcelain, white-ware, stoneware, tile, electric insulation, slips and glazes), cements; fertilizers, chemicals (especially aluminum sulfate), insecticides, paint filler; linoleum.

Shipping regulations: None.*

See also kaolinite and aluminum silicate.

kaolinite $\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2 \cdot 2\text{H}_2\text{O}$. A clay mineral, rarely found pure, but it is the main constituent of kaolin and some other clays (q. v.).

Use: Suggested as an ion-exchange material.

kaon. See fundamental particle.

"Kao-Spheres." ⁹⁹ Trade name for a spherical form of kaolin cracking catalysts.

Typical analysis (volatile free basis):

SiO_2 52.9%; Al_2O_3 45.0%; Fe_2O_3 0.3%,
 TiO_2 1.7%; Na_2O and K_2O 0.05%. Tamped bulk density: 0.78 gm/cc.

kapoc oil. See kapok oil.

kapok. Cotton-like fibers obtained from the seed pods of various species of *Ceiba* and *Bombax*. The fibers are extremely light and resilient but are too brittle for spinning.

Sources: Indonesia, Philippines, Ecuador, West Africa.

Uses: Life jackets, insulation, pillows, upholstery.

kapok oil (kapoc oil).

Derivation: By pressing the seeds of *Eriodendron anfractuosum* and *Bombax ceiba*.

Habitat: The tropics.

Properties: Yellow-green oil, pleasant odor and taste. Soluble in alcohol, ether, and chloroform; sp. gr. 0.9235; saponification number 181-205; iodine value 117-129.

Grades: Technical.

Containers: Barrels.

Uses: Edible oil; soap stock.

Shipping regulations: None.*

"Kappadione." ¹⁰⁰ Trademark for menadiol sodium diphosphate, U. S. P.

"Kapsol" Plasticizer. ⁵⁵ Trademark for methoxyethyl oleate (q. v.).

"Karathane." ²³ Trademark for an agricultural fungicide-miticide based on dinitro(1-methylheptyl) phenyl crotonate and supplied as a wettable powder or liquid concentrate. May be combined with most other insecticides and fungicides, except oil-based products.

Use: Controls powdery mildew and various species of mites on plants.

karaya gum (sterculia gum; Indian tragacanth, kadaya gum). A natural exudation from certain Indian trees, of the genus *Sterculia*. Color varies from large white tears to dark brown or black.

Properties: The chemical composition, viscosity and adhesive properties of the gum vary with the climate, elevation and soil in which the tree is grown. Properties also depend on freshness and time of storage. Viscosity greatly decreases over six months storage.

Typical specifications: Acid number varies from 13.4 to 21.3; moisture 11.6-15.3%, ash 6.1-7.0%; does not dissolve in water, but forms a translucent colloidal sol. Powdered gum swells in water.

Uses: Pharmaceuticals, textiles, foods; often as a substitute for tragacanth gum.

"Karbate." ²¹⁴ (Impervious carbon and graphite). Trademark for carbon and graphite materials made impervious to fluids under pressure by impregnation with chemically resistant materials. Strength is increased by this impregnation but thermal conductivity is not lowered, nor are the other properties of carbon or graphite base modified to any extent. It is resistant to thermal shock and to attack by most non-oxidizing chemicals.

Properties: Sp. gr. 1.75-1.9, tensile strength 1700-2600 psi; compressive strength 9-11,000 psi, elastic modulus 20-30 psi $\times 10^5$; electric resistivity 0.0003-0.0016 ohm inches; linear coefficient of thermal expansion, impervious carbon 0.0000054 per °C, impervious graphite, 0.0000043 per °C (100°C), thermal conductivity 3-86 Btu/hr/sq ft/°F/ft for carbon and graphite forms respectively. These materials are machineable.

Forms: Supplied as complete equipment items; also available in blocks, cylinders, tubes.

Uses: Pipe; fittings, valves; pumps, heat exchangers, towers and absorbers for chemical process equipment.

"Karkote." ⁴²³ Trademark for asphalt-gilsonite automotive protective coatings.

Karl Fischer reagent. A solution of iodine, sulfur dioxide and pyridine in methanol, or better, since the solution is more stable, in methyl "Cellosolve." It is used in the determination of water.

"Karmex." ²⁸ Trademark for a wettable powder containing 80% diuron. Selective weed control in sugar cane, pineapple, cane-berries, alfalfa, grapes, cotton and peppermint; also for same non-selective uses as "Telvar."

• **Containers:** 2-lb canisters

"Karmex" DL. ²⁸ Trademark for suspension containing 28% diuron for pre-emergence weed control in cotton.
Containers: 1/2-gal cans.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- "Kasil."** ²⁰¹ Trade name for various potassium silicate anhydrous glasses, anhydrous powders, and liquids.
- "Katanol."** ³⁰⁷ Trademark for a series of textile chemicals.
- "Katanol" 0/50.** Solubilized sulfur phenol condensate, 50% active.
Properties: Brown, viscous liquid; sp. gr. 1.2-1.3; soluble in water.
Uses: Mordant for basic dyes on cotton and rayon and for acid dyes on rayon.
- "Katanol" W.** Solubilized sulfur phenol condensate; 75% active.
Properties: Fine, tan powder, density 0.9-1.0; soluble in water.
Uses: Reserving agent for animal fibers in union dyebaths and in speck dyeing; wool reserving agent in dyeing of mixed fibers, mordant for basic dyes in paper processing.
- "Katanol" WB Conc.** Modified solubilized sulfur phenol condensate; 99% active.
Properties: Light gray, fine powder; density 0.6-0.7, soluble in water.
Uses: Wool reserving agent in union and speck dyeing.
- "Katapol" PN-430.** ³⁰⁷ Trade name for a cationic emulsifier and corrosion inhibitor, alkyl polyoxyethylene amine, 100% active.
Properties: Brown liquid; sp. gr. 0.94; soluble in water and hydrocarbons.
Containers: Drums; bulk.
Uses: Emulsifier for agricultural chemicals in hydrocarbon solvents; emulsifier for mineral oils; acid corrosion inhibitor for ferrous alloys; emulsifier in leather processing.
- "Katapol" VP-532.** ³⁰⁷ Trade name for a cationic surfactant, alkyl polyoxyethylene glycol amine; 20% active.
Properties: Cloudy, amber liquid; sp. gr. 1.00-1.02; soluble in water; stable to acid, alkali and metal ions; exhibits cationic properties in acid media and nonionic qualities in alkaline systems.
Containers: Drums.
Uses: Scouring agent for wool in acid or neutral solutions; scouring agent and dyeing assistant for shearlings; antistatic agent for polyester fibers and polyacrylonitrile fibers.
- "Katapone" VV-328.** ³⁰⁷ Trade name for a corrosion inhibitor, quaternary ammonium chloride in isopropanol, cationic; 85% active.
Properties: Deep amber, clear, viscous liquid; sp. gr. 0.99; soluble in water, 10% HCl solution, carbon tetrachloride, ethanol, ethylene glycol, xylene; stable to strong acids, mild alkalies, metallic ions.
Containers: 10-lb packages; 50-, 425-lb drums.
Uses: Acid corrosion inhibitor for steel, copper and aluminum; improved performance is obtained by admixture with an "Igepal"; corrosion inhibitor and bactericide in oil producing and processing equipment.
- "Katigen."** ³⁰⁷ Trademark for certain sulfur dyestuffs. Used for the dyeing of cotton and rayon. Characterized by good fastness to light, washing, etc. To a certain extent also used for the dyeing of paper.
- kauri.** A fossil (hard) copal resin (q. v.) derived from the kauri pine (*Agathis australis*) of New Zealand.
Uses: In varnishes and lacquers; to evaluate the solvent power of petroleum thinners for varnishes and paints.
- kauri-butanol value.** A measure of the solvent power of petroleum thinners used in paints and varnishes. The kauri-butanol value is the number of milliliters of the thinner required to cause cloudiness when added to 20 grams of a solution of kauri gum in butyl alcohol. The solution is prepared in the proportion of 100 grams of kauri in 500 grams of butyl alcohol.
- "Kaurit."** ⁴⁴⁰ Trademark for a series of urea resin adhesives for plywood, coreboard and particle board.
- kava** (kava-kava; ava-ava, kawa). Dried rhizome and roots of *Piper methysticum* of Polynesia, the fluid extract is used in medicine.
- kava-kava.** See kava.
- kawa.** See kava.
- "Kaydol."** ⁴⁵ Trademark for white mineral oil, U. S. P.
Properties: Sp. gr. 0.880-0.895 (60°F); Saybolt viscosity 345-355 (100°F); odorless and tasteless.
Uses: Pharmaceutical and cosmetic formulations; plastics, tobacco; paper; animal husbandry.
- "Kaylo."** ¹⁹¹ Trademark for a hydrous calcium silicate high temperature insulation used on pipes, tanks, etc.
- K-capture** (K-radiation). A type of radioactive decay in which one of the electrons outside the nucleus of an atom is captured by the nucleus and immediately combines with a proton to form a neutron. The product of this radioactivity has the same mass number as the parent but the atomic number is one unit less. Thus Fe-55 with atomic number 26 decays by K-capture to form Mn-55, with atomic number 25. Terms synonymous with K-capture are K-electron capture and orbital electron capture.
- Keene's cement.** See gypsum cements.
- "Kelacid."** ³²² A trademark for alginic acid.
Properties: A cream colored highly refined, fibrous powder passing essentially through 60 mesh and having a moisture content of about 8%; insoluble in water but swells rapidly.
Grades: Refined (complies with NF requirements).
Containers: 10-, 50-, and 200-lb drums.
Uses: Tablet disintegrant; hemostatic agent.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Kelco-Gel." ³²² Trademark for refined sodium alginate. Available as HV and LV grades.

Properties: Cream colored, semi-fibrous powder; viscosity 1% by weight about 400 cps (HV) and 50 cps (LV); about neutral pH.

Grade: Refined (N. F. XI grade).

Containers: 10-, 50-, 200-lb drums.

Uses: Thickening, suspending, stabilizing, binding and gelling agent for foods, pharmaceuticals, cosmetics, welding rods, ceramics, latex paints, industrial gels, pastes, coatings, films.

"Kelcoloid." ³²² Trademark for the following propylene glycol alginate products.

Properties:

"Kelcoloid" LVF": A cream colored algin in powder form passing essentially through 80 mesh Tyler screen, soluble in hot or cold water to form a relatively low viscosity solution (1% by weight 120 cps) with pH about 4. Moisture content about 13%. Differs from sodium alginate in that it tolerates acid media in pH range 3 to 6 and is less reactive with heavy metal and alkaline earth ions.

"Kelcoloid HVF": Same as for "Kelcoloid LVF" except that water solutions have high viscosity (2% by weight about 7000 centipoises).

"Kelcoloid" O: Same as LVF except that water solutions have a lower viscosity (2% by weight about 115 cps).

Grades: Refined.

Containers: 10-, 50-, 200-lb drums.

Uses: As hydrophilic colloid - an emulsifier, thickener, stabilizer, suspending, foam stabilizing and whipping agent in aqueous media below pH 7.0. Suitable for food, pharmaceutical, cosmetic and industrial uses.

Shipping regulations: None.*

"Kelcosol." ³²² Trademark for a sodium alginate product.

Properties:

"Kelcosol": Cream colored, highly refined fibrous powder passing essentially through 80 mesh and with moisture content about 11%; dissolves rapidly in hot or cold water to form clear, highly viscous solutions. Has about neutral pH value. (Viscosity 1% by weight about 1200 cps.) Forms firm gels in acid to neutral pH with alkaline earth salts such as calcium phosphates.

Grades: Refined. (Complies with N. F. requirements.)

Containers: $\frac{1}{4}$ -, $\frac{3}{4}$ -lb bottles; 10-, 50-, 200-lb drums.

Uses: See algin.

Shipping regulations: None.*

"Kelecin." ⁶⁴ Trade name for a line of soybean lecithins; emulsifying and dispersing agents. Grades: Plastic and fluid. Either grade single- or double-bleached.

Uses: Paints, printing inks; mastics; animal feeds; engine lubricants; rubber processing, plastics; cosmetics; and in margarine, animal and vegetable oils, pre-mixed

bread formulations, chocolate candy. Shipping regulations: None.*

K-electron capture. See K-capture.

"Kel-F." ¹⁵⁸ Tradename for a line of fluorocarbon products, including polymers of trifluorochloroethylene and certain copolymers available as extrusion and molding powders, resins, dispersions, gums, oils, waxes and greases, that are characterized by high thermal stability, resistance to chemical corrosion, high dielectric strength, high impact, tensile and compressive strength.

"Kel-F" Plastics, a trifluorochloroethylene polymer: (C_2ClF_3). Colorless, non-flammable thermoplastic material; chemically inert, highly temperature resistant; exceptionally stable; high impact strength; resistant to thermal shock; impervious to corrosive chemicals and highly resistant to most organic solvents; high compression strength; zero moisture absorption, non-wettability; excellent electrical properties; wide temperature utility -320°F to +390°F (and under certain conditions as low as -460°F); excellent clarity. Note:

"Kel-F" Plastics molding compounds may be plasticized with lower-molecular weight "Kel-F" Polymer Oil Fractions. The oil is a highly-fluorinated organic material with the same basic chemical structure as the high polymer. The plasticizer, where essential, renders the material softer, more pliable, tougher and gives an extended flex life to molded products. Plasticized molding powders with up to 25 per cent plasticizer added are available. "Kel-F" Brand Plastics can be molded by injection, extrusion, compression and transfer methods, producing parts that can be machined, engraved, cut, drilled, punched, sanded and polished. The powders can be converted into rods, tubes, sheets, laminates, film and wire coatings in addition to the molded shapes.

Uses: Valve diaphragms, tips and seats; gaskets, LOX lip seals; flow meters; O-rings, extruded tubing; electrical parts and encapsulating; self-locking nuts; vent seals, fuel bladders.

"Kel-F" Brand Dispersions provide protection for surfaces that do not lend themselves to the use of molded plastic because of size, design or construction. The dispersions are fine particles of "Kel-F" Plastic suspended in a volatile organic liquid and applied by spray, dip or spread coating techniques.

Uses: In pipe lines, trailer tanks, pumps, mixers, relays, transformers, storage tanks, flowmeters; insulating tape.

"Kel-F" Brand Elastomer gum is available in two grades, chemically similar, but slightly different in vulcanize properties. The elastomer offers particular chemical inertness. Retains stability exposed to JP4 and JP5 fuels at temperatures to +400°F.

Uses: O-rings; gaskets; hose; fuel cells;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

kephalin. See cephalin.

"Kepone." ⁵⁰ Trademark for decachloro-octahydro-1,3,4-metheno-2H-cyclobuta-[c,d]pentalen-2-one. Available as a 50% wettable powder for use on non-bearing citrus in Florida, specific against the citrus rust mite.

"KER." ¹¹ Trademark for a series of epoxy resins.

"Keranol." ³⁰⁰ Trademark for a modified cationic softener for fabrics. Compatible with resin and other finishes. Also used on synthetic fibers as antistatic agent.

keratin. The protein of hair, hoofs, horns, etc.

"Keripon." ³⁰⁰ Trademark for a water soluble synthetic fatty ester with wetting and re-wetting properties for textile, leather and paper.

kerite.

1. A mixture of tar or asphaltum with sulfur and animal or vegetable oils. Used as a substitute for rubber.
2. One of the constituents of bitumen.

kermes (kermes berries; scarlet corns; grains of kermes, alkermes). The dried females of the shield louse *Coccus ilicis*. These insects contain a red dye which is the oldest coloring matter known. The coloring principle is considered to be kermesic acid $C_{18}H_{12}O_9$.

kermes berries. See kermes.

kernite $Na_2B_4O_7 \cdot 4H_2O$. A natural sodium borate, found in Kern County, California. Colorless to white, two good cleavages; luster vitreous to pearly, hardness 3, sp. gr. 1.95.

Use: Major source of borax and boron compounds.

kerocaine. See procaine hydrochloride.

kerogen. The organic oil-yielding matter present in oil shales. Not a definite compound but a complex mixture of various complex compounds that vary from one shale to another. Usually a soft brown powder, only slightly soluble in ordinary organic solvents. Contains small proportions of nitrogen and sulfur.

kerosine (kerosene). (The spelling kerosine is preferred by ASTM and ACS publications.) A distilled hydrocarbon from petroleum or shale oil, having a boiling range from about 150-300°C. Currently the most important uses are as fuel for jet engines, and as a heating fuel. Formerly used as an illuminant. Kerosine is also often used as a solvent for cleaning purposes; also in emulsions as an insecticide.

"Kessco." ²⁶⁰ Trade name for a series of fatty acid esters. Available as:

3354. Mono and diglyceride of liquid fatty acids.

3354-N. Mono and diglyceride of liquid fatty acids.

33D54. Diglyceride composition of liquid fatty acids.

8254. Polyoxyethylene fatty acid ester.

12254. Polyoxyethylene derivative of liquid fatty acid.

18254. Polyoxyethylene derivative of liquid fatty acid.

26254. Polyoxyethylene derivative of liquid fatty acid.

E-119. Complex polyhydroxy fatty acid ester.

E-122. Polyglycol ether fatty acid ester.

Properties: Yellow oily liquids; fatty odor; soluble in most organic solvents.

Uses: Emulsifiers; dispersants; wetting agents; lubricants; softeners.

"Kesscoflex." ²⁶⁰ Trade name for a series of plasticizers and solvents. Available as:
MCP. Dimethoxyethyl phthalate.
BCP. Dibutoxyethyl phthalate.
DOA. Di-2-ethylhexyl adipate.
DIOA. Di-iso-octyl adipate.
BCO. Butoxyethyl oleate.
BS. Butyl stearate.
BO. Butyl oleate.
MCO. Methoxyethyl oleate.
MCS. Methoxyethyl stearate.
BCS. Butoxyethyl stearate.
BCL. Butoxyethyl laurate.
DBT. Dibutyl tartrate.
TRA. Glycerol triacetate.
DIA. Glycerol diacetate.

"Kesscomir." ²⁶⁰ Brand of isopropyl myristate with small amounts of palmitate and stearate esters.

Properties: Oily, colorless liquid, practically odorless, iodine number 1.0, sp. gr. 0.852 (25°C); f. p. -1°C; b. p. 164°C (4 mm); insoluble in water.

Uses: Emollient and solvent in cosmetics.

"Kesscowax" A21, A33. ²⁶⁰ Trade name for monostearate (acid stabilized). Mixtures of mono- and diglycerides plus an auxiliary emulsifier to render them acid stable and self-emulsifying.

Properties: White to cream, wax-like solids; slight fatty odor; iodine value, 3.0 max; m. p. 52.5-56.5°C (A21), 45-51°C (A33); partially soluble hot in aliphatic and aromatic solvents; water-dispersible.

Containers: 225-lb fiber drums.

Uses: Emulsifiers, opacifiers, and bodying agents for systems involving acids or acid reacting substances such as anti-perspirant, bleach, lemon and medicated creams and lotions.

"Kessco X-159." ²⁶⁰ Trade name for a fatty alkylolamide.

Properties: Waxy solid, light yellow, mild odor. M. p. 71.5°C; dispersible in hot water.

Uses: Thickener; opacifier; pearling agent.

"Kessco X-168." ²⁶⁰ Trade name for a substituted imidazoline.

Properties: Liquid; cationic; mild odor; dispersible in water. Soluble in most common organic solvents.

Uses: Wetting agent in acid solutions; emulsifier for oils and solvents.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Kessco X-209." ²⁶⁰ Trade name for a fatty alkylolamide.

Properties: Light yellow liquid; anionic; mild odor. Soluble in water; limited solubility in most organic solvents.

Uses: Foam stabilizer for detergents, thickener for shampoos.

kesso oil. See valerian oil, Japanese.

"Ketac." ⁵⁷ Trademark for ketone-formaldehyde resins.

ketene $\text{H}_2\text{C}=\text{CO}$.

Properties: Colorless, highly toxic gas; disagreeable taste, irritating to the lungs. Readily polymerizes; cannot be shipped or stored in a gaseous state.

Derivation: Pyrolysis of acetone or acetic acid by passing its vapor through a tube at 500-600°C.

Constants: M. p. -151°C ; b. p. -56°C .

Containers: Steel bottles for intraplant transfer only.

Uses: Acetylating agent, generally reacting with compounds having an active hydrogen atom; reacts with ammonia to give acetamide. Starting point for making various commercially important products, especially acetic anhydride and acetate esters.

4-ketobenzotriazine (benzazimide; 4-keto-(3H)-1,2,3-benzotriazine) $\text{C}_7\text{H}_5\text{N}_3\text{O}$ (bicyclic).

Properties: Tan powder, m. p. 210°C (dec.), soluble in alkaline solutions and organic bases.

Uses: Organic synthesis.

alpha-ketoglutaric acid (2-oxopentanedioic acid) $\text{HOOCCH}_2\text{CH}_2\text{COCOOH}$. M. p. 113.5°C , soluble in water and alcohol. Important in cell metabolism.

beta-ketoglutaric acid (ADA, acetonedicarboxylic acid) $\text{HO}_2\text{CCH}_2\text{COCCH}_2\text{CO}_2\text{H}$.

Properties: Colorless needles; m. p. 135°C (dec); soluble in water and alcohol, insoluble in benzene and chloroform.

Derivation: By heating dehydrated citric acid and concentrated sulfuric acid together.

Use: Organic synthesis.

ketoexamethylene. See cyclohexanone.

ketone, Michler's. See tetramethyldiaminobenzophenone.

ketonimine dyes. Dyes whose molecules contain the $\text{-NH}=\text{C=}$ chromophore group. There are only two members in the class. These are auramine (Colour Index 655) and a closely related homolog, methyl aurin (Colour Index 656) in which a methyl group replaces one of the hydrogen atoms of aurin. These are basic dyes used on cotton with tannin or tartar emetic as mordants.

ketopropane. See acetone.

alpha-ketopropionic acid. See pyruvic acid.

gamma-ketovaleric acid. See levulinic acid.

kev. See electron volt.

Keyes process. A distillation process involving the addition of benzene to the constant-boiling 95% alcohol-water solution in order to obtain absolute (100%) alcohol. On distillation a ternary azeotrope mixture containing all three components leaves the top of the column while anhydrous alcohol leaves the column bottom. The azeotrope (which separates into two layers) is redistilled separately for recovery and reuse of the benzene and alcohol.

Kick's law. The amount of energy required to crush a given quantity of material to a specified fraction of its original size is the same no matter what the original size.

"Kierole TT." ⁴² Proprietary product. Solvent type soap.

Properties: Amber liquid. Disperses readily in water and alkaline kier liquors at 50°C up.

Containers: 55-gal steel drums.

Use: As assistant in obtaining uniform quality in cotton kier boiling process. Promotes uniform penetration of kier liquor.

kieselguhr. See diatomite.

kieserite $\text{MgSO}_4 \cdot \text{H}_2\text{O}$. A natural magnesium sulfate occurring in enormous quantities in the Stassfurt salt beds, Germany. Also found in Austria and India. See also epsomite and magnesium sulfate.

"killed" steels. Steel deoxidized by the addition of aluminum, ferrosilicon, etc., while the mixture is maintained at melting temperature until all bubbling ceases. The steel is quiet and begins to solidify at once without any evolution of gas when poured into the ingot molds.

killen. See chondrus.

"Kilmag." ⁵⁰ Trademark for a formulation of calcium arsenate for the control of certain fly maggots under poultry cages.

kilogram. The term has two meanings, as follows:

1. A mass identical with that of the international kilogram, which is carefully preserved at the International Bureau of Weights and Measures in France. This is approximately the mass of a liter of water just above the freezing point.
2. A force equal to the weight of one kilogram mass, measured at the surface of the earth at sea level.

kinetin $\text{C}_{10}\text{H}_9\text{N}_5\text{O}$. 6-Furfurylaminopurine.

Derivation: From desoxyribonucleic acid.

Use: Causes plant cells to divide, possibly can lead to discovery of an antikinetic which may be used in cancer treatment.

king's blue. See cobalt blue.

king's green. See copper acetoarsenite.

king's yellow. See orpiment (pigment).

kish.

1. Impure graphite which separates from

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

molten iron during the process of smelting in a blast furnace.

2. Dross on the surface of molten lead.

"Kjelgest." ¹⁶ Trademark for a pure grade of potassium sulfate with a nitrogen content not over 0.01%; containing less than 2% water and approximately 95% K_2SO_4 . Containers: 5- and 10-lb fiber drums. Uses: Digestions in the determination of nitrogen by the official methods of the Association of Official Agricultural Chemists and of the American Oil Chemists' Society.

Shipping regulations: None.*

"Kleanrol." ²⁸ Trademark for a soldering flux based on zinc chloride plus ammonium chloride.

Properties: White crystalline powder.

Containers: 50-lb and 500-lb drums.

Use: As a solder blanket flux in automatic soldering of side seams in the manufacture of tinned containers.

"Klearol." ⁴⁵ Trademark for a white mineral oil, technical grade.

Properties: Sp. gr. 0.828-0.838, Saybolt viscosity 55-65 (100°F); odorless and tasteless.

Uses: Cosmetic preparations; shell egg preservation; further organic synthesis.

"Kleenup." ²⁵³ Brand name for a type of insecticide and fungicide product containing petroleum oils.

Klein's reagent.

Derivation: A saturated solution of cadmium borotungstate, formula variously given, possibly $2CdO \cdot B_2O_3 \cdot 9WO_3 \cdot 18H_2O$.

Constants: Sp. gr. 3.28.

Use: For the separation of minerals by specific gravity.

"Kloben." ²⁸ Trademark for an agricultural herbicide, a wettable powder containing 50% neburon, used as a selective weed control agent. Caution!

Containers: 5- and 25-lb fiber drums.

k meson. See fundamental particle.

"K Monel." ²⁸³ Trademark for a wrought age-hardenable alloy containing approximately 65% nickel, 30% copper and 3% aluminum, has high strength and hardness, good corrosion resistance, and is non-magnetic down to -150°F.

"knockout" drops. See chloral hydrate.

knock rating. See octane number.

"Knox-Out." ²⁰⁴ Trademark for a line of household and farm insecticides.

"Knox-Out Aerosol Insecticide." ²⁰⁴ Trademark for a mixture containing DDT, pyrethrins, and piperonyl butoxide for space spraying to control flying insects.

"Knox-Out Dual-Use Garden Dust." ²⁰⁴ Trademark for a mixture containing DDT, cryolite, and copper sulfate totaling 50.7% active ingredients. For control of most chewing garden insects.

Packed in 2-lb cartons for application by duster or direct from the box.

"Knox-Out EQ-53 Emulsion Concentrate." ²⁰⁴ Trademark for a mixture containing 25% DDT. For dilution with water for mothproofing washable woollens or for spraying or painting over large areas for residual control of crawling insects.

"Knox-Out Farm Insecticide." ²⁰⁴ Trademark for a powder containing 25% lindane. To be mixed with water for spraying or painting to control a wide range of pests and parasites of poultry, livestock and garden.

"Knox-Out Garden Dust." ²⁰⁴ Trademark for an insecticide containing 5% DDT, easily and readily applied with an ordinary dust gun or from the 1-lb sifter pack.

"Knox-Out Insecticide Powder." ²⁰⁴ Trademark for a 10% DDT insecticide powder.

"Knox-Out Insect Spray." ²⁰⁴ Trademark for a 5% DDT and pyrethrin oil-base double-use insecticide for space-spraying to kill flying insects and for spraying or painting on surfaces for residual control of crawling insects.

"Knox-Out Multi-Purpose Garden Dust." ²⁰⁴ Trademark for a combined insecticide and fungicide containing DDT, cryolite, and copper sulfate totaling 50.7% active ingredients. For control of most chewing garden insects.

"Knox-Out Roaches." ²⁰⁴ Trademark for a DDT-chlordane combination insecticide for spraying on crawling insects, or painting or spraying on surfaces for residual control.

"Ko-Blend IS." ¹⁷⁹ A masterbatch of insoluble sulfur and non-staining SBR rubber. Masterbatch is made by co-precipitating the insoluble sulfur with the rubber in latex form. The non-staining antioxidant is added to insure protection of the masterbatch during production and storage. The masterbatch contains 50% insoluble sulfur. Uses: To control sulfur bloom in applications such as light-colored mechanical goods, white sidewall tires, shoe soles, etc.

Koch's acid. See 1-naphthylamine-3,6,8-trisulfonic acid.

"Kodel." A polyester type synthetic fiber.

kojic acid [5-hydroxy-2-(hydroxymethyl)-4-pyrone] $C_6H_6O_4$. An antibiotic substance. Properties: Crystals; m.p. 152-154°C; soluble in water, acetone, alcohol, slightly soluble in ether; insoluble in benzene; mildly antibiotic.

Derivation: Fermentation of starches and sugars by certain molds.

Use: Chemical intermediate; metal chelates; insecticide; antifungal and antimicrobial agent.

kola. See cola.

kola nuts. See cola.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

kola seeds. See cola.

Kolbe-Schmidt reaction. The preparation of salicylic acid or its derivatives from carbon dioxide and sodium or potassium phenolate.

"Kollidon." ⁴⁴⁰ Trademark for polyvinylpyrrolidone (q. v.). Available as:

"Kollidon" 17: K-value 17 ± 1 .

"Kollidon" 25: K-value 25 ± 1 .

"Kolo." ⁵⁵ Trademark for series of insecticidal dusts and sprays containing sulfur.

"Koloc." ²⁴⁸ Trademark for a resin emulsion for application to cotton and wool. It stops the shrinking and felting of wool, increases tensile strength, improves wearing quality, reduces fiber loss in processing and service.

"Konaktion." ¹⁹⁰ Trademark for a brand of phytonadione, vitamin K_1 (q. v.).

"Kontakt." ²⁴² Trademark for a group of fat splitting reagents.

"Kopol." ³⁶ Processed Congo copal gums in fused, esterified and modified (with ester gum) grades.

Properties: Color D to I (USDA rosin standards); acid number 10-85, melting point $165-200^\circ\text{F}$, capillary tube method. Soluble cold in acetates, coal-tar solvents, turpentine and drying oils. Imparts hardness, toughness, rubbing and polishing properties and tight adhesion.

Uses: Floor, rubbing and spar varnishes; high-bake enamels; floor paints, metal primers; etc.

"Kopoxite 159." ¹¹ Trademark for resorcinol diglycidyl ether (q. v.).

koppite. A variety of pyrochlore (q. v.).

kordofan gum. See arabic gum.

"Koresin." ³⁰⁷ Brand name for a rubber tackifier; para-tert-butylphenol acetylene resin; 100% active.

Properties: Brittle, hard granules ranging in color from tan to brown; m.p. (capillary) $120-130^\circ\text{C}$; soluble in acetone, benzene, cyclohexane, petroleum ether, ethyl acetate, n-butanol; insoluble in water and ethanol.

Uses: Rubber tackifier for GR-S stocks and cement and for mixtures of natural rubber and GR-S; used as a resin in the manufacture of lacquers, inks, and varnishes.

"Korez." ⁴¹ Trade name for a silica-filled, synthetic-resin, acid-proof cement of the phenol-formaldehyde type especially good as a mortar cement for electro-refining work. Can be used up to 360°F .

"Korundal XD." ⁴⁴⁶ Trade name for a 90% alumina brick with high density. Resistant to corrosion and penetration by molten slags and fluxes, thermal shock, and can withstand load at temperatures up to 3000°F and higher.

Uses: Top checker courses of glass tank

furnaces; aluminum alloy furnaces; electric furnaces producing alloys; piers; supporting arches and other constructions where heavy loads at high temperatures prevail.

"Kosmos." ¹¹⁰ Brand name for a line of carbon blacks similar to the "Dixie" line (q. v.).

Kourbatoff's reagents. Four etching agents used in the micro-analysis of carbon steels.

(a) A 4% solution of nitric acid in isoamyl alcohol.

(b) A 20% solution of hydrochloric acid in isoamyl alcohol. To this is added one-third of its volume of a saturated solution of nitroaniline or nitrophenol in alcohol.

(c) 1 part of a 4% solution of nitric acid in acetic anhydride to which is added 1 part each of methyl alcohol, ethyl alcohol and isoamyl alcohol.

(d) 3 parts of a saturated solution of nitrophenol added to 1 part of a 4% solution of nitric acid in ethyl alcohol.

kowrie gum. See copal.

"KP-23" Plasticizer. ⁵⁵ Brand name for butoxyethyl stearate (q. v.).

"KP-90" Plasticizer. ⁵⁵ Brand name for butyl epoxy stearate (q. v.).

"KP-140" Plasticizer. ⁵⁵ Brand name for tributoxethyl phosphate (q. v.).

"KP-201" Plasticizer. ⁵⁵ Brand name for dicyclohexyl phthalate (q. v.).

Kr. Symbol for krypton.

K-radiation. See K-capture.

kraft paper. See wood pulp.

"Kralac A-EP." ²⁴⁸ Trademark for a high styrene-butadiene copolymer.

Properties: Hard, creamy white resin produced as relatively fine, friable granules which flow easily and are free from objectionable dusting; sp. gr. 1.04; softening range $185-200^\circ\text{F}$; soluble in the usual organic solvents for rubber.

Use: With natural and chemical rubbers, especially recommended for high-grade soles, tiling and molded parts. Main function is that of greatly increasing the hardness of elastomeric compounds.

"Kralastic." ²⁴⁸ Trademark for a series of ABS (acrylonitrile, butadiene, styrene) resins.

Properties: Granular rubber-plasticized resins; rigid and tough, dimensionally stable, light in weight; chemically resistant; good electrical properties.

Uses: Injection and extrusion applications; chemical pipe; cathode edge strips; cams, gears, cable floats, wheels, etc.

"Kralon." ²⁴⁸ Trademark for a series of rigid thermoplastic resin-rubber blends used for conduit and irrigation pipe, tool handles, automotive air ducts and other applications.

Krebs cycle. See TCA cycle.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Kremnitz white. Old name for white lead produced in Europe by the chamber process. See lead carbonate, basic.

krennerite (Au, Ag) Te_2 . One of the gold-telluride group of minerals. Corresponds to the same general formula as sylvanite (q. v.), and calaverite (q. v.). Silver-white to pale yellow color.

Constants: Sp. gr. 8.35.

Occurrence: United States (Colorado), Rumania.

"KR Monel." ²⁸³ Trademark for a wrought age-hardenable alloy containing approximately 65% nickel, 30% copper and 3% aluminum which has had its machining qualities enhanced by a controlled carbon content.

Kroll process. The best known and widely used process for obtaining titanium metal. Titanium tetrachloride is reduced with magnesium metal at red heat and atmospheric pressure, in the presence of an inert gas blanket of helium or argon. Magnesium chloride and titanium metal are produced. Essentially the same process is also used for obtaining zirconium.

"Kromad." ³²⁹ Trademark for a broad-spectrum turf fungicide which effectively prevents and controls brown patch, dollar spot, copper spot and leaf-spot diseases.

"Krome Guard." ³⁰² Trademark for pigmented and unpigmented paints and lacquers for use on metal surfaces.

"Kromfax" Solvent. ²¹⁴ Trademark for thiodiethylene glycol (q. v.).

"Kromik." ¹⁴¹ Trade name for a multiple pigment rust-inhibiting primer for shop coatings or for first field coat on structural steel.

"Kromold W." ²⁴⁴ Trademark for blend of vegetable, mineral, and animal waxes. Containers: Non-returnable steel drums averaging 400-425 lbs net. Use: To waterproof leather.

"Kromospense." ⁷⁴ Trademark for a pigment dispersant to produce tinting pastes compatible in many aqueous and oil solutions.

"Kronisol" Plasticizer. ⁵⁵ Trademark for dibutoxyethyl phthalate (q. v.).

"Kronitex" AA Plasticizer. ⁵⁵ Trademark for a grade of tricresyl phosphate.

Properties: Clear, nearly colorless oily liquid. Soluble in most other organic liquids; insoluble or limited solubility in certain amines, mineral oil, glycerin and glycols.

Typical specifications: Sp. gr. 1.165 (20/20°C); f. p. -33°C (stiff gel), boiling range 241-255°C (4 mm); acidity 0.01% (max) as acetic acid; phenols 0.03% (max); odor mild; flash point 500°F; fire point none up to 625°F; vapor pressure < 0.02 mm (150°C); refractive index 1.555 (25°C); viscosity 120 cps (20°C); surface tension 39 dynes/cm (20°C); coefficient of thermal expansion 0.00068 from 10-40°C; wt/gal

9.5 lbs.

Containers: 5-gal cans; 55-gal drums.

Uses: Primary plasticizer for most resins imparting flame retardance, low oil and water extraction, permanent flexibility, and stability at elevated temperatures. It is one of the least migratory plasticizers.

"Kronitex" K-3 Plasticizer. ⁵⁵ Trademark for a grade of tricresyl phosphate.

Properties: Insoluble or limited solubility in certain amines, mineral oil, glycerine and glycols. Soluble in most other organic liquids.

Typical specifications: Sp. gr. 1.145 \pm 0.005, (20/20°C); f. p. -23°C (stiff gel); boiling range, 250 to 266°C; acidity (max) 0.01% as acetic acid; odor, slight, flash point 505°F; fire point, none at 625°F; vapor pressure < 0.02 mm (150°C); refractive index 1.553 \pm 0.002 (25°C); viscosity, 220-300 cps, (20°C); surface tension 37 dynes/cm (20°C); thermal expansion, 0.00067 per °C, (10° to 40°C); wt/gal 9 lbs.

Containers: 5-gal can (50 lbs net); 55-gal can (520 lbs net).

Uses: Primary plasticizers that impart flame retardance to plastics; lubricating oils; as an extreme pressure lubricant; a plasticizer for baking or regular lacquers; in hydraulic fluids; as a non-burning dust pick-up material for air filter systems, etc.

"Kronitex" MX Plasticizer. ⁵⁵ Trademark for cresyl phenyl phosphate.

Properties: Insoluble or limited solubility in certain amines, mineral oil, glycerine, and glycols, soluble in most other organic liquids.

Typical specifications: Sp. gr. 1.195 \pm 0.010 (20/20°C); freezing point -38°C (stiff gel); boiling range 235-255°C (4 mm); acidity (max) 0.01% as acetic acid; odor, very slight, flash point 460°F, fire point, none at 625°F; vapor pressure, < 0.02 mm Hg (150°C); refractive index 1.561 \pm 0.002 (25°C); viscosity, 60-70 cps (20°C); surface tension, 42 dynes/cm (20°C); thermal expansion, 0.00067 per °C, (10°-40°C); wt/gal, 9.5 lbs.

Containers: 5-gal can (50 lbs net), 55-gal can (545 lbs net).

Uses: As primary plasticizer imparting flame retardance to plastics; lubricating oils, as an extreme pressure lubricant; a plasticizer for baking or regular lacquers; in hydraulic fluids; as a non-burning dust pick-up material for air filter systems, etc.

"KRS-5." ¹³⁴ Trade name for thallium bromide-iodide, synthetic optical crystal. Used as prisms and windows in infrared spectroscopy; infrared achromatic lenses; as lens components for microscope objectives for use in the infrared; military infrared optical instruments.

"Kryocide." ²⁰⁴ Trademark. A natural cryolite insecticide, as a dust, bait or spray for control of many chewing insect pests.

"Kryocide-C" contains some copper and "Kryocide D-50" contains sulfur.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"**Kryolith.**" ²⁰⁴ Trademark for sodium fluo-aluminate (natural Greenland cryolite).

krypton Kr. Element of atomic number 36, zero group of periodic system. Colorless wholly inert gas—does not combine chemically with any element. Liquefies at -151.7°C .

Derivation: By fractional distillation of liquid air. Air contains 0.00005% of krypton.

Grades: Highest purity.

Containers: Hermetically sealed glass flasks.

Uses: Filling electric luminescent tubes.

Shipping regulations: Non-flammable gas. Green label. *

krypton 85. Radioactive krypton of mass number 85.

Properties: Half-life 10.3 years; radiations, beta, with a small component of gamma; radiotoxicity, relatively low.

Derivation: A fission product extracted from irradiated nuclear fuel.

Forms available: Gas of high chemical purity, but mixed with other isotopes of krypton, in sealed glass flasks.

Uses: Principally for self-luminous markers. Shipping regulations: Poison, class D, radioactive material. Red or blue label. *

krypton 86. Isotope of krypton that is used in measurement of standard meter. See meter.

"**K-Stay.**" ⁶⁹ Trademark for proprietary mixture of oil soluble sulfonic acid of high molecular weight in a petroleum base oil. Properties: Amber liquid, sp. gr. 0.88-0.90; acid no. 1.0-1.1.

Uses: Processing aid for elastomers.

"**KTPL**" Resins. ¹¹ Trademark for polystyrene resins, available as fine beads.

Properties: Clear, hard, thermoplastic, water-white resins. Lower molecular weight than molding grades of polystyrene. High chemical and light stability, resistant to acids and alkalis, have good solvent release.

Uses: Protective coatings; floor tiles.

KTPP. Abbreviation for potassium tripolyphosphate.

"**Kubola.**" ⁵¹ Trademark for a brown, soda base, block grease of high melting point for use in open bearings. Grades are available which melt at various high temperatures and provide a uniform lubricating film on slow moving shafts.

kunzite. See spodumene.

"**Kure-Blend MT.**" ¹⁷⁹ A trademark for a masterbatch containing 50% tetramethyl thiuram disulfide and 50% non-staining SBR rubber. Masterbatch is made by co-precipitating the TMDT with the polymer in latex form and a non-staining antioxidant is added to protect the polymer during production and storage.

Uses: As an ultra accelerator in masterbatch form and applications such as mechanical goods, tubes, etc.

"**Kuron.**" ²³³ Weed-killing composition containing 2-(2,4,5-trichlorophenoxy)propionic acid esters of mono-, di-, and tri-propylene glycol monobutyl ethers.

Kurrol's salt $\text{NaPO}_3(\text{IV})$. A fibrous insoluble form of sodium metaphosphate obtained from the melt by undercooling to 550°C and seeding. This name has also been applied to material that was probably NaPO_3 II and/or III. See sodium meta-phosphate.

"**Kutrol.**" ³³⁰ Trademark for uroenterone, an extract of pregnancy urine.

"**Kutwell.**" ⁵¹ Trademark for emulsible, or soluble, cutting oils consisting of good quality base mineral oils to which emulsifiers are added. Water emulsions are used as coolants in metal-cutting operations.

kyanite. See cyanite.

"**Kymene.**" ²⁶⁶ Trademark for a series of resins designed to contribute wet-strength to paper. Available as 30 and 40% aqueous solutions.

"**Kynex.**" ³¹⁵ Trademark for sulfamethoxypyridazine (q. v.).

kynurenine acid $\text{C}_{10}\text{H}_7\text{NO}_3$. A metabolic product of tryptophan.

Properties: Yellow needles; m. p. $282-283^{\circ}\text{C}$; soluble in hot alcohol; insoluble in ether.

Use: Nutrition studies.

"**Kyrax**" A. ¹⁴⁴ Trademark for polyvinyl stearate.

Properties: White, waxy solid; m. p. $46-48^{\circ}\text{C}$; sp. gr. ($20/20^{\circ}\text{C}$) 0.960-0.982, refractive index ($n_{55/D}$) 1.4550; iodine no. 3 max, acid no. 2 max; soluble in benzene, carbon tetrachloride, mineral spirits and halogenated propellants.

Containers: 22-, 120-, and 200-lb fiber drums.

Uses: Synthetic wax for polishes, coatings, mold release.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

L

l-. Prefix meaning levorotatory. See article under D-.

L-. Prefix referring to stereoisomeric form. See article under D-.

"L 13/59." See O, O-dimethyl-2, 2, 2-trichloro-1-hydroxyethylphosphonate.

"L-26." ³⁰⁴ Trade name for lead 2-ethyl hexoate, $[\text{Pb}(\text{CH}_3(\text{CH}_2)_5\text{CH}(\text{C}_2\text{H}_5)\text{COO})_2]$.

Properties: Pale straw-colored viscous liquid; sp. gr. 1.52.

Containers: Metal drums (50 lbs net).

Uses: Hardener for silicone paint films and insulating varnishes, asphalt base removable coatings and reinforcing agent for lubricating oils and greases.

La. Symbol for lanthanum.

Labarraque's solution. Aqueous solution containing 4-6% sodium hypochlorite, an approximately equal amount of sodium chloride, and about 1% of sodium hydroxide or carbonate to stabilize the solution. Pale green color, chlorine odor. Keep in closed bottle, out of light. Used as a disinfectant and bleach.

See also Javelle water.

labdanum oil (ladanum oil).

Properties: A golden-yellow, essential oil; fine, ambergris odor. A crystalline body separates on standing. Soluble in alcohol, ether and chloroform. Sp.gr. 1.011.

Derivation: By distillation of the gum resin of *Cistus ladaniferus*.

Method of purification: Rectification.

Grade: Technical.

Containers: Glass bottles; tins.

Use: Perfumes.

Shipping regulations: None.*

labeled compound. See tracer.

lac (lacca). See shellac.

laccase. An oxidizing enzyme which oxidizes phenols to ortho- and para-quinones. It is found in the latex of the lac tree, in potatoes, sugar beets, apples, cabbages and other plants.

lac dye. A brilliant red dye obtained by maceration of crude lac.
See shellac.

lachrymators. Substances that function as tear gases.

L acid. See 1-naphthol-5-sulfonic acid and 1-naphthylamine-5-sulfonic acid.

lacmoid (resorcinol blue)
 $(\text{HO})_2\text{C}_6\text{H}_3\text{N}[\text{C}_6\text{H}_4(\text{OH})_2]_2$.

Properties: Lustrous, dark-violet, crystalline scales. Soluble in alcohol, ether, acetone, phenol, and glacial acetic acid; slightly soluble in water.

Derivation: From resorcinol by treatment with sodium nitrite.

Method of purification: Crystallization.

Grade: Technical.

Containers: Tins; glass bottles.

Use: Indicator in analytical chemistry.

Shipping regulations: None.*

lacmus. Chemically pure litmus (q. v.).

lacquer. A type of solvent-base paint that forms a film by evaporation of the solvent or by congealing from a molten state. The binders, or film-forming constituents, consist of cellulose esters or ethers, especially nitrocellulose, often in combination with alkyd resins. Examples of solvents are ethyl alcohol, methyl isobutyl ketone, butyl acetate, toluene and xylene. The term lacquer is also applied to the baking finish applied to the interior of food and beverage cans.

Grades: Dip, spray, brush.

Use: Coating metals, wood (especially furniture), etc.

Shipping regulations: May be flammable liquid. Red label.*

lac sulfur. See sulfur, lac.

lactalbunin. See albumin, milk.

lactams. Cyclic amides produced from amino acids by the removal of one molecule of water. An example is caprolactam (q. v.),

$\text{CH}_2(\text{CH}_2)_4\text{CONH}$, derived from epsilon-aminocaproic acid, $\text{NH}_2(\text{CH}_2)_5\text{COOH}$.

lactase. An enzyme present in intestinal juices and mucosa which catalyzes the production of glucose and galactose from lactose.

Use: Biochemical research.

lactic acid (alpha-hydroxypropionic acid; milk acid). $\text{CH}_3\text{CHOHCOOH}$.

Properties: Colorless or yellowish, odorless, hygroscopic syrupy liquid. B.p. (15 mm) 122°C; m.p. 18°C; sp.gr. 1.2. Miscible with water, alcohol, glycerin; soluble in ether; insoluble in chloroform, petroleum ether, carbon disulfide. Cannot be distilled at atmospheric pressure without decomposition; when concentrated above 50%, it is partially converted to lactic anhydride.

Derivation: (a) By fermenting starch, molasses, potatoes, etc. and neutralizing the acid as soon as formed with calcium or zinc carbonate. The solution of lactates is

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

concentrated and decomposed with sulfuric acid; (b) synthetically from sulfite pulp liquor.

Grades: Technical, 22% and 44%, edible, 50 to 80%; plastic, 50 to 80%; U. S. P. XVI (85-90%); C. P.

Containers: Barrels; carboys; 55-gal drums; tank trucks.

Uses (in approximate order of volume):

Foods and beverages, as acidulant, flavoring, preservative; chemicals (salts, plasticizers, adhesives, pharmaceuticals); tanning; plastics and textiles.

Shipping regulations: None.*

lactic acid dehydrogenase. An enzyme found in animal tissues and yeast which acts upon lactic acid producing pyruvic acid.

Use: Biochemical research.

lactogenic hormone. See luteotropin.

lactonitrile (alpha-hydroxypropionitrile, acetaldehyde cyanohydrin) CH_3CHOHCN .

Properties: Straw-colored liquid, acid to methyl red; m. p. -40°C ; b. p. $182-184^\circ\text{C}$ (760 mm) (slight decomposition), sp. gr. 0.9919 (18.4°C), refractive index (18.4/D) 1.4058. Soluble in water and alcohol. Insoluble in petroleum ether and carbon disulfide.

Derivation: Acetaldehyde and hydrocyanic acid.

Grades: Technical; 95-97% purity.

Containers: Glass carboys.

Uses: Solvent; intermediate in production of ethyl lactate.

lactophenine (lactylphenetidine)

$\text{OC}_2\text{H}_5\text{C}_6\text{H}_4\text{NHCOC}(\text{OH})\text{CH}_3$.

Properties: White, crystalline powder.

Soluble in water, slightly soluble in alcohol. M. p. 118°C .

Derivation: By the action of lactic acid on phenetidine.

Method of purification: Crystallization.

Grade: Technical.

Containers: Tins, glass bottles.

Use: Medicine.

Shipping regulations: None.*

lactose (milk sugar; saccharum lactis)

$\text{C}_{12}\text{H}_{22}\text{O}_{11} \cdot \text{H}_2\text{O}$.

Properties: White, hard, crystalline mass or white powder, sweet taste, odorless.

Stable in air. Soluble in water, insoluble in ether and chloroform; very slightly soluble in alcohol.

Constants: Sp. gr. 1.525, m. p. decomposes at 203.5°C .

Derivation: From whey, by concentration and crystallization.

Method of purification: Recrystallization.

Grades: Crude; fermentation; spray dried; edible; U. S. P. XVI.

Containers: 100-lb bags; 100-, 225-lb drums; 175-, 200-lb barrels.

Uses: Pharmacy; infant foods; bacteriology; baking and confectionery; margarine and butter manufacture; pyrotechnics; medicine.

Shipping regulations: None.*

lactylphenetidine. See lactophenine.

lac wax. A wax obtained from lac consisting of myricyl and ceryl alcohols, free and combined with various fatty acids.

Shipping regulations: None.*

LAD. Abbreviation for lithium aluminum deuteride (q. v.).

ladanum oil. See labdanum oil.

"Ladex."⁵¹ Trademark for an extreme-pressure grease used in heavy-duty roller bearings in steel mill equipment. Suitable for grease gun application and in pressure systems. Recommended for use at moderate speed and in the presence of water, but where excessive temperatures do not prevail.

lady's slipper. See cypripedium.

Lafon's reagent. Sulfuric acid solution of ammonium or sodium selenite, used as a test for codeine.

LAH. Abbreviation for lithium aluminum hydride.

lake. A special type of pigment consisting essentially of an organic soluble coloring matter combined more or less definitely with an inorganic base or carrier. It is characterized generally by a bright color and a more or less pronounced translucency when made into an oil paint.

Under this term are included two (and perhaps three) types of pigment: (1) the older, original type composed of hydrate of alumina dyed with a solution of the natural organic color, (2) the more modern and far more extensive type made by precipitating from solution various coal-tar colors by means of a metallic salt, tannin, or other suitable reagent, upon a base or carrier either previously prepared or coincidentally formed, and (3) a number combining both types in varying degree, which might be regarded as a third class. (ASTM definition, ASTM D 16-52).

Lakes are used extensively in the preparation of printing inks, lithographic inks, paints, and in the printing of wall paper and such materials.

lake dyes. Dyes used for the making of lakes by combination with or adsorption on salts of calcium, barium, chromium, aluminum, phosphotungstic acid, or phosphomolybdic acid.

See also mordant dyes.

Lake Red C. Red pigments made by coupling 2-chloro-5-aminotoluene-4-sulfonic acid with beta-naphthol and forming various metal salts.

Properties: Good resistance to bleeding; reasonable light resistance, good transparency; produces inks with good flow.

Grades: Resinated and non-resinated.

Uses: General purpose color for letterpress, gravure, flexographic, moisture set, heat set inks; specially for offset printing inks.

"Laktane."⁵¹ Trademark for a solvent especially prepared for use as lacquer diluent

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

and in rotogravure printing inks. Its boiling range is typically 218-228°F.

lambda particle. See fundamental particle.

lamb mint. See peppermint.

"Laminac" Resins. ⁵⁷ Trademark for a proprietary grade of polyester resin used mainly in the manufacture of reinforced plastics. Most widely used reinforcement is glass fiber. A wide variety of "Laminac" resins are available characterized by properties such as extremely high strength-to-weight ratio, water resistance, chemical resistance, and good electrical properties. Typical products fabricated include speedboats, radomes, tanks for water and chemical storage, and sports car bodies.

laminates. Products composed of thin layers or sheets united by an adhesive. Wood products such as plywood are made up of layers of veneer bonded with synthetic resin or casein glues. Safety glass may be made of layers of plastic hot-pressed together. Combinations of glass fabric, cloth, paper, plastics, etc., are in growing use for numerous purposes.

lamp black. A black or gray pigment made by burning low-grade heavy oils or similar carbonaceous materials with insufficient air, and in a closed system such that the soot can be collected in settling chambers. Properties are markedly different from carbon black. Used as black pigment for cements, ceramic ware, mortar, inks, linoleum, surface coatings, crayons, polishes, carbon paper, soap, etc.; ingredient of insulating compositions, liquid-air explosives, matches, fertilizers, furnace lutes, lubricating compositions; reagent in cementation of steel.

Containers: Bags.

"Lanasure." ³²⁸ Lanolin-containing emulsion for hosiery finish, easily compatible with resin and duller finishes. Is durable through ordinary washing. Does not build up on equipment, and serves as a release agent for hosiery from hosiery forms. Hosiery following a usual wash still exhibits a good hand.

"Lanamid." ²⁴³ Trademark for neutral-dyeing, pre-metallized dyes.

"Lanaset Resin." ⁵⁷ Trademark. A melamine-formaldehyde resin applied to woven and knitted wool fabrics to control wool shrinkage and felting.

lanatocide C $C_{49}H_{76}O_{20}$. A glycoside obtained from the leaves of *Digitalis lanata*.

Properties: White crystals or powder; odorless; hygroscopic; extremely poisonous! M. p. about 250°C, with decomposition. Insoluble in water, soluble in dioxane and pyridine. Specific rotation (20°C) +32.0 to +34.5°.

Grades: N. F. XI.

Use: Medicine.

land pebble. A type of phosphate rock consisting of "pebbles" of phosphatic material in a clay and sand matrix. It sometimes contains a small amount of uranium, which is recovered as a by-product.

Occurrence: Florida.

Use: Source of phosphate for fertilizer and other uses.

langbeinite $K_2Mg_2(SO_4)_3$. A natural sulfate of potassium and magnesium, found in salt deposits.

Properties: Colorless, yellowish, reddish, greenish; luster vitreous; hardness 3.5-4; sp. gr. 2.83.

Occurrence: New Mexico, Germany, India.

Use: Source of potash.

"Lanitol." ³⁰⁰ Trademark for a group of alkylarylsulfonate type detergents.

"Lanitol" F: Flake; sodium salt.

"Lanitol" CW: Powder; same as flake, plus alkaline builders.

"Lanitol" KL: Liquid; triethanolamine salt.

"Lanoc." ²⁰⁶ Brand name of a range of mothproofing agents, for application to textiles.

"Lanole B." ⁴² Proprietary product. Blend of sodium oleate and solvents.

Properties: Clear amber colored liquid.

Disperses readily in water at all temperatures.

Containers: 55-gal steel drums.

Uses: Scouring agent for the removal of tar, grease and paint from woolen textile fabrics primarily.

lanolin (wool fat, hydrous).

Properties: Yellowish-white, or nearly white, ointment-like mass, incorporated with not less than 25% and not more than 30% of water. Slight odor. Soluble in ether, chloroform; insoluble in water.

Derivation: A fat obtained from the wool of sheep.

Grades: Technical; U. S. P. XVI.

Containers: Drums.

Uses: Ointment base; cosmetics, leather-dressing, finishing and softening agent; rosin soaps; superfatting toilet soaps.

Shipping regulations: None.*

lanolin, anhydrous (wool fat; alapurin).

Properties: Brownish-yellow, tenacious, unctuous mass free of water and having not more than a slight odor. Soluble in benzene, ether, acetone, petroleum ether, and hot alcohol; sparingly soluble in cold alcohol, insoluble in water but can be mixed with about twice its weight of water without separation. M. p. 36-42°C.

Derivation: A fat obtained from the wool of sheep.

Grades: Technical, cosmetic; U. S. P. XVI.

Containers: 400-lb drums.

Uses: See lanolin.

Shipping regulations: None.*

lanosterol (ischolesterol) $C_{30}H_{50}O$. An unsaturated sterol closely related to cholesterol; m. p. 139-140°C.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"**Lanoxin**,"³⁰¹ Trademark for preparations of digoxin (q. v.).

lanthana. See lanthanum oxide.

lanthanide series. Modern name given to the rare earth series of elements (see rare earth metals). The individual members of the series are called lanthanides or lanthanons.

lanthanons. See lanthanide series.

lanthanum La. Element of atomic number 57; group III of the periodic table; from the point of view of chemical behavior it is classed as one of the rare-earth elements of the cerium group.

Properties: White, malleable, ductile metal; oxidizes rapidly in air. Sp. gr. 6.18-6.19; m. p. 920°C; b. p. 4200°C; soluble in acids; decomposes water to lanthanum hydroxide and hydrogen.

Derivation: By electrolysis of lanthanum chloride and reduction of chloride or fluoride with calcium metal. For sources see rare-earth minerals.

Containers: Boxes.

Use: Lanthanum salts; electronic devices; pyrophoric alloys; rocket propellants, reducing agent.

Shipping regulations: None.*

lanthanum acetate $\text{La}(\text{C}_2\text{H}_3\text{O}_2)_3 \cdot x\text{H}_2\text{O}$.

Properties: White powder, soluble in water.

Purities up to 99.9+%. Soluble in acids.

Containers: Glass bottles; fiber drums.

lanthanum ammonium nitrate

$\text{La}(\text{NO}_3)_3 \cdot 2\text{NH}_4\text{NO}_3 \cdot 4\text{H}_2\text{O}$.

Properties: Colorless crystals; soluble in water.

Grades: Purities to 99.9+%.

lanthanum antimonide LaSb . Made in high purity for use as a binary semiconductor.

lanthanum arsenide LaAs . Made in high purity for use as a binary semiconductor.

lanthanum carbonate $\text{La}_2(\text{CO}_3)_3 \cdot \text{H}_2\text{O}$.

Properties: White powder; insoluble in water; soluble in acids.

Grades: Up to 99.9+% La salts.

Containers: Glass bottles, fiber drums.

lanthanum chloranilate $\text{La}_2(\text{O}:\text{C}_6\text{Cl}_2\text{O}_2:\text{O})_3 \cdot n\text{H}_2\text{O}$.

Used as a reagent for fluoride determination.

lanthanum chloride $\text{LaCl}_3 \cdot 7\text{H}_2\text{O}$.

Properties: White crystals; transparent; hygroscopic; (for anhydrous) sp. gr. 3.842 (25°C); m. p. 872°C. Soluble in alcohol, water; acids.

Derivation: Treatment of lanthanum carbonates or oxides with hydrochloric acid in an atmosphere of dry hydrogen chloride.

Grades: Purities to 99.9+%.

Containers: Glass bottles, fiber drums.

Uses: Anhydrous trichloride of rare-earth metal is often used to prepare the metal.

lanthanum fluoride LaF_3 .

Properties: White powder, insoluble in water, acids.

Grades: Purities up to 99.9+%.

Containers: Glass bottles, fiber drums.

lanthanum nitrate $\text{La}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$.

Properties: White crystals; hygroscopic.

Caution: Keep well stoppered. B. p. 126°C; m. p. 40°C. Soluble in alcohol, water, acids.

Grades: Purities to 99.9+%.

Containers: Glass bottles, fiber drums.

Uses: Antiseptic; gas mantles.

Shipping regulations: Oxidizing material.

Yellow label.*

lanthanum oxalate $\text{La}_2(\text{C}_2\text{O}_4)_3 \cdot 9\text{H}_2\text{O}$.

Properties: White powder, insoluble in water, slightly soluble in acids.

Grades: Purities to 99.9+%.

Containers: Glass bottles, fiber drums.

lanthanum oxide (lanthana; lanthanum trioxide; lanthanum sesquioxide) La_2O_3 .

Properties: White or buff, amorphous powder; sp. gr. 6.51 (15°C); m. p. 2315°C. Soluble in acids; insoluble in water; hisses in moist air like quicklime.

Derivation: By extraction from monazite sand, by ignition of hydroxide or oxyacid (oxalate, sulfate, nitrate, etc.); by direct combustion of free metal (burns with brilliant, white light).

Grades: Purities to 99.9+%.

Containers: Boxes, glass bottles, fiber drums.

Uses: Instead of lime in calcium lights; incandescent gas mantles; in optical glass; technical ceramics.

Shipping regulations: None.*

lanthanum phosphide LaP . Made in high purity for use as a binary semiconductor.

lanthanum sesquioxide. See lanthanum oxide.

lanthanum sulfate $\text{La}_2(\text{SO}_4)_3 \cdot 9\text{H}_2\text{O}$.

Properties: White crystals. Sp. gr. 2.821; refractive index (n_D 20/D) 1.564; soluble in alcohol; slightly soluble in water, acids.

Derivation: By dissolving hydroxide, carbonate or oxide in dilute sulfuric acid.

Grades: Purities to 99.9+%.

Containers: Glass bottles, fiber drums.

Uses: The sulfates of the rare-earth elements are often used for atomic weight determination of the element.

lanthanum trioxide. See lanthanum oxide.

lanthionine $\text{S}(\text{CH}_2\text{CHNH}_2\text{COOH})_2$. A non-essential amino acid first obtained from deaminated wool.

Properties: Crystals; slightly soluble in water; insoluble in alcohol, ether, chloroform, and acetone.

DL-lanthionine: chars 240°; decomposes 286-292°C.

L(+)-lanthionine: darkens 245°C; decomposes 293-295°C.

D(-)-lanthionine: darkens 245°C; decomposes 293-295°C.

Use: Biochemical research.

"**Lanum**,"¹²³ Trademark for purified wool fat prepared for medicinal and pharmaceutical use.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

lapis lazuli (lazurite) $\text{Na}_{4-5}\text{Al}_3\text{Si}_3\text{O}_{12}\text{S}$.

A natural sodium aluminum sulfosilicate, usually somewhat impure.

Properties: Color deep blue to greenish blue; luster vitreous; hardness 5-5.5; sp. gr. 2.4.

Occurrence: Afghanistan; U. S. S. R.; Chile; California.

Use: Ornamental stone; as coloring agent in cosmetics. Formerly a paint pigment (ultramarine) but now superseded by the artificial product.

larch agaric. See agaric.

larch turpentine. See turpentine, Venice.

lard (adepts). Purified internal fat of the hog.

Properties: Soft, white unctuous mass, faint odor, bland taste. Soluble in ether, chloroform, light petroleum hydrocarbons, carbon disulfide, insoluble in water. M. p. 36-42°C.

Chief constituents: Stearin, palmitin, olein. Containers: Tins; steel drums.

Uses: Cooking, pharmacy (ointments, ce-rates); perfumery (pomades).

lard oil (grease oil).

Properties: Colorless or yellowish oil, with peculiar odor and bland taste. Soluble in benzene, ether, chloroform, and carbon disulfide; slightly soluble in alcohol.

Chief constituents: Olein, with a small percentage of the glycerides of solid fatty acids.

Constants: M. p. -2°C; refractive index (20/D) 1.470; sp. gr. 0.915; saponification value 195-196; iodine value 56-74.

Derivation: By cold pressing lard.

Adulterants: Cotton seed, petroleum oils.

Grades: Prime winter edible; prime winter inedible; off prime; extra no. 1; no. 1; no. 2.

Containers: Wooden barrels, steel drums; tank cars.

Uses: Lubricant; illuminant; metal cutting compounds; oiling wool; soap manufacture.

Shipping regulations: None.*

"Larex." ¹⁵² Trade name for a series of lard oils, composed of glycerine combined predominantly with unsaturated fatty acids; produced in nine grades to fit all kinds of uses, from high grade oils for such applications as precision lubrication to lower grade oils for uses in which quality is not critical, such as for compounding, fine drilling and machinery.

Containers: 5-, 55-gal; tank truck; tank car.

"Larothidol." ¹⁶² Trademark for a brand of bithionol.

"Larvacide." ⁴⁰¹ Trade name for various products containing chloropicrin.

"Larvacide 15." ⁴⁰¹ Trade name for a liquid fumigant containing chloropicrin (15%), carbon tetrachloride and carbon disulfide. Containers: 30-, 50-gal drums.

Use: For control of insects and rodents in stored grain.

Caution: Poison label. May be fatal if inhaled or swallowed.

"Larvacide 100." ⁴⁰¹ Trade name for commercially pure chloropicrin.

Containers: 1-lb bottles; 50-, 100-, 150-, 250-lb cylinders.

Uses: As a fumigant for control of storage insects, on stored grain; also used for soil fumigation to control fungi, weeds and soil insects.

Hazards: Toxic. Do not breathe vapors. Avoid contact with skin or clothing. Poison label.

"Larvacide 70 Aerosol." ⁴⁰¹ Trade name for a fumigant containing chloropicrin (70%).

Containers: 50-, 100-, 150- and 250-lb cylinders.

Use: As a space fumigant for control of storage insects and rodents.

Warning: Poisonous vapor.

"Larvacide 85 Aerosol." ⁴⁰¹ Trade name for a fumigant containing chloropicrin (85%) and methyl chloride (15%).

Containers: 50-, 100-, 150-, and 250-lb cylinders.

Use: For control of insects and rodents in grain storage buildings.

Warning: Poisonous vapor.

LATB. See lithium aluminum tri-tert-butoxy-hydride.

"Latentacid E." ⁴²² Trade name for ethyl para-toluenesulfonate, used as an accelerator in thermosetting resins such as urea-formaldehyde, melamine and furfural resins, also as an ethylating agent.

"Latentacid M." ⁴²² Trade name for methyl para-toluenesulfonate; used as an accelerator in thermosetting resins such as urea-formaldehyde, melamine and furfural resins, also as a methylating agent.

latent heat. The quantity of heat absorbed or given off per unit weight of a material during a change of state such as ice to water, or water to steam.

latex. (Plural: latices or latexes; the former is preferred.) A milk-like fluid in which small globules or particles of natural or synthetic rubber or plastic are suspended in water. The milky sap from the rubber tree is the original example. In this material there is about 60% water, 35% rubber, and 5% other materials. Small amounts of impurities act as stabilizers to prevent settling. (Natural proteins serve this purpose in natural latex, and emulsifying agents are purposely added with synthetics.) Other impurities are also present (sugar-like components and salts in natural latex, polymerization catalyst residues in synthetics), which sometimes affect the products made from the latex. Ammonia is added to natural latex to prevent decomposition during shipment and storage. Latex is used in paints, in producing special papers, in adhesives, and to make foam and sponge rubber. The

* See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

term latex is also applied to rubber products made directly from latex, as latex girdles, latex pillows, etc. Common synthetic latices include ordinary styrene-butadiene rubber, and polystyrene, polyvinyl chloride, polyvinylidene chloride, polyacrylate resins. Latex is also produced from reclaimed rubber.

latex paints. See emulsion paints.

"Lathanol LAL." ²⁴³ Brand name for a proprietary product, a highly refined sodium "lauryl" sulfoacetate; an organic detergent possessing wetting, scouring, emulsifying and dispersing properties; a prolific foamer.

Properties: White, dry powder, pH 6.9-7.1 in 0.25% water solution, stable to hard water; stable to acid and alkali in a pH range of 5.0-8.5; solubility in water solution 1% at 25°C, 25% at 100°C, surface tension (0.2% solution) 32 dynes/cm (25°C); hygroscopicity appreciable, keep containers sealed; sp. gr. 0.55; min active organic content 40%, odor sweet, pleasant, flavor practically tasteless.

Grades: Technical.

Containers: Non-returnable 55-gal fiber drums. (250-lbs net). Smaller packings if desired.

Uses: Tooth pastes, tooth powders; liquid dentifrices; foaming bath salts, shampoos, synthetic detergent bars.

latices. Plural of latex.

"Laticrete." ²⁴⁸ Trade name for a latex-based surfacing compound, a "flexible concrete" combining the resilient and long-wearing properties of rubber with the structural characteristics of concrete.

Properties: Light gray (can be pigmented), non-dusting, high chemical resistance; resiliency of wood flooring, flexible over wide temperature range; non-slipping, fire retardant and spark-proof; low noise factor.

Use: Flooring; tank lining; cement binder for brick, tile and glass; waterproofing tunnels, basements, channels; concrete repairing; highways; playgrounds, tennis courts, etc.

"Latyl." ²⁸ Trademark for a group of finely dispersed dyes developed particularly for coloration of "Dacron" polyester fiber, on which they have exceptionally good light and wet fastness properties.

"Latyl" Carrier A. ²⁸ Trademark designation for a white powder used to increase the dyeability of "Dacron" polyester fiber.

laudanidine (levo-laudanine; tritopine)

$C_{20}H_{25}O_4N$. An alkaloid.

Properties: White crystals; m. p. 182-185°C; insoluble in water; soluble in alcohol, benzene, chloroform and slightly soluble in ether.

Derivation: From opium.

laudanine $C_{20}H_{25}NO_4$ (optically inactive form of laudanidine.)

Properties: Small prisms; poisonous! Soluble in benzene and chloroform; slightly soluble in alcohol and ether; m. p. 166°C.

Derivation: By extraction from opium.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

laudanosine $C_{21}H_{27}NO_4$. An alkaloid.

Properties: White needles; poisonous! Soluble in alcohol, ether and benzene; insoluble in water. M. p. 89°C.

Derivation: From opium.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Glass bottles.

Uses: Medicine.

laudanum (tincture of opium).

Properties: Brown liquid; poisonous! Soluble in alcohol and ether.

Derivation: Granulated opium dissolved in dilute alcohol and purified.

Grades: Technical, U. S. P. XVI.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

laughing gas. See nitrous oxide.

laundry blue. Materials used to color white cottons and linens with a blue tint in order to hide the yellow color produced by the alkali in the washing process. Usually a synthetic dye. Soluble Prussian blue is also used for this purpose.

lauraldehyde. See lauryl aldehyde.

laurel. See laurus.

laurel oil, volatile (sweet bay oil; laurel leaf oil).

Properties: A bright yellow liquid; aromatic odor; soluble in alcohol, ether, chloroform and benzene; sp. gr. 0.924.

Chief known constituents. Cineole; pinene.

Derivation: Distilled from the leaves or berries of *Laurus nobilis*.

Method of purification: Rectification.

Grades: Technical.

Containers: Glass bottles; cans; drums.

Uses: Medicine, flavors; perfumes.

Shipping regulations: None.*

Laurent's acid. See 1-naphthylamine-5-sulfonic acid.

Laurent's alpha acid. See 1-nitronaphthalene-5-sulfonic acid.

"Laurex." ²⁴⁸ Trademark for the zinc salts of a mixture of fatty acids in which lauric acid predominates.

Properties: Yellowish white granulated waxy powder; sp. gr. 1.15; m. p. 95-105°C; soluble in benzol; insoluble in acetone, gasoline, ethylene dichloride, and water.

Use: A fatty acid activator and plasticizer for use in all stocks as a processing aid.

lauric acid (dodecanoic acid) $CH_3(CH_2)_{10}COOH$.

A fatty acid occurring in many vegetable fats as the glyceride, especially in coconut oil and laurel oil.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Colorless needles; sp. gr. 0.833; m. p. 44°C; b. p. 225°C (100 mm); refractive index 1.4323 (n_D 45/D); insoluble in water, soluble in alcohol and ether.

Derivation: Fractional distillation of mixed coconut or other acids.

Grades: 99.8% pure; technical.

Containers: 55-gal drums, tank cars.

Uses: Alkyd resins; wetting agents; soaps; detergents; cosmetics; insecticides; metallic soaps; chemical raw material.

lauric aldehyde. See lauryl aldehyde.

"Laurine." 227 Trademark for hydroxycitronellal (2,6-dimethyl-2-hydroxyoctanal-8) $(\text{CH}_3)_2\text{C}(\text{OH})(\text{CH}_2)_5\text{CH}(\text{CH}_3)\text{CH}_2\text{CHO}$.

Properties: Colorless liquid; rather sweet and intense odor, characteristic of linden; stable; not likely to discolor; sp. gr. (25/25°C) 0.917-0.921, refractive index (20°C) 1.447-1.450; soluble in 1 part of 50% alcohol.

Uses: An extremely versatile perfume material, used extensively in such florals as lilac, hyacinth, jasmine, magnolia, narcissus, and the basis of many linden and lily-of-the-valley scents. In floral perfumes for soap, it shows good strength and tenacity.

lauroyl chloride $\text{C}_{11}\text{H}_{23}\text{COCl}$.

Properties: Water-white liquid, refractive index 1.445 (20°C); m. p. -17°C, b. p. 145°C (18 mm); decomposes in water and alcohol, soluble in ether.

Containers: 13-gal carboys; drums.

Use: Synthesis.

lauroyl peroxide (alperox C, dodecanoyl peroxide) $(\text{C}_{11}\text{H}_{23}\text{CO})_2\text{O}_2$.

Properties: White, coarse powder, tasteless, faint odor; soluble in oils and in most organic solvents; slightly soluble in alcohols, insoluble in water; m. p. 53-55°C.

Grades: Technical (about 95%).

Containers: 1-lb (net) fiber containers; 100-lb polyethylene-lined drums.

Uses: Bleaching agent, intermediate and drying agent for fats, oils, and waxes, polymerization catalyst.

Shipping regulations: Oxidizing material. Yellow label.*

laurus (sweet bay; bay; noble laurel, laurel).

Derivation: Leaves and fruit of *Laurus nobilis*.

Habitat: Mediterranean region; cultivated in Mexico.

Grades: Technical.

Containers: Bags.

Uses: Medicine; source of laurel oil, volatile.

Shipping regulations: None.*

lauryl acetate. See dodecyl acetate.

lauryl alcohol (alcohol C-12; n-dodecanol) $\text{CH}_3(\text{CH}_2)_{10}\text{CH}_2\text{OH}$.

Properties: Colorless liquid, with floral odor; sp. gr. 0.830-0.836; refractive index 1.444; m. p. 24°C; b. p. 259°C. Soluble in 2 parts of 70% alcohol.

Derivation: Reduction of coconut oil fatty acids.

Containers: 55-gal drums, 8000-gal tank cars.

Uses: Synthetic detergents; lube additives; pharmaceuticals; rubber; textiles; perfumes.

lauryl aldehyde (lauric aldehyde; dodecyl aldehyde; aldehyde C-12 lauric; dodecanal; lauraldehyde) $\text{CH}_3(\text{CH}_2)_{10}\text{CHO}$.

Properties: Colorless liquid, becoming solid at cool temperatures, with a strong fatty floral odor; sp. gr. 0.828-0.836; refractive index 1.433-1.440; m. p. 44°C. Soluble in 90% alcohol; insoluble in water.

Use: Perfumery.

lauryl bromide (n-dodecyl bromide; 1-bromododecane) $\text{C}_{12}\text{H}_{25}\text{Br}$.

Properties: Clear, colorless to pale straw-colored mobile liquid with coconut odor and low volatility.

Typical properties: Sp. gr. 1.026 (25/25°C); boiling range (5-95% at 45 mm Hg) 151-208°C; f. p. -15.5°C.

Grade: Technical, approx 60% pure.

Derivation: Coconut oil.

Use: Possible intermediate for quaternary ammonium compounds.

lauryl chloride. Commercially, a mixture of n-alkyl chlorides, with $\text{C}_{12}\text{H}_{25}\text{Cl}$ dominant.

A clear, water-white, oily liquid, with a faint fatty odor. Completely miscible with most organic solvents, slightly miscible with alcohol; immiscible with water.

Typical properties: Sp. gr. 0.863 (15.5/15.5°C); crystallization point -19°C, distillation range 112-160°C (5 mm); flash point 113°C, fire point 135°C.

Grades: Refined; technical.

Containers: 5-, 55-gal drums; tank cars.

Uses: Synthesis of esters, sulfides, lauryl mercaptan (used in styrene-butadiene polymerization), other organics.

lauryl glycerin. See glycerol monolaurate.

lauryl mercaptan (n-dodecyl mercaptan, tert-dodecyl mercaptan) $\text{C}_{12}\text{H}_{25}\text{SH}$ (approx.).

Properties (technical material, mixture of isomeric compounds): Water-white or pale-yellow liquid, mild characteristic odor; sp. gr. 0.85 (20/20°C); m. p. -7.5°C; distillation range 200-235°C at ordinary pressure, 100 to 200°C at 5 mm pressure; refractive index 1.45-1.47; insoluble in water; soluble in methanol, ether, acetone, benzene, gasoline, and ethyl acetate.

Grades: 95% min.

Containers: Steel drums; carboys; tank cars.

Uses: Manufacture of synthetic rubber and plastics, also in the synthesis of pharmaceuticals, and in insecticides and fungicides.

lauryl methacrylate $\text{CH}_2=\text{C}(\text{CH}_3)\text{COO}(\text{CH}_2)_{11}\text{CH}_3$.

The commercial material is a mixture, containing also lower and higher fatty derivatives.

Containers: Drums.

Uses: Polymerizable monomer for plastics, molding powders, solvent coatings, adhesives, oil additives; emulsions for textile, leather, and paper finishing.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

lauryl pyridinium chloride $C_{12}H_{25}NC_5H_5Cl$

Properties: Mottled tan semisolid. Soluble in water and organic solvents. Flash point 165°C; fire point 175°C.

Grade: Technical, contains higher and lower fatty acid derivatives.

Containers: 100-, 375-lb polyethylene-lined drums.

Uses: Cationic detergent; dispersing and wetting agent; ingredient of fungicides and bactericides.

lautal. A hard aluminum alloy containing 4-5% copper, 1.5-2% silicon and fractional percentages of other metals such as iron, manganese, or magnesium.

"Lauxein."⁵⁸ Trademark for casein and soybean adhesives, dry powders good for low-temperature applications and glue bonding where water-resistance is desired. Containers: Multiwall bags and fiber drums. Uses: Bonding and cold setting glues used in the manufacture of plywood; furniture; case goods of all types.

"Lauxite."⁵⁸ Trademark for a series of urea, phenolic, melamine and resorcinol resins. Available in dry powders or liquids. Used for bonding, cold setting and impregnating adhesives and glues for furniture, plywood and aircraft; for hot and cold pressing; for radio frequency equipment; for molding of diversified components from granulated wood.

lava. A rock ejected from volcanoes. Lavas are composed mainly of silicates with a wide range in composition, the silica content varying from 40 to 80%, the balance generally consisting of oxides of aluminum, iron, calcium, magnesium, potassium and sodium, together with some water.

lavandin oil. Yellowish volatile oil having a lavender odor, although somewhat more camphoraceous. Its main component is linalool.

Derivation: Distillation of flowers of *Lavandula latifolia fragrans*. It is a cross of lavender and spike, native to the Alps. See also lavender oil.

Containers: Drums.

Use: Perfumery.

Shipping regulations: None.*

lavender (garden lavender; true lavender).

Properties: Grayish-lavender particles.

Chief constituent: Lavender-flower oil.

Derivation: The dried blossoms of *Lavandula vera* (officinalis).

Habitat: Mediterranean region.

Grades: Medium; ordinary; select.

Containers: Boxes; bales.

Uses: Medicine; insecticide; perfumery; source of lavender oil.

Shipping regulations: None.*

lavender oil (lavender flower oil).

Properties: Essential oil; colorless, yellowish, or greenish-yellow; characteristic lavender odor; strongly aromatic; slightly bitter taste.

Chief known constituents: Linalool, linalyl

acetate, geraniol, cumarin, furfural, and borneol.

Constants: These vary considerably, especially with district from which oil is obtained. The following are U. S. P. XVI specifications: Sp. gr. 0.875-0.888; optical rotation -3° to -10°; refractive index 1.4590-1.4700, linalyl acetate content not less than 30%; angular rotation -3 to -10°; soluble in 4 vols. of 70% alcohol.

Derivation: Distilled from the fresh flowers of several species of the genus *Lavandula*.

Adulteration: Turpentine oil, cedar-wood oil, lavender-spike oil, terpinyl acetate, geranyl acetate, ethyl esters of the following acids: citric, oxalic, succinic, tartaric.

Containers: 1-, 5-, 10-lb bottles; cans.

Use: Perfumery.

Shipping regulations: None.*

lavender oil, terpeneless (See essential oils, terpeneless.)

Concentration: About 1.75-2 times that of the ordinary lavender oil.

Constants: Sp. gr. 0.893-0.898; optical rotation, about -5°.

Solubility in alcohol: 15 parts per 100 parts of 60% alcohol; 55 parts per 100 parts of 70% alcohol.

Shipping regulations: None.*

lavender-spike oil (spike oil; aspic oil; Spanish lavender oil; Spanish spike oil). See also lavandin oil.

Properties: Pale-yellow to yellow liquid; camphoraceous lavender-like odor; sp. gr. 0.900-0.915 (15°C); optical rotation -5° to +5°; refractive index (n_D 20/D) 1.4630-1.4680. Soluble in some dilution between one and three volumes of 70% alcohol, becomes hazy on further dilution; soluble in fixed oils; slightly soluble in glycerol; usually forms cloudy solutions with mineral oil.

Derivation: Steam distillation of flowers of *Lavender latifolia*; purified by rectification.

Uses: Soaps, bath preparations; masking odor in sprays and disinfectants.

"Lavenol 'A,' 'B,' and 'C'."¹⁸⁸ Brand names for a series of synthetic lavender oil substitutes of various types.

"Laval."¹⁸⁸ Brand name for a substitute for linalyl acetate.

lawrencium. Name suggested for element 103, made by bombarding californium (no. 98) with boron 10 and boron 11 nuclei. Atomic weight believed to be about 257, and half life only about 8 seconds. See also actinide elements.

lawsonia alba. See henna.

Layor caranga. See agar-agar.

lazulite $MgAl_2(OH)_2(PO_4)_2$. A natural basic aluminum phosphate.

Properties: Color blue; luster vitreous; hardness 5-5.5; sp. gr. 3.0-3.1.

Occurrence: Europe; North Carolina, Georgia, California.

Use: Minor gem stone.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

lazurite. See lapis lazuli.

lb. Abbreviation for pound.

L. C. L. Abbreviation for less than carload lots.

leaching. The process of extraction of a soluble component from a mixture with an insoluble component, by percolation of the mixture with a solvent, usually water, resulting in the solution and later separation of the soluble component. Synonymous with lixiviation. Examples: separation of tannin from barks, mineral salts from roasted ores.

lead (plumbum) Pb. An element of atomic number 82, of group IV of the periodic system. A heavy, malleable, ductile, gray, soft metal of low tensile strength rarely found native.

Properties: Sp. gr. 11.35 (20°C); m. p. 327.4°C; b. p. 1525-1620°C (760 mm). Soluble in dilute nitric acid; insoluble in water but slowly soluble in water containing weak acid; resists corrosion; relatively impenetrable by nuclear radiation.

Sources: Principally galena, cerussite, anglesite and pyromorphite; much lead is recovered from scrap lead at secondary smelters.

Derivation: By roasting and reduction of the ores.

Impurities: Silver, bismuth and copper.

Method of purification: Desilverizing, oxidation and electrolytic refining.

Types of lead: High purity (impurities less than 10 ppm), pure (99.9+%); pig lead, paste.

Types of pig lead:

Chemical lead. A trade term used to describe the undesilverized lead produced from the southeastern Missouri ores. Typical assay is 0.04-0.08% copper, 0.005-0.015% silver, and less than 0.005% bismuth.

Soft and desilverized leads. Used mainly in white lead, sheet, pipe, shot, and alloys.

Hard, or antimonial lead. Lead hardened or strengthened by up to 16% antimony. See antimonial lead alloys.

Acid and copper leads. Made by adding small proportions of copper to refined and desilverized lead. It is then equivalent to chemical lead.

Corroding lead. A lead refined until it is sufficiently pure for the manufacture of white lead by the corroding process.

Forms available: Ingots, sheet, pipe, shot, buckles or straps, grids, coils of pipe, tanks, valves, rod, wire, bars, cams, drums, traps, bends and lined or coated equipment; metallic paste; powder.

Uses (in approximate order of volume):

Metal products (cable covering, solder, caulking lead, ammunition, bearing metals, sheet lead, pipes — the last two are especially important in the chemical industry — type metal, brass and bronze); storage batteries; chemicals (tetraethyl lead,

misc.); pigments (red lead and litharge, white lead, others); miscellaneous (weights, annealing, galvanizing, as a shield in handling and shipping radioactive material, as sound-deadener or sound-proofer in plastics).

lead acetate (sugar of lead) $\text{Pb}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 3\text{H}_2\text{O}$.

Properties: White crystals (commercial grades are frequently brown or gray lumps); poisonous! Absorbs carbon dioxide when exposed to air, becoming insoluble in water. Soluble in water; slightly soluble in alcohol; freely soluble in glycerol. Sp. gr. 2.50; m. p. loses $3\text{H}_2\text{O}$ at 75°C; b. p. 280°C, decomposes.

Derivation: By the action of acetic acid on litharge or thin lead plates.

Method of purification: Crystallization.

Impurities: Lead carbonate.

Grades: Powdered; granular; white crystals; C. P.

Containers: Barrels; multiwall paper sacks; drums.

Uses: Medicine; lead salts; textiles, with alum as a mordant in dyeing and printing cottons; weighting silk; indigo resist; waterproofing; manufacturing varnishes; lead driers; manufacture of chrome pigments; ingredient of hair dyes; analytical reagent.

Warning! Harmful dust. MCA warning label.

Shipping regulations: None. *

lead acetate, monobasic $\text{PbO}(\text{CH}_3\text{COO})_2$.

Properties: White powder; poisonous! Soluble in water, alcohol, and acids.

Derivation: By the interaction of lead oxide and acetic acid.

Method of purification: Recrystallization.

Grades: Technical; C. P.

Containers: Tins; glass bottles.

Uses: Lead salts; analytical chemistry; medicine.

lead alloys. See Tables under fusible alloys.

lead antimonate (Naples yellow; antimony yellow) $\text{Pb}_3(\text{SbO}_4)_2$.

Properties: Orange-yellow powder; very poisonous! Insoluble in water.

Derivation: By the interaction of solutions of lead nitrate and potassium antimonate, concentration and crystallization.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Wooden kegs; fiber drums.

Uses: Paint pigment; staining glass, crockery and porcelain.

Shipping regulations: None. *

lead, antimonial. See antimonial lead alloys.

lead arsenate $\text{Pb}_3(\text{AsO}_4)_2$.

Properties: White crystals; very poisonous! Soluble in nitric acid; insoluble in water; sp. gr. 6 to 7.

Derivation: By the action of a soluble lead salt on a solution of sodium arsenate, concentration and crystallization.

Method of purification: Recrystallization.

Grades: Technical; C. P.

Containers: Powder: sacks; 100-lb barrels; paste: cases; tins; 100-lb kegs; 300- and

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

600-lb barrels; C. P.: multiwall paper sacks.

Use: Insecticide; herbicide.

Warning: Poisonous if swallowed. MCA warning label.

Shipping regulations: Solid: Class B poison. Poison label. *

lead arsenite $\text{Pb}(\text{AsO}_2)_2$.

Properties: White powder; soluble in nitric acid; insoluble in water.

Grades: Technical.

Use: Insecticide.

Shipping regulations: Solid: Class B poison. Poison label. *

lead azide $\text{Pb}(\text{N}_3)_2$.

Properties: Colorless needles; explodes at 350°C; a sensitive detonating agent.

Should always be handled and shipped when submerged in water, to reduce sensitivity.

Derivation: The reaction of sodium azide with a lead salt.

Use: Primary detonating compound for high explosives.

Shipping regulations: Dextrinated type only.

Explosive, Class A. Initiating explosive label. Not accepted by express. *

lead-base Babbitt.

1. A bearing metal with 10-15% antimony, 2-10% tin, up to 0.2% copper, with or without arsenic, and remainder lead. See Babbitt metal. Sometimes known as white-metal bearing alloys.

2. Another type of lead-base Babbitt contains alkaline-earth metals. Used in railway and diesel-engine bearings.

lead, black. See graphite.

lead, blue. A term applied to galena to distinguish it from white lead ore. It is also applied to lead sulfate, blue basic (q. v.).

lead borate $\text{Pb}(\text{BO}_2)_2 \cdot \text{H}_2\text{O}$.

Properties: White powder, poisonous!

Soluble in dilute nitric acid, insoluble in water. Sp. gr. 5.598.

Derivation: By the interaction of solutions of lead hydroxide and boric acid, with subsequent crystallization.

Grades: Technical; C. P.

Containers: 1-, 5-lb bottles; wooden kegs.

Uses: Varnish and paint drier; waterproofed paints; lead glass; galvanoplastic work.

Shipping regulations: None. *

lead borosilicate. A constituent of optical glass, composed of a mixture of the borate and silicate of lead.

lead bromate $\text{Pb}(\text{BrO}_3)_2 \cdot \text{H}_2\text{O}$.

Properties: Colorless crystals. Poisonous!

Soluble in hot water; sp. gr. 5.53; decomposes at about 180°C.

Grades: Technical.

lead bromide PbBr_2 .

Properties: White powder. Slightly soluble in hot water; insoluble in alcohol. Sp. gr.

6.66; b. p. 916°C; m. p. 373°C.

Grades: Technical.

lead burning. Pieces of lead sheet and pipe are joined together by the use of solder or autogenous welding. Lead is a comparatively fusible metal and lead burning is accomplished as follows:

The parts to be joined are scraped clean and placed near together. Then a clean bar of the same metal is applied with an oxy-gas or oxy-hydrogen flame so that the three parts melt together locally. This is a simple process (yet it requires skill) and is sometimes used for lead roofing though principally used in making chemical equipment.

lead carbolate. See lead phenate.

lead carbonate PbCO_3 . See also lead carbonate, basic.

Properties: White, powdery crystals; poisonous! Soluble in acids; insoluble in water and alcohol. Sp. gr. 6.43; decomposed by heat 315°C.

Derivation: By adding a solution of sodium bicarbonate to a solution of lead nitrate.

Occurs in nature as cerussite.

Impurities: Basic lead carbonate.

Grades: Technical.

Containers: Wooden barrels; fiber drums.

Use: Paint pigment.

Shipping regulations: None. *

lead carbonate, basic (lead subcarbonate; white lead; BCWL; ceruse; lead flake) $2\text{PbCO}_3 \cdot \text{Pb}(\text{OH})_2$.

Properties: White, amorphous powder; poisonous! Soluble in acids; insoluble in water; decomposes at 400°C; sp. gr. 6.14.

Derivation: (a) Dutch process. By the corrosion of lead buckles in pots by means of acetic acid and carbon dioxide generated by the fermentation of waste tan-bark.

(b) Carter process. By treating very finely divided lead in revolving wooden cylinders with dilute acetic acid and carbon dioxide.

Grades: Dry, ground in oil; C. P.

Containers: Bottles; bags.

Uses: Paint pigment; putty; ceramic glazes.

Shipping regulations: None. *

lead chloride PbCl_2 .

Properties: White crystals, poisonous!

Slightly soluble in hot water; insoluble in alcohol and cold water. Sp. gr. 5.88, m. p. 498°C; b. p. 950°C.

Derivation: By the addition of hydrochloric acid or sodium chloride to a solution of a lead salt, with subsequent crystallization. Method of purification: Recrystallization.

Grades: Technical; C. P.

Containers: 1-, 5-lb bottles; 400-lb fiber drums.

Uses: Preparation of lead salts; lead chromate pigments; analytical reagent.

Shipping regulations: None. *

lead, chocolate. A pigment prepared by first calcining lead oxide with about 30% copper oxide and then reducing the product of this operation to a uniform smoothness and homogeneity.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

lead chromate PbCrO_4 .

Properties: Yellow crystals; poisonous!
Soluble in acids; insoluble in water; sp. gr. 6.123; m. p. 844°C .
Derivation: By interaction of solutions of sodium chromate and lead nitrate.
Method of purification: Washing.
Grades: Technical; C. P.
Containers: 1-lb bottles; tin cans; wooden barrels; fiber drums.
Use: Paint pigment.
Shipping regulations: None.*
See also chrome yellows.

lead chromate, basic. See chrome red.

lead-coating. Coatings of lead or lead-rich alloys are (1) deposited by dipping into the molten metal, after applying a layer of tin to secure good adhesion of the lead coating; (2) by electroplating from a fluosilicate or fluoborate bath, or (3) by spraying.
See metal spraying.

lead cyanide $\text{Pb}(\text{CN})_2$.

Properties: White to yellowish powder; very poisonous! Slightly soluble in water, decomposes in acid.
Derivation: By the interaction of solutions of potassium cyanide and lead acetate.
Grades: Technical.
Containers: Wooden kegs; fiber drums.
Use: Metallurgy.
Shipping regulations: None.*

lead dioxide (lead oxide, brown; plumbic acid, anhydrous; lead peroxide; lead superoxide) PbO_2 .

Properties: Brown, hexagonal crystals, will cause many materials to take fire if merely mixed with them owing to its strong oxidizing action; hence care needed in storing and shipping; poisonous! Soluble in glacial acetic acid; insoluble in water and alcohol; sp. gr. 8.91, m. p., decomposes.

Derivation: By adding bleaching powder to an alkaline solution of lead hydroxide.

Impurities: Lead chloride.

Grades: Technical; C. P.

Containers: 1-, 5-lb bottles; 1-, 5-lb cans; 200-lb fiber drums, barrels.

Uses: Oxidizing agent; medicine; oxidizing agent in dye and intermediate manufacture; electrodes; batteries; rubber substitutes; textiles (mordant, discharge in dyeing with indigo); matches; explosives; analytical reagent.

Shipping regulations: Oxidizing material.
Yellow label.*

lead dust. Lead in very finely powdered form.

lead, electrolytic. Pure lead obtained by electrolytic deposition.

lead ethylhexoate. See soaps, metallic.

lead flake. See lead carbonate, basic.

lead fluosilicate (lead silicofluoride)

Properties: Colorless crystals; soluble in water; decomposes when heated.

Grades: Technical.

Use: Solution for electrorefining lead.

lead formate $\text{Pb}(\text{CHO}_2)_2$.

Properties: Brownish-white, lustrous, very finely divided, crystalline substance; soluble in water; poisonous! Decomposes at 190°C .

Grades: Technical.

Containers: Multiwall paper sacks.

Use: Reagent in analytical determinations.

lead glance. See galena.

lead hydrate. See lead hydroxide.

lead hydroxide (lead hydrate; hydrated lead oxide) $\text{Pb}(\text{OH})_2$ or $\text{Pb}_2\text{O}(\text{OH})_2$.

Properties: White, bulky powder; poisonous! Soluble in alkalis, slightly soluble in water; soluble in nitric and acetic acid; sp. gr. 7.592; m. p., decomposes at 145°C ; absorbs carbon dioxide from air.

Derivation: By the addition of sodium or ammonium hydroxide to a solution of a lead salt with subsequent filtration and drying.

Grades: Technical.

Containers: Cans.

Use: Lead salts.

Shipping regulations: None.*

lead hyposulfite. See lead thiosulfate.

lead iodide PbI_2 .

Properties: Golden-yellow crystals or powder; odorless, poisonous! Soluble in potassium iodide and concentrated sodium acetate solutions; insoluble in water and alcohol; sp. gr. 6.12; m. p. 358°C , b. p. 872°C .

Derivation: By the interaction of lead acetate and potassium iodide.

Method of purification: Crystallization.

Grades: Technical; C. P.

Containers: Jars, tin boxes.

Uses: Bronzing, mosaic gold; printing; photography; medicine.

Shipping regulations: None.*

lead lining. Tanks are made with loose linings of sheet lead surrounded by a wooden, steel, or concrete exterior. Often the sheet lining is strapped, bolted or riveted with lead rivets to the reinforcing structure. Another method of joining lead to reinforcing metal is by means of a film of solder. The so-called homogeneous coating or lining consists in having the lead united to the reinforcing metal by means of a non-metallic flux which forms a bond that holds its strength nearly to the melting point of lead.

lead linoleate (lead plaster) $\text{Pb}(\text{C}_{18}\text{H}_{31}\text{O}_2)_2$.

Properties: Yellowish-white paste; poisonous! Soluble in oils; insoluble in water.

Derivation: By heating a solution of lead nitrate with sodium linoleate.

Grades: Technical; fused (contains 26.5% Pb).

Containers: 125-, 400-lb drums.

Uses: Medicine; drier in paints and varnishes.

Shipping regulations: None.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

lead-manganese linoleate (manganese-lead linoleate).

Properties: Dark-brown, plaster-like mass; soluble in chloroform, hot linseed oil.

Grades: Technical.

Use: Drier in paints, varnishes, inks.

lead metasilicate. See lead silicate.**lead metavanadate.** See lead vanadate.**lead molybdate** PbMoO_4 .

Properties: Yellow powder; poisonous!

Soluble in acids; insoluble in water and alcohol.

Derivation: By adding a solution of lead nitrate to a solution of ammonium molybdate, concentration and crystallization.

Grades: Technical; C. P.

Containers: Bottles.

Use: Analytical chemistry; pigments (see molybdate oranges).

Shipping regulations: None.*

See also wulfenite.

lead (mono)nitroresorcinate.

Shipping regulations: Explosive, class A.

Initiating explosive label. Not accepted by express.*

lead monoxide. See litharge.**lead beta-naphthalenesulfonate** $\text{Pb}(\text{C}_{10}\text{H}_7\text{SO}_3)_2$.

Properties: White crystalline powder, poisonous! Soluble in alcohol, insoluble in water.

Derivation: By the action of lead acetate on beta-naphthalenesulfonic acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Kegs.

Use: Organic preparations.

Shipping regulations: None.*

lead naphthenate.

Properties: Soft, yellow, resinous semi-transparent material. Gives deposits in highly acid oils, but not when mixed with suitable quantities of cobalt or manganese. Soluble in alcohol; m. p. approx. 100°C.

Derivation: Addition of lead salt to aqueous sodium naphthenate solution.

Grades: Liquid: 16%, 24% Pb; solid: 37% Pb.

Containers: Steel drums; fiber drums.

Uses: Paint and varnish drier; wood preservative and insecticide; catalyst for reaction between unsaturated fatty acids and sulfates in the presence of air, lube oil additive to produce chatterless oils and extreme-pressure lubricants.

Shipping regulations: None.*

lead nitrate $\text{Pb}(\text{NO}_3)_2$.

Properties: White crystals; promotes combustion in contact with organic matter; poisonous! Soluble in water and alcohol; sp. gr. 4.53; decomposes between 205 and 223°C.

Derivation: By the action of nitric acid on lead.

Grades: Technical, C. P.

Containers: 1-, 5-lb bottles; 1-lb cartons; fiber drums.

Uses: Lead salts, medicine; mordant in

dyeing and printing calico; matches; paint pigment; mordant for staining mother-of-pearl; oxidizer in the dye industry; sensitizer in photography; explosives; tanning; process engraving and lithography.

Fire hazard: Dangerous; oxidizing material.

In contact with organic or other readily oxidizable substances it will cause violent combustion or ignition.

Shipping regulations: Oxidizing material.

Yellow label.*

lead nitrite (basic lead nitrite; lead subnitrite).

Properties: Light-yellow powder, variable composition, essentially

$3\text{PbO} \cdot \text{N}_2\text{O}_3 \cdot \text{H}_2\text{O}$. Soluble in dilute nitric acid. Easily decomposed.

Grades: Technical.

lead nitrite, basic. See lead nitrite.**lead ocher.** See massicot (1).**lead octoate.** See soaps, metallic.**lead oleate** $[\text{CH}_3(\text{CH}_2)_7\text{CH}:\text{CH}(\text{CH}_2)_7\text{COO}]_2\text{Pb}$.

Properties: White powder or ointment-like granules or mass; poisonous! Soluble in alcohol, ether, turpentine, and benzene; insoluble in water.

Derivation: Reaction of oleic acid with lead hydrate or carbonate, or by the interaction of lead acetate and sodium oleate.

Grades: Technical.

Containers: Wooden kegs; 500-lb drums.

Uses: Varnishes; lacquers; paint drier; high-pressure lubricants.

lead, orange. See orange mineral.**lead orthophosphate, normal.** See lead phosphate.**lead oxide, brown.** See lead dioxide.**lead oxide, hydrated.** See lead hydroxide.**lead oxide, red** (red lead; minium; plumbic oxide) Pb_3O_4 .

Properties: Bright red powder, partly soluble in acids; insoluble in water. Sp. gr. reported variously 8.32-9.16; decomposes between 500 and 530°C.

Derivation: By carefully heating litharge in a furnace in a current of air.

Grades: Technical; 95%, 97%, 98%.

Containers: Bottles; 500-lb barrels; multi-wall paper sacks.

Uses: Storage batteries; paints; glass; pottery and enameling, varnish; lead dioxide; purification of alcohol; packing pipe joints, rubber pigment; red pencils.

Shipping regulations: None.*

lead oxide, yellow. See litharge.**lead peroxide.** See lead dioxide.**lead phenate** (lead phenolate; lead carbolate)

$\text{Pb}(\text{OH})\text{OC}_6\text{H}_5$.

* Properties: Yellowish to grayish-white powder; poisonous! Soluble in nitric acid; insoluble in water and alcohol.

Derivation: By boiling phenol with litharge.

lead phenolate. See lead phenate.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

lead phenolsulfonate (lead sulfocarbolate)

Properties: White crystals or powder.
Soluble in water and alcohol.

lead phosphate (normal lead orthophosphate)

Properties: White powder; sp. gr. 6.9-7.3, m. p. 1014°C. Poisonous! Insoluble in water; soluble in acids and alkalis.
Grades: C. P.

lead phosphite, dibasic $2\text{PbO} \cdot \text{PbHPO}_3 \cdot \frac{1}{2}\text{H}_2\text{O}.$

Properties: Fine white acicular crystals; sp. gr. 6.94; refractive index 2.25.
Insoluble in water.

Containers: 40-, 350-lb fiber drums.

Uses: Heat and light stabilizer for vinyl plastics and chlorinated paraffins. As an ultraviolet screening and anti-oxidizing stabilizer for vinyl and other chlorinated resins in paints and plastics.

Caution: Dibasic lead phosphite should be stored in closed containers, away from open flame, and at temperatures not to exceed 400°F. Avoid exposure to sparks or static electricity by grounding equipment and using wooden scoops.

lead plaster. See lead linoleate.

lead-potassium glass. See flint glass.

lead protoxide. See litharge.

lead, red. See lead oxide, red.

lead resinate.

Properties: Brown lustrous translucent lumps or yellow-white powder, or yellowish-white paste; poisonous! Insoluble in most solvents.

Derivation: By heating a solution of lead acetate and rosin oil.

Impurities: Lead oxide.

Grades: Precipitated, 23% Pb.

Containers: 50-lb kegs; 115-lb barrels.

Uses: Paint and varnish drier; textile waterproofing agent.

Shipping regulations: None.*

lead salicylate $\text{Pb}(\text{C}_6\text{H}_4\text{OHCOO})_2 \cdot \text{H}_2\text{O}.$

Properties: White crystals; soluble in hot water and alcohol.

Containers: Drums.

lead sesquioxide $\text{Pb}_2\text{O}_3.$

Properties: Reddish-yellow powder. Soluble in alkalis and acids, insoluble in water.

Derivation: By gently heating metallic lead.

Grades: Technical.

Containers: Wooden kegs; fiber drums.

Uses: Medicine; ceramics; ceramic cements; metallurgy; varnishes; paint pigment.

Shipping regulations: None.*

lead-shot metal. An alloy of lead and arsenic.

The arsenic content may range from 0.3 to 0.8% and may be added either in the form of white arsenic or arsenical dross. The arsenic imparts a greater fluidity to the metal and increases the tendency of the metal to assume a spherical form in passing through the air when dropped from the top of the lead-shot tower. With too

little arsenic, the drops are pear-shaped, with too much they become double-convex. The addition of about 0.025% sodium sulfide to the water at the bottom of the tower prevents oxidation of the lead.

lead silicate (lead metasilicate) $\text{PbSiO}_3.$

Formula and names of dubious accuracy.

Properties: White, crystalline powder; insoluble in most solvents.

Derivation: By the interaction of lead acetate and sodium silicate.

Grades: Technical.

Containers: Wooden kegs; fiber drums; multiwall paper sacks.

Uses: Ceramics; fireproofing fabrics.

Shipping regulations: None.*

lead silicate, basic (white lead silicate). A pigment made up of an adherent surface layer of basic lead silicate and basic lead sulfate cemented to silica.

Properties: Excellent film-forming properties with vegetable drying oils combined with low specific gravity.

Derivation: Fine silica is mixed with litharge and sulfuric acid. The mixture is then furnaceed in a rotary kiln and ground to break up agglomerates.

Containers: Bags.

Use: As white lead pigment in exterior mixed pigment house paints.

lead silicates. Of various compositions. The anhydrous forms are made by roasting lead oxide with silica. Another means of preparation is by drying the reaction product of silica gel, litharge and acetic acid. Used in rubbers and films as fillers and to protect them against sunlight.

lead silicofluoride. See lead fluosilicate.

lead-silver Babbitt. A bearing metal with a small amount of copper (up to 0.2%), up to 5% tin, 10-15% antimony, from 2.5 to 5.1% silicon and remainder lead. See Babbitt metal.

lead-soap lubricants. Lead salts saponified with fats. These lubricants are hard at low temperatures, viscous at ordinary temperatures, but they become somewhat fluid on heating by friction. They are employed as "extreme-pressure lubricants." Due to their high melting point, they are not suited for high speed work.

Shipping regulations: None.*

See lead naphthenate; lead oleate; lead stearate; also metallic soaps.

lead-sodium hyposulfite. See lead-sodium thiosulfate.

lead-sodium thiosulfate (lead-sodium hyposulfite; sodium-lead hyposulfite; sodium-lead thiosulfate) $\text{PbS}_2\text{O}_3 \cdot 2\text{Na}_2\text{S}_2\text{O}_3.$

Properties: Heavy, small, white crystals. Soluble in solutions of thiosulfates.

Grades: Technical.

Use: Matches.

lead stannate $\text{PbSnO}_3 \cdot 2\text{H}_2\text{O}.$

Properties: Light-colored powder. Insoluble

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

in water. Approximate temperature of dehydration 170°C.

Uses: Additive in ceramic capacitors; pyrotechnics.

"Leadstar." ³⁰⁴ Trade name for normal lead stearate $[Pb(C_{17}H_{35}COO)_2]$ vinyl stabilizer.

Properties: Fine white unctuous powder, sp. gr. 1.41; refractive index 1.59.

Containers: Fiberboard drums containing 40 and 200 lbs.

Uses: Lubricating, stabilizing and water-proofing properties in vinyl plastics.

lead stearate $Pb(C_{17}H_{35}O_2)_2$. Poisonous!

Properties: White powder; m. p. 105°C, sp. gr. 1.323; soluble in ether and alcohol, insoluble in water.

Derivation: By heating a solution of lead acetate with sodium stearate.

Grades: Technical.

Containers: Tin cans; multiwall paper sacks.

Use: Varnish and lacquer drier; high-pressure lubricants; lubricant in extrusion processes; stabilizer for vinyl polymers; component of greases, waxes and paints.

Shipping regulations: None.*

lead styphnate. See lead trinitroresorcinate.

lead subcarbonate. See lead carbonate, basic.

lead subnitrite. See lead nitrite.

lead, sugar of. See lead acetate.

lead sulfate $PbSO_4$.

Properties: White, rhombic crystals, poisonous! Slightly soluble in hot water; insoluble in alcohol. Sp. gr. 6.12-6.39, m. p. 1170°C.

Derivation: By the interaction of solutions of lead nitrate and sodium sulfate.

Grades: Technical, C. P.

Containers: Bottles; boxes, kegs, barrels, multiwall paper sacks.

Use: Storage batteries; paint pigments.

lead sulfate, basic (white lead, sublimed; white lead sulfate). Approximate formula $PbSO_4 \cdot PbO$.

Properties: White monoclinic crystals, sp. gr. 6.92, m. p. 977°C, only slightly soluble in hot water or acids.

Grades: Vary from 72 to 85% lead sulfate and remainder lead oxide. Sold dry or ground in oil.

Derivation: Three methods are used:

(a) Lead sulfide ore (galena) is subjected to high temperatures in an oxidizing atmosphere.

(b) Molten lead is sprayed into a jet of ignited fuel gas and air in the presence of sulfur dioxide gas.

(c) Atomized metallic lead is mixed with water and sulfuric acid is added under controlled conditions.

Containers: Barrels; multiwall paper sacks.

Uses: Paints, ceramics; pigments in general, rubber industry.

lead sulfate, blue basic (sublimed blue lead, blue lead).

Composition: Lead sulfate (min) 45%, lead oxide (min) 30%, lead sulfide (max) 12%,

lead sulfite (max) 5%, zinc oxide 5%, carbon and undetermined matter (max) 5%.

Properties: Blue-gray corrosion-inhibiting pigment; insoluble in water or alcohol.

Containers: Barrels.

Uses: Component of structural-metal priming coat paints; an excellent rust-inhibitor in paints; rarely used for color.

Derivation: By heating lead ores in special furnaces.

lead sulfide (plumbous sulfide) PbS .

Properties: Silvery, metallic crystals or black powder. Soluble in acids; insoluble in water and alkalies. Sp. gr. 7.13-7.7; m. p., decomposes.

Derivation: (a) Found in nature as the mineral galena (q. v.); (b) by passing hydrogen sulfide gas into an acid solution of lead nitrate.

Grades: Technical, C. P.

Containers: 1-lb bottles, wooden barrels; fiber drums.

Uses: Ceramics; metallic lead; infrared radiation detector.

Shipping regulations: None.*

lead sulfocarbolate. See lead phenolsulfonate.

lead sulfocyanide. See lead thiocyanate.

lead superoxide. See lead dioxide.

lead tallate. A lead derivative of tall oil.

Grades: Liquid, 16% Pb; solid, 24% Pb.

Containers: Drums.

Uses: See soaps, metallic.

lead tannate.

Properties: Amorphous, brownish-yellow powder; poisonous! Slightly soluble in alcohol and water.

Use: Medicine.

lead telluride $PbTe$. Single crystals used as a photoconductor and a semiconductor in thermocouples and the like.

lead, tellurium. An alloy containing 0.04-0.10% tellurium. An important alternative for hard lead. More resistant to corrosion by sulfuric acid than pure "chemical" lead as well as stronger and tougher. See types of lead, under lead.

lead tetraacetate $Pb(CH_3COO)_4$.

Properties: Colorless or faintly pink crystals, sometimes moist with glacial acetic acid.

M. p. 175°C; density 2.228 (17°C); soluble in benzene, chloroform, nitrobenzene, hot glacial acetic acid.

Derivation: From red lead (Pb_3O_4) and glacial acetic acid in the presence of acetic anhydride.

Containers: Glass bottles; fiber drums.

Uses: Selective oxidizing agent in organic synthesis.

Caution! Poisonous! Avoid contact with skin. Provide adequate ventilation.

• Shipping regulations: Poison, class B. Poison label.*

lead tetraethyl. See tetraethyl lead.

lead thiocyanate (lead sulfocyanate) $Pb(SCN)_2$.

Properties: A white or light-yellow, crystalline powder; soluble in potassium

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

thiocyanate, nitric acid and slightly soluble in cold water; decomposes in hot water. Sp. gr. about 3.8.

Containers: Drums (100 lbs net).

Uses: As an ingredient of priming mixture for small-arms cartridges; in safety matches; in dyeing.

lead thiosulfate (lead hyposulfite) PbS_2O_3 .

Properties: White crystals; poisonous! Soluble in acids and sodium thiosulfate solution; insoluble in water. M. p., decomposes.

Derivation: By the interaction of solutions of lead nitrate and sodium thiosulfate, concentration and crystallization.

Shipping regulations: None.*

lead titanate PbTiO_3 .

Properties: Pale-yellow solid; insoluble in water.

Derivation: Interaction of oxides of lead and titanium at a high temperature. Contains lead sulfate and lead oxide as impurities.

Use: Paint pigment.

lead trinitroresorcinate (lead styphnate)

$\text{C}_6\text{H}(\text{NO}_2)_3(\text{O}_2\text{Pb})$.

Properties: Explosive, exploding at 260-310°C, sp. gr. 3.1 for monohydrate and 2.9 for anhydrous. Monohydrate is monoclinic orange-yellow crystals; practically insoluble in water.

Shipping regulations: Explosive, class A. Initiating explosive label. Not accepted by express.*

lead tungstate (lead wolframate) PbWO_4 .

Properties: Yellowish powder, poisonous! Soluble in acid; insoluble in water. Sp. gr. 8.235; m. p. 1130°C.

Derivation: By mixing solutions of lead nitrate and sodium tungstate, concentrating and crystallizing.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Wooden kegs; fiber drums.

Use: Pigment.

Shipping regulations: None.*

lead vanadate (lead metavanadate; lead vanadinate) $\text{Pb}(\text{VO}_3)_2$.

Properties: Yellow powder; insoluble in water; decomposes in nitric acid.

Grades: Technical.

Containers: Glass bottles; fiber drums.

Uses: Preparation of other vanadium compounds; pigment.

Shipping regulations: None.*

lead vanadinate. See lead vanadate.

lead vitriol. See anglesite.

lead water. A 1% solution of basic lead acetate.

lead, white. See lead carbonate, basic, also lead silicate, basic; and lead sulfate, basic.

lead wolframate. See lead tungstate.

lead wool. Fine filaments or threads of metallic lead, prepared and used as a wooly mass for packing pipe joints.

lead yellow. See chrome yellows.

lead zirconate titanate (LZT) PbTiZrO_3 .

Forms piezoelectric crystals. Used as an element in hi-fi sets and as a transducer for ultrasonic cleaners.

leaf green. A very durable pale-green pigment obtained by igniting a mixture of chromic oxide and pure aluminum hydrate. A name also applied to chlorophyll (q. v.).

"Leafox" Agricultural Zinc Oxide. ²⁶⁸ Brand name for a commercially lead-free zinc oxide for agricultural purposes. It incorporates easily in water and makes a satisfactory spray, or can be used with other material for dusting.

Containers: 50-lb bags.

Uses: For the control of mottle leaf and little leaf in citrus plants.

leather, artificial. A material usually produced by coating a fabric with a dope consisting of a mixture of pyroxylin, castor or other oil, and pigments in an organic solvent. The solvent evaporates leaving a tough flexible coating. Ornamental effects can be produced by passing the finished leather through calender rolls or embossing presses.

leather, chamols. Made from the flesh layer of a split sheep skin by treating with fish oils, piling in contact with other similarly treated skins and allowing the fish oils to oxidize.

leather, chrome-tanned. See chrome tanning.

leather grease. See degrass.

leatheroid. Tough fibrous material made in thin sheets or boards, similar to vulcanized fiber, and used for electric insulation.

Leblanc process. Obsolete process for manufacturing sodium carbonate from sodium sulfate and coke.

lecithin (lecithol; ovalecthin; phospholitein; phosphatidyl choline). Approximate formula: $\text{CH}_2(\text{R})\text{CH}(\text{R}')\text{CH}_2\text{OPO}(\text{OH})\text{O}-(\text{CH}_2)_2\text{N}(\text{OH})(\text{CH}_3)_3$, R and R' being fatty acid groups. A group of phosphatides. They are mixtures of the diglyceride residues of stearic, palmitic, and oleic acids, linked to the choline ester of phosphoric acid.

Derivation: Egg yolk, other animal and vegetable sources, particularly soybeans and corn.

Grades: Edible; technical; bleached; purified; fluid; plastic.

Containers: Bottles; drums; carload lots.

Uses: Emulsifying agent, dispersant, wetting agent, penetrating agent, antioxidant; in vitamins for animal feeds; in margarine to improve consistency, in baked goods, pharmaceuticals, cosmetics; as a lubricant for textile fibers; in rubber and plastics fabrication; in inks, paints, polishes, sprays, pigment pastes and lubricating oils.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

lecithol. See lecithin.

"Lecton." ²⁸ Trademark for acrylic resin-coated glass fabrics and laminates used as electric insulating material because of thermal stability up to 130°C. Resistant to fluorinated hydrocarbons.

"Lectro." ³⁰⁴ Trademark for a series of vinyl stabilizers. Available as:

"Lectro 60." Lead silicate-complex vinyl stabilizer.

Properties: Fine white powder; sp. gr. 4.0; refractive index 2.1.

Containers: Multiwall paper bags (50 lbs net).

Uses: Economical stabilizer for vinyl electrical insulation and tape. Special "XL" grade available for vinyl electrical insulation.

"Lectro 77." Lead chlorophthalosilicate compound.

Properties: Fine white powder; sp. gr. 4.15. Containers: Multiwall paper bags (50 lbs net).

Uses: Heat and light stabilizer for all types of electrical insulation in the 60°C through 80°C U. L. classes, including those requiring water immersion resistance.

"Lectro 78." Tetrabasic lead fumarate ($4\text{PbO} \cdot \text{PbC}_2\text{H}_2(\text{COO})_2 \cdot 2\text{H}_2\text{O}$) compound.

Properties: Fine creamy-white powder; sp. gr. 6.54; refractive index 2.1.

Containers: Fiberboard drums containing 50 and 325 lbs.

Uses: Heat stabilizer for phonograph records, electrical insulation and electrical grade plastisols. Vulcanization agent for chlorosulfonated polyethylene.

"Ledate." ⁶⁹ Trade name for lead dimethyldithiocarbamate $[(\text{CH}_3)_2\text{NC}(\text{S})\text{S}]_2\text{Pb}$.

Properties: Gray, odor none; toxicity same as for any lead compound; m. p. above 258°C, sp. gr. 2.5. Insoluble in water, acetone, benzene, carbon disulfide, and gasoline.

Use: Vulcanization accelerator with litharge.

"Lederacillin." ⁵⁷ Trademark for penicillin.

"Lederplex." ⁵⁷ Trademark for Vitamin B complex.

"Ledinac." ⁵⁷ Trademark for liver protein hydrolysate-amino acids.

lees black. Charcoal from wine lees.

"Lehigh" Leaded Zinc Oxides. ²⁶⁸ Brand name covering a range of leaded zinc oxides.

Grades: Several grades to meet requirements of individual uses. Materials with 35 and 50% lead calculated as PbSO_4 more generally in demand.

Containers: 50-lb bags.

Use: Extensively used in exterior paints and primers.

"Lemac." ⁶⁵ Trademark for a series of polyvinyl acetates in bead form, at various molecular weights. Used in lacquers, adhesives, special coatings.

"Lemasize." ⁶⁵ Trademark for alkali-soluble resin beads, which are dissolved in ammonia or soda ash solution, and applied in warpsizing of acetate and synthetic fibers.

Lemery's white precipitate. See mercury, ammoniated.

"Lemoflex." ⁶⁵ Trademark for a series of internally-plasticized polyvinyl alcohols having excellent flexibility and cold-water solubility.

Uses: Adhesives; permanently plasticized films; cold-water-soluble films.

"Lemol." ⁶⁵ Trademark for a series of polyvinyl alcohols in partially and fully hydrolyzed form at various molecular weights. Used in adhesives, emulsions, polymerization, film-coatings, polyester release agents, textile printing, finishing and sizing. Supplied as free-flowing powder.

lemon bioflavonoid complex. See bioflavonoids.

lemon chrome. See barium chromate.

lemon, essential salt of. See potassium binoxalate.

lemon-grass oil.

Properties: Two basic types are commercially available: (a) East Indian oil, dark yellow to light brown-red in color; pronounced heavy lemon-like odor; sp. gr. 0.900-0.910 (15/15°C), optical rotation -3° to $+1^\circ$, refractive index (n 20/D) 1.4830-1.4890; soluble in alcohol; slightly soluble in glycerol. (b) "West Indian" oil; light yellow to light brown or orange; odor is lemon-like but of lighter character than East Indian oil; sp. gr. 0.875-0.900 (15/15°C); optical rotation -3° to $+1^\circ$; refractive index (n 20/D) 1.4830-1.4890; soluble in fixed oils and alcohol, slightly soluble in glycerol.

Derivation: Steam distillation of Cymbopogon grasses: (a) East Indian oil from Cymbopogon flexuosus and Andropogon nardus var. flexuosus. (b) "West Indian" oil from Cymbopogon citratus and Andropogon nardus var. ceriferus.

Method of purification: Rectification.

Containers: Cans, drums.

Uses: Aromatic; isolates and ionones.

lemon oil (limonis oil).

Properties: Pale to deep-yellow or greenish yellow, limpid liquid; fragrant lemon-like odor; aromatic, mild, bitterish taste; sp. gr. 0.856-0.861 (sometimes 0.854); optical rotation $+56^\circ$ to $+67^\circ$; refractive index 1.474-1.476, evaporation residue 2.1 to 6.6. Not perfectly soluble in 6 to 8 vols. of 90% alcohol, soluble in 0.5 to 1 vol. of 95% alcohol; soluble in carbon disulfide and glacial acetic acid.

Chief known constituents: Citral; limonene; phellandrene; levo- and dextro-pinene; geraniol; linalool; esters; aldehydes (nonylic, octylic and decylic). Citral

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

content 3.5 to 5%.

Derivation: From Citrus limon.

Grades: U. S. P. XVI; California; Messina.

Containers: Glass bottles; cans; drums.

Uses: Flavoring agent; soft drinks; perfumery; confectionery; polishes.

lemon oil, terpeneless. (See essential oils, terpeneless.)

Strength: 14 to 20 times that of lemon oil.

Constants: Sp. gr. 0.896-0.900; optical rotation 0° to -8° . Soluble 10 to 20 vols. in 100 vols. of 70% alcohol, and in all proportions in 90% alcohol.

Shipping regulations: None.*

lemon peel.

Derivation: The outer rind of the ripe fruit Citrus limon.

Habitat: Northern India, cultivated in Italy and West Indies, Spain, United States and other semi-tropical countries.

Grades: Technical.

Containers: Boxes.

Uses: Cooking; confectionery, lemon oil.

Shipping regulations: None.*

lemon yellow. See chrome yellows.

"Lenigallol."⁹ Trade name for acetpyrogall (pyrogallol triacetate).

"Leonil" SA.³⁰⁷ Trademark for a textile chemical specialty, a naphthalene sulfonic acid derivative, 77% active; anionic.

Properties: Fine, tan powder; soluble in water; stable to 10% H_2SO_4 ; density 0.55-0.65.

Uses: Leveling and penetrating agent in acid and chrome color dyeing of wool.

lepidine (gamma-methylquinoline; cincholepidine) $C_9H_9NCH_3$. An alkaloid.

Properties: An oily liquid; quinoline-like odor; turns red-brown on exposure to light. Sp. gr. 1.086; b. p. $266^\circ C$; solidifies about $0^\circ C$. Soluble in alcohol, ether, and benzene; slightly soluble in water.

Derivation: From cinchonine.

Method of purification: Rectification.

Grade: Technical.

Containers: Amber glass bottles.

Use: Organic preparations.

Shipping regulations: None.*

lepidolite (lithia mica) $K_2Li_3Al_4Si_7O_{21}(OH, F)_3$.

A fluosilicate of potassium, lithium, and aluminum, found in pegmatites. Rubidium occurs as an impurity. A variety of mica (q. v.).

Properties: Color pink and lilac to gray; luster pearly; perfect micaceous cleavage, hardness 2.5-4; sp. gr. 2.8-3.0.

Occurrence: California, South Dakota, New Mexico, South Africa.

Use: Source of lithium and rubidium; flux in glass and ceramics production.

lepidomelane. See mica.

leptandra (Culver's root; black root).

Derivation: Dried rhizome and roots of *Veronica virginica*.

Habitat: Eastern United States.

Grade: Technical.

Containers: Bags.

Use: Medicine.

lepton. The name of a group of fundamental particles (q. v.). A lepton is a fundamental particle whose mass is equal to or less than that of a muon, or mu-meson. The group includes muons, electrons, neutrinos, and photons.

"Lethane."²³ Trademark for insecticide concentrates based on beta-butoxy-beta-thiocyanodiethyl ether. Supplied in petroleum distillate.

Use: Knockdown agent and toxicant in household, dairy and industrial insecticide sprays; mosquito larvicides.

lethargy. A term used in nuclear technology as a measure of the energy loss of neutrons in slowing down by multiple scattering in the moderator. It is the natural logarithm of the ratio of the initial energy to the energy of the state in question.

leucine (alpha-amino-gamma-methylvaleric acid; alpha-aminoisocaproic acid) $(CH_3)_2CHCH_2CH(NH_2)COOH$. An essential amino acid. Found naturally in the L(-) form.

Properties: White crystals; soluble in water; slightly soluble in alcohol; insoluble in ether; optically active (natural form).

DL-leucine m. p. $332^\circ C$ with decomposition.

L(-)-leucine m. p. $295^\circ C$; sp. gr. 1.239 ($18/4^\circ C$).

Derivation: Hydrolysis of protein (edestin, hemoglobin, zein), organic synthesis from the alpha-bromo acid.

Containers: Drums.

Use: Nutrition and biochemical studies.

Available commercially as DL-leucine.

leucite $KAl(SiO_3)_2$ or $K_2O \cdot 4SiO_2$. A natural potassium-aluminum silicate found in lava. Color, white or gray; white streak; vitreous or greasy luster. Contains 21.5% potash. Constants: Sp. gr. 2.45-2.50; hardness 5.5-6. Occurrence: United States (Wyoming, Montana, Arkansas); Italy (most abundant source), Brazil; Sardinia; Bohemia; Asia Minor, Africa; Australia; Java; Borneo; Siberia.

Containers: Glass bottles; fiber cans.

Use: Possible source of potash.

leuco-alizarin. See anthrarobin.

leuco-compounds. See vat dyes.

leucogen. See sodium bisulfite.

leucoline. See quinoline.

"Leucosol."²⁸ Trademark for a line of vat colors especially prepared for textile printing.

"Leukanol."²³ Trademark for synthetic tanning assistants of the sulfonic-type, supplied in liquid and solid grades. Powerful dispersants for vegetable tannins and bleaches for chrome-tanned leather.

Use: Tanning and bleaching leather.

"Leukeran."³⁰¹ Trademark for chlorambucil (q. v.).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

levallorphan tartrate (*l*-N-allyl-3-hydroxymorphinan bitartrate) $C_{19}H_{25}NO \cdot C_4H_6O_6$.

Properties: White or practically white, odorless crystalline powder. M. p. 174-177°C. Soluble in water; sparingly soluble in alcohol; insoluble in ether and chloroform.

Grade: U. S. P. XVI.

Use: Medicine.

Levant wormseed. See *santonica*.

levarterenol (*l*-norepinephrine; *l*-arterenol; *l*-alpha-(aminomethyl)-3,4-dihydroxybenzyl alcohol) $C_6H_3(OH)_2CH(OH)CH_2NH_2$. A peripheral vasoconstrictor.

Properties: Microcrystals; occurs in adrenal glands. Decomposes at 217°C.

Use: Medicine.

levarterenol bitartrate (*l*-norepinephrine bitartrate) $(HO)_2C_6H_3CHOHCH_2NH_2 \cdot C_4H_6O_6 \cdot H_2O$.

Properties: White or faintly gray crystalline, odorless powder; affected by air and light; m. p. 100-106°C; freely soluble in water; slightly soluble in alcohol; practically insoluble in ether and chloroform; pH (0.1% solution) 3.0-4.0.

Grade: U. S. P. XVI.

Use: Medicine.

leveling agents. Compounds added to the dye bath in conjunction with certain dyes to assist in bringing about the level or even deposition of the latter.

"**Leveller.**" ²³² Brand name for a series of dyebath assistants and dispersing agents.

"**Levelume.**" ⁷² Trade name for bright, high leveling nickel process. Prepared from nickel sulfate, nickel chloride, boric acid and organic addition agents. Solution is operable at high current densities (60 to 80 a. s. f.) and produces ductile, low stress deposits. Applications are in electrical appliance decorative plating, automotive trim, plumbing fixtures.

levisticum oil. See *lovage oil*.

"**Levo-Dromoran**" **Tartrate.** ¹⁹⁰ Trademark for a brand of levorphanol tartrate, (q. v.), the levorotatory form of 3-hydroxy-N-methylmorphinan tartrate.

levonordefrin *l*-1-(3',4'-dihydroxyphenyl)-2-amino-1-propanol, *l*-3,4-dihydroxynorephedrine $C_6H_4(OH)_2(CHOHCHNH_2CH_3)$. White to buff-colored, odorless, crystalline solid. M. p. 205°-215°C. Practically insoluble in water; slightly soluble in acetone, chloroform, alcohol, and ether; freely soluble in aqueous solutions of mineral acids.

Grade: N. F. XI.

Use: Medicine.

"**Levophed**" **Bitartrate.** ¹⁶² Trademark for levarterenol bitartrate.

levorotatory. Having the property when in solution of rotating the plane of polarized light to the left or counterclockwise. Levorotatory compounds are given the prefix *l*- to

distinguish them from their dextrorotatory or *d*- isomers.

See also optical isomerism, and the prefix *D*-.

levorphanol tartrate (levo-3-hydroxy-N-methylmorphinan tartrate dihydrate)

$C_{17}H_{23}NO \cdot C_4H_6O_6 \cdot 2H_2O$.

Properties: White, odorless, bitter crystalline powder; m. p. 114-116°C; insoluble in chloroform and ether; slightly soluble in alcohol and water; stable to light, air, heat and moisture; pH (1% solution) 3.4-4.0.

Grade: N. F. XI.

Use: Medicine.

levulic acid. See *levulinic acid*.

levulinic acid (gamma-ketovaleic acid; aceto-propionic acid; levulic acid) $CH_3CO(CH_2)_2COOH$.

Properties: Crystals. B. p. 245-246°C (760 mm); m. p. 33-35°C; sp. gr. 1.1447 (25/4°C); refractive index 1.442 (16/D). Completely soluble in water, alcohols, esters, ethers, ketones, aromatic hydrocarbons. Insoluble in aliphatic hydrocarbons.

Containers: 5-, 55-gal containers.

Uses: Organic synthesis; pharmaceuticals; chrome plating; solder flux; stabilizer for calcium greases; control of lime deposits.

Shipping regulations: None.*

levulin, synthetic. See *levulosin*.

levulose. See *fructose*.

levulosin (levulin, synthetic; fructosin) $(C_6H_{10}O_5)_x$.

Properties: Deliquescent, amorphous, white solid; m. p. 140-145°C (dec); very soluble in water, slightly soluble in alcohol; insoluble in ether.

Derivation: Carbohydrate from the rhizomes of *Helianthus tuberosus* (Jerusalem artichoke); also produced by organic synthesis.

"**Lewis.**" ²⁰⁴ Trademark designating different brands of household lye.

Lewis acids. See *acid*.

lewisite. See *beta-chlorovinyl-dichloroarsine*.

"**Lewisol.**" ²⁶⁶ Trademark for a series of maleic alkyl-modified rosin-esters.

Uses: In lacquers and varnishes to give gloss, hardness, adhesion, and resistance to after-yellowing; also used in sanding sealers, enamels and printing inks.

Lewis process. A process for the production of carbon black from natural gas. The gas is burned in a limited supply of air. The black smoke is condensed with water, settled, filtered, dried, and powdered. The process produces a soft black useful in rubber compounding.

"**Lexan.**" ²⁴⁵ Trademark for thermoplastic carbonate-linked polymers produced by reacting bisphenol A and phosgene. Used in molding applications and other industrial arts.

See also polycarbonate resins.

Leyden blue. See *cobalt blue*.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

LH. Abbreviation for luteinizing hormone.

Li. Symbol for lithium.

liatris (deer's tongue; vanilla plant; wild vanilla).

Derivation: Leaves of *Liatris odoratissima*.

Habitat: United States (Virginia to Florida and Louisiana).

Grade: Technical.

Containers: Boxes.

Uses: Medicine; perfumery; flavoring tobacco.

Shipping regulations: None.*

"Librium" Hydrochloride. ¹⁹⁰ Trademark for a brand of chlordiazepoxide hydrochloride (q. v.).

lichen blue. See litmus.

lichenic acid. See fumaric acid.

lichenin $C_6H_{10}O_5$.

Properties: Amorphous compound resembling and isomeric with starch. Soluble in water.

Derivation: From Iceland moss.

Shipping regulations: None.*

licorice. See glycyrrhiza.

lidocaine (alpha-diethylaminoaceto-2,6-xylylide) $C_6H_3(CH_3)_2NHC(O)CH_2N(C_2H_5)_2$.

Properties: White or slightly yellow crystalline powder; characteristic odor; m. p. 66-69°C; b. p. 180-182°C (at 4 mm); soluble in alcohol, ether or chloroform; insoluble in water.

Derivation: By action of diethylamine on chloroacetylxylylide.

Grade: U. S. P. XVI.

Use: Medicine.

light oils. Fractional distillates from coal-tar, with b. p. range from 110-210°C, consisting of a mixture of benzene, pyridine, toluene, xylene, phenol and cresols.

Grade: Technical.

Containers: Tank cars; iron drums.

Uses: Source of benzene, solvent naphthas, toluene, xylene, phenol and cresols.

Fire hazard: Dangerous.

Shipping regulations: Flammable liquid. Red label.*

Note: The term is also sometimes used for oils of about the same b. p. range, but from other sources.

light red. A red pigment obtained by calcining yellow ochre.

See ochers.

linaloe oil. See linaloe oil, Mexican.

"Lignasan." ²⁸ Trademark for fungicide based on ethyl mercury phosphate.

Containers: 2-lb bags; 125-lb drums.

Use: For controlling sap stain or "blue stain" of lumber.

"Lignasan" X. ²⁸ Trademark for product containing ethyl mercury phosphate.

Properties: Blue, free-flowing powder.

Containers: 125-lb drums; bulk; 4-oz envelopes packed in 50-lb drums.

Uses: Biological control of paper mill slime;

preservation of starch and adhesives compositions and alum solutions.

lignin. The major non-carbohydrate constituent of wood and woody plants, comprising about one fourth of many such materials. It functions as a natural plastic binder for the cellulose fibers. Its chemical composition has been given as $(C_{10}H_{13}O_3)_x$ but this is undoubtedly oversimplified. These atoms are believed to be grouped structurally as $-(C_6H_4)(OCH_3)C_3H_6O-$ since there is evidence of benzene nuclei, methoxy groups, and 3-carbon side chains. There is also evidence of unsaturation.

Lignin is removed from wood by both the sulfate and soda paper pulp processes (see wood pulp), and limited amounts have been recovered from these sources and other wood waste.

Containers: 70-lb bags; 250-lb drums.

Uses: Stabilization of asphalt emulsions; rubber reinforcement; ceramic binder and deflocculant; dye leveler and dispersant; oil mud additive, precipitation of proteins; extender for phenolic plastics.

lignin sulfonates (lignosulfonates). Metallic sulfonate salts made from the lignin of sulfite pulp-mill liquors. See lignin. Molecular weights range from 1000 to 20,000.

Properties: Light-tan to dark-brown powder; no pronounced odor; stable in dry form and relatively stable in aqueous solution; non-hygroscopic; no definite m. p.; decompose above 200°C, sp. gr. about 1.5. Generally give colloidal solutions or dispersions in water, practically insoluble in all organic solvents.

Uses: Dispersing agents in concrete and carbon black-rubber mixes; extenders for tanning agents; oil mud additives; ore flotation agents; production of vanillin, industrial cleaners, gypsum slurries, dyestuffs, pesticide formulations.

Commercially available as the salts of most metals and of ammonium.

See also sulfite waste liquor.

lignite. A low rank of coal between peat and subbituminous coal. The distinction of lignite from these materials is not sharp, as the transition from one to the other is gradual. Brown coal is a form of lignite closely related to peat. Lignites contain 20-45% moisture as mined and have heating values of 5500-8300 Btu/lb. They tend to disintegrate when exposed to weather and may ignite spontaneously. The principal U. S. deposits are in North Dakota, South Dakota, Montana, Texas, Louisiana, Mississippi, and Arkansas.

lignite wax. See montan wax.

lignocellulose. Plant tissue compounds containing cellulose, hemicellulose and lignin in a form of combination that is not well understood and probably varies with specific circumstances.

lignoceric acid (n-tetracosanoic acid) $CH_3(CH_2)_{22}COOH$. A long chain saturated

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

fatty acid found in minor quantities in most natural fats.

Properties: Crystals; m. p. 84.2°C; b. p. 272°C (10 mm); sp. gr. 0.8207 (100/4°C); refractive index 1.4287 (100°C); nearly insoluble in ethanol.

Source: Lignite and beechwood tar; peanut oil; sphingomyelin.

Grades: Technical; 99%.

Use: Biochemical research.

"**Lignocol.**"¹³⁸ Trademark for an anti-skinning agent.

Properties: Clear, colorless to pale yellow liquid, miscible with alcohols, mineral spirits, toluene, vegetable oils and ester solvents; soluble in alkalis.

Containers: 40-, 450-lb drums.

Uses: An anti-skinning agent for paints, varnishes, enamels and other quick-drying finishes, particularly applicable in dipping tanks and industrial finishes where skinning is encountered; an anti-oxidant for printing inks and putties, and anti-gumming agent for hydrocarbon solvents.

lignosulfonates. See lignin sulfonates.

"**Lignox.**"²³⁶ Brand name for a proprietary soluble calcium lignosulfonate in dry powder form. Used for treatment of drilling mud containing calcium ions and in brine emulsion muds.

Containers: Asphalt-lined paper bags containing 50 lbs.

ligroin (petroleum ether; benzene). A saturated, volatile fraction of petroleum boiling in the range 20-135°C (58-275°F). It is used as a solvent, mostly in the laboratory.

The term ligroin should be used in place of benzene or petroleum ether. There is a special grade known as petroleum benzine (q. v.).

Fire hazard: Dangerous! Use with adequate ventilation; avoid prolonged breathing of vapor.

Shipping regulations: Flammable liquid.

Red label. Legal label name: benzene or petroleum ether.*

"**Lilial.**"²²⁷ C₁₄H₂₀O. Trademark for para-tert-butyl-alpha-methylhydrocinnamaldehyde; [alpha-methyl-beta-(para-tert-butyl-phenyl) propionaldehyde].

Properties: Lilial is a clear, stable, slightly yellow liquid. Lilial Prime, a less highly refined grade, is slightly cloudy. Powerful odor recalling linden blossoms. Sp. gr. 0.942-0.949 (25/25°C); refractive index (n_D 20) 1.5030-1.5100; flash point TCC 204°C. Clearly soluble in 3 parts of 80% alcohol, 1 part of 90% alcohol.

Occurrence: Not found in nature.

Storage: Store in tightly-closed containers, preferably full. Avoid heat.

Uses: Building and bouquetting of lily, muguet, orange flower, lilac and other floral blends.

"**Lily.**"²⁴² Trade name for a high grade of stearic acid. (Iodine value of 1.0 max.)

lily-of-the-valley. See convallaria.

Lima oil. See petroleum.

lime. In a narrow specific sense this refers to calcium oxide (q. v.). It is also used as a loose general term which refers to any of the various chemical and physical forms of quicklime, hydrated lime, and hydraulic lime used for any purpose. (Adapted from ASTM definition; ASTM C41-47.)

lime acetate. See calcium acetate.

lime, agricultural. Lime slaked with a minimum amount of water to form calcium hydroxide.

lime, air-slaked. Lime which has absorbed carbon dioxide and moisture from exposure to the atmosphere. It consists of a powder composed of calcium carbonate and calcium hydroxide.

Shipping regulations: None.*

lime-ammonium nitrogen. Ammonium nitrate with dolomite.

lime, chloride of. See chlorinated lime.

lime citrate. See calcium citrate.

lime, compounds of. See corresponding compounds of calcium.

lime, fat. A pure lime which combines readily with water to form a fine white powder, free from grit, and makes a smooth stiff paste with excess of water.

See also lime, lean.

Caution: Must not be loaded hot.

lime glass. See glass.

lime hydrate. Calcium hydroxide or hydrated lime.

lime, hydrated (slaked lime). A term usually applied to the commercial limes marketed as such after having been slaked with the correct quantity of water to yield a dry, fine powder. See also calcium hydroxide. Containers: Multiwall paper sacks; wooden barrels.

Shipping regulations: None.*

lime, hydraulic. A variety of calcined limestone which, when pulverized, absorbs water without swelling or heating and gives a cement that hardens under water. The limestone burned for this purpose usually contains from 10-17% silica, alumina and iron and from 40-45% lime, with magnesia sometimes replacing lime to a considerable extent. Hydraulic limes slake more slowly than do ordinary limes and range all the way from those with feeble hydraulic properties to limes which harden well under water.

Caution: Must not be loaded hot.

lime hypophosphite. See calcium hypophosphite.

lime, lean. A lime which does not slake freely with water due to the fact that it has been prepared from limestone containing a high percentage of impurities, e. g., silica, iron, alumina, etc.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

See also lime, fat.

Caution: Must not be loaded hot.

lime, liver of. See lime, sulfurated.

lime nitrate. See calcium nitrate.

lime-nitrogen. See calcium cyanamide.

lime oil (limette oil). An oil obtained from *Citrus aurantifolia*, which is grown in the West Indies and Mexico. Two different oils are produced, one by expression and the other by distillation of the peel, also as a by-product in the evaporation of lime juice used for the production of citric acid.

Expressed oil:

Properties: A golden-yellow oil hardly distinguishable from a high-grade lemon oil but having a more intense odor.

Chief known constituents: Citral, bisabolene, citriopten. Citral content: 2.2-6.6% (Burgess).

Constants: Sp. gr. 0.878-0.901 (usually 0.880-0.884) (15°C); optical rotation +32° to +38°, refractive index 1.482-1.486, evaporation residue 10-18%, saponification value of the residue 160-181. Soluble in 4-10 vols of 90% alcohol (with turbidity, bluish fluorescence and separation of waxy constituents).

Distilled oil:

Properties: Unpleasant turpentine odor.

Chief known constituents: Terpeneol, bisabolene. No citral.

Constants: Sp. gr. 0.860-0.870 (15°C), optical rotation +33° to +47°, refractive index 1.4702-1.4707.

Containers: Bottles; cans.

Uses: Extracts, flavoring, perfumery; toilet soaps; cosmetics.

Shipping regulations: None.*

lime oil, terpeneless. See essential oils, terpeneless.

Concentration: About 12-16 times that of the ordinary oil.

Constants: Sp. gr. (about) 0.92-0.93, optical rotation (about) -2°.

Shipping regulations: None.*

lime, quick. See calcium oxide.

lime saltpeter. See calcium nitrate.

lime slag cement. See slag cement.

lime, slaked. See lime, hydrated.

lime-soda process. The use of slaked lime (calcium hydroxide) and soda ash (sodium carbonate) to remove hardness in water. Hardness is caused by the presence of soluble calcium and magnesium salts (carbonates, chlorides, sulfates).

limestone CaCO_3 . A rock composed mainly of calcium carbonate in the form of the mineral calcite (q. v.). Limestones are sometimes classed according to the impurities contained, e. g.,

Dolomitic limestone: Usually a limestone containing more than 5% magnesium carbonate.

See dolomite.

Magnesium limestone: A term used inter-

changeably with dolomitic limestone.

Argillaceous limestone: A limestone containing clay.

Siliceous limestone: A limestone containing sand or quartz.

Limestones are also named according to the formation in which they occur. See also marble.

Occurrence: Found in all parts of the United States, Canada, and most other countries.

Uses: Building stone; metallurgy (flux); manufacture of lime, source of carbon dioxide; agriculture; road ballast.

limestone, hydraulic. See lime, hydraulic.

limestone whiting. See whiting.

lime, sulfurated (calcic liver of sulfur; liver of lime, hepar calcis; calcium sulfide, crude, calx sulfurata). A mixture of calcium sulfide (q. v.) and calcium sulfate.

Properties: Yellowish-gray or grayish-white powder; odor of hydrogen sulfide. Soluble in acids; insoluble in water and alcohol.

Derivation: By roasting calcium sulfate with coke.

Grade: Technical.

Containers: Iron drums.

Uses: Medicine; depilatory, luminous paint.

Shipping regulations: None.*

lime-sulfur solution. A solution made by boiling together lime (50 lbs), sulfur (100 lbs) and water (100 gals) and diluting to one-tenth strength. Used extensively as a fungicidal spray on fruit trees and as a sheep dip.

Shipping regulations: None.*

limette oil. See lime oil.

lime-uranite. See autunite.

lime water.

Properties: Clear, colorless, odorless, alkaline aqueous solution of calcium hydroxide containing not less than 0.14 g of $\text{Ca}(\text{OH})_2$ in each 100 cc at 25°C. (Note: The strength varies with the temperature at which the solution is stored.) Sp. gr. about 1.00 (25°C). Absorbs carbon dioxide from the air.

Grade: U. S. P. XVI.

Containers: Glass bottles; carboys.

Use: Medicine.

Shipping regulations: None.*

limonene dioxide. See dipentene dioxide.

limonene, inactive (or racemic or dl). See dipentene.

limonene monoxide. See dipentene monoxide.

limonis oil. See lemon oil.

limonite (brown hematite, brown ironstone clay, brown iron ore) $\text{FeO}(\text{OH}) \cdot n\text{H}_2\text{O}$. A natural iron oxide. Most limonite is now thought to be an amorphous form of goethite and other iron oxides with adsorbed and capillary water. Often mixed with small amounts of hematite, clay, sand, and manganese oxides.

Properties: Color dark brown to black, occasionally yellow brown; streak yellow

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

brown to brown; luster vitreous to dull; hardness 5-5.5; sp. gr. 3.6-4.0.

Varieties:

Bog iron. A variety of iron ore occurring as loose porous masses and found in marshy ground.

Yellow ochre (umber). Earthy material, mixed with clay. See also umber.

Brown clay (ironstone). Compact, often nodular masses, with clay.

Occurrence: Widespread.

Use: An ore of iron; yellow pigment.

linaloe oil. See linaloe oil, Mexican.

linaloe oil, Mexican (linaloe oil).

Properties: Water-white or yellowish oil.

Chief known constituents: Linalool; geraniol; terpineol.

Constants: Sp. gr. 0.875-0.891 (15°C), optical rotation -3° to -14° , refractive index, 1.460-1.465; acid value up to 3.0; ester value 1-42.

Soluble in 1.5-2 vols of 70% alcohol, in 4-5 vols or more of 60% alcohol.

Derivation: By distilling the wood and fruit of several species of *Bursera*.

Habitat: Mexico.

Containers: 5-lb bottles; cans.

Use: Perfumery.

Shipping regulations: None.*

linaloe wood. The strongly fragrant wood of Cayenne and French Guiana which, upon distillation, yields linaloe oil (q. v.). When exported, it is in the form of cord wood from which the bark has not been removed. It is hard and heavy, cleaves easily, and the surface is reddish although yellow when freshly cut.

Shipping regulations: None.*

linalol. See linalool.

linalool (linalol)

$(\text{CH}_3)_2\text{C}=\text{CHCH}_2\text{CH}_2\text{C}(\text{CH}_3)\text{OHCH}:\text{CH}_2$.

3,7-Dimethyl-1,6-octadien-3-ol. Linalool is the *l*-isomer; coriandrol is the *d*-isomer.

Properties: Colorless liquid, odor similar to that of bergamot oil and French lavender. Soluble in alcohol and ether.

Constants: Sp. gr. 0.858-0.868; b. p. 195-199°C.

Derivation: Derived from many essential oils, particularly from rosewood, petit grain, linaloe wood, bergamot, ho oil, and others.

Method of purification: Rectification.

Grades: Ex bois de rose; synthetic.

Containers: Glass bottles, drums.

Use: Perfumery.

Shipping regulations: None.*

linalyl acetate $\text{C}_{10}\text{H}_{17}\text{C}_2\text{H}_3\text{O}_2$.

Properties: Clear, colorless, oily liquid; odor of bergamot; b. p. 108-110°C, sp. gr. 0.908-0.920; refractive index (*n*_D²⁰) 1.450-1.458; soluble in alcohol, ether, diethyl phthalate, benzyl benzoate, mineral oil, fixed oils, alcohol, slightly soluble in propylene glycol; insoluble in water, glycerin.

Derivation: By the action of acetic anhydride

on linalool in presence of sulfuric acid.

Method of purification: Rectification.

Grades: Technical (92%); 96-98%.

Containers: Glass bottles; drums.

Uses: Extracts; perfumery.

Shipping regulations: None.*

lindane (gamma-benzene hexachloride) $\text{C}_6\text{H}_6\text{Cl}_6$.

The gamma isomer of 1,2,3,4,5,6-hexachlorocyclohexane.

Properties: White, crystalline powder with slight musty odor. M. p. 112.5°C. Freely soluble in acetone, benzene, and chloroform; soluble in alcohol; slightly soluble in ethylene glycol; practically insoluble in water.

Derivation: Chlorination of benzene in the presence of ultraviolet light. The mixture of stereoisomers, containing about 12% lindane, is separated by fractional crystallization.

Grade: U. S. P. XVI; technical.

Containers: Bags, drums.

Use: Insecticide, herbicide; medicine.

Hazard: (For dry formulations, 25% and over): Warning! May be fatal if swallowed. May be absorbed through skin. (Dry formulations less than 25%): Caution! Avoid breathing dust, vapor, or spray mist. Avoid contact with skin and eyes. MCA warning labels.

"Lindol." ³⁵² Trademark product consisting of tricresyl phosphate.

Properties: Clear, transparent, oily liquid; color (Hazen Std.) 100; sp. gr. (20°C) 1.170; free phenols none, acidity not over 0.01%; ester value more than 99%; b. p. (10 mm) 260-275°C, pour pt. -15°C , flash point 225°C, surface tension 43 dynes/cm, specific heat 0.42 cal/g/°C, hydrolysis (16 hrs in boiling water) trace; solubility in water (25°C) 0.0004 ml/100 ml; refractive index (25°C) 1.553; viscosity 80 cps, 285 seconds, Saybolt Universal. Miscible in all proportions with well known lacquer solvents and diluents.

Containers: 1-, 5-gal cans; 55-gal drums.

Uses: Plasticizer in artificial leather, adhesives, lacquers and plastics of cellulose nitrate, ethylcellulose, vinyl resins, etc; blending agent for resins, grinding medium for pigments, fireretarding agent; lubricating agent.

Shipping regulations: None.*

"Lindsite." ⁸⁸ Trademark for a rare earth oxide glass polishing agent. Contains cerium and other rare earth oxides in the proportion in which they occur naturally.

linear accelerator. A particle accelerator which accelerates electrons or ions through small voltages at a series of electrodes arranged in line, without the use of a magnet.

linnaeite Co_3S_4 , or $(\text{CoNi})_3\text{S}_4$. Steel-gray metallic mineral with reddish tarnish. Essentially cobalt sulfide but part of the cobalt is nearly always replaced by nickel and to a less extent by iron and copper.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Luster, metallic. Does not occur in large amounts.

Constants: Sp. gr. 4.8-5; hardness 5.5.

Occurrence: United States (Maryland, Missouri, Nevada), Germany.

Use: Source of cobalt and nickel.

"Linodoxine." ²⁹⁹ Trademark for a combination drug containing linoleic acid and pyridoxine hydrochloride (vitamin B-6).

"Linoll." ²²¹ Trade name for a series of foundry core oils.

linoleic acid (linolic acid)

$\text{CH}_3(\text{CH}_2)_4\text{CH}:\text{CHCH}_2\text{CH}:\text{CH}(\text{CH}_2)_7\text{COOH}$. An unsaturated fatty acid with two double bonds, widely distributed as a glyceride in the plant kingdom. It has been classed as the most important polyethenoid acid found in fats and oils. It is of commercial importance as a constituent of drying oils used in paints and varnishes. It is one of the so-called essential fatty acids in the human diet. Both the conjugated and nonconjugated acids are called linoleic acid (conjugated is 9, 11-octadecadienoic, $\text{CH}_3(\text{CH}_2)_5\text{CH}:\text{CHCH}:\text{CH}(\text{CH}_2)_7\text{COOH}$; nonconjugated is 9, 12-octadecadienoic, as in formula at beginning of article).

Properties: Colorless to straw-colored liquid; sp. gr. 0.905 (15/4°C); m. p. -5°C, b. p. 228°C (14 mm); refractive index 1.4710 (15°C). Insoluble in water, soluble in most organic solvents.

Commercial sources: Linseed oil, safflower oil; tall oil.

Grades: Technical, purified (99+%); edible grade free from chick edema.

Containers: Drums.

Uses: Soaps; special driers for protective coatings; emulsifying agents, medicine, foods; feeds; biochemical research.

linolein. A glyceride of linoleic acid. It is the constituent of linseed oil which induces the drying property.

linolenic acid (9, 12, 15-octadecatrienoic acid)

$\text{CH}_3\text{CH}_2\text{CH}:\text{CHCH}_2\text{CH}:\text{CHCH}_2\text{CH}:\text{CH}(\text{CH}_2)_7\text{COOH}$. An unsaturated fatty acid containing three double bonds (a nonconjugated triene acid), which occurs as the glyceride in many seed fats, although often in small amounts. Linolenic acid is considered one of the essential fatty acids in the diet. It must also be present in drying oils in appreciable proportion to produce effective film formation and hence the natural oils such as linseed, perilla and hempseed possessing a linolenic acid content of 25 to 65% are in demand. Their principal use is in the manufacture of synthetic resins and of paints, varnishes, printing inks, etc.

Properties: Colorless liquid; soluble in most organic solvents, insoluble in water; sp. gr. 0.916 (20/4°C); m. p. -11°C; b. p. 230°C (17 mm).

Grade: Purified 99+%.

Uses: Medicine; biochemical research.

linolenyl alcohol

$\text{CH}_3\text{CH}_2\text{CH}:\text{CHCH}_2\text{CH}:\text{CHCH}_2\text{CH}:\text{CH}(\text{CH}_2)_7\text{CH}_2\text{OH}$. The fatty alcohol derived from linolenic acid. It has a long straight carbon chain with three double bonds. Available commercially as a 50% product. Liquid at room temperature.

Typical specifications: Iodine value 190; cloud point 50.0°F; sp. gr. 0.864; color, white.

Derivation: Reduction of acid made from linseed oil.

Impurities: Oleyl and linoleyl alcohols with some saturated alcohols.

Uses: Protective coatings; flotation; lubricants; surface active agents; resins; synthetic fibers.

linoleum. Oxidized linseed oil, rosin and powdered cork are heated and the mass pressed hot onto canvas. Colors are obtained by mixing pigments in with the mass.

linoleyl alcohol

$\text{CH}_3(\text{CH}_2)_4\text{CH}:\text{CHCH}_2\text{CH}:\text{CH}(\text{CH}_2)_7\text{CH}_2\text{OH}$. The fatty alcohol derived from linoleic acid. It has a long, straight carbon chain with two double bonds in it. Available commercially as a 50-60% pure alcohol. It is liquid at room temperature.

Typical specifications: Iodine value 137; sp. gr. 0.855, color, white; cloud point 59°F.

Derivation: Reduction of linoleic acid.

Impurities: Mostly oleyl alcohol with some linolenyl, and saturated alcohols.

Uses: Protective coatings, flotation, paper; surface active agents, resins, and leather.

linoleyltrimethylammonium bromide. An amorphous solid from yellow to very light brown in color. Very soluble in water, alcohol.

Uses: Germicide, deodorant; used as algicide and in slime control.

linolic acid. See linoleic acid.

linseed (flaxseed; linum).

Derivation: Ripe seeds of *Linum usitatissimum* (flax).

Habitat: Cultivated extensively.

Grades: Technical, N. F. XI.

Containers: Bags.

Uses: Source of linseed oil and cake, medicine as a demulcent and emollient.

Shipping regulations: None. *

linseed cake. The press cake formed when the seeds are crushed and the oil is extracted. See linseed oil meal.

linseed oil (flaxseed oil).

Properties: Golden-yellow, amber or brown oil with peculiar odor and bland taste; thickens and hardens on exposure to air, darkening and acquiring a pronounced taste. It is a typical drying oil. Soluble in ether, chloroform, carbon disulfide, petroleum ether, and turpentine; slightly soluble in alcohol.

Constants: These vary with source and treatment of the oil. Typical specifications

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

for the raw oil are: sp. gr. 0.931-0.936; iodine value, Wijs, (min) 177; saponification value 189-195; acid no (max) 4 (ASTM D 234-48); sp. gr. 0.925-0.935; iodine value, Hanus, (min) 170; saponification value 187-195.

Chief constituents: Glycerides of linolenic, oleic, linoleic and saturated fatty acids.

The drying property is due to the linoleic and linolenic groups.

Derivation: From the seeds of the flax plant *Linum usitatissimum* by expression, or solvent extraction. Various refining and bleaching methods are used.

Grades: Raw (see linseed oil, raw), boiled (see linseed oil, boiled); double boiled; blown (see linseed oil, blown); varnish makers, refined (see linseed oil, refined).

Containers: Cans; drums; tank cars.

Uses: Paints; varnishes; linoleum and oil-cloth; printing inks; core oils; linings and packings; synthetic resins; caulking; soap; pharmaceuticals.

linseed oil, blown. Linseed oil which is bodied, i. e., its viscosity is increased by having air bubbled through it while heated to 125°C. The reaction is mainly oxidation followed by polymerization of the oxidized molecules. The resulting product dries to a harder film than heat-bodied oils and is used largely in interior paints and enamels.

linseed oil, boiled. The term is a misnomer since the oil is not boiled. Small amounts of the oxides of manganese, lead, or cobalt, or their naphthenates, resinsates or linoleates, are added to hot linseed oil. The substances so introduced are known as driers and serve to accelerate the drying of the oil. The "boiled oil" becomes thicker, more dense and assumes a darker hue.

linseed oil meal (linseed cake). The crushed and extracted residue from flaxseed (linseed). This is generally prepared by the "old process" consisting of crushing the seeds, cooking with steam, and hydraulic expression of the oil from the resulting cake. It is sold by the varying protein content. An example of a 33% protein meal has a typical analysis of 33.1% crude protein, 8.0% crude fiber; 34.5% nitrogen-free extract; 10.2% ether extract (fat) and contains approximately 74% total digestible nutrients.

Containers: Bags or bulk.

Uses: Animal feeds; fertilizer ingredient.

Shipping regulations: None.*

linseed oil, raw. Untreated raw oil from the flaxseed presses which is filtered through duck and flannel filter cloths in a plate and frame press. Yellow-brown or amber in color.

linseed oil, refined. Raw linseed oil which has been treated for the removal of solid fats, foreign matter and mucilaginous material. May be treated with acid or alkali, and fuller's earth used

for bleaching and clarification of the final product.

"Linstyrol." "Trade name for styrenated linseed oil. Dries hard overnight and has good compatibility characteristics. Used for styrenated alkyds, vehicle reinforcement.

linters. Fleecy fibers from one-eighth to one-quarter of an inch in length, which adhere to cottonseed after it has been passed once through a cotton-gin. They are removed from the seed by a second ginning.

Uses: Rayon manufacture; pyroxylin; artificial leather; photographic films; plastics; explosives.

Shipping regulations: None.*

linum. See linseed.

lion's tooth. See taraxacum.

lipase. A class of enzymes which hydrolyze fats to glycerol and fatty acids. Lipase is abundant in the pancreas, but also occurs in gastric mucosa, in the small intestine, and in fatty tissue. It is found in milk, wheat germ, and various fungi. Commercial pancreatin and most trypsin preparations contain lipase. Commercial uses are in the manufacture of cheese and similar foods, for removal of fat spots in dry cleaning or grease accumulations.

lipid (lipide). A term used to define fats and fat-like materials. It includes all substances which are: (1) relatively insoluble in water but are soluble in the fat solvents (benzene, chloroform, acetone, ether, etc.), (2) related either actually or potentially to fatty acid esters, and (3) utilizable by the animal organism.

lipide. The form for lipid preferred by Chemical Abstracts.

dl-alpha-lipoic acid (6,8-dithiooctanoic acid; thioctic acid; POF)
 $\text{SSCH}_2\text{CH}_2\text{CH}(\text{CH}_2)_4\text{COOH}$. A pyruvate oxidation factor. Pyruvate is a normal intermediate in carbohydrate metabolism.

Properties: Crystals; m. p. 60-61°C, b. p. 160-165°C. Practically insoluble in water; soluble in fat solvents; forms a water-soluble sodium salt.

Sources: Food sources, yeast and liver.

Uses: Nutrition; biochemical research.

"Lipiodine." ³⁰⁵ Trademark for ethyl diiodobradate.

Use: Medicine.

lipotropic agent. An agent which, because of its affinity for fats and oils, helps to regulate the metabolism of fat and cholesterol in the animal body. Inositol is an example.

Lipowitz's metal. See Tables I and III under fusible alloys.

lipoxidase. An enzyme which catalyzes the addition of oxygen to the double bonds of unsaturated fatty acids of plant origin.
Use: Biochemical research; whitening bread.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Liqro." ²²⁸ Trademark for a whole tall oil obtained as a by-product of pulp and paper manufacture by the Kraft process.

Properties: Brown liquid; sp. gr. (60/60°F) 0.98-1.00; pour point, 45°F; viscosity 90-110 SSU at 210°F; moisture 0.4%; acid number 160-170; saponification number 165-175; rosin acids number 76-86, ash 0.4%.

Analysis: Fatty acids, 46-56%; rosin acids, 41-46%; sterols, high alcohols, etc., 6-9%.

Uses: Suitable for use as emulsifying agent for many applications such as asphalt emulsions, cutting oils, disinfectants, etc. Other uses include linoleum, core oils, soaps, and uses where a low cost mixture of rosin and fatty acids is required.

"Liquamast." ²⁹⁹ Trade name for veterinary product containing oxytetracycline hydrochloride and propylene glycol.

"Liquamycin." ²⁹⁹ Trademark for veterinary medicine containing oxytetracycline hydrochloride and propylene glycol.

liquefaction. The separation of two or more components of a mixture by heating to a temperature at which one component melts away leaving the others as solids. Used in the separation of an alloy constituent on heating or cooling.

liquefied petroleum gas (compressed petroleum gas; LPG). A compressed or liquefied gas obtained as a by-product in petroleum refining or natural gasoline manufacture. It usually consists of pure propane and butane, or a butane containing both normal and isobutanes. Its heating value is about 2600-3400 Btu/cu ft, depending on its composition.

Containers: Cylinders and drums; tank cars and tank trucks.

Uses: Domestic fuel, for small communities and isolated homes; industrial fuel; motor fuel; chemical synthesis; especially synthetic rubber.

Shipping regulations: Flammable gas. Red label.*

liquid air. Air which has been subjected to a series of compression, expansion and cooling operations until it liquefies. It may be a milky liquid due to the presence of carbon dioxide or transparent and somewhat blue in color if the carbon dioxide is removed.

Uses: Manufacture of oxygen and nitrogen, physical research.

liquid amber orientalis. See styrax.

liquid ammonia. See ammonia, liquid.

liquid bleach. See chlorine.

"Liquid Blue." ²⁴⁴ A proprietary blend of organic dyestuffs. Manufactured in red and green modifications.

Properties: Soluble in water in all proportions. Gives level tint, completely discharged by sodium hypochlorite bleach to eliminate build-up.

Containers: Quarts, 6 to a case; 2-oz bottles, 16 to a carton, 6 cartons to a case.

Uses: Laundry blue.

Liquid Bright Gold. See gold, ceramic decorating.

Liquid Bright Palladium. ²⁸ Palladium metal with fluxes and vehicles, suitable for application to green ceramics by brushing, stamping, spraying or stenciling, followed by firing to a silvery mirror surface.

Containers: 100- and 500-g bottles.

Uses: Decorating pottery, glass, tile, terracotta, enameled metals.

Liquid Bright Platinum. See Liquid Bright Palladium.

liquid bronzes. See bronzing liquid.

liquid crystal. A liquid having the optical properties of a crystal.

liquid pitch oil. See creosote, coal tar.

liquid propellants. See rocket propellants.

"Liquid Resin SS." ³²⁸ Brand name for a water-soluble urea-formaldehyde resin used alone or with "NCF Paste" to procure a stiff finish on fabrics.

liquid rosin. See tall oil.

"Liqui-Moly." ²⁸⁹ Trademark for a series of extreme condition lubricants compounded with submicronized molybdenum disulfide (MoS₂) in a wide range of petroleum and synthetic oils and greases, volatile hydrocarbons and various resin vehicles. Because of its property of adhering tightly to metals, the molybdenum sulfide creates a load-bearing lubricative film between metal surfaces. The lubricants are suited for extreme pressure, high and low temperatures, and boundary lubrication problems. Molybdenum sulfide is thermally stable and retains its lubricity from -300° to 750°F in air and up to 2000°F in absence of air.

Containers: 1-pt, 1-gal cans; 5-gal steel pails.

liquor, ammonia. See ammonia liquor.

liquorice. See glycyrrhiza.

"Lissolamines" A and V. ²⁰⁶ Brand name for stripping assistants for the correction of faulty dyed and printed materials. The "A" brand is designed primarily for treating materials dyed with azoic colors and the "V" brand for materials dyed with vat dyestuffs.

liter. The volume of one kilogram of water at its temperature of maximum density (4°C) at standard atmospheric pressure. A liter is about 1.05 quarts, or 0.26 gallons.

"Lithafrax." ²⁸⁰ Trademark for a ceramic material made from beta-spodumene.

litharge (lead oxide, yellow; plumbous oxide; lead protoxide; lead monoxide) PbO. An oxide of lead made by heating metallic lead to 550°C. Exists in red and yellow

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

modifications. In one manufacturing process, litharge may be collected in cakes of from 1 to 1.5 tons in weight when it will cool very slowly. The inner part of the cake will swell up and form flakes of red litharge; the outer part, which is necessarily chilled more rapidly, solidifies in lumps of yellow oxide. The flake may be separated from the lump by sifting and marketed as such. The solid material that remains on the screens is ground wet, settled in water and dried. This product is known as levigated litharge. The colors of the commercial grades vary from canary yellow through lemon- to reddish-yellow or red, while a very pure product has the color of yellow ochre. Mechanical compression will turn the pure yellow varieties red. Litharge is soluble in alkalis and acids but insoluble in water. Sp. gr. 9.53; m. p. 888°C.

Grades: C. P.; fused; powdered.

Containers: Bottles; cartons; kegs; wooden and steel barrels; multiwall paper sacks.

Uses: (in approximate order of volume)

Storage batteries; ceramic cements and fluxes, pottery and glazes, glass; chromium pigments; oil refining; varnishes, paints, enamels, ink, linoleum; insecticides; rubber; acid resisting compositions; match head compositions; leather tanning; other lead compounds; medicine.

Warning: Harmful dust. MCA warning label.

Shipping regulations: None.*

See also massicot.

litharge glass. A glass in which litharge (PbO) replaces part of the calcium oxide of ordinary lime-soda glass.

litharge-glycerin cement. Made by mixing glycerin with one sixth to one half portion of water and mixing with enough litharge to give a paste of desired consistency. Must be used as soon as mixed. Fillers retard the setting and avoid cracking. The product is somewhat resistant to acids.

"Lithcote." ¹⁴⁵ Trademark for a line of protective coatings available as LC-19, LC-24, LC-25, LC-34, LC-73, LC-82D, baked modified phenolic or epoxy linings or as LC-610, a catalyzed epoxy coating.

Uses: To prevent corrosion and product contamination.

lithia mica. See lepidolite.

lithic acid. See uric acid.

lithium Li. Element of atomic number 3, group Ia of the periodic system; the lightest of the alkali elements, and the lightest solid element.

Properties: Soft silvery metal; must be kept under gasoline or kerosene or in inert gases. Surface changes from silver to gray on exposure to air. Sp. gr. 0.534, m. p. 179°C, b. p. 1317°C; hardness 0.6 Moh's scale; viscosity of liquid less than that of water, heat capacity equal to that

of water. Good electrical conductor.

Reacts with water, oxygen, and also with nitrogen gas at ordinary temperature.

Sources: Amblygonite, lepidolite, spodumene, petalite, Searles Lake brine (trona) containing dilithium-sodium phosphate.

Derivation: By electrolysis of a fused mixture of lithium chloride and potassium chloride.

Grades: 99.0%, available as ingots, rods, wire, ribbon, and shot.

Containers: Glass bottles containing kerosene; hermetically sealed copper or aluminum cartridges, 2.25 to 108 grams.

Uses: (in approximate order of volume)

Thermonuclear weapons (H-bomb); reducing and hydrogenating agents (lithium hydride, lithium amide, lithium aluminum hydride); alloy hardeners; pharmaceuticals; lithium salts; Grignard agents. Scavenger and degasifier for both stainless and mild steels; deoxidizer in copper and copper alloys; catalyst in the production of synthetic "natural" rubber; selective reducing agent in organic synthesis; intermediate in vitamin A production; additive in rocket propellants; heat transfer medium.

Fire hazard: Dangerous.

Shipping regulations: Flammable solid.

Yellow label.*

lithium acetate LiOOCCH₃ · 2H₂O.

Properties: Deliquescent, colorless crystals.

Pleasant taste leaving a salty aftereffect; m. p. 70°C. Soluble in alcohol and water.

Derivation: Reaction between lithium carbonate and acetic acid.

Use: Medicine.

lithium acetylsalicylate LiOOCCH₂H₄OOCCH₃.

Properties: White, crystalline powder.

Slightly hygroscopic. Soluble in water and alcohol; decomposes in moist air.

Derivation: By adding powdered, anhydrous lithium carbonate to an ethereal solution or suspension of acetylsalicylic acid and precipitating by means of ether.

Use: Medicine.

lithium alcoholates (lithium methylate, ethylate, n-propylate, isopropylate, n-butylate) LiOCH₃, LiOC₂H₅, LiOC₃H₇, LiOC₄H₉.

Properties: White powders which discolor slowly upon standing, changing from white to brown throughout the particle, even in closed bottles, decomposed by water. All soluble in their corresponding alcohols, in benzene, and in ether. Solubility increases with increasing molecular weight.

Grades: 98% alcoholate.

Uses: Condensation-type organic reactions of Claisen group; oxidation and reduction reactions; preparation of inorganic compounds of lithium where water would produce hydrolysis or hydrates, or where product would be too soluble in water.

lithium aluminate LiAlO₂.

Properties: White powder; m. p. above 1625°C; sp. gr. (25°C) 2.55. Insoluble in water.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Grades: Ceramic.

Containers: 100-, 250-lb fiber drums.

Uses: As a flux in high-refractory porcelain enamels.

lithium aluminum deuteride (LAD) LiAlD_4

Properties: White to gray microcrystalline material, sp. gr. 1.02 g/cc. Stable in dry air at room temperature, but very sensitive to moisture. Decomposes above 140°C liberating deuterium. Soluble in diethyl ether, tetrahydrofuran. Slightly soluble in other low molecular weight ethers.

Preparation: By reacting aluminum chloride with lithium deuteride.

Containers: Glass bottles, vials.

Uses: Introduction of deuterium atom into molecule by reduction of same groups attacked by lithium aluminum hydride.

Hazards: Obtain detailed information on precautions before handling this material.

Shipping regulations: Flammable solid. Yellow label. *

lithium aluminum hydride (LAH) LiAlH_4

Properties: Light porous white powder.

Sp. gr. 0.917 g/ml. Sometimes turns gray on standing. Stable in dry air at room temperature, but very sensitive to moisture, even that in ordinary air. Decomposes to lithium hydride, aluminum metal and hydrogen above 130°C without melting. Soluble in diethyl ether, tetrahydrofuran, dimethyl "Cellosolve." Slightly soluble in dibutyl ether. Insoluble or very slightly soluble in hydrocarbons and dioxane.

Preparation: Reaction of aluminum chloride with lithium hydride.

Containers: Glass bottles, polythene bags placed in metal cans, up to 6-gallon capacity; steel drums, fiber cans.

Uses: Reducing agent for over 60 different functional groups, especially for pharmaceutical, perfume, and fine organic chemicals, source of hydrogen; propellant, catalyst in polymerizations.

Hazards: Caution! Obtain detailed information on precautions before opening containers of this material. May ignite spontaneously on grinding or rubbing, or from static sparks. Fires must be controlled by smothering with powdered limestone. All ordinary extinguishers must not be used.

Shipping regulations: Flammable solid. Yellow label. *

lithium aluminum hydride, ethereal LiAlH_4 plus ether.

Properties: Colorless solution in ether; very reactive to water.

Derivation: From lithium hydride and ether solution of aluminum chloride.

Use: See lithium aluminum hydride.

Shipping regulations: Flammable liquid. Red label. *

lithium aluminum tri-tert-butoxyhydride

(LATB; lithium tri-tert-butoxyaluminumhydride) $\text{LiAl}[\text{OC}(\text{CH}_3)_3]_3\text{H}$.

Properties: White powder; sp. gr. 1.03 g/cc.

Stable in dry air but sensitive to moisture. Decomposes above 400°C with evolution of hydrogen. Soluble in the dimethyl ether of diethylene glycol, tetrahydrofuran, diethyl ether, slightly soluble in other ethers.

Containers: Glass bottles.

Uses: For stereospecific reductions of steroid ketones and for reductions of acid chlorides to aldehydes.

Hazards: Reacts with water to evolve hydrogen but does not usually ignite.

Shipping regulations: Flammable solid. Yellow label. *

lithium amide LiNH_2

Properties: White crystalline solid; sp. gr. 1.18, melts 380-400°C, decomposes in water.

Derivation: Reaction of lithium hydride with ammonia.

Grades: 92-95% lithium amide.

Containers: 25-, 100-, 300-lb fiber drums.

Uses: Organic synthesis, including antihistamines and other pharmaceuticals.

Shipping regulations: Flammable solid. Yellow label. *

lithium arsenate $\text{Li}_3\text{AsO}_4 \cdot \text{H}_2\text{O}$

Properties: White powder, sp. gr. 3.07 (15°C). Caution! Poisonous! Slightly soluble in water.

lithium benzoate $\text{LiC}_7\text{H}_5\text{O}_2$

Properties: White crystals or powder; soluble in water and alcohol.

Derivation: Reaction of benzoic acid with lithium carbonate.

Containers: Drums.

lithium bichromate. See lithium dichromate.

lithium bitartrate $\text{LiC}_4\text{H}_5\text{O}_6 \cdot \text{H}_2\text{O}$. White crystals, soluble in water.

lithium borate. See lithium metaborate, lithium tetraborate.

lithium borohydride LiBH_4

Properties: White to gray crystalline powder, decomposes in vacuum above 200°C, soluble in lower primary amines and ethers, sp. gr. 0.66, extremely hygroscopic.

Derivation: Reaction of sodium borohydride and lithium chloride.

Grades: Technical.

Containers: Glass bottles.

Uses: Source of hydrogen and other borohydrides, reducing agent for aldehydes, ketones and esters.

Shipping regulations: Flammable solid. Yellow label. *

lithium bromate LiBrO_3 . White crystals, soluble in water.

lithium bromide LiBr

Properties: White cubic deliquescent crystals, or as a white to pinkish white granular powder, odorless; sharp, bitter taste. Sp. gr. 3.464; m. p. 547°C, b. p. 1265°C; very soluble in water, alcohol, and ether. Slightly soluble in pyridine, soluble in methanol, acetone, glycol.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

A hot concentrated solution dissolves cellulose. Forms addition compounds with ammonia and amines. Forms double salts with CuBr_2 , HgBr_2 , HgI_2 , $\text{Hg}(\text{CN})_2$, and SrBr_2 .

Derivation: Reaction of hydrobromic acid with lithium carbonate.

Grades: N. F. XI; 53% (min) LiBr brine.

Containers: 5-, 50-lb glass jars; bags; brine in 400-, 700-lb steel drums.

Uses: Pharmaceuticals; air conditioning; humectant.

lithium butyl. See butyllithium.

lithium n-butylate. See lithium alcoholates.

lithium carbide Li_2C_2 . A crystalline white powder; sp. gr. 1.65 (18°C); decomposes in water; soluble in acid, with evolution of acetylene.

lithium carbonate Li_2CO_3 .

Properties: White powder; sp. gr. 2.111; m. p. 735°C ; b. p., decomposes; more soluble in cold than in hot water; g/100 ml at 0°C 1.54, at 100°C 0.72; soluble in acids, insoluble in alcohol.

Derivation: Finely ground ore (spodumene) is roasted with sulfuric acid at 250°C . (Amblygonite, lepidolite, and dilithium sodium phosphate are also used as sources.) Lithium sulfate is leached from the mass and converted to the carbonate by precipitation with soda ash.

Grades: Technical, C. P.

Containers: 100-, 250-lb fiber drums.

Uses: Ceramics and glasses, pharmaceuticals, catalyst; lithium hydroxide and other lithium compounds; coating of arc-welding electrodes.

lithium chlorate LiClO_3 .

Properties: Needlelike crystals, deliquescent; m. p. 128°C ; decomposes at 270°C , more soluble in water than any other inorganic salt (313 g per 100 ml water at 18°C); very soluble in alcohol.

Uses: Air conditioning; inorganic and organic chemicals; propellants.

lithium chloride LiCl .

Properties: White deliquescent crystals; sp. gr. 2.068; m. p. 614°C , b. p. 1360°C ; very soluble in water, alcohols, ether, pyridine, nitrobenzene.

Derivation: Reaction of lithium ores with chlorides.

Grades: Technical, 99% (min) assay; 35-40% brine, inhibited.

Containers: Crystals: 25-, 50-, 100-lb paper-lined drums, brine: 75-, 275-, and 500-lb steel drums.

Uses: Air conditioning, welding and soldering flux; dry batteries; heat-exchange media; salt baths; desiccant; humectant; general chemical; production of lithium metal; soft drinks and mineral water to reduce escape of carbon dioxide.

Caution! Apparently poisonous if taken internally in appreciable amounts, particularly if sodium chloride intake is low.

lithium chromate $\text{LiCrO}_4 \cdot 2\text{H}_2\text{O}$.

Properties: Yellow, crystalline deliquescent powder; soluble in water and forms a eutectic at -60°C . Soluble in alcohols.

Uses: Corrosion inhibitor; oxidizing agent for organic material, especially in the presence of light.

lithium citrate $\text{Li}_3\text{C}_6\text{H}_5\text{O}_7 \cdot 4\text{H}_2\text{O}$.

Properties: White powder or granules; m. p., decomposes; soluble in water; slightly soluble in alcohol.

Derivation: Reaction of citric acid with lithium carbonate.

Containers: 25-, 50-, 100-lb fiber drums.

Uses: Beverages; pharmaceuticals; dispersion stabilizer.

lithium cobaltite LiCoO_2 . Dark blue powder; insoluble in water. The compound exhibits both the fluxing property of lithium oxide and the adherence-promoting property of cobalt oxide.

Use: Ceramics.

lithium deuteride LiD .

Properties: Gray crystals, sp. gr. 0.906 g/cc.

Reacts slowly with moist air. Thermally stable to its melting point* of 680°C .

Insoluble in all inert organic materials.

Containers: Glass bottles.

Uses: Source of deuterium for reaction studies.

Shipping regulations: Flammable solid. Yellow label.*

lithium dichromate (lithium bichromate)

$\text{Li}_2\text{Cr}_2\text{O}_7 \cdot 2\text{H}_2\text{O}$.

Properties: Yellowish red, crystalline powder; deliquescent; soluble in water.

Caution! Keep well stoppered!

Constants: M. p. 130°C .

lithium ethylate. See lithium alcoholates.

lithium fluophosphate $\text{LiF} \cdot \text{Li}_3\text{PO}_4 \cdot \text{H}_2\text{O}$.

Properties: White crystals.

Derivation: By the interaction of lithium fluoride and lithium phosphate.

Grades: Technical.

Containers: Wooden kegs; fiber drums.

Use: Ceramics.

Shipping regulations: None.*

lithium fluoride LiF .

Properties: Fine white powder; sp. gr. 2.295;

m. p. 870°C ; b. p. 1670°C ; slightly soluble

in water; does not react with water at red heat; soluble in acids and hydrofluoric acid, insoluble in alcohol. Poisonous!

Derivation: Reaction of hydrofluoric acid with lithium carbonate.

Grades: Guaranteed 98% (min) LiF ; C. P., single pure crystals.

Containers: 25-, 50-, 100-lb fiber drums; barrels.

Uses: Welding and soldering flux; ceramics; heat exchange media; synthetic crystals in infrared and ultraviolet instruments; proposed for use in space components.

lithium greases. Greases using lithium soaps of the higher fatty acids as a base.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Water resistant; stable when heated above their melting point and cooled again. Used in aircraft and low temperature service. See lithium stearate; lubricating greases. Lithium hydroxystearate from hydrogenated castor oil is also widely used.

Lithium hydride LiH .

Properties: White, translucent, crystalline mass, or powder. Commercial product is light bluish-gray due to minute amount of colloiddally dispersed lithium. Sp. gr. (20°C) 0.82; m. p. 680°C; decomposition pressure nil at 25°C, 0.7 mm at 500°C, 760 mm at approx. 850°C. Decomposed by water, forming hydrogen and lithium hydroxide; insoluble in benzene and toluene; soluble in ether.

Derivation: Reaction of molten lithium with hydrogen.

Grades: 93-95%, based on hydrogen evolution.

Containers: Cans, cases; drums.

Uses: Desiccant, source of hydrogen, condensing agent in organic synthesis; preparation of lithium amide and double hydrides; nuclear shielding material.

Shipping regulations: Flammable solid. Yellow label.*

Lithium hydroxide (a) LiOH (b) $\text{LiOH} \cdot \text{H}_2\text{O}$.

Properties: Colorless crystals, sp. gr. (a) 2.54 (b) 1.83, m. p. (a) 462°C, b. p. decomposes; soluble in water, slightly soluble in alcohol.

Derivation: Causticizing of lithium carbonate.

Grades: Technical; C. P.

Containers: 25-, 75-, 200-, 375-lb paper-lined steel drums.

Uses: Storage battery electrolyte; carbon dioxide absorbent, lubricating greases, general chemical, ceramics.

Lithium hydroxystearate

Properties: White powder, m. p. 205°C.

Dissolves in hot petroleum oil to form greases.

Derivation: From hydrogenated castor oil.

Use: In greasemaking.

Lithium hypochlorite LiOCl .

Use: Bleach.

Shipping regulations: Dry, containing more than 39% available chlorine, oxidizing material. Yellow label.*

Lithium iodate LiIO_3 .

Properties: White powder, sp. gr. 4.487 (25°C), m. p. 50-60°C (transition point from alpha to beta form), soluble in water, insoluble in alcohol.

Lithium iodide (a) LiI , (b) $\text{LiI} \cdot 3\text{H}_2\text{O}$.

Properties: White crystals; soluble in water and in alcohol. Sp. gr. (a) 4.063, (b) 2.34 (25°C); m. p. (a) 446°C, (b) 72°C, loses water; b. p. 1171°C. Soluble in water and alcohol. Extremely hygroscopic.

Derivation: By the action of hydriodic acid on lithium hydroxide, with subsequent crystallization.

Method of purification: Recrystallization.

Containers: Glass bottles.

Uses: Medicine; mineral waters; photography.

Shipping regulations: None.*

Lithium isopropylate. See lithium alcoholates.

Lithium lactate $\text{LiC}_3\text{H}_5\text{O}_3$.

Properties: White odorless powder; very soluble in water with practically neutral reaction.

Use: Wherever a dry alkali lactate is required. Lithium lactate is non-hygroscopic and stable, whereas sodium and potassium lactates can be prepared in solution only.

Lithium manganite Li_2MnO_3 .

Properties: Reddish-brown powder. Insoluble in water. Extremely stable.

Containers: Drums.

Uses: Smelter addition in the manufacture of frit, as a mill addition; ceramic bonded grinding wheels.

Lithium metaborate dihydrate $\text{LiBO}_2 \cdot 2\text{H}_2\text{O}$.

Properties: White crystalline powder; soluble in water; m. p. 840°C (anhydrous).

Grade: Ceramic.

Containers: 100-, 300-lb fiber drums.

Uses: Ceramics (flux in enamel cover coats, increases resistance to torsion).

Lithium metasilicate (lithium silicate) Li_2SiO_3 .

Properties: White powder; m. p. 1201°C, sp. gr. (25°C) 2.52; insoluble in water.

Grade: Ceramic.

Containers: 100-, 300-lb fiber drums; multiwall paper sacks.

Uses: Flux in glazes and ceramic enamels; welding rod coating.

Lithium metavanadate. See lithium vanadate.

Lithium methoxide. See lithium methylate.

Lithium methylate (lithium methoxide) CH_3OLi .

Properties: White powder.

Derivation: Reaction of lithium with methanol.

See also lithium alcoholates.

Lithium molybdate Li_2MoO_4 . A white crystalline

compound soluble in water. M. p. 705°C.

Small amount, added as a mill addition, has given the necessary adherence for applying a white covercoat directly to steel. Also used as catalyst in petroleum cracking.

Lithium nitrate LiNO_3 .

Properties: Colorless powder; sp. gr. 2.38, m. p. 261°C, soluble in water and alcohol.

Derivation: Reaction of nitric acid with lithium carbonate.

Grades: Technical, commercially pure; reagent.

Containers: 25-, 50-, 100-lb steel drums.

Uses: Ceramics; pyrotechnics, salt baths; heat-exchange media, refrigeration systems; general chemical.

Shipping regulations: Oxidizing material.

Yellow label.*

Lithium nitride Li_3N .

Properties: Brownish-red crystals of hexagonal structure.

Chemical behavior: In dry air, no reaction at 25°C, at elevated temperatures, ignites

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

and burns intensely. Water vapor in moist air causes slow decomposition. Reacts with water giving lithium hydroxide and ammonia. Density approx. 1.3 g/cc (25°C); m. p. 845°C; decomposition pressure not measurable below 1250°C.

lithium orthophosphate. See lithium phosphate.

lithium perchlorate LiClO_4 .

Properties: Colorless deliquescent crystals, sp. gr. 2.429; m. p. 236°C; decomposes at 290°C; has more available oxygen than liquid oxygen (on a volume basis). Reacts with 4NH_3 to form an ammoniate. Forms $\text{LiClO}_4 \cdot 3\text{H}_2\text{O}$, colorless crystals with sp. gr. 1.84; m. p. 75°C. Soluble in water and alcohol.

Use: Suggested as an oxidizer in solid rocket propellants.

lithium peroxide Li_2O_2 .

Properties: Fine white powder or a sandy yellow granular material; m. p. decomposes, density 2.14 g/cc (20°C). In closed container no detectable loss of available oxygen. Water solution at 20°C may be caused to decompose when catalyzed with manganese or iron salts. Soluble in water, 8% (20°C); anhydrous acetic acid, 5.6% (20°C), insoluble in absolute alcohol (20°C).

Uses: As supplier of active oxygen, commercial samples have 32.5% to 34% available oxygen content.

Shipping regulations: Oxidizing material. Yellow label.*

lithium phosphate (lithium orthophosphate) $2\text{Li}_3\text{PO}_4 \cdot \text{H}_2\text{O}$.

Properties: White, crystalline powder, soluble in acids; slightly soluble in water, sp. gr. 2.41.

lithium n-propylate. See lithium alcoholates.

lithium ricinoleate $\text{LiOOC}_{17}\text{H}_{32}\text{OH}$.

Properties: A fine white powder. M. p. 174°C. Insoluble or very limited solubility in most organic solvents.

Derivation: Castor oil.

Uses: Alcoholysis and ester interchange catalyst.

lithium salicylate $\text{HOC}_6\text{H}_4\text{COOLi}$.

Properties: White or grayish-white crystals or granular powder; odorless, sweet taste, deliquescent in moist atmosphere. Soluble in water and alcohol.

Derivation: By heating a solution of salicylic acid and lithium carbonate until effervescence ceases.

Containers: Drums.

Use: Medicine.

Shipping regulations: None.*

lithium silicate. See lithium metasilicate.

lithium silicon.

Shipping regulations: Flammable solid. Yellow label.*

lithium stearate $\text{LiC}_{18}\text{H}_{35}\text{O}_2$.

Properties: White crystals, sp. gr. 1.025; m. p. 220°C; insoluble in cold and hot water, alcohol, and ethyl acetate; forms gels with

mineral oils. Good lubricant.

Derivation: Reaction of stearic acid with lithium carbonate.

Grades: Grease; cosmetic.

Containers: 25-, 50-, 100-lb fiber drums; 50-lb asphalt-lined bags.

Uses: Cosmetics; plastics; waxes; greases; lubricant in powder metallurgy.

lithium sulfate $\text{Li}_2\text{SO}_4 \cdot \text{H}_2\text{O}$.

Properties: Colorless crystals, sp. gr. 2.06; m. p. 130°C; soluble in water, insoluble in 80% alcohol. Does not form alums.

Derivation: Reaction of sulfuric acid with lithium carbonate or with spodumene ore. Grades: Technical and pharmaceutical.

Containers: 25-, 50-, 100-lb fiber drums.

Uses: Pharmaceutical products.

lithium tetraborate $\text{Li}_2\text{B}_4\text{O}_7 \cdot 5\text{H}_2\text{O}$.

Properties: White crystalline powder; m. p., loses water 200°C; very soluble in water, insoluble in alcohol.

Derivation: Reaction of boric acid with lithium carbonate.

Grades: Technical.

Containers: 25-, 50-, 100-lb fiber drums.

Use: Ceramics.

lithium titanate Li_2TiO_3 . White powder.

Insoluble in water. Exhibits strong fluxing properties when used in small percentages in titanium-bearing enamels. The insolubility permits its use as a mill addition in vitreous and semi-vitreous glazes.

Containers: Drums.

lithium tri-tert-butoxyaluminumhydride. See lithium aluminum tri-tert-butoxyhydride.

lithium tungstate Li_2WO_4 . White crystals; soluble in water.

lithium vanadate (lithium metavanadate)

$\text{LiVO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: Yellowish powder, soluble in water.

Use: Medicine.

lithium zirconate Li_2ZrO_3 . White powder, insoluble in water. It has been found to be a very efficient flux in glasses containing zirconium dioxide. It is recommended as a flux in zirconium-opacified enamels, glazes and porcelains.

lithium-zirconium silicate $2\text{Li}_2\text{O} \cdot \text{ZrO}_2 \cdot \text{SiO}_2$.

White powder. A strong flux in enamels, glazes and porcelains. It can be used in place of lithium zirconate.

lithocholic acid $\text{C}_{24}\text{H}_{46}\text{O}_3$. One of the bile acids, contains only one hydroxyl group.

Properties: Crystallizes in leaflets from alcohol; m. p. 184-186°C. Not precipitated by digitonin. Freely soluble in hot alcohol; soluble in ethyl acetate; slightly soluble in glacial acetic acid; insoluble in water, ligroin.

Derivation: From bile and gallstones; from deoxycholic acid or cholic acid.

Use: Biochemical research.

lithographic stone. A fine-grained limestone of uniform texture free from veins and spots.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

It must be compact enough to take a good polish and yet sufficiently porous to absorb the grease of the draftsman's crayon.

lithol reds. Lithol reds are pigments made by combining the intermediates Tobias acid and beta-naphthol. This type of red is available as sodium, barium and calcium toners and lakes; the sodium is the lightest shade, the barium is what may be termed a medium shade and the calcium lithols are deep reds or maroons. Lithol reds are the lowest in cost of the organic reds and are widely used in enamels where maximum permanency is not required. They are non-bleeding in oil, but bleed slightly in lacquer solvents, and badly in soap solutions. They are used to quite an extent in exterior finishes, but they do not have the lightfastness of para reds or toluidine reds and therefore are not generally used in automotive finishes or bulletin paints. They find application in drum enamels, toy enamels, novelty finishes, etc. Resinated lithols contain a metallic resinate and they are generally brighter in mass tone and cleaner in tints, but lack the opacity of the non-resinated lithols and usually have poorer flow in enamels.

lithol rubine $\text{OOC}_{10}\text{H}_7(\text{OH})\text{N}:\text{NC}_6\text{H}_5(\text{CH}_3)\text{SO}_2\text{OCa}$.

An azo pigment used in paints, printing inks, plastics and cosmetics. Made by diazotizing para-toluidine-meta-sulfonic acid, and coupling with beta-oxynaphthoic acid. Pigment is used as the calcium salt.

lithophone. See lithopone.

lithopone (lithophone, Orr's white, Charlton white, Griffith's white; zinc baryta white, zinc sulfide white).

Properties: White powder, consisting of barium sulfate, zinc sulfide and zinc oxide.

Derivation: By mixing solutions of barium sulfide and zinc sulfate, filtering, washing and drying the precipitate. The latter is heated to redness, plunged into water while hot, ground with water, thoroughly washed and dried.

Grades: Technical.

Containers: 400-, 450-, 500-, 600-lb barrels; multiwall paper sacks.

Uses: Paint pigment; rubber industry, printers' white ink; pigment in filling white leathers, paper, linoleum, oilcloth and window-shade cloth; face powders, cosmetics, etc.

Shipping regulations: None.*

lithopone, cadmium. A lithopone in which cadmium replaces the zinc. Its uses are similar to lithopone (q. v.).

See also cadmium reds, in which selenium replaces some of the sulfur.

"Lithosol." ²⁸ Trademark for a line of intermediates, dyes, and chemicals especially prepared for the manufacture of lakes and organic pigments. They also have some textile applications.

"Lithotone." ³²⁹ Trademark for a brand of paraformaldehyde-type, photomechanical film developer.

litmus (lacmus; lichen blue).

Properties: A blue, amorphous powder (frequently compressed into small cakes or sticks). Soluble in water; changes color with acidity of solution; red at pH 4.5, blue at pH 8.3.

Derivation: By treating various lichens (particularly *Variolaria lecanora* and *V. rocella*) with ammonia and potash and then fermenting the mass.

Grades: Technical.

Containers: Glass bottles; boxes.

Uses: Indicator in analytical chemistry.

Shipping regulations: None.*

litmus paper. White, unsized paper which has been dipped in an infusion of litmus in water. Used as an indicator in analytical chemistry.

liver of lime. See lime, sulfured.

liver of sulfur. See potash, sulfured.

liver ore. See cinnabar.

livers of antimony. Impure double sulfides of antimony, obtained by heating antimony pentasulfide with alkaline sulfides. Sodium sulfantimonate is the most important.

Properties: Brown powder; slightly soluble in water.

Shipping regulations: None.*

liver starch. See glycogen.

livingstonite HgSb_4S_7 or $\text{HgS} \cdot 2\text{Sb}_2\text{S}_3$.

Properties: Lead-gray mineral, metallic luster, red streak. Contains 24.8% mercury, 53.1% antimony, 22.1% sulfur. Resembles stibnite (q. v.) in form. Sp. gr. 4.1-4.8; hardness 2.

Occurrence: Mexico.

Use: Source of mercury.

lixiviation. See leaching.

"LNA." ⁶⁵ Trademark for leucyl aminopeptidase substrate used as diagnostic agent in medicine.

"Lo-Bax." ⁸⁴ Trademark for a chlorine sterilizer designed especially for handlers of milk and other dairy and food products who require clear, fast-killing bactericidal solutions. It is a stable, quick-dissolving powder containing 50% available chlorine.

"Lobette-5." ²⁹⁶ Trade name for limed rosin possessing a capillary tube melting point of typically 116°C, acid value 85, color Isaac/Harry (Rosin Standards). Used in printing ink, paint, and varnish.

lobelia (Indian or wild tobacco; asthma weed).

Dried leaves and tops of *Lobelia inflata*.

Habitat: United States and Canada.

Grades: Technical.

Containers: Bags; bales.

Use: Medicine.

Shipping regulations: None.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

lobeline. Formula said to be $C_{22}H_{27}NO_2$.

Properties: Yellow honey-like liquid; poisonous! Crystallizes as needles from alcohol. Soluble in alcohol and chloroform; slightly soluble in ether.

Derivation: By extraction from the seeds of *Lobelia inflata*.

Method of purification: Rectification.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

lobeline sulfate. The commercial material is a mixture of the sulfate salts of the total alkaloids of lobelia, with *l*-lobeline predominating, and lesser amounts of lobelanine, lobelanidine, and lobelidine present. Properties: Yellow crystalline solid, somewhat hygroscopic, soluble in water; slightly soluble in alcohol and chloroform.

Use: Medicine.

"Lockebrite."²⁴⁵ Trademark for abrasive and cleaning material for porcelain insulators.

locust bean. See carob seed.

locust-bean gum. See carob-seed gum.

locust kernel. A purified carob-seed gum free from starch.

Use: Same as carob-seed gum.

lodestone. See magnetite.

loellingite (löllingite) $FeAs_2$. Natural iron arsenide, with some Co, Ni, Sb, and S. Properties: Color silver white to steel gray; streak grayish black; hardness 5-5.5, sp. gr. 7.4.

Occurrence: Maine, New York, New Jersey, Colorado, Canada.

Use: Source of arsenic.

loess clay. See brick clay.

"Logo."³⁰² Trademark for solutions of organic polymeric substances used for surface treatment for plastics.

"Logofoll."³⁰² Trademark for a strippable protective coating composition.

"Logoquant."³⁰² Trademark for protective coating compositions for use on plastic articles.

"Logoset."³⁰² Trademark for synthetic enamels and varnishes.

logwood (hematoxylon).

Derivation: The heartwood of *Hematoxylon campechianum*. The raw logwood comes in the form of rough logs, 3 feet long, which are either ground or rasped into small chips. These chips, after being aged by being exposed to the atmosphere, are subjected to extraction.

Habitat: Central America; Mexico; and West Indies.

Uses: Textile and leather dyeing; medicine; ink-making.

Shipping regulations: None.*

logwood crystals. See hematoxylol.

loja bark. See cinchona bark, *loxa*.

löllingite. See loellingite.

"Lomar."⁷⁸ Trademark for a series of naphthalenesulfonic acid condensates used as powerful dispersing agents for dyes, pigments, graphite, clays, mica, carbon black, and other inert powders, especially in the cement, plaster, ceramic, paper, paint, and rubber industries.

"Lomax" Process.⁴¹⁶ Patented process of cracking in the presence of hydrogen to convert petroleum distillates ranging from kerosines to heavy vacuum gas oils into lower boiling products. Process is characterized by ability to make varying proportions of gasolines and light distillates from heavy vacuum gas oils, by production of greatly reduced quantities of light gases (when compared with conventional catalytic cracking), by the predominance of branched-chain isomers in the light hydrocarbons, and by the production of high quality middle oils.

"Lomotil."⁷⁰ Trademark for brand of diphenoxylate hydrochloride with atropine sulfate.

London purple, solid. An insecticide containing arsenic trioxide, aniline, lime, and ferrous oxide.

Warning! Poisonous if swallowed. MCA warning label.

Shipping regulations: Class B poison. Poison label.*

longwort. See pyrethrum root.

"Loosol."²⁵⁶ Trade name for a light red liquid, sp. gr. 1.050 (15.6°C); boiling range 100-272°C. Used as an antioxidant in scrubbing oils and in gas manufacture.

loranskite. See euxenite.

loretin (ferron, 7-iodo-8-hydroxyquinoline-5-sulfonic acid) $C_9H_6N(1)(OH)(SO_3H)$.

Properties: Sulfur-yellow, almost odorless, tasteless, crystalline powder; m. p. 260-270°C, with some decomposition. Slightly soluble in water and alcohol; insoluble in ether.

Derivation: Obtained from the potassium salt of 8-hydroxyquinoline-5-sulfonic acid by the action of potassium iodide, bleaching powder and hydrochloric acid.

Uses: Medicine; colorimetric reagent for ferric iron.

"Lorexane."²⁰⁷ Trademark for pure gamma-benzene hexachloride, the gamma isomer of hexachlorocyclohexane. A powerful insecticide for humans and animals.

"Lorfan" tartrate.¹⁹⁰ Trademark for a brand of levallorphan tartrate (q. v.).

"Lorite."¹⁴⁸ Trademark for a natural extender composed of predominantly acicular particles containing approximately 80% calcium carbonate and 20% diatomaceous earth. Sp. gr. 2.54; one pound bulks 0.04732 gal; oil absorption, 24; retained on No. 325 sieve, 1.0%.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: 50-lb paper bags net.

Uses: "Lorite" has a flattening and bodying effect in paints and is recommended for sealers, flats, semi-glosses, and undercoaters, and for emulsion paints due to its low soluble salt content.

"Lorol." ²⁸ Trademark for a series of technical grade straight chain (normal) even-numbered carbon alcohols ranging from C₈ (octyl) to C₁₈ (stearyl), and including also mixtures of these.

Properties: Colorless liquids ("Lorol" 5 to 22) or white flakes ("Lorol" 24, 28). Sp. gr. about 0.83.

Containers: 55-gal drums or 8000-gal tank cars for liquids; 50- or 140-lb fiber containers for solids.

Composition data: For "Lorol" 5, 7, 9, approximate percentages by weight of alcohols are as follows:

	"Lorol" 5	"Lorol" 7	"Lorol" 9
decyl	2.6	2.5	1.0
lauryl	61.0	55.5	71.0
myristyl	23.0	21.0	26.0
cetyl	11.2	10.2	2.0
stearyl	2.2	10.8	—

"Lorol" 11 is approximately 80% lauryl, 20% myristyl.

"Lorol" 20 is essentially normal octyl alcohol.

"Lorol" 22 is essentially normal decyl alcohol.

"Lorol" 24 is cetyl alcohol meeting requirements of N. F. VIII.

"Lorol" 28 is technical grade stearyl alcohol. Also available as U. S. P. grade.

Uses: "Lorol" 5. Intermediate in manufacture of detergents, lubricating oil additives, quaternary ammonium compounds, mercaptans and textile finishing agents.

"Lorol" 7. Intermediate in manufacture of lubricating oil additives.

"Lorol" 9. Manufacture of lauryl chloride and its derivatives.

"Lorol" 11. Manufacture of lauryl chloride and its derivatives.

"Lorol" 20. Antifoam agent; intermediate in manufacture of plasticizers, lubricating oil additives and perfumes.

"Lorol" 22. Antifoam agent; intermediate in manufacture of quaternary ammonium compounds, lubricating oil additives, perfumes, and plasticizers.

"Lorol" 24. Emulsifying and softening agent in cosmetics, salves, and ointments.

"Lorol" 28. (Technical) Mold lubricant; intermediate in manufacture of lubricating oil additives; quaternary ammonium compounds and textile finishing agents.

"Lorol" 28 (U. S. P.). Ingredient in lipsticks, cosmetic creams, lotions, ointments, and salves.

"Lorridol." ³⁵⁴ A wetting and emulsifying agent.

Properties: Straw-colored organic liquid; sp. gr. 0.98; soluble in water; miscible with alcohol, glycerin, vegetable oils, carbon tetrachloride, cyclohexanol, and

petroleum ether; pH of a 5% aqueous solution, 8.7.

Uses: As a wetting agent in textile processing; as an emulsifying agent in cosmetics, dry-cleaning fluids, leather polishes, shaving creams, insecticides, paints, etc.

"Lotol" Latex. ²⁴⁸ Trademark for a complete line of compounded latices, based on all types of synthetic and natural latices.

"Lotusate." ¹⁶² Trademark for talbutal.

"Loupole." ⁷⁸ Trademark for a detergent used for boiling-off rayon piece goods at low and elevated temperatures; particularly recommended for graphite streak removal; has good compatibility with soap and other detergents.

lovage oil (levisticum oil).

Properties: A yellow-brown volatile oil, with a sharp odor. Soluble in alcohol, ether, chloroform, carbon disulfide, acetone, and benzene. Sp. gr.: Root oil, 1.00 to 1.049; fruit oil, 0.935; herb oil, 0.928.

Derivation: Distilled from the root, fruit or herb of *Levisticum officinale*.

Method of purification: Rectification.

Grade: Technical.

Containers: Glass bottles; copper flasks.

Uses: Flavors, and to a small extent, perfumes.

Shipping regulations: None.*

low-melting alloys. See fusible alloys.

low-pressure resins. See contact resins.

low-soda aluminas. Aluminum oxide (Al₂O₃) with less than 0.15% sodium oxide (Na₂O) content.

Use: High grade electric insulators and other ceramic bodies.

low-temperature carbonization. Destructive distillation of coal at relatively low temperatures (below 500°C) in order to produce the greatest possible yield of liquid products, and relatively small proportions of gases.

LOX. An abbreviation for liquid oxygen, especially when used as a rocket fuel.

loxa bark. See cinchona bark, loxa.

"Loxite." ²⁷⁷ Trademark for rubber cements, dispersions, and latices, consisting of natural and synthetic rubbers and reclaimed rubbers in latex form, dispersed in water, or dissolved in solvents.

Grades: Natural and synthetic latices and dispersions in water; reclaimed rubber dispersions, natural, synthetics, or reclaim in solvents.

Containers: 55-gal drums.

Uses: Impregnating and spreading paper and textiles; adhesives for rubber to metal, rubber to rubber, etc.

Hazards: Latices and dispersions: none. Keep from freezing. Solvent cements: same as solvent.

"LP Compound." ⁴²⁸ Trademark for soak cleaner for all metals except aluminum and

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

bright zinc. Contains mild alkali, wetting agents and buffering agents.

LPG. Abbreviation for liquefied petroleum gas.

LSD. Abbreviation for lysergic acid diethylamide.

See lysergic acid.

"LTV" Silicone Compound. ²⁴⁵ Trade name for a group of low temperature vulcanizing silicone potting and embedding compounds that cure to a flexible, resilient solid at 70 to 80°C. Has a useful temperature range of -65 to 175°C with typical cure times on potted assemblies of 16 hours at 75°C or 72 hours at room temperature. LTV (low temperature vulcanizing) 602, the first grade of the material to become commercially available, is crystal clear. Has good electrical properties and other general properties typical of methyl silicone family.

Uses: Used to provide mechanical and dielectric protection for electronic components and assemblies including shock, vibration, moisture, ozone, corona and other environmental hazards of the space age.

Lu. Symbol for lutetium.

Lube Oil Additive 564. ²⁸ Trade name for a solution of methacrylate polymers containing basic nitrogen in light neutral oil. Density 7.5 lbs/gal. Used to provide detergency for motor oils, particularly under low-temperature, low-power, stop-and-go driving conditions, and to improve viscosity index. Concentration required averages 2%.

lube oil additives. Chemicals added in small amounts to lubricating oils to impart special qualities, such as low pour point when chlorinated hydrocarbons are added. Other special properties imparted by typical additives are:

Property	Additive
low viscosity index	butene polymers
detergent and suspensoid properties	metallic stearate soaps
oxidation stability	calcium stearate
reduced foaming tendency	silicone compounds

lube oils. See lubricating oils.

lubricating greases. Lubricating greases are generally mixtures of a mineral oil or oils with one or more metallic soaps. The most common soaps are those of sodium, calcium, barium, aluminum, lead, lithium, potassium and zinc. Oils thickened with residuum, petrolatum or wax may be called greases. Some form of graphite may be added. Greases range in consistency from thin liquids to solid blocks and in color from transparent, stainless greases to heavy black residuum greases. The specifications for a grease are determined by the speed, load, temperature, environment,

and metals in the desired application. Texture of grease may be smooth, buttery, ropy or stringy, fibrous, spongy, or rubbery. The texture does not necessarily indicate the viscosity of the grease, but is related to the formulation and methods of manufacture.

See also lubricating oils.

lubricating oils (lube oils). Selected fractions of refined mineral oils used for lubrication of moving surfaces. The term is also sometimes used to refer to transformer oils used for electrical insulating purposes and cooling. Lubricating oils usually have small amounts of additives to impart special properties such as viscosity index and detergency. They range in consistency from thin liquids to grease-like substances. In contrast to lubricating greases, lube oils do not contain solid or fibrous materials.

"Lubricin" N-1. ²⁰² Trademark for a light viscosity derivative of castor oil that increases the oiliness and wetting power of mineral oils, decreases corrosion, and exhibits detergent action on tar, varnish, and carbon deposits. Used as an additive for lubricating oils, motor fuels, and cutting oils.

"Lubricin" V-1. ²⁰² Trademark for a lubricant which facilitates the processing of rigid vinyl plastics.

lubricity. The property of forming a lubricating film between moving surfaces, particularly when such surfaces are subjected to heavy loads and rapid movement. Lubricity depends partly upon the wetting ability of the film-forming material. Viscosity is somewhat related to lubricity but the relation is complicated. Oiliness is sometimes used as approximately equivalent to lubricity.

"Lubriscal." ¹⁶ Trademark for a lubricating, sealing, and rust inhibiting stopcock grease. Properties: Tacky, smooth textured, odorless, stable; free from vegetable or animal oil, nearly acid and alkali proof and practically insoluble in water; vapor pressure less than 10^{-5} mm (20°C).

Grades: Improved formula, m. p. approx. 40°C; high vacuum formula, m. p. approx. 50°C, for high vacuum (3×10^{-6} mm) work only.

Containers: 25-g collapsible tubes; 500-g cans.

Shipping regulations: None.*

"Lubrol." ²⁰⁶ Brand name of proprietary emulsifying and antistatic agents.

lucanthone hydrochloride (1-(2-diethylaminoethylamino)-4-methylthioxanthone hydrochloride).

Properties: Yellow crystals, m. p. 195-196°C. Freely soluble in water; slightly soluble in alcohol.

Containers: Bottles.

Use: Medicine.

"Lucidol." ¹⁵⁴ Trademark for benzoyl peroxide and/or other solid organic peroxides.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

luciferin. An albumin present in some animals which, under the influence of the enzyme luciferase, can be oxidized and exhibit bioluminescence, or "cold light."

"Lucite." ²⁸ Trademark for line of methacrylate ester polymers available as granules, resins or syrup.

See acrylate resins.

"Lucite" 41, 42, 44, 45 and 46 are respectively the methyl, ethyl, n-butyl, iso-butyl and mixed 50-50 n-butyl and isobutyl ester polymers.

"Ludox" AS. ²⁸ Trademark for an aqueous colloidal sol containing approximately 30% silica and 0.25% ammonia; pH at 25°C 9.5-9.6; f. p. 32°F (0°C).

Containers: 55-gal drums.

Use: See "Ludox" HS and LS colloidal silicas. Suitable for applications requiring a volatile stabilizer which would be detrimentally affected by sodium ions present in other grades of "Ludox."

"Ludox" HS. ²⁸ Trademark for an aqueous colloidal sol containing approximately 30% silica. Ratio, wt, $\text{Na}_2\text{O}:\text{SiO}_2$, 1:95, pH at 25°C 9.65-10.15, f. p. 32°F (0°C).

Containers: 55-gal drums, tank trucks, tank cars.

Uses: For antislip treatment of rayon, cotton, and wool staple for improved yarn strength, compounding and post-dip treatment of latex foams and films to improve modulus and effect rubber savings; modifying latex adhesives for improved bond strengths; for increased hardness and slip resistance in emulsion floor waxes; improved water and heat resistance of adhesive coatings and fibrous structures; for antisoil treatment of pile fabrics and miscellaneous substrates; frictionizing agent for paper; binder for inorganic materials; precoating photosensitized paper for color contrast.

"Ludox" LS. ²⁸ Trademark for an aqueous colloidal sol containing approximately 30% silica. Ratio, wt, $\text{Na}_2\text{O}:\text{SiO}_2$, 1:285, pH at 25°C 8.2-8.7.

Use: See "Ludox" HS.

"Ludox" SM. ²⁸ Trademark for an aqueous colloidal sol containing approximately 15% silica characterized by extremely small particle size averaging only 7 millimicrons. Ratio, wt, $\text{Na}_2\text{O}:\text{SiO}_2$, 1:159; pH at 25°C 8.1, f. p. 32°F (0°C).

Containers: 55-gal drums.

Uses: Binder for inorganic fibrous materials; antisoil applications to smooth surfaces; paper coatings to improve abrasion resistance, printability and other properties; latex adhesive compositions for improved adhesion.

"Lugatol." ⁴⁴⁰ Trademark for a series of hetero-polar azo dyestuffs with mainly anionic activity.

Uses: For leather of all types.

Lugol's solution (iodine solution, strong). An aqueous solution containing 5 g iodine and

10 g potassium iodide per 100 ml water.

Grade: U. S. P. XVI.

Use: Pharmaceutical.

"Lukens Carbon-Moly Steel Plate." ²⁵⁵ Molybdenum steel plate material made to ASTM A-204 specification.

"Lukens Chrome-Moly Steel Plate." ²⁵⁵ Chromium-molybdenum steel plate material made to ASTM A-387 specification.

"Lukens Clad Steels." ²⁵⁵ High alloy materials available in composite clad plate integrally and completely bonded to a variety of carbon or alloy backing steels by hot rolling. These include the stainless steels, types 405, 410, 430, 304, 304L, 309, 310, 316, 316Cb, 316L, 317, 317L, 321, 347, and nickel, low carbon nickel, Inconel, Monel, copper and cupro-nickel.

"Lukens Digester Steel." ²⁵⁵ A silicon-free rimmed steel which has been used for paper mill digesters.

"Lukens Manganese-Moly Steel Plate." ²⁵⁵ Manganese-molybdenum steel plate made to ASTM A-302 specification.

"Lukens Manganese-Vanadium Steel Plate." ²⁵⁵ High strength, low alloy steel plate made to ASTM A-242 specification.

"Lukens Nine Nickel Steel Plate." ²⁵⁵ Low carbon, high nickel steel plate made to ASTM A-353 specification.

"Lukens T-1 Steel Plate." ²⁵⁵ High strength proprietary steel plate for pressure vessel and structural applications and for abrasion resistance.

"Lumatex." ⁴⁴⁰ Trademark for a series of mineral and organic pigment dyestuffs which can be fixed on all types of textile fibers with suitable binders. Fixation by short curing at 100-130°C.

Uses: Screen and roller printing; dyeing.

lumbang oil (candle-nut oil).

Properties: A limpid, colorless or yellowish liquid; pleasant odor; bland taste. Soluble in alcohol, ether, chloroform, and carbon disulfide. Sp. gr. 0.920-0.927 (15°C); saponification value 190-193; iodine number 140-164; refractive index 1.4790 (15°C).

Derivation: From the candle-nut, the seed of *Aleuritis moluccana*, by expression.

Method of purification: Filtration.

Grades: Crude, refined.

Containers: Wooden barrels.

Uses: Illuminant; paints; caulking; soap manufacture, wood preservative.

Shipping regulations: None. *

"Luminal." ¹⁶² Trademark for phenobarbital.

luminescence. The emission of light (visible or invisible) without high temperature or incandescence; i. e., "cold light," as from a firefly. Both organic and inorganic substances may have the property of luminescence. A distinction is made between fluorescent and phosphorescent kinds of luminescence in that fluorescent substances

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

cease to shine when the exciting source is removed, while phosphorescent substances continue to radiate light for a characteristic period of time thereafter. See fluorescence; phosphorescence. The exciting source may be (1) photons, i. e., light or other radiation different in wave length from the light being emitted; (2) moving charged particles such as alpha, beta or gamma particles; (3) energy from chemical, biochemical or crystallographic changes. Special types of luminescence named according to the kind of substances involved or of the exciting source are bioluminescence, chemiluminescence, electroluminescence, photoluminescence and triboluminescence.

Common examples of luminescence in addition to the firefly are the light from neon lamps or from lightning, and the light from phosphor crystals of television tubes or fluorescent lighting tubes.

"Lumnite." An aluminous cement of the sintered type.

See cement, aluminous.

"Lump Coal." ²⁸ Trademark for permissible dynamites (types C and CC) with very low velocity of detonation.

Use: For coal mining where maximum production of large-size coal is desired.

lunar caustic. See silver nitrate, fused.

lupanine $C_{15}H_{24}N_2O$. A poisonous alkaloid.

Both dextro and levo forms are known. The latter is a colorless oil. The material has also been described as a yellow syrupy liquid with green fluorescence.

Properties. (d-form) White needles, m. p. 40°C, distils undecomposed at 220°C (10 mm); slightly soluble in water, with an alkaline reaction, soluble in alcohol, ether, and chloroform, refractive index (n_D 24) 1.5444.

Derivation: From the seeds of *Lupinus albus* and *Lupinus angustifolius*.

Method of purification: Crystallization.

Grade: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

"Luperco." ¹⁵⁴ Trade name for compounds of benzoyl peroxide or some other organic peroxide finely dispersed with an organic or inorganic filler.

"Luperox." ¹⁵⁴ Trademark for pastes of finely divided benzoyl peroxide dispersed in water or oils of various types.

"Lupersol." ¹⁵⁴ Trade name for solutions of organic peroxides.

"Lupersol 101." ¹⁵⁴ Trade name for 2,5-dimethyl-2,5-di(tert-butylperoxy)hexane (q. v.).

"Lupersol DDM." ¹⁵⁴ Trade name for methyl ethyl ketone peroxide (q. v.).

lupetazine. See 2,5-dimethylpiperazine.

2,6-lupetidine. See 2,6-dimethylpiperidine.

lupinidine. See sparteine.

lupinine $C_{10}H_{19}ON$.

Properties: White, crystalline alkaloid; poisonous! Soluble in alcohol, ether, acetone, and chloroform; decomposed by water. M. p. 69-71°C; b. p. 255-257°C.

Derivation: By extraction from the seeds of *Lupinus luteus* and *Lupinus niger*.

Method of purification: Crystallization.

Grade: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

"Lupolen." ⁴⁴⁰ Trademark for series of polyethylenes of density 0.918-0.960 and melt index 0.2-20. Special grades contain polyisobutylene.

See "Oppanol B."

"Lupomin." ⁷⁸ Trademark for a series of nitrogen compounds used for softening and finishing textiles.

"Luposec." ⁷⁸ Trademark for a stable cationic emulsion of waxes with aluminum salts used in one-bath method for showerproofing or water-repelling all textile fabrics.

"Luposol." ⁷⁸ Trademark for a prepared solution of locust bean gum used for finishing or as a printing paste.

lupulin (humulin). A bright, yellowish-brown granular powder of characteristic odor and hop taste, obtained from *Humulus lupulus* (hops). It contains lupulon and humulon.

lupulon. An antibiotic constituent of hops (see lupulin).

Properties. Crystallizes as prisms from methanol, m. p. 94°C, stable in absence of air, but turns yellow and develops odor on standing in air for several days. Soluble in alcohol; slightly soluble in water.

"Lurex." ²³³ Trademark for metallic yarns which are laminations of clear plastic films and aluminum foil or metallized film. Used in furnishing and apparel applications. The films generally used are cellulose-acetate-butyrate, or polyester film.

"Lusane." ²⁸ Trademark for a special dye for cotton, with outstanding brilliancy of shade and lightfastness.

"Lustan." ⁵¹ Trademark for a mold oil for glass machines. Comprises a low-carbon-base oil to which colloidal graphite has been added.

luster. The appearance of the surface of a substance in reflected light. The term is used particularly in describing minerals. Types of luster are: (a) metallic, like metals, or the mineral pyrite; (b) vitreous, like glass or quartz; (c) adamantine, exceedingly brilliant, like diamond; (d) resinous, like resin, or sphalerite; (e) dull, not bright or shiny; like chalk. Also called earthy luster. Other types are greasy, silky, and pearly.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Luster Colors. ²⁸ Liquids containing resins or similar organic compounds of various base or precious metals.

Containers: Precious metal lusters, 500-g (1-lb) bottles; base metal lusters, gal (7-lb) bottles.

"Lustrex." ⁵⁸ Trademark for styrene resin powders or latices.

"Lustrone" Colors. ²³ Trademark for plasticized nitrocellulose lacquers tinted with dyes.

Use: Transparent color effects on leather.

lutecium. Discontinued form for lutetium.

lutein. A yellow pigment isolated from the corpus luteum, and found in body fats and egg yolks. It is a carotenoid and is similar to, or identical with xanthophyll (q.v.).

luteinizing hormone. Obsolete term for interstitial-cell-stimulating hormone.

luteotropin (adenohypophyseal luteotropin, prolactin; galactin, lactogenic hormone). One of the hormones secreted by the anterior lobe of the pituitary gland. It aids in causing growth of the mammary gland and initiates milk secretion by the mammary gland; it also influences the activity of the corpus luteum, including the secretion of progesterone.

Properties: Crystalline protein; molecular weight about 33,300, almost insoluble in water; soluble in dilute acids and acidified methanol and ethanol.

Use: Medicine.

lutetia. See lutetium oxide. See also rare earths.

lutetium (formerly lutecium) Lu. Atomic number 71, group III of the periodic table; one of the rare-earth elements of the yttrium subgroup.

Properties: Metallic luster. Sp. gr. 9.849; b.p. 1900°C (approx); reacts slowly with water; soluble in dilute acids.

Derivation: Reduction of the fluoride with calcium.

Grades: Regular, high purity (ingots, lumps).

Uses: In nuclear technology.

lutetium chloride $\text{LuCl}_3 \cdot x\text{H}_2\text{O}$.

Purity: Up to 99.9% lutetium salts.

Containers: Glass bottles; fiber drums.

lutetium fluoride $\text{LuF}_3 \cdot 2\text{H}_2\text{O}$.

Purity: Up to 99.9% lutetium salts.

Containers: Glass bottles; fiber drums.

lutetium nitrate $\text{Lu}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$.

Purity: Up to 99.9% lutetium salts.

Containers: Glass bottles; fiber drums.

Shipping regulations: Oxidizing material. Yellow label. *

lutetium oxide (lutetia) Lu_2O_3 .

Properties: White solid; slightly hygroscopic; absorbs water and carbon dioxide from the air.

Grades: Up to 99.9% purity.

Containers: Glass bottles; fiber drums.

lutetium sulfate $\text{Lu}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$.

Purity: Up to 99.9% lutetium salts.

Containers: Glass bottles; fiber drums.

2,3-lutidine (2,3-dimethylpyridine)

$\text{NC}(\text{CH}_3)\text{C}(\text{CH}_3)\text{CHCHCH}$.

Properties: Liquid; b.p. 161.5°C; f.p.

-15.5°C; density 0.949 (20°C), refractive index 1.5085 (n 20/D); solubility 13.3 g in 100 g water at 20°C; solubility of water in 100 g at 20°C, 131 g; soluble in water in all proportions below 16°C.

Purity: Commercial 95%.

2,4-lutidine (2,4-dimethylpyridine)

$\text{NC}(\text{CH}_3)\text{CHCH}(\text{CH}_3)\text{CHCH}$.

Properties: Liquid; b.p. 158.7°C; density 0.9325 (20°C), refractive index 1.5000 (n 20/D). Soluble in water in all proportions below 23°C.

Purity: Commercial 95%.

2,5-lutidine (2,5-dimethylpyridine)

$\text{NC}(\text{CH}_3)\text{CHCHCH}(\text{CH}_3)\text{CH}$.

Properties: Liquid, b.p. 157.3°C, density 0.9331 (20°C), refractive index 1.5005 (n 20/D), solubility 10.0 g in 100 g water at 20°C, solubility of water in 100 g at 20°C, 95 g, soluble in water in all proportions below 13°C.

Purity: Commercial 95%.

2,6-lutidine (2,6-dimethylpyridine)

$\text{NC}(\text{CH}_3)\text{CHCHCHCH}(\text{CH}_3)$.

Properties: Colorless oily liquid, peppermint odor, sp. gr. 0.932, b.p. 143°C; f.p. -6.6°C, refractive index 1.4973 (n 20/D). Derived from coal tar.

Typical specifications: 95% min. purity, f.p. -9.4°C min; distills (95%) within a 2°C range including 143.7°C.

Uses: Pharmaceuticals, resins; dyestuffs, rubber accelerators; insecticides.

3,4-lutidine (3,4-dimethylpyridine)

$\text{NCHC}(\text{CH}_3)\text{C}(\text{CH}_3)\text{CHCH}$.

Properties: Liquid, f.p. -12°C.

3,5-lutidine (3,5-dimethylpyridine)

$\text{NCHC}(\text{CH}_3)\text{CHCH}(\text{CH}_3)\text{CH}$.

Properties: Liquid, b.p. 172.7°C; f.p. -6.6°C, density 0.944 (20°C); refractive index 1.5049 (n 20/D), solubility 3.3 g in 100 g water at 20°C; solubility of water in 100 g at 20°C, 55.4 g.

Purity: Commercial 95%.

2,6-lutidine-N-oxide $\text{ONC}(\text{CH}_3)\text{CHCHCHCH}(\text{CH}_3)$.

Purity: 98% minimum.

"Lutocylol." ³⁰⁵ Trademark for ethisterone

U. S. P.

Use: Medicine.

lututrin. A uterine-relaxing factor obtained from the corpus luteum of sow ovaries by a process of salting out followed by dialysis.

It is a water-soluble protein or polypeptide.

Grade: N. N. D.

"Luxapole." ⁷⁸ Trademark for compositions for treating textile fibers and particularly for finishing agents and dye penetrants.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Luxol." ²⁸ Trademark for a line of spirit and lacquer-soluble dyes. Used in lacquers, wood stains, spirit prints, inks.

"LX-685." ²¹ Designation for proprietary heat-reactive resin used in the manufacture of ready-mixed aluminum paints, grease and gasoline resistant coatings, floor and deck enamels and concrete curing compounds.

"Lyamine." ¹²³ Trademark for lysine for use as an animal feed supplement.

"Lycedan." ⁹¹ Trademark for a brand of adenosine-5-phosphoric acid for medicinal

lysine. See betaine.

lysine hydrochloride. See betaine hydrochloride.

lycopodium (club-moss; vegetable sulfur).

Properties: Fine yellow powder.

Derivation: Spores of *Lycopodium clavatum* (club moss).

Habitat: North America, Asia and Europe.

Grades: Technical.

Containers: Multwall paper sacks, cases.

Uses: Medicine; pyrotechnics.

Shipping regulations: None. *

lycorine $C_{16}H_{17}NO_4$. An alkaloid.

Properties: White crystals, poisonous!

Slightly soluble in water, alcohol, and ether. M.p. 280°C.

Derivation: By extraction of *Lycoris radiata*.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None. *

"Lycra." ²⁸ Trademark for a spandex fiber. Available in yarn with denier sizes from 70 to 560.

Properties: Sp. gr. 1.0; tensile strength (psi) 9,000; break elongation 570%, moisture regain 0.3%; m. p. 250°C; tensile recovery 95% from 50% elongation; solution in dimethyl formamide (hot).

Uses: Foundation garments, swim wear, surgical hose, and other elastic products. See also spandex.

Lydian stone (touchstone; basanite). A velvet-black form of quartz (q. v.) closely allied to or grading into chert, jasper or flint.

Use: Testing quality of precious metals (the metal tested is rubbed on the Lydian stone and the mark is checked against others made by alloys of predetermined composition).

lye. See sodium hydroxide and potassium hydroxide.

"Lykopen." ²³ Trademark for sodium hydro-sulfite. White crystalline powder, water-soluble, 94% min. $Na_2S_2O_4$. Powerful reducing agent for vat dyestuffs. Bleaching agent.

Use: Dyeing, printing, and stripping of textile fabrics; bleaching of soap,

glue, etc.; oxygen scavenger in synthetic rubber manufacture.

lyophilic. Characterizing a material which readily goes into colloidal suspension; if into water, it may be termed hydrophilic. The colloid is supposedly stabilized by the formation of a protective layer of molecules of the dispersing medium about the suspended particles. Examples: glue, gelatin.

lyophilization. The freeze drying of biological materials. The material to be dried is first frozen and then placed in a high vacuum so that the water (ice) vaporizes into the vacuum without melting, and the non-water components are left behind in an undamaged state. Used for blood plasma, certain antibiotics and other heat-sensitive materials.

lyophobic. Characterizing a material which exists in the colloidal state without having any significant affinity for the medium. Such colloids are generally stabilized by the adsorption of ions and coagulate when the charge is neutralized. Examples: colloidal gold, colloidal arsenic sulfide.

lysergic acid $C_{16}H_{16}N_2O_2$. A product of ergot alkaloids which is used, as D-lysergic acid diethylamide (LSD), in medical research in the field of mental disorders. Lysergic acid has now been synthesized. Properties: Crystallizes (with 1-2 molecules of water) in plates from water. M.p. 240°C (dec). It is amphoteric (behaves as both an acid and a base); moderately soluble in pyridine; slightly soluble in water and the usual, neutral organic solvents; soluble in alkaline and acid solutions.

Derivation: Alkaline hydrolysis of ergot alkaloids; organic synthesis beginning with indolepropionic acid.

Use: Medical research; synthesis of ergonovine. Derivatives of this acid may be of use as non-lethal incapacitating drugs in chemical warfare.

lysine (methylglyoxalidine) $CH_3\dot{C}NCH_2CH_2NH_2$. Properties: Colorless, hygroscopic crystals; mousy odor; m. p. 105°C; b. p. 195°C. Soluble in water, alcohol, and ether.

Derivation: From ethylenediamine hydrochloride and sodium acetate by dry distillation, decomposing the hydrochloride of the new base with concentrated potassium hydroxide and crystallizing.

Method of purification: Recrystallization.

Grades: Technical; 50% solution.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None. *

lysine (alpha, epsilon-diaminocaproic acid) $NH_2(CH_2)_4CH(NH_2)COOH$. An essential amino acid.

Properties: Colorless crystals; soluble in water; slightly soluble in alcohol; insoluble in ether; optically active.

D(-)-lysine, m. p. 224°C with decomposition.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

L(+)-lysine, m. p. 224°C with decomposition.

Derivation: Fermentation or extraction of natural proteins; organic synthesis.

Containers: Glass bottles; fiber cans.

Uses: Biochemical and nutrition studies; pharmaceuticals; culture media; fortification of foods and feeds.

Commercially available as the DL- and L-lysine monohydrochloride.

"Lysol," ³⁴⁶ Trademark for a disinfectant containing soap and ortho-hydroxydiphenyl and xylenols as active ingredients.

Properties: Brown, oily liquid, cresylic odor, non-poison. Phenol coefficient 5; miscible with water and alcohol; sp. gr. 1.043.

Derivation: Saponification of a fatty oil and combination of resultant soap with xylenols

and ortho-hydroxydiphenyl, followed by addition of propylene glycol.

Containers: Glass bottles; steel drums.

Uses: Disinfectant, germicide, fungicide, antiseptic.

lysozyme. An enzyme found in egg white which dissolves certain bacteria and hydrolyzes sugar linkages in glycoproteins.

"Lytron" Sand Conditioner. ⁵⁸ Trademark for a finely divided, pale yellow powder, polyelectrolyte designed especially for foundry sand systems.

Containers: Nonreturnable fiber drums.

Use: Improves sand workability and packability for better metal casting molds.

LZT. Abbreviation for lead zirconate titanate.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

M

M. Abbreviation for molar, used to characterize the concentration of a solution. A molar solution contains one gram-molecular weight of a substance in one liter of solution.

m-. Abbreviation for meta- (q. v.).

MAC. Abbreviation for methyl allyl chloride.

"Macaloid." ⁴¹⁷ Trade name for beneficiated hectorite (q. v.) used to produce a mineral gel of the bentonite type.

macassar gum. See agar-agar.

mace. The coating (arillus) of nutmeg seeds (*Myristic fragrans*).

Habitat: Molucca Islands; cultivated in the tropics and East Indies, Ceylon, South America, India and Philippine Islands.

Grades: No. 1; No. 2; siftings.

Containers: Bales.

Use: Medicine.

Shipping regulations: None. *

mace oil.

Properties: Colorless or pale yellowish liquid; agreeable, aromatic odor, resembling oil of nutmeg. Soluble in alcohol, ether, and chloroform.

Chief known constituents: Pinene, dipentene, myristic acid and myristicin.

Constants: Sp. gr. 0.91-0.93; optical rotation +10°.

Derivation: Distilled from the seed of *Myristica fragrans*.

Grades: Technical.

Containers: Cans; drums.

Uses: Flavoring; perfumery.

Shipping regulations: None. *

machine oil. A medium duty grade of lubricating oil used in lubrication of machine parts.

M acid. See 1-amino-5-naphthol-7-sulfonic acid.

Mack's cement. See gypsum cements.

Macquer's salt. See potassium arsenate.

macromole. See macromolecule.

macromolecule (macromole). A very large molecule containing hundreds or thousands of atoms, such as a polymer molecule. Most molecules contain relatively few atoms (two, three, etc., up to about ten). Colloidal particles are often referred to as macromolecules.

"Macroport" A. ²⁴⁹ Trademark for aluminum oxide catalyst carrier. Available as

spheres, pellets and aggregate of fused aluminum oxide.

macroscopic cross section. The form of the cross section (q. v.) usually used in nuclear technology. It is the product of the cross section and the number of target particles per unit volume. It is also the reciprocal of the mean free path for the process in question.

macrose. See dextran.

macrofin. See cimicifugin.

madder.

Derivation: Pulverized root of *Rubia tinctorum*, a plant formerly cultivated in Europe and Asia Minor. The glucosides contained therein, when decomposed by fermentation, yield alizarin, now largely replaced by alizarin obtained from the anthracene oil of coal-tar.

See also madder lake.

madder lake. Madder lake is a pigment produced from the dyestuff known as alizarin red and takes the place of the coloring matter that was made many years ago from the madder plant. It is a bluish shade of red that is comparatively transparent, and its use in the paint industry is largely confined to stains where a permanent pigment is desired. It is used in making mahogany shades and is widely used in inks. It has very good permanency and is non-bleeding in oil and lacquer solvents. Madder lake is also used for artists' oil colors.

Maddrell's salt. NaPO_3 , II, NaPO_3 , III or mixtures thereof. These are insoluble crystalline forms of sodium metaphosphate produced, together with NaPO_3 , I, by heating sodium phosphate, monobasic (NaH_2PO_4). At 300-475°C NaPO_3 , II is produced and at lower temperatures, NaPO_3 , III.

See sodium metaphosphate.

"Madrison." ¹⁹⁰ Trademark for a brand of sulfadimethoxine (q. v.).

magenta. See fuchsin.

magic number. A name in common use to denote certain particularly stable numbers of neutrons or protons in nuclei. These were deduced from empirical observation of the number of stable isotopes or isotones of nuclei that had 2, 8, 20, 28, 50, 82, or 126 neutrons or protons or both. Modern theory, particularly the "shell" theory of the nucleus, has derived these numbers from the quantum numbers or

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

nuclei, based on an interpretation similar to the theory of the atom which has stable shells of electrons.

magister of bismuth. See bismuth subnitrate.

magister of lead. Old name for lead carbonate, basic.

magister of sulfur. Sulfur precipitated by acids from solutions of hyposulfites or polysulfides. It is in the amorphous form.

"Mag-Li-Kote." ¹³⁹ Trademark for a burned dolomite, ground; used for coating pig casting machine molds, cinder ladles, stools and ingot molds.

"Maglite." ¹²³ Trademark for light magnesium oxide.

magma.

1. In medicine, a class of preparations in which finely divided, freshly precipitated, insoluble, inorganic hydroxides are suspended in water to form a viscous, opaque mixture which may settle out on standing. Magmas of bismuth, magnesium and iron are used, commonly called milk of bismuth, milk of magnesia, etc.
2. In geology, a liquid, molten mass within the earth's crust (e.g., lava). The source of igneous rocks.

"Magmaster" Magnesite. ⁴²⁶ Trademark for dead burned magnesite.

Derivation: Synthetic.

Containers: Bulk and bags.

Uses: In the manufacture of refractories.

"Magnafloat." ²⁵⁰ Trademark for iron-oxide heavy media systems for the purification of coal, sand, gravel, and other similar materials.

magnalium. An alloy of aluminum and magnesium.

"Magnamycin." ²⁹⁹ Trademark for carbomycin.

magnesia. See magnesium oxide.

magnesia alba. See magnesium carbonate.

magnesia-alumina $\text{MgO} \cdot \text{Al}_2\text{O}_3$. A synthetic spinel.

magnesia, burnt. See magnesite, dead-burned.

magnesia, calcined. See magnesite, caustic-calcined.

magnesia, caustic-calcined. See magnesite, caustic-calcined.

magnesia-chromia $\text{MgO} \cdot \text{Cr}_2\text{O}_3$. A synthetic spinel.

magnesia, dead-burned. See magnesite, dead-burned.

magnesia, fused. Used as a refractory and to handle electricity at high temperatures. See "Magnorite."

magnesia, heavy. See magnesium oxide.

magnesia, light. See magnesium oxide.

magnesia magma (milk of magnesia). A white opaque, more or less viscous suspension of magnesium hydroxide in water from which varying proportions of water usually separate on standing.

Grade: U. S. P. XVI.

Use: Medicine.

magnesia mixture. One part each of ammonium chloride and magnesium sulfate dissolved in 8 parts of water to which 4 parts of ammonia water, of sp. gr. 0.96, are added and the whole filtered. Used in determination of phosphorus.

magnesia, refractory. See magnesite, dead-burned.

magnesite. The natural mineral, MgCO_3 . The term magnesite is sometimes loosely used as a synonym for magnesia, as are also the terms caustic-calcined magnesite, dead-burned magnesite, and synthetic magnesite. See following articles and magnesium oxide. Properties: White, yellowish, grayish-white, brown, mostly crystalline in form. Sp. gr. 3-3.12; hardness 3.5-4.5.

Occurrence: United States (California, Washington, Nevada), Austria, Greece.

Uses: To make the various grades of magnesium oxide; to produce carbon dioxide.

See also magnesium carbonate.

magnesite, burnt. See magnesite, dead-burned.

magnesite, calcined. See magnesite, caustic-calcined.

magnesite, caustic-calcined (caustic-calcined magnesia; calcined magnesite; calcined magnesia) Principally magnesia (magnesium oxide) MgO . The product obtained by firing magnesite, or other substances convertible to magnesia upon heating, at temperatures below 1560°C so that some carbon dioxide is retained (2-10%) and the magnesia displays adsorptive capacity or activity.

Grades: Technical, rubber.

Uses (in approximate order of volume):

Magnesium oxychloride and oxysulfate cements, 85% magnesium oxide insulation; rubber; uranium processing; chemical processing (adsorption & catalysis), rayon; refractories; paper pulp; acid-neutralizing fertilizers; minor uses are welding rod coatings, fillers, glass constituents, abrasives.

magnesite, dead-burned (burnt magnesia; dead-burned magnesia; refractory magnesia; burnt magnesite) Magnesium oxide, MgO . The granular product obtained by burning (firing) magnesite, or other substances convertible to magnesia upon heating, above 1450°C long enough to form ... granules suitable for use as a refractory ... (ASTM definition). Synthetic magnesium hydroxide or chloride is sometimes used instead of magnesite as a source.

Grades: 85-87% (from magnesite ores); 97-99% (from sea water and brines).

Uses: Refractories, as grains or basic

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

brick, the latter especially in open hearth furnaces for steel, furnaces for non-ferrous metal smelting, and in cement and other kilns.

"Magnesite H-W." ⁴⁴⁶ Trade name for an over 90% burned magnesia brick with minor added components to control properties. Resistant to molten metal and basic slags. Used in open hearth furnaces, electric steel furnaces, copper and nickel converters, refining industries, and other metallurgical industries.

magnesite, synthetic. Usually means magnesium oxide, MgO , as obtained from sea water, sea water bitterns, or well brines. The preliminary product is usually magnesium hydroxide or chloride, which is then heated, or sometimes treated with steam and heated in the case of the chloride, to obtain the oxide. Synthetic magnesite constitutes the purer grades of dead-burned magnesite.

magnesium Mg. Element of atomic number 12 of group II in the periodic table.

Properties: Silvery, malleable, moderately hard metal. Oxidizes and tarnishes in moist air but is stable in dry air. In finely divided form is easily ignited and burns with an intense white light. The solid form must be heated above its melting point before it will burn. Sp. gr. 1.69-1.75; m. p. 650°C, b. p. 1120°C. Soluble in acids; insoluble in water.

Derivation: (a) By electrolysis of fused magnesium chloride; (b) by reduction of magnesium oxide with ferrosilicon (Pidgeon process), (c) by reductor of magnesium oxide with carbon.

Method of purification: Distillation.

Forms available: Ingots; bars, 50-, 100- to 150-mesh powder; sheet and plate; rod, tubing; ribbon, castings. See also magnesium dust.

Uses (in approximate order of volume). Structural parts, including alloys (air-craft usage declining; use in missiles, automobiles is increasing); powder for pyrotechnics (including flares) and flash photography; production of iron, nickel, zinc, and other metals; magnesium compounds and organic synthesis; cathodic protection devices; reducing agent in production of titanium, zirconium, hafnium, uranium, beryllium, etc; optical mirrors, precision instruments; substitute for zinc in dry batteries.

Fire hazard: Dangerous! Combustible, particularly in form of powder, shavings or thin sheets.

Shipping regulations: Flammable solid. Yellow label, when the metal is in powder or scrap form.*

magnesium acetate (a) $Mg(OOCCH_3)_2$ or (b) $Mg(OOCCH_3)_2 \cdot 4H_2O$.

Properties: Colorless crystalline aggregate or monoclinic crystals. Acetic acid odor. (a) M. p. 323°C, sp. gr. 1.42, (b) m. p. 80°C, sp. gr. 1.45. Soluble in water and

(dilute) alcohol.

Derivation: Interaction of magnesium carbonate and acetic acid.

Grades: Technical.

Uses: Calico printing (fixing aniline black); textiles (fixing eosins); medicine; deodorant, disinfectant and antiseptic.

magnesium acetylacetonate $Mg(C_5H_7O_2)_2$.

Crystalline powder. Slightly soluble in water. Resistant to hydrolysis. A chelating non-ionizing compound.

magnesium acetylsalicylate

$Mg(OOCC_6H_4OOCCH_3)_2$.

Properties: White, almost tasteless and odorless powder. Freely soluble in water; less soluble in alcohol.

Derivation: Interaction of acetylsalicylic acid and a magnesium salt; e. g., the carbonate, oxide, or hydroxide.

Use: Medicine.

magnesium ammonium phosphate (magnesium ammonium orthophosphate)

$MgNH_4PO_4 \cdot 6H_2O$.

Properties: White powder; sp. gr. 1.71; m. p. decomposes to magnesium pyrophosphate, $Mg_2P_2O_7$; soluble in acids; insoluble in alcohol and water.

Derivation: By the interaction of solutions of a magnesium salt and ammonium phosphate.

Grades: Technical.

Containers: Glass bottles.

Uses: Medicine; fire retardant for fabrics; fertilizer.

Shipping regulations: None.*

magnesium ammonium orthophosphate. See magnesium ammonium phosphate.

magnesium ammonium sulfate (ammonium magnesium sulfate) $Mg(NH_4)_2(SO_4)_2 \cdot 6H_2O$.

Properties: Colorless crystals; sp. gr. 1.70; soluble in water.

Derivation: Solutions of magnesium and ammonium sulfates.

magnesium arsenate $Mg_3(AsO_4)_2 \cdot xH_2O$. White powder when pure, insoluble in water.

Technical material is highly hydrated and made from magnesium carbonate and arsenic acid.

Containers: Fiber cans and drums; multiwall paper sacks.

Use: Insecticide.

Warning: Poisonous if swallowed. MCA warning label.

Shipping regulations: Poison, class B. Poison label.*

magnesium benzoate $Mg(C_7H_5O_2)_2 \cdot 3H_2O$.

Properties: White crystalline powder; m. p. about 200°C; soluble in hot water and alcohol.

Use: Medicine.

Shipping regulations: None.

magnesium biphosphate. See magnesium phosphate, monobasic.

magnesium borate $3MgO \cdot B_2O_3$ or $Mg(BO_2)_2 \cdot 8H_2O$.

Properties: Transparent, colorless crystals

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

or white powder. Soluble in alcohol, acetic acid, and inorganic acids; slightly soluble in water.

Derivation: By heating magnesium oxide, boric anhydride and potassium hydrogen fluoride.

Containers: Glass bottles; fiber cans.

User: Preservative; antiseptic; fungicide.

Shipping regulations: None.*

magnesium borocitrate

$Mg(BO_2)_2 \cdot Mg_3(C_6H_5O_7)_2 \cdot 14H_2O$.

Properties: White powder or small, white, lustrous scales. Soluble in water.

Derivation: By mixing magnesium borate and magnesium citrate.

Grades: Technical.

Containers: Boxes; glass bottles.

Use: Medicine.

Shipping regulations: None.*

magnesium-boron fluoride.

Grade: Technical.

Containers: 145-lb steel drums.

Use: Metal flux.

magnesium bromate $Mg(BrO_3)_2 \cdot 6H_2O$.

Properties: White crystals or crystalline powder. Soluble in water; insoluble in alcohol.

Constants: Sp. gr. 2.29; m. p. loses $6H_2O$ ($200^\circ C$); b. p. decomposes.

Derivation: By adding magnesium sulfate to a solution of barium bromate.

Method of purification: Recrystallization.

Grades: Pure; reagent.

Containers: Glass bottles; 25-lb tin boxes.

Use: Analytical reagent.

Fire hazard: Dangerous.

Shipping regulations: Oxidizing material.

Yellow label.*

magnesium bromide $MgBr_2 \cdot 6H_2O$.

Properties: Colorless, very deliquescent crystals; bitter taste. Soluble in water; slightly soluble in alcohol.

Constants: M. p. about $165^\circ C$ with loss of H_2O . Anhydrous m. p. $700^\circ C$.

Derivation: By the action of hydrobromic acid on magnesium oxide with subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical; C. P.

Containers: Glass bottles.

Uses: Medicine; organic syntheses.

Shipping regulations: None.*

magnesium-calcium chloride. See calcium-magnesium chloride.

magnesium carbonate (magnesium carbonate, precipitated; magnesia alba) $MgCO_3$. The term magnesium carbonate is generally reserved for the synthetic, pure variety. See also magnesite.

Properties: Very light odorless white powder; sp. gr. 3.04. Soluble in acids; insoluble in water.

Derivation: By mixing solutions of magnesium sulfate and sodium carbonate, filtering and drying.

Grades: Technical; U. S. P. XVI.

Containers: Bags or paper-lined barrels;

1-lb to 100-lb.

Uses: Magnesium salts; rubber pigments; inks; glass; pharmaceuticals, dentifrices and cosmetics; free-running table salts; mineral waters; filtering medium.

magnesium carbonate, precipitated. See magnesium carbonate.

magnesium chlorate $Mg(ClO_3)_2 \cdot 6H_2O$.

Properties: White powder. Bitter taste.

Very hygroscopic. Caution! Keep well stoppered. Soluble in water; slightly soluble in alcohol.

Constants: Sp. gr. 1.8; m. p. $35^\circ C$; (decomposes at $120^\circ C$).

Containers: Glass bottles with ground stoppers.

Use: Medicine; defoliant; desiccant.

Shipping regulations: Oxidizing material.

Yellow label.*

magnesium chloride (a) $MgCl_2$;

(b) $MgCl_2 \cdot 6H_2O$.

Properties: Colorless or white crystals; deliquescent. Sp. gr. (a) 2.32, (b) 1.56; m. p. (a) $708^\circ C$, (b) loses $2H_2O$ at $100^\circ C$; b. p. (a) $1412^\circ C$, (b) decomposes to oxychloride. Soluble in water and alcohol.

Derivation: By the action of hydrochloric acid on magnesium oxide or hydroxide, especially the latter when precipitated from sea water or brines.

Method of purification: Recrystallization.

Grades: Technical (crystals, fused, flakes, granulated); C. P.

Containers: 100-lb bags; 350-, 575-, 700-lb drums.

Uses: For the electrolytic process of making magnesium metal; magnesium salts; disinfectants; fire extinguishers; fireproofing wood; magnesium oxychloride cement; refrigerating brines; ceramics; cooling drilling tools in drilling for saline deposits and to prevent the dissolution of salts; textiles (size, dressing and filling of cotton and woolen fabrics, thread lubricant; carbonization of wool); paper manufacture; road dustlaying compounds; floor sweeping compounds; flocculating agent and catalyst.

Shipping regulations: None.*

magnesium citrate, dibasic (acid magnesium citrate) $MgHC_6H_5O_7 \cdot 5H_2O$.

Properties: White or slightly yellow, odorless granules or powder. Soluble in water, insoluble in alcohol.

Derivation: Citric acid and magnesium hydroxide or carbonate.

Use: Medicine; dietary supplement.

magnesium cyclamate. A non-nutritive sweetener. See sodium cyclamate.

magnesium dioxide. See magnesium peroxide.

magnesium dust. Finely divided magnesium metal used in pyrotechnics, photographic flash-lights, and chemical preparations. Shipping regulations: Flammable solid. Yellow label.*

magnesium fluoride (magnesium flux) MgF_2 .

Properties: White crystals; exhibits

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

fluorescence by electric light. Soluble in nitric acid; insoluble in alcohol and water. Sp. gr. 3.0; m. p. 1396°C.

Derivation: By adding sodium fluoride or hydrofluoric acid to a solution of magnesium salt.

Grades: Technical; C. P.

Containers: 1-lb bottles; wooden barrels; multiwall paper sacks.

Uses: Ceramics; glass.

Shipping regulations: None.*

magnesium fluosilicate (magnesium silico-fluoride) $\text{MgSiF}_6 \cdot 6\text{H}_2\text{O}$.

Properties: White, efflorescent crystalline powder; sp. gr. 1.788; decomposes on heating. Soluble in water.

Derivation: By treating magnesium hydroxide or carbonate with hydrofluosilicic acid.

Grades: Technical (crystals; solution).

Containers: Crystals: 400-lb barrels; drums. Solution: 400-lb barrels.

Uses: Ceramics; concrete hardeners, waterproofing; mothproofing.

Shipping regulations: None.*

magnesium flux. See magnesium fluoride.

magnesium formate $\text{Mg}(\text{CHO}_2)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless crystals; soluble in water; insoluble in alcohol and ether.

Derivation: By the action of formic acid on magnesium oxide.

Grades: Technical.

Containers: Boxes; glass bottles.

Uses: Analytical chemistry, medicine.

Shipping regulations: None.*

magnesium gluconate $\text{Mg}(\text{C}_6\text{H}_{11}\text{O}_7)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Odorless, almost tasteless, white powder or fine needles. Soluble in water.

Derivation: Magnesia or magnesium carbonate dissolved in gluconic acid.

Method of purification: Crystallization.

Grades: Pharmaceutical.

Containers: Cans; fiber drums.

Uses: Medicine, has been proposed for use in dentifrices.

Shipping regulations: None.*

magnesium glycerinophosphate. See magnesium glycerophosphate.

magnesium glycerophosphate (magnesium glycerinophosphate) $\text{MgPO}_4 \cdot \text{C}_3\text{H}_5(\text{OH})_2$.

Properties: Colorless powder; soluble in water; insoluble in alcohol.

Derivation: By the action of glycerophosphoric acid on magnesium hydroxide.

Method of purification: Crystallization.

Grades: Technical.

Containers: 1-, 5-lb bottles; 5-, 10-, 25-lb cans.

Use: Medicine; stabilizer for plastics.

Shipping regulations: None.*

magnesium hydrate. See magnesium hydroxide.

magnesium hydrogen phosphate. See magnesium phosphate, dibasic.

magnesium hydroxide (magnesium hydrate; in aqueous suspension: milk of magnesia; magnesia magma, q. v.) $\text{Mg}(\text{OH})_2$.

Properties: White powder or milky liquid.

Soluble in solutions of ammonium salts and dilute acids; almost insoluble in water and alcohol; sp. gr. 2.36; m. p. decomposes.

Derivation: By precipitation from a solution of a magnesium salt by sodium hydroxide.

It occurs naturally as brucite (q. v.).

Grades: Technical; medicinal; N. F. XI (powder).

Containers: Wooden barrels or drums; glass bottles; carboys.

Uses: Sugar refining; medicine; dentifrices.

Shipping regulations: None.*

magnesium hypophosphite $\text{Mg}(\text{H}_2\text{PO}_2)_2 \cdot 6\text{H}_2\text{O}$.

Properties: White efflorescent crystals;

sp. gr. 1.59; decomposes at 100°C to evolve phosphine. Soluble in water; slightly soluble in alcohol.

Derivation: By the action of hypophosphorous acid on magnesium oxide.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

magnesium hyposulfite. See magnesium thiosulfate.

magnesium iodide (a) MgI_2 ; (b) $\text{MgI}_2 \cdot 8\text{H}_2\text{O}$.

Properties: White, deliquescent, crystalline powder; discolors in air; soluble in water, alcohol, and ether. M. p. 632°C; sp. gr. (a) 4.48.

Derivation: By heating magnesium in iodine vapors.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

magnesium lactate $\text{Mg}(\text{C}_3\text{H}_5\text{O}_3)_2 \cdot 3\text{H}_2\text{O}$.

Properties: White crystals; very bitter taste; soluble in water; slightly soluble in alcohol.

Derivation: By the action of lactic acid on magnesium oxide, with subsequent crystallization.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

magnesium limestone. See limestone.

magnesium methoxide (magnesium methylate) $(\text{CH}_3\text{O})_2\text{Mg}$.

Properties: Colorless crystalline solid; decomposes on warming.

Derivation: Reaction of magnesium and methanol.

Uses: Dielectric coating; cross-linking agent; to form stable gels; catalyst.

magnesium methylate. See magnesium methoxide.

magnesium mica. See phlogopite.

magnesium nitrate $\text{Mg}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$.

Properties: White crystals; soluble in water and alcohol. Deliquescent. Sp. gr. 1.464,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

m. p. 95°C.

Derivation: By the action of nitric acid on magnesium oxide, with subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical; C. P.

Containers: 1, 5-lb bottles; drums.

Use: Pyrotechnics.

Fire hazard: Dangerous; oxidizing material.

In contact with organic or other readily oxidizable substances it will cause violent combustion or ignition.

Shipping regulations: Oxidizing material.

Yellow label. *

magnesium nitride Mg_3N_2 .

Properties: Yellow-green crystals, insoluble in cold water; slightly soluble in alcohol or ether.

magnesium oleate $Mg(C_{18}H_{33}O_2)_2$.

Properties: Yellowish mass; soluble in linseed oil, hydrocarbons, alcohol, and ether; insoluble in water.

Derivation: By the interaction of magnesium chloride and sodium oleate.

Grades: Technical.

Containers: Wooden kegs; steel drums; fiber drums.

Uses: Varnish driers; in dry-cleaning solvents (to prevent spontaneous ignition); emulsifying agent; lubricant for plasticizers.

Shipping regulations: None. *

magnesium oxide (magnesia; periclase; magnesia, heavy; magnesia, light) MgO . The term magnesia is usually reserved for magnesium oxide that has been specially processed, and implies the purer varieties. See Derivation, below. The term periclase applies both to the natural mineral, MgO , and to the product obtained by calcining high purity magnesite ore or sea water magnesia above 1700°C.

Properties: White powder, either light or heavy depending upon whether it is prepared by heating magnesium carbonate or the basic magnesium carbonate; sp. gr. about 3.6 (varies); m. p. 2800°C, insoluble in water and alcohol; soluble in acids and ammonium salt solutions.

Derivation: (a) By calcining magnesium carbonate or basic magnesium carbonate; see also magnesite, caustic-calcined; magnesite, dead-burned, magnesite, synthetic; (b) by treating magnesium chloride with lime and heating, or by heating magnesium chloride in air.

Grades: Technical; C. P.; U. S. P. XVI; 99.5%; fused; low boron; rubber; semiconductor.

Containers: Fiber drums; multiwall paper sacks; tonnage lots.

Uses: High temperature refractories; electrical insulation; pharmaceuticals and cosmetics; rayon; filler, as in rubbers; oxychloride and oxysulfate cements; adsorption and catalysis; food packaging; semi-conductors; uranium processing; in space components, possibly for nose-cones.

magnesium oxide, active. See magnesium oxide.

magnesium oxide, heavy. See magnesium oxide.

magnesium oxide, light. See magnesium oxide.

magnesium oxychloride cement (Sorel cement).

A mixture of magnesium chloride and magnesium oxide that reacts with water to form a solid mass, presumed to be magnesium oxychloride. Fillers such as wood flour, sawdust, sand, powdered stone, talc, cork, and more recently, powdered metals, are usually present. A variety of proprietary mixtures are available.

magnesium palmitate $Mg(C_{16}H_{31}O_2)_2$.

Properties: Crystalline needles or white lumps; m. p. 121.5°C; insoluble in water and alcohol.

Use: Varnish drier; lubricant for plastics.

magnesium perborate $Mg(BO_3)_2 \cdot 7H_2O$.

Properties: White powder; sparingly soluble in water; decomposes with evolution of oxygen.

Derivation: By the action of peroxide or electrolytic oxidation of borate solutions.

Method of purification: Crystallization.

Containers: Glass bottles; metal cans.

Uses: Driers; bleaching; antiseptic.

Shipping regulations: Oxidizing material.

Yellow label.

magnesium perchlorate (a) $Mg(ClO_4)_2$;

(b) $Mg(ClO_4)_2 \cdot 6H_2O$.

Properties: White, crystalline, deliquescent; very soluble in water and alcohol; decomposes on heating; explosive when in contact with reducing materials!

Derivation: Magnesium hydroxide and perchloric acid.

Containers: Glass ground stoppered bottles; special non-returnable metal cans.

Use: (a) As a regenerable drying agent for gases.

Shipping regulations: Oxidizing material.

Yellow label. *

magnesium permanganate $Mg(MnO_4)_2 \cdot 6H_2O$.

Properties: Bluish-black, friable, deliquescent crystals. Soluble in water.

Use: Medicine (strong antiseptic).

magnesium peroxide (magnesium dioxide) MgO_2 .

Properties: White, tasteless, odorless powder. Decomposes above 100°C. Insoluble in water; soluble in dilute acids with formation of hydrogen peroxide. Available oxygen 28.4%. The technical grade is composed of 15% (min) magnesium peroxide and the rest is magnesium hydroxide.

Derivation: From sodium or barium peroxide with magnesium sulfate in a concentrated solution.

Grades: Technical; 15, 25, and 50%.

Containers: 25-, 100-, 200-lb drums.

Uses: Bleaching and oxidizing agent; medicine.

Fire hazard: Dangerous.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Shipping regulations: Oxidizing material.
Yellow label.*

magnesium phosphate. See magnesium phosphate, dibasic; magnesium phosphate, monobasic; or magnesium phosphate, tribasic.

magnesium phosphate, dibasic (dimagnesium orthophosphate; dimagnesium phosphate, magnesium phosphate, secondary; magnesium hydrogen phosphate)
 $\text{MgHPO}_4 \cdot 3\text{H}_2\text{O}$.

Properties: White, crystalline powder; decomposes to pyrophosphate on heating. Soluble in dilute acids; slightly soluble in water. Sp. gr. 2.13.

Derivation: By the action of orthophosphoric acid on magnesium oxide.

Grades: Technical, C. P.

Containers: Glass bottles.

Use: Medicine; stabilizer for plastics, food additive.

Shipping regulations: None.*

magnesium phosphate, monobasic (magnesium biphosphate, acid magnesium phosphate, magnesium tetrahydrogen phosphate)
 $\text{MgH}_2(\text{PO}_4)_2 \cdot 2\text{H}_2\text{O}$.

Properties: White, hygroscopic; crystalline powder, decomposes to metaphosphate by heat. Soluble in water and acids; insoluble in alcohol.

Derivation: By the action of orthophosphoric acid on magnesium hydroxide.

Grades: Technical.

Containers: Boxes, barrels, kegs, bags.

Use: Medicine; fireproofing wood, stabilizer for plastics.

Shipping regulations: None.*

magnesium phosphate, neutral. See magnesium phosphate, tribasic.

magnesium phosphate, secondary. See magnesium phosphate, dibasic.

magnesium phosphate, tribasic (magnesium phosphate, neutral, trimagnesium phosphate) $\text{Mg}_3(\text{PO}_4)_2 \cdot 8\text{H}_2\text{O}$ or $5\text{H}_2\text{O}$.

Properties: Fine, soft, bulky white powder, odorless and tasteless; sp. gr. 2.41, loses all water at 400°C. Soluble in acids, insoluble in water.

Derivation: Reaction of magnesium oxide and phosphoric acid at high temperatures.

Grades: Technical, reagent, N. F. XI.

Containers: Bags; barrels, drums.

Uses: Dentifrice polishing agent, pharmaceutical antacid, adsorbent, stabilizer for plastics, food additive.

magnesium phosphite $\text{MgHPO}_3 \cdot 3\text{H}_2\text{O}$.

Properties: White, crystalline powder, slightly soluble in water.

magnesium pyrophosphate $\text{Mg}_2\text{P}_2\text{O}_7 \cdot 3\text{H}_2\text{O}$.

Properties: White powder; soluble in acids; insoluble in alcohol and water. Sp. gr. 2.56; loses water at 100°C.

magnesium ricinoleate $\text{Mg}(\text{OCC}_{17}\text{H}_{32}\text{OH})_2$.

Properties: Coarse, yellow granules with faint fatty acid odor; m. p. 98°C; sp. gr. 1.03 (25/25°C). Used in cosmetics.

magnesium salicylate $\text{Mg}(\text{C}_7\text{H}_5\text{O}_3)_2 \cdot 4\text{H}_2\text{O}$.

Properties: Colorless, efflorescent crystalline powder. Soluble in water and alcohol.

Derivation: By the action of salicylic acid on magnesium hydroxide.

Method of purification: Crystallization.

Grades: Technical.

Containers: Wooden kegs; glass bottles.

Use: Medicine.

Shipping regulations: None.*

magnesium silicate $3\text{MgSiO}_3 \cdot 5\text{H}_2\text{O}$ (variable).

See also magnesium trisilicate and serpentine.

Properties: Fine, white powder; sp. gr. 2.6-2.8; insoluble in water or alcohol.

Derivation: By the interaction of a magnesium salt and a soluble silicate.

Grades: Technical, C. P.

Containers: 1-lb bottles; wooden kegs; multi-wall paper sacks.

Uses: Medicine; rubber industry; ceramics; glass, refractories, manufacture of permanently dry resins and resinous compositions, paints and varnishes (filler); animal and vegetable oils (bleaching agent); odor absorbent, filter medium, catalyst and catalyst carrier, anticaking agent in foods.

Shipping regulations: None.*

magnesium silicofluoride. See magnesium fluosilicate.

magnesium-sodium sulfate. See sodium-magnesium sulfate.

magnesium stannate $\text{MgSnO}_3 \cdot 3\text{H}_2\text{O}$.

Properties: White crystalline powder.

Soluble in water. Approximate temperature of decomposition 340°C.

Use: Additive in ceramic capacitors.

magnesium stearate (dolomol) $\text{Mg}(\text{C}_{18}\text{H}_{35}\text{O}_2)_2$.

Technical grade contains small amounts of the oleate and 7% magnesium oxide MgO .

Properties: Soft white light powder; sp. gr. 1.028; m. p. 88.5°C (pure), 132°C (technical); tasteless, odorless. Insoluble in water, soluble in hot alcohol.

Grades: Technical, U. S. P. XVI.

Containers: Fiber cans, multiwall paper sacks.

Use: Dusting powder, lubricant in making tablets, drier in paints and varnishes, flattening agent, in medicines; stabilizer and lubricant for plastics; emulsifying agent in cosmetics.

magnesium sulfate (a) MgSO_4 ; (b) (Epsom salts) $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$.

Properties: Colorless crystals, small usually needlelike, cooling, saline, bitter taste, neutral to litmus; sp. gr. (a) 2.65; (b) 1.678; soluble in glycerol; very soluble in water; sparingly soluble in alcohol.

Derivation: (a, b) By the action of sulfuric acid on magnesium oxide, hydroxide or carbonate, (b) mined in a high degree of purity in State of Washington, U. S. A.

Method of purification: Recrystallization.

Grades: Technical; C. P.; U. S. P. XVI.

Containers: Bottles; boxes, multiwall bags, kegs; barrels; bags; carloads.

Use: Medicine; leather industry, fireproofing;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

textiles (warp-sizing cotton goods, loading cotton goods, weighting silk, dyeing and calico printing); mineral waters; motion-picture snow; ceramics; explosives; matches; fertilizers; paper (sizing); cosmetic lotions; dietary supplement.

Shipping regulations: None.*

magnesium sulfite $\text{MgSO}_3 \cdot 6\text{H}_2\text{O}$.

Properties: White, crystalline powder; slightly soluble in water; insoluble in alcohol. M. p., loses $6\text{H}_2\text{O}$ at 200°C ; b. p. decomposes.

Derivation: By the action of sulfurous acid on magnesium hydroxide.

Method of purification: Crystallization.

Grades: Technical.

Containers: Wooden barrels; glass bottles.

Uses: Medicine; paper pulp.

Shipping regulations: None.*

magnesium tetrahydrogen phosphate. See magnesium phosphate, monobasic.

magnesium thiosulfate (magnesium hyposulfite) $\text{MgS}_2\text{O}_3 \cdot 6\text{H}_2\text{O}$.

Properties: Colorless crystals; soluble in water; insoluble in alcohol. Sp. gr. 1.818.

Use: Medicine.

magnesium trisilicate. Approximately $\text{Mg}_2\text{Si}_3\text{O}_8 \cdot 5\text{H}_2\text{O}$.

Properties: Fine, white, odorless, tasteless powder; free from grittiness. Insoluble in water and alcohol; readily decomposed by mineral acids.

Derivation: Naturally occurring, as talc; by reaction of soluble magnesium salts with soluble silicates.

Grades: Technical; U. S. P. XVI.

Containers: Drums.

Uses: Industrial odor absorbent; decolorizing agent; antioxidant; medicine.

magnesium tungstate (magnesium wolframate) MgWO_4 .

Properties: White crystals; soluble in acids, insoluble in water and alcohol.

Derivation: By the interaction of solutions of magnesium sulfate and ammonium tungstate.

Grades: Technical.

Containers: Wooden kegs.

Uses: Fluorescent screens for x-rays; luminescent paint.

magnesium wolframate. See magnesium tungstate.

magnesium zirconium silicate MgZrSiO_5 .

Properties: White solid; m. p. 3200°F ; density 80 lbs/cu ft; insoluble in water, alkalis; slightly soluble in acids.

Containers: 80-lb paper bags; 500-lb drums.

Uses: Electrical resistor ceramics, glaze opacifier.

"Magnesol." ⁵⁵ Brand name for a synthetic proprietary product, adsorptive magnesium silicate.

Properties: White solid; insoluble in water, mineral and vegetable oils, petroleum and chlorinated hydrocarbon solvents.

Bulk density 24-28 g/100 cc.

Grades: Dry-cleaning; industrial.

Containers: 50-lb multiwall paper bags.

Uses: Solvent purification, clarification and recovery; oil refining; deodorizing and decolorizing of a large variety of oils and fats.

Shipping regulations: None.*

magnetic pyrites. See pyrrhotite.

magnetite (lodestone; iron ore, magnetic)

Fe_3O_4 , often with Ti, Mg.

See also iron oxide, black.

Properties: Black mineral; black streak; submetallic, or dull, to metallic luster.

Contains 72.4% iron. Readily recognized by strong attraction by magnet. Soluble in powder form in hydrochloric acid. Decomposes at 1538°C to ferric oxide Fe_2O_3 . Sp. gr. 4.9-5.2; hardness 5.5-6.5.

Occurrence: United States (New Jersey, New Jersey, Pennsylvania, Arkansas, California, Washington, Utah); Cuba; Norway; Sweden; Germany; Siberia; Italy; Austria; Switzerland, Japan.

Use: Important ore of iron.

magnetohydrodynamic generator (MHD generator). A power generating device in which a very highly heated ionized gas containing free electrons (a plasma) is passed through a magnetic field in such a way that some of the electrons are caused to flow in an external circuit through electrodes that project into the generator. The plasma may consist of electrically heated air or argon, or hot combustion gases.

"Magnorite." ²⁴⁹ Trademark for fused magnesium oxide refractory products.

Properties: Sp. gr. 3.58, fusion point as high as 4750°F (2620°C) depending on purity; coefficient of thermal expansion 0.0000150; mean specific heat (30- 1800°C) 0.29 cal/g/ $^\circ\text{C}$.

Grades and Uses: Available in grains of standard mesh sizes, cements, and shapes. Refractory grade for use in cements. Prefired shapes for lining metal melting furnaces and chemical reactor linings. Electrical grade as insulating medium in tubular type heating elements.

"Magon." ¹⁶⁹ Trademark for 1-azo-2-hydroxy-3-(2,4-dimethylcarboxanilido)naphthalene-1'-(2-hydroxybenzene), used in the colorimetric determination of magnesium.

"Magron." ²³³ Vegetation maturing containing magnesium chlorate.

maguay. See cantala.

maize oil. See corn oil.

malacca nut. See semecarpus nut.

malachite (green carbonate of copper)

$\text{Cu}_2(\text{OH})_2\text{CO}_3$, CuCO_3 , $\text{Cu}(\text{OH})_2$ or $2\text{CuO} \cdot \text{CO}_2 \cdot \text{H}_2\text{O}$. Native hydrated basic copper carbonate.

Properties: Bright-emerald to grass-green color, sometimes nearly black. Pale green streak, silky, adamantine, or dull luster. 71.9% CuO , 19.9% CO_2 , balance water.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Found with other copper ores often as an alteration product. Soluble in acids.

Sp. gr. 3.9-4.03; hardness 3.5-4.

Occurrence: United States (New Jersey, Pennsylvania, Wisconsin, Arizona, New Mexico, Utah, Nevada); Russia; France; England; Germany; Cuba; Chile, Australia; South Africa; West Africa.

Uses: Source of copper; ornamental stoneware (table tops, vases, etc.); pigment (limited); malachite green usually refers to the organic dye).

malachite, artificial. See copper carbonate.

malachite green (benzaldehyde green; victoria green). A triphenylmethane dye, being the zinc double chloride, oxalate, or ferric double chloride of tetramethyl-para-amino-triphenylcarbinol. The term is sometimes applied to the mineral malachite.

Containers: Barrels.

Use: Dyeing.

malachite green toners. See phosphotungstic pigments.

malakin. See salicyl-para-phenetidine.

"Malaphos." ⁸⁸ Trademark for anti-dusting, wettable powder and emulsifiable solution containing malathion.

malathion $C_{10}H_{19}O_6PS_2$. (O,O-dimethyl dithiophosphate of diethyl mercaptosuccinate). The common name (approved by the Ent. Soc.) of a phosphate insecticide with relatively low mammalian toxicity.

Properties: Yellow, high boiling liquid; (b. p. 156-157°C, under 0.7 mm with slight decomposition); m. p. 2.85°C, refractive index ($n_{25/D}$) 1.4985, sp. gr. 1.2315 (25°C), vapor pressure (20°C) approximately 0.00004 mm. Miscible with most polar organic solvents. Practically insoluble in water; stable to light but decomposes when heated to excessively high temperatures. Slow decomposition in the presence of iron, steel, tin plate, and copper. Hydrolyzed in the presence of alkaline materials.

Purity: Technical grade is 95+ % pure.

Derivation: From diethyl maleate and dimethyl dithiophosphoric acid.

Containers: 500-lb lined metal drums.

Caution! Harmful if swallowed. Avoid prolonged breathing of dust or spray mist. Avoid prolonged contact with skin; wash thoroughly after using. Avoid contamination of feed and foodstuffs. (U. S. Pesticides Regulations label.) (MCA label similar.)

Uses: General insecticide including control of aphids, spider mites, scales, and house flies as well as a wide range of other sucking and chewing insects.

Malay fishberry. See cocculus.

male fern. See aspidium.

maleic acid (maleinoic acid)

$HOOCCH:CHCOOH$ (cis isomer).

Properties: Colorless crystals, possessing a characteristic repulsive, astringent taste; faint odor. More toxic than the

isomeric fumaric acid. Do not confuse with malic acid! Soluble in water, alcohol; very slightly soluble in benzene; sp. gr. 1.59; m. p. 130-131°C; at temperatures slightly above the m. p. is converted partly to fumaric acid.

Derivation: Catalytic oxidation of benzene; byproduct from manufacture of phthalic anhydride; catalytic oxidation of C_4 hydrocarbons.

Method of purification: Crystallization.

Grades: Technical; reagent.

Uses: Organic synthesis (malic, succinic, aspartic, tartaric, propionic, lactic, malonic, acrylic, hydracrylic acids); in the textile industry as such or in the form of various salts in the dyeing and finishing of cotton, wool and silk; in manufacture of synthetic resins, preservative for oils and fats.

Shipping regulations: None.* Poison label used and recommended by manufacturers.

maleic anhydride (2,5-furandione)

$HCC(O)OC(O)CH$.

Properties: Colorless needles, sp. gr. 0.934 (20/4°C); m. p. 53°C, b. p. 200°C, soluble in acetone, hydrocarbons, ether, chloroform, petroleum ether.

Derivation: By passing a mixture of benzene vapor and air over a vanadium oxide catalyst at about 450°C. Phthalic anhydride or butenes are also used.

Grades: Technical, rods, flakes, lumps, briquettes, and molten.

Containers: 75-, 175-, 200-, 275-lb fiber drums (rod, flake and lump); 575-lb iron drums (fused), tank cars (molten).

Uses: For polyester resins; alkyd coating resins, agricultural chemicals; paper sizing, drying oils; organic synthesis (malic, succinic, aspartic, tartaric, propionic, lactic, malonic acids); dyeing and finishing of textiles; preservative for oils and fats.

Warning! Causes burns. Avoid contact with eyes, skin or clothing. MCA warning label.

Shipping regulations: None.*

maleic hydrazide (1,2-dihydro-3,6-pyridazine-dione) $HCC(O)NHNHC(O)CH$.

Properties: A solid, decomposing at 260°C; slightly soluble in hot alcohol, more soluble in hot water.

Uses: To kill crabgrass, treatment of tobacco plants; stops sprouting during storage of onions, potatoes, and carrots; as a growth inhibitor; sugar content stabilizer in sugar beets.

maleinic acid. See maleic acid.

maleo-pimaric acid. Reaction product of maleic anhydride and β -pimaric acid; derived from pine gum.

Properties: Crystalline solid; m. p. about 225°C; soluble in most organic solvents; insoluble in water or aliphatic hydrocarbons.

malic acid (common malic acid; hydroxy-succinic acid; apple acid)
 $COOHCH_2CH(OH)COOH$. Do not confuse

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

with maleic acid, a highly poisonous derivative.

Properties: Colorless crystals; agreeable sour taste; sp. gr. (dl-form) 1.601, (d or f form) 1.595 (20/4°C); m. p. (dl) 128°C, (d or f) 100°C; b. p. (dl) 150°C (dec), (d or f) 140°C (dec). Very soluble in water and alcohol; slightly soluble in ether.

Derivation: Occurs naturally in unripe apples, gooseberries, cherries, raspberries, tomatoes, mountain-ash berries, and syrup residues. Made synthetically by the catalytic oxidation of benzene to maleic acid which is converted to malic acid by heating with steam under pressure.

Grades: Technical, active and inactive.

The natural material is levorotatory, but the synthetic material is inactive.

Containers: Glass jars; fiber cans; drums.

Uses: Medicine; manufacture of various esters and salts, in wine manufacture to age it by removing tartrates; food acidulant.

Shipping regulations: None.*

mallow, marsh. See althea.

malonamide nitrile. See cyanoacetamide.

malonic acid (methanedicarboxylic acid)

$\text{CH}_2(\text{COOH})_2$.

Properties: White crystals; soluble in water, alcohol and ether. M. p. 132-134°C; b. p. decomposes; sp. gr. 1.63.

Derivation: From monochloroacetic acid by action with potassium cyanide, followed by hydrolysis.

Method of purification: Crystallization.

Grades: Technical.

Containers: Tins.

Use: Intermediate for barbiturates and pharmaceuticals.

Shipping regulations: None.*

malonic dinitrile $\text{CH}_2(\text{CN})_2$ (propanedinitrile; methylene cyanide).

Properties: Colored crystals. M. p. 32.1°C; b. p. 220°C.

Use: Organic synthesis.

malonic ester. See ethyl malonate.

malonic ethyl ester nitrile. See ethyl cyanoacetate.

malonic methyl ester nitrile. See methyl cyanoacetate.

malonic nitrile. See cyanoacetic acid.

malonylurea. See barbituric acid.

malt. Yellowish or amber-colored grains of barley which have been partially germinated by artificial means. It contains dextrin, maltose and amylolytic enzymes and has an agreeable, characteristic odor and sweet taste. Black malt is grain which has been scorched in the drying process.

Uses: Amber: brewing; medicine (extract of malt). Black: coloring.

Shipping regulations: None.*

maltase (glucase; alpha-glucosidase). An enzyme which hydrolyzes maltose to

glucose. Occurs in the small intestine, in yeast, molds and malt; usually associated with the enzyme amylase. Recovered in relatively pure form by treating yeast with toluene, chloroform or ethyl acetate, centrifuging to separate from the undissolved matter, and adding ammonia to avoid decomposition.

malt, extract of. See extract of malt.

maltine. See extract of malt.

maltine, French. Same as diastase, malt.

maltobiose. See maltose.

maltose (malt sugar; maltobiose) $\text{C}_{12}\text{H}_{22}\text{O}_{11} \cdot \text{H}_2\text{O}$.

The most common reducing disaccharide; composed of two molecules of glucose.

Found in starch and glycogen.

Properties: Colorless crystals; m. p. 102-103°C; soluble in water; soluble in alcohol; insoluble in ether.

Derivation: By the enzymatic action of diastase (usually obtained from malt extract) on starch.

Containers: Glass bottles; fiber cans; drums.

Uses: Nutrient; sweetener; culture media; stabilizer for polysulfides.

Shipping regulations: None.*

malt sugar. See maltose.

"Mam." ³⁴² Trademark for dimethyl anthranilate. Used in perfumery.

mandarin oil (tangerine oil).

Properties: Essential oil; golden yellow (from mature fruit); olive green (from immature fruit). Characteristic refreshing odor.

Chief known constituents: Limonene; methyl esters of anthranilic and methylanthranilic acids.

Constants: Sp. gr. 0.854-0.859 (15°C); optical rotation +65 to +75°; refractive index 1.475-1.478; acid value up to 1.7; ester value 5 to 11; after acetylation 12.5. Soluble in 7 to 10 vols of 90% alcohol (with some turbidity).

Derivation: Expressed from the fresh peel of the mandarin orange *Citrus nobilis*, L.

Containers: Drums.

Uses: Flavoring; medicine.

Shipping regulations: None.*

mandelic acid (phenylglycolic acid; alpha-phenylhydroxyacetic acid; benzoglycolic acid; known also as amygdalic acid) $\text{C}_6\text{H}_5\text{CHOHCOOH}$. Exists in stereoisomeric forms. The properties are those of the dl-form.

Properties: Large white crystals or powder with a faint odor, sp. gr. 1.30; m. p. 117-119°C. Darkens on exposure to light.

Soluble in ether; slightly soluble in water and alcohol.

Derivation: Hydrolysis of the cyanohydrin formed from benzaldehyde, sodium bisulfite, and sodium cyanide. Can be obtained from amygdalin, the glucoside found in almonds.

Containers: Glass bottles; 25-, 100-lb drums.

Use: Medicine; organic synthesis.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Mandelin's reagent. One gram of ammonium vanadate dissolved in 200 cc of conc. sulfuric acid. The reagent gives characteristic color tests with certain alkaloids.

mandelonitrile gentiobioside. See amygdalin.

mandetyl-para-phenetidine. See amygdophe-nine.

mandrake. See podophyllum.

maneb (MnEBD; manganese ethylenebisdithiocarbamate) ($-\text{SSCNHCH}_2\text{CH}_2\text{NHCSS}-$)Mn. A fungicide obtained by treating a solution of nabam with manganous sulfate.
Properties: Very similar to zineb (q. v.). Brown powder; decomposes on heating.
Derivation: From disodium ethylene bis-dithiocarbamate and a manganese salt.
Caution! May cause irritation of eyes, nose, throat, and skin. May be harmful if inhaled or swallowed. MCA warning label.
Use: Fungicide for foliage.

manganese Mn. Element with atomic number 25. A reddish-gray or silvery, brittle metallic element of group VII in the periodic table. Considered essential for plants and animals.

Properties: Softer than iron when pure; sp. gr. 7.2, m. p. 1245°C , b. p. 2097°C ; decomposes water; slowly dissolves in dilute acids.

Occurrence: Never found native. Important manganese ores are pyrolusite, manganite, psilomelane, rhodochrosite, rhodonite, wad. Manganiferous iron, silver, and zinc ores are also important (franklinite). A large source is open hearth slags. Principal sources of ores. United States, Russia, India, Brazil, West Africa, Cuba.

Derivation: By reduction of the oxide with aluminum or carbon. Pure manganese is obtained electrolytically from sulfate or chloride solutions.

Grades: Technical, pure or electrolytic, powdered.

Containers: 500-, 900-lb barrels, drums; boxes.

Uses: Purifying and scavenging agent in the production of several metals, iron, copper, chrome-nickel, aluminum alloys, alloy steels; source of manganese chemicals.

Shipping regulations: None.*

manganese acetate $\text{Mn}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 4\text{H}_2\text{O}$.

Properties: Pale red crystals; very soluble in water and alcohol, sp. gr. 1.59, m. p. 80°C .

Derivation: By the action of acetic acid on manganese hydroxide.

Method of purification: Crystallization.

Grades: Technical, C. P.

Containers: 1-lb bottles, wooden kegs; fiber cans and drums.

Uses: Textile dyeing; manufacturing bistr; catalyst in various chemical processes involving oxidation, leather tanning and finishing; paint and varnish (drier, boiled oil manufacture); fertilizers, food packaging.

manganese-ammonium sulfate (manganous ammonium sulfate) $\text{MnSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$.
Properties: Light-red crystals; sp. gr. 1.83; soluble in water.

manganese arsenate. See manganous arsenate.

manganese, battery. See manganese dioxide.

manganese binoxide. See manganese dioxide.

manganese black. See manganese dioxide.

manganese, bog. See wad.

manganese borate MnB_4O_7 .

Properties: Reddish-white powder; insoluble in water.

Derivation: By the action of boric acid on manganese hydroxide.

Grades: Technical; C. P.

Containers: 1-lb bottles; wooden kegs; fiber drums.

Use: Varnish and oil drier.

Shipping regulations: None.*

manganese-boron. An alloy of manganese and boron used in the making of brass, bronze and other alloys.

manganese bromide. See manganous bromide.

manganese-bronze. Alloy of 55 to 60% copper, 38 to 42% zinc, up to 3.5% manganese, with or without small amounts of iron, aluminum, tin or lead.

manganese carbonate (manganous carbonate) MnCO_3 (found as rhodochrosite).

Properties: Rose-colored crystals; almost white when precipitated. Soluble in dilute acids, insoluble in water. Sp. gr. 3.125; m. p., decomposes.

Derivation: A precipitate from the addition of sodium carbonate to a solution of a manganese salt followed by filtration, washing and drying.

Grades: Technical, C. P.

Containers: Bottles; bags; drums; carloads.

Uses: Manufacture of manganese salts; medicine, paint pigment, fertilizers, feed additive.

Shipping regulations: None.*

manganese chloride. See manganous chloride.

manganese chromate. See manganous chromate.

manganese citrate (manganous citrate)

$\text{Mn}_3(\text{C}_6\text{H}_5\text{O}_7)_2$.

Properties: White powder, soluble in water in presence of sodium citrate.

Derivation: By the action of citric acid on manganese hydroxide.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

manganese dioxide (manganese binoxide; manganese black, battery manganese; manganese peroxide) MnO_2 . The natural form is pyrolusite.

Properties: Black crystals or amorphous powder; soluble in hydrochloric acid, insoluble in water. Sp. gr. 5.026; m. p.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

decomposes to Mn_2O_3 and oxygen at $535^\circ C$.

Derivation: (a) Found in nature as such. See pyrolusite. (b) By heating manganese oxide in a furnace in presence of oxygen. (c) Decomposition of manganous nitrate. (d) By certain electrolysis processes.

Grades: Technical; C. P.

Containers: Bottles; multiwall paper sacks, bags; drums; carloads.

Uses: In general, one of the prime oxidizing agents. For many uses, pyrolusite ore is interchangeable with the synthetic compound. Typical oxidizing uses are oxidation of leuco dye compounds, manufacture of purpurin from alizarin, of benzoic acid and benzaldehyde from toluene, production of hydroquinone. Also used in pyrotechnic mixtures, matches, and match box friction surfaces, dry cells and electrodes; for making other manganese compounds; in glass enamels and glazes as colorant, decolorizer and scavenger; as coloring agent in brick pigments and inks, for paint driers, fertilizer; feed additive; water treatment; rubber compounding; processing of uranium ore; in ferrites; in removal of hydrogen sulfide from gases; in manufacture of electrolytic zinc, in alloy steels, cast irons and wrought irons; medicine.

Shipping regulations: None.*

manganese dioxide, black. See pyrolusite.

manganese ethylenedisithiocarbamate. See maneb.

manganese fluoride. See manganous fluoride.

manganese gluconate $Mn(C_6H_{11}O_7)_2 \cdot 2H_2O$.

Properties: Light pinkish powder or coarse pink granules. Soluble in water, insoluble in alcohol and benzene.

Method of purification: Crystallization.

Grades: Pharmaceutical.

Containers: Cans; fiber drums.

Uses: Medicinal; feed additive, dietary supplement.

Shipping regulations: None.*

manganese glycerinophosphate. See manganese glycerophosphate.

manganese glycerophosphate (manganese glycerinophosphate) $MnC_3H_7O_3 \cdot PO_3$.

Properties: Yellowish-white or pinkish powder; odorless, nearly tasteless. Soluble in water in presence of citric acid, slightly soluble in water; insoluble in alcohol.

Derivation: By the action of glycerophosphoric acid on manganese hydroxide.

Grades: Technical.

Containers: Glass bottles; boxes.

Use: Medicine (for its glycerophosphate content).

Shipping regulations: None.*

manganese green. See barium manganate.

manganese hydrate. Used as a synonym for manganese hydroxide. See manganic hydroxide, manganous hydroxide.

manganese hydrogen phosphate. See manganous phosphate, acid.

manganese hydroxides. See manganic hydroxide; manganous hydroxide.

manganese hypophosphite $Mn(H_2PO_2)_2 \cdot H_2O$.

Properties: Pink crystals or powder; odorless; tasteless.

Caution! An explosion may occur if manganese hypophosphite is heated or triturated with nitrates, chlorates, or other oxidants.

Soluble in water; insoluble in alcohol.

Derivation: Interaction of manganese sulfate and calcium hypophosphite.

Method of purification: Crystallization.

Grades: Technical.

Containers: 1-lb bottles; 5-, 10-, 25-lb cans; 100-lb kegs; drums.

Use: Medicine; dietary supplement.

Shipping regulations: None.*

manganese iodide. See manganous iodide.

manganese lactate $Mn(C_3H_5O_3)_2 \cdot 3H_2O$.

Properties: Pale red crystals; soluble in water and alcohol.

Derivation: By the action of lactic acid on manganous hydroxide.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

manganese-lead linoleate. See lead-manganese linoleate.

manganese linoleate $Mn(C_{18}H_{31}O_2)_2$.

Properties: Dark brown, plaster-like mass, soluble in linseed oil.

Derivation: By boiling a manganous salt, sodium linoleate and water.

Grades: Technical.

Containers: Wooden kegs; drums.

Uses: Paint and varnish drier, pharmaceutical preparations.

Shipping regulations: None.*

manganese monoxide. See manganous oxide.

manganese naphthenate.

Properties: Hard, brown, resinous mass.

When precipitated in the cold it is a pale buff in color, but darkens immediately on solution. Soluble in mineral spirits, hardens on exposure to air. M. p. (approx) $130-140^\circ C$.

Derivation: Precipitation from mixture of soluble manganese salts and aqueous sodium naphthenate solution.

Containers: 50-lb steel drums.

Uses: Paint and varnish drier.

Shipping regulations: None.*

manganese nitrate. See manganous nitrate.

manganese oleate $Mn(C_{18}H_{33}O_2)_2$.

Properties: Brown, granular mass; soluble in oleic acid and ether; insoluble in water.

Derivation: By boiling manganese chloride, sodium oleate and water.

Grades: Technical.

Containers: Wooden kegs.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Uses: Medicine; varnish drier.

Shipping regulations: None.*

manganese oxalate $\text{MnC}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$.

Properties: White crystalline powder; soluble in dilute acids; very slightly soluble in water. Sp. gr. 2.453; m. p., decomposes at 150°C.

Derivation: By adding sodium oxalate to manganese chloride.

Grades: Technical.

Containers: Wooden barrels.

Uses: Metallic manganese; paint and varnish drier.

Shipping regulations: None.*

manganese oxides. See manganous oxide;

manganic oxide; manganese dioxide.

Several other oxides of manganese are known, as manganic-manganous oxide Mn_3O_4 ; manganese trioxide MnO_3 ; and manganese heptoxide Mn_2O_7 . These have not been found of importance commercially.

manganese peroxide. See manganese dioxide.

manganese phosphate. See manganous orthophosphate. See also manganous phosphate, acid.

manganese protoxide. See manganous oxide.

manganese pyrophosphate. See manganous pyrophosphate.

manganese resinate.

Properties: Dark, brownish-black mass or flesh colored powder. Soluble in hot linseed oil, insoluble in water.

Derivation: By boiling manganese hydroxide, resin oil and water.

Grades: Technical.

Containers: Wooden kegs, drums.

Use: Varnish and oil drier.

Fire hazard: Dangerous.

manganese sesquioxide. See manganic oxide.

manganese silicate. See manganous silicate.

manganese steel. See also ferromanganese.

1. Low-manganese steel. Manganese in steel counteracts brittleness from sulfur; inexpensively increases hardenability. In small quantities also influences grain size; used to make low-carbon, high-strength steels; increases tensile strength, reduces "hot shortness" or "red shortness" caused by sulfur, permitting metal to be hot worked, is also a deoxidizer.

2. Austenitic manganese steel (high-manganese steel; Hadfield's manganese steel). Composition 1.0 to 1.4% carbon, 10 to 14% manganese (usually 13-14%). An extremely tough non-magnetic alloy; high strength, high ductility, excellent resistance to wear; an outstanding material for resisting severe service combining abrasion and heavy impact. Available as castings up to several tons and as sheet, plate, and bar stock. Work hardens readily; has rather low yield strength at first, but deformation hardens it. Generally considered unmachinable, although it is possible to cut it with cemented carbide and

cobalt high-speed steel tools. Most finishing is done with grinders; used in well-drill bits, crushers, power-shovel teeth, etc.

manganese sulfate. See manganous sulfate.

manganese sulfite. See manganous sulfite.

manganese tallate. Manganese salts of tall oil fatty acids. Used as a drier.

manganese-titanium.

Composition: Contains manganese, titanium, aluminum, iron, silicon.

Properties: (regular) M. p. 2650°F; (special) m. p. 2430°F.

Uses: (regular) Deoxidizer in high grade steel; (special) non-ferrous alloys deoxidizer.

manganic acetylacetonate $\text{Mn}[\text{CH}(\text{COCH}_3)_2]_3$.

Properties: Brown crystalline solid; m. p. 172°C.

Derivation: Reaction of a manganese salt with acetylacetone and sodium carbonate.

manganic fluoride MnF_3 .

Properties: Red crystalline solid; sp. gr. 3.54; decomposed by water and by heat; poisonous!

Use: Fluorinating agent.

manganic hydroxide (manganese hydroxide; hydrated manganic oxide) $\text{Mn}(\text{OH})_3$.

Rapidly loses water to form $\text{MnO}(\text{OH})$.

Properties: A brown powder; sp. gr. 3.258; m. p., decomposes; decomposes in acids; insoluble in water.

Derivation: By the action of oxygen on precipitated manganous hydroxide.

Grades: Technical.

Containers: Wooden barrels.

Uses: Pigment for fabrics; ceramics.

Shipping regulations: None.*

manganic oxide (manganese oxide; manganese sesquioxide) Mn_2O_3 . In nature as manganite (q. v.).

Properties: Black, lustrous powder, sometimes tinged brown; very hard, sp. gr. 4.5; soluble in cold hydrochloric acid, hot nitric acid (decomposes), hot sulfuric acid, insoluble in water.

manganic oxide, hydrated. See manganic hydroxide.

"Manganin."¹⁵⁵ Trade name for an alloy of copper, manganese, and nickel.

Properties: Resistivity, 290 ohms per circular mil foot; low thermal emf vs. copper; temperature coefficient of resistance ± 0.000015 between 15-35°C; when wound, subject to strains which must be relieved by artificially aging by baking at 250-280°F for 24-48 hours.

Forms: Wire; ribbon; shunt strip.

Uses: Resistors in Wheatstone bridges,

* decade boxes, potentiometers, etc.; shunts in DC ammeters.

manganite (gray manganese ore)

$\text{Mn}_2\text{O}_3 \cdot \text{H}_2\text{O}$. Steel-gray to iron-black mineral, reddish-brown to black streak,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

submetallic luster. Contains 62.4% manganese, 27.3% oxygen, 10.3% water.

Formed in the same deposits as pyrolusite (q. v.), which is frequently an alteration product of manganite. Sp. gr. 4.2-4.4, hardness 4. Insoluble in water; soluble in hot sulfuric acid and hydrochloric acid.

Occurrence: United States (Michigan, Colorado); Germany; Sweden; England; Canada.

Use: An important ore of manganese.

manganosite. See manganous oxide.

manganous-ammonium sulfate. See manganese-ammonium sulfate.

manganous arsenate (manganese arsenate, manganous arsenate, acid) MnHASO_4 .

Properties: Reddish-white powder. Hygroscopic; poisonous! Soluble in acids; slightly soluble in water.

manganous arsenate, acid. See manganous arsenate.

manganous bromide (manganese bromide) $\text{MnBr}_2 \cdot 4\text{H}_2\text{O}$.

Properties: Red crystals, very soluble in water; deliquescent.

Derivation: Action of hydrobromic acid with manganese dioxide, manganous carbonate, or manganous hydroxide.

manganous carbonate. See manganese carbonate.

manganous chloride (manganese chloride)

(a) MnCl_2 , (b) $\text{MnCl}_2 \cdot 4\text{H}_2\text{O}$.

Properties: Rose-colored crystals; deliquescent. Sp. gr. (a) 2.478; (b) 1.913; m. p. (a) 650°C ; (b) 87.5°C ; b. p. (b) 106°C . Very soluble in water; slightly soluble in alcohol; insoluble in ether.

Derivation: By the action of hydrochloric acid on manganese dioxide, with subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical, C. P.

Containers: Drums.

Uses: Catalyst in the chlorination of organic compounds; paints (drier, manufacture of a brown pigment by reaction with a solution of dichromates); dyeing; pharmaceutical preparations; stimulant in fertilizer compositions; feed additive; dietary supplement.

Shipping regulations: None.*

manganous chromate (manganese chromate; manganous chromate, basic) $2\text{MnO} \cdot \text{CrO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: Brown powder; slightly soluble in water with hydrolysis.

manganous chromate, basic. See manganous chromate.

manganous citrate. See manganese citrate.

manganous fluoride (manganese fluoride) MnF_2 .

Properties: Reddish powder; soluble in acids; insoluble in water, alcohol, and ether. Sp. gr. 3.98; m. p. 856°C .

Derivation: By the action of hydrofluoric

acid on manganous hydroxide.

Grades: Technical.

manganous hydroxide (manganese hydroxide)

$\text{Mn}(\text{OH})_2$. Occurs naturally as pyrochroite.

Properties: White-pink trigonal crystals; sp. gr. 3.258; hardness 2.5; decomposes with heat; insoluble in water and alkali; soluble in acids and ammonium salts.

manganous iodide (manganese iodide)

(a) MnI_2 ; (b) $\text{MnI}_2 \cdot 4\text{H}_2\text{O}$.

Properties: (a) White deliquescent, crystalline mass; (b) rose crystals; sp. gr. (a) 5.01; m. p. (a) 638°C ; b. p. (a) 1061°C ; soluble in water with gradual decomposition.

Derivation: By the action of hydriodic acid on manganous hydroxide.

manganous nitrate (manganese nitrate)

$\text{Mn}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$.

Properties: Pink crystals; very soluble in water, deliquescent; soluble in alcohol. Sp. gr. 1.82; b. p. 129°C ; m. p. 26°C .

Grades: Technical; C. P.

Containers: Glass bottles; non-returnable tins.

Uses: Ceramics; intermediates; catalyst; manganese dioxide.

Shipping regulations: Oxidizing material. Yellow label.*

manganous orthophosphate (manganese phosphate) $\text{Mn}_3(\text{PO}_4)_2 \cdot 7\text{H}_2\text{O}$.

Properties: Reddish-white powder; soluble in mineral acids; insoluble in water.

Derivation: By the action of orthophosphoric acid on manganous hydroxide.

manganous oxide (manganese protoxide; manganese monoxide, manganese oxide; manganosite) MnO .

Properties: Grass-green powder; soluble in acids, insoluble in water. Sp. gr. 5.09-5.18, m. p. 1650°C , but converted to Mn_3O_4 if heated in air.

Derivation: (a) By reduction of the dioxide in hydrogen. (b) By heating the carbonate with exclusion of air.

Grade: Technical.

Containers: Wooden barrels, iron drums; multiwall paper sacks.

Uses: Medicine; textile printing; analytical chemistry; catalyst in manufacture of allyl alcohol; ceramics; dry batteries; paints; colored glass, bleaching tallow.

Shipping regulations: None.*

manganous phosphate, acid (manganese hydrogen phosphate; manganese phosphate; manganous phosphate, secondary)

$\text{MnHPO}_4 \cdot 3\text{H}_2\text{O}$.

Properties: Pink powder. Contains some tribasic phosphate. Soluble in acids; slightly soluble in water.

Use: Feed additive.

manganous phosphate, secondary. See manganous phosphate, acid.

manganous pyrophosphate (manganese pyrophosphate) (a) $\text{Mn}_2\text{P}_2\text{O}_7$; (b) $\text{Mn}_2\text{P}_2\text{O}_7 \cdot 3\text{H}_2\text{O}$.

Properties: White, amorphous powder;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

sp. gr. (a) 3.71. Soluble in solutions of potassium or sodium pyrophosphate; insoluble in water.

manganous silicate (manganese silicate)

MnSiO_3 . Occurs naturally as rhodonite.

Properties: Red crystals or yellowish-red powder. Insoluble in water.

Constants: Sp. gr. 3.72; m. p. 1323°C.

Derivation: By the interaction of manganous salts with sodium silicate.

manganous sulfate (manganese sulfate)

$\text{MnSO}_4 \cdot 4\text{H}_2\text{O}$.

Properties: Translucent, pale rose-red, efflorescent prisms. Soluble in water; insoluble in alcohol.

Constants: Sp. gr. 2.107; m. p. 30°C; anhydrous, m. p. 700°C; decomposes at 850°C.

Derivation: Byproduct of production of hydroquinone; or by the action of sulfuric acid on manganous hydroxide or carbonate.

Method of purification: Crystallization.

Grades: Technical, C. P.; fertilizer.

Containers: Bottles; boxes; kegs; 375-lb barrels; 600-lb casks; multiwall paper sacks.

Uses: Fertilizers; paints and varnishes; ceramics; paper, textile dyes; medicines, vitamins; fungicides, feed additive, dietary supplement, ore flotation, catalyst in viscose process; production of other manganese compounds.

manganous sulfite (manganese sulfite, manganous sulfite, normal) MnSO_3 .

Properties: Grayish-black or brownish-red powder. Soluble in solution of sulfur dioxide; insoluble in water.

manganous sulfite, normal. See manganous sulfite.

mangle. See semecarpus nut.

mangrove.

Derivation: From *Rhizophora mucronata*.

Habitat: West Africa and Borneo.

Grades: Mangrove cutch: 30-35% tannin, liquid; 25% tannin.

Containers: Wooden barrels.

Use: Tanning industry.

Shipping regulations: None.*

Manila gum copal.

Properties: Generally pebble-like pieces of a pale brownish color. Soluble in ether, methyl alcohol and ethyl alcohol; partially soluble in amyl alcohol; insoluble in water.

Constants: Sp. gr. 1.062; m. p. 230-250°C.

Derivation: A copal resin imported from the Philippine Islands.

Grade: Technical.

Containers: Bags.

Uses: Spirits varnishes; enamel paints.

Shipping regulations: None.*

See also copal.

manila hemp. See abaca.

"Manilyl." ¹⁸⁸ Brand name for a replacement for natural ylang ylang oil.

manioc root. See cassava starch.

manjak. See glance pitch.

manna. Solid sweetish exudation of *Fraxinus ornus* (manna ash). Small round lumps, yellow or grayish.

Constituents: Mannitol and derivatives.

Habitat: Mediterranean basin, Spain to Asia Minor.

Containers: Bags.

Use: Medicine.

Shipping regulations: None.*

manna sugar. See mannitol.

mannite. See mannitol.

mannitol (manna sugar; mannite) $\text{C}_6\text{H}_8(\text{OH})_6$. Hexahydric alcohol.

Properties: White, crystalline powder, odorless, of faint, sweet taste, nonhygroscopic.

Soluble in water; slightly soluble in lower alcohols and amines; almost insoluble in other organic solvents.

Constants: Sp. gr. 1.52; m. p. 165-167°C; specific rotation (20°C) between +23° and +24°, b. p. 290-295°C (at 3-3.5 mm).

Derivation: By hydrogenation of corn sugar or glucose, also by extraction from manna ash, or from seaweed.

Grades: Reagent; commercial; N. F. XI.

Containers: Bottles; fiber drums.

Uses: Base or excipient for tableting; ingredient in electrolytic condensers; basis of dietetic sweets; starting point for many derivatives.

Shipping regulations: None.*

mannitol hexanitrate (hexanitromannite; HNM, nitromannite; nitromannitol) $\text{C}_6\text{H}_8(\text{ONO}_2)_6$.

Properties: Colorless crystals, m. p. 112-113°. Explosive! Soluble in alcohol, acetone, ether, insoluble in water.

Derivation: By nitrating mannitol with mixed acid, purifying by precipitation from organic solvents, and stabilizing.

Grades: Technical; N. N. D.

Containers: Water-tight wooden barrels for wet shipment.

Uses: Explosive cap ingredient; medicine (admixed with a large proportion of carbohydrate).

Fire hazard: Dangerous.

Shipping regulations: Explosive, class A.

Initiating explosive label. Not accepted by express.*

D(+)-mannose $\text{C}_6\text{H}_{12}\text{O}_6$. A carbohydrate found naturally in some plant polysaccharides.

Properties: Crystals from alcohol or acetic acid, sweet taste with bitter after-taste; m. p. 132°C (dec).

Derivation: By treating vegetable ivory with sulfuric acid; oxidation of mannitol.

Containers: Bottles; drums.

Use: Biochemical research.

"Mansulox." ²⁵⁰ Trademark for an oxygen-bearing manganese sulfur ladle addition used in making free machining steel.

"Man-Tan." ²³⁶ Brand name for a proprietary, economical tannin mud thinner containing selected ground mangrove bark.

Container: Multiwall paper bag containing 50 lbs.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

manure salts. Potash salts containing high percentage of chloride and from 20-30% of potash (K_2O). Used in fertilizer.

See potash-magnesia double salt.

"Manzate." ²⁸ Trademark for agricultural and horticultural fungicide based on maneb (manganese ethylenebisdithiocarbamate) for control of diseases on certain vegetables and fruits.

Containers: 3- and 4½-lb bags; 50-lb fiber drums.

Use: For spray or dust application of tomatoes, celery, potatoes, onions, carrots, and certain other fruits and vegetables.

"Mapharsen." ³³⁰ Trademark for oxophenarsine hydrochloride.

maphenide hydrochloride (para-aminomethylbenzenesulfonamide hydrochloride; 4-homo-sulfanilamide hydrochloride; marfanil) (SO_2NH_2) $C_6H_4CH_2NH_2 \cdot HCl$.

Properties: White crystals; freely soluble in water; m. p. 260-265°C.

Use: Medicine.

"Mapico Black." ¹³³ Trademark for a synthetic magnetite (magnetic oxide of iron), fine and smooth, possessing remarkable coloring power for this type of pigment. Used in paint as a metal protective coating on steel surfaces, used as a tinting color in emulsion and other paints; widely used in cement products such as shingles and cement brick.

"Mapico Brown." ¹³³ Trademark for proprietary iron oxides, much finer, smoother and stronger than natural earth browns; used in paint, cement, stucco, leather finishes, rubber, etc.

"Mapico Red." ¹³³ Trademark for proprietary oxides of iron. Mapico Red #516 Medium and Dark represent the most readily dispersed oxides available. Mapico Reds #297, #347, #387, #477, and #567 developed especially for the rubber industry have excellent aging properties. These reds are also used in paints, lacquers, cement and stucco, leather finishes, roofing granules, asbestos shingles, electronic ferrites, etc.

"Mapico Tan." ¹³³ Trademark for proprietary, heat-resistant tan colors used extensively in roofing granules and baking enamels. Also used in emulsion paints, enamels, leather finishes, and rubber.

"Mapico Yellow." ¹³³ Trademark for proprietary ferric oxide hydrates, possessing from 4-6 times the tinting strength of natural earth yellows and in addition being finer and smoother. Used generally in paints, enamels, and lacquers, cement and stucco, leather finishes, etc.

maple sugar. Impure sucrose with flavor due to impurities characteristic of maple tree sap. Used as flavor.

"MAPO." ²⁹³ Trademark for tris[1-(2-methyl)-aziridinyl]phosphine oxide (q. v.).

"Maprofix" HM. ³²⁸ Trade name for sodium lauryl sulfate, 40% active powder. Used as a foaming detergent.

"Maprofix Paste." ³²⁸ Trademark for sodium lauryl sulfate. Its uses include: detergent, scouring agent, dyeing assistant, and dispersant in the textile industry.

"Maprofix TLS." ³²⁸ Trademark for triethanolamine lauryl sulfate. It is used as a detergent or as a foaming agent.

"Maprofix TLS-65." ³²⁸ Trade name for triethanolamine lauryl sulfate, 65% active; a paste.

"Maprofix WA; WAQ." ³²⁸ These specially refined sodium lauryl sulfates differ solely in their salt content. Both are widely used in liquid cream shampoos.

"Mapromol HSY." ³²⁸ Trademark for a product consisting of a blend of raw and sulfonated fatty alcohol, used as a textile softener.

"Maprotex." ³²⁸ Brand named product consisting of a sulfated fatty alcohol blend and applied in the textile industry as a continuous boil-off detergent for synthetics.

"MAPS." ²⁹³ Trademark for tris[1-(2-methyl)-aziridinyl]phosphine sulfide, $C_3H_8N_3PS$. Properties similar to "MAPO" but has lower water solubility.

"Marabond." ¹²¹ Trade name for a partially purified calcium lignosulfonate used in oil well cement retarders, foundry supplies, and some ceramic products.

"Maracarb" Chelating Agents. ¹²¹ Trade name for complex mixtures of the salts of lower molecular weight lignosulfonic acids and the salts of the alkaline reversion products of hexoses and pentoses which are produced from wood in the sulfite pulping process. Available in liquid and powder form. Used in fertilizers and agricultural chemicals.

"Maracell-E." ¹²¹ Brand name for a partially desulfonated sodium lignosulfate, developed for use as an organic agent for internal boiler treatments over a wide range of temperatures and pressure. Claimed to prevent or inhibit scale formation in boiler tubes, injectors, feed lines and economizers.

"Maraniol." ²²⁷ Trademark for 4-methyl-7-ethoxycoumarin $C_2H_5OC_6H_3OCOC_2H_5$. Properties: White crystals, walnut odor; stable; not known to cause discoloration; congealing point 113.0-114.0°; 1 gram is clearly soluble in 100 ml of 95% alcohol. Occurrence: Not found in nature. Uses: In fougere and chypre compositions.

marany nut. See semecarpus nut.

"Marasperse." ¹²¹ Trademark for a line of lignosulfonates used as dispersants or emulsion stabilizing agents. The basic lignin monomer unit is a substituted phenyl propane. Available in various types for specific uses.

*See "I. C. C. Shipping Regulations," page xlii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Brown powder; completely soluble in water, insoluble in oils and most organic solvents.

Containers: 50-lb multi-wall paper bags.

Uses: Dyestuffs; oil well drilling fluids; gypsum board; agricultural chemical formulations; industrial cleaners; carbon black dispersions; ceramics; concrete.

"Maratan." ¹²¹ Trade name for a highly purified sodium lignosulfonate retan agent for chrome retanned sole and insole leathers. Available in powder (50-lb paper bags) or liquid form (barrels; tank cars).

Marathon-Howard process. A treatment of waste sulfite liquor from sulfite pulp manufacture to recover chemicals and reduce stream pollution. The waste sulfite is treated with lime and precipitates (1) a calcium sulfite product for use in preparing fresh cooking acid for the sulfite pulp process and (2) a basic calcium salt of lignin sulfonic acid (see lignin sulfonates) which can be pressed and used as a fuel or can be used as raw material for vanillin, lignin plastics, and other chemicals. The remaining liquor, with its biological oxygen demand reduced 80 percent, is dumped into the stream as waste.

"Marax." ²⁹⁹ Trademark for a combination drug containing ephedrine sulfate, theophylline, and hydroxyzine hydrochloride.

marble. A coarse to fine granular or crystalline limestone, generally susceptible of a high polish. Marbles vary considerably in composition, structure and appearance. The term "marble" is rather loosely applied commercially and is sometimes used for ornamental stones which are not limestone.

Uses: Building and ornamental stone; (chips) artificial stone; source of carbon dioxide, neutralization of acids, (flour) abrasives for soaps.

See also whitening.

marcasite (white iron pyrites) FeS_2 , as in pyrite. Pale brass-yellow mineral deepening in color after exposure. Metallic luster, streak nearly black. Resembles pyrite but can be distinguished from it by crystalline form, by chemical tests and by whiter color on fresh fracture. Contains 46.6% iron, 53.4% sulfur, sometimes with small amount of arsenic.

Constants: Sp. gr. 4.6-4.9, hardness 6-6.5. **Occurrence:** United States (Illinois, Wisconsin, Missouri), Czechoslovakia, Germany, England.

Uses: Ore of iron; sulfuric acid manufacture, jewelry and costume decoration.

"Marcol." ⁵¹ Trademark for low viscosity N. F. white oils used in pharmaceutical and cosmetic products. Also used on food packaging machinery, cigar and cigarette machines and on candy and baking machinery where an innocuous lubricant is necessary.

"Marco" Resins. ²⁶³ Proprietary products. Unsaturated polyester resins. Several grades. Maximum viscosity 40 poises (at 25°C).

Uses: Low pressure molding and laminating for glass fiber reinforced plastics; potting, casting, and embedding resins.

"Marco" Resins. ⁴²¹ Trademark for a series of styrenated polyester resins containing additives to suit them to various fabrication methods: hand layup, spray-up, matched die molding, and casting.

"Marcothix" Resins. ⁴²¹ Trademark for a series of thixotropic forms of "Marco" resins. Their thixotropicity prevents excessive drainage during application to vertical surfaces.

"Marex." ³²² Trade name for low viscosity ammonium alginate.

Properties: Cream colored powder; approximately 80 mesh; pH about 6; viscosity (1% by weight) about 85 cps.

Grade: Technical.

Containers: 10-, 50-, 100- and 300-lb drums.

Uses: Stabilizing, moisture controlling, suspending, plasticizing agent.

"Marezine." ³⁰¹ Trademark for cyclizine hydrochloride and cyclizine lactate. Used in medicine.

marfanil. See maphenide hydrochloride.

margaric acid. See n-heptadecanoic acid.

margarine oils. Edible oils, used in the manufacture of oleomargarine, and containing not over 0.1% free fatty acid.

marialite. See wernerite.

marigold. See calendula.

marihuana. See cannabis.

"Marincate." ¹²³ Trademark for magnesium trisilicate.

"Marinco." ¹²³ Trademark for magnesium hydroxides, oxides and carbonates.

"Marinex." ⁵¹ Trademark for lubricating oil containing compounding suiting it for lubrication of the cylinders of multi-stage air compressors.

marjoram oil (calamintha oil).

Properties: Colorless, yellowish or greenish-yellow liquid, strong, penetrating odor.

Soluble in alcohol, ether, and chloroform.

Chief known constituents: Terpeneol; terpenes.

Constants: Sp. gr. 0.890-0.910, optical rotation +5° to +18°.

Derivation: Distilled from the flowering herb of *Origanum marjorana* L.

Method of purification: Rectification.

Grade: Technical.

Containers: Copper flasks; glass bottles.

*** Uses:** Medicine; perfuming soaps; toilet preparations; flavors.

Shipping regulations: None.*

marking nut. See semecarpus nut.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

marl. A natural mixture of clay and calcium or magnesium carbonate.

"Marlate." ²⁸ Trademark for methoxychlor insecticides, supplied in 50% wettable powder and 24% emulsifiable oil formulations.

Use: For control of various insects on food and forage crops, on livestock, and in buildings, especially in dairy operations and elsewhere where a low toxicity agricultural insecticide is required.

"Marlex." ³⁰³ Trademark for a complete family of olefin polymers.

Low density polyethylene, used for coatings, films, blow molding.

"Marlex" 1478: Density 0.914 g/cc; melt index 7.8.

"Marlex" 1531: Density 0.915 g/cc; melt index 3.1.

"Marlex" 2030: Density 0.920 g/cc; melt index 3.0.

"Marlex" 2278: Density 0.922 g/cc; melt index 7.8.

"Marlex" 2331: Density 0.923 g/cc; melt index 3.1.

"Marlex" 2380: Density 0.923 g/cc, melt index 8.0.

"Marlex" 2420: Density 0.924 g/cc, melt index 2.0.

"Marlex" 2520: Density 0.925 g/cc; melt index 2.0.

Medium density polyethylene, used for films.

"Marlex" 2950: Density 0.929 g/cc; melt index 5.0.

"Marlex" 3328: Density 0.933 g/cc, melt index 2.8.

High density ethylene copolymer, used for sheets, blow molding, and injection molding.

"Marlex" 5003: Density 0.950 g/cc, melt index 0.3.

"Marlex" 5005: Density 0.950 g/cc; melt index 0.5.

"Marlex" 5012: Density 0.950 g/cc, melt index 1.2.

"Marlex" 5040: Density 0.950 g/cc; melt index 4.0.

"Marlex" 5065: Density 0.950 g/cc; melt index 6.5.

High density polyethylene, used for film, sheets, blow molding, and injection molding.

"Marlex" 6002: Density 0.960 g/cc, melt index 0.2.

"Marlex" 6009: Density 0.960 g/cc; melt index 0.9.

"Marlex" 6015: Density 0.960 g/cc; melt index 1.5.

"Marlex" 6035: Density 0.960 g/cc, melt index 3.5.

"Marlex" 6050: Density 0.960 g/cc, melt index 5.0.

High density tailored resin, used for heavy duty film, wire coatings, extruded pipes, injection molding.

"Marlex" TR-101: Density 0.940 g/cc; melt index 0.2.

"Marlex" TR-201: Density 0.950 g/cc; melt index 0.3.

"Marlex" TR-202: Density 0.950 g/cc; melt index 0.5.

"Marlex" TR-212: Density 0.960 g/cc; melt index 0.3.

"Marlex" TR-213: Density 0.970 g/cc; melt index 0.2.

"Marlex" TR-414: Density 0.955 g/cc; melt index 0.3.

Low density tailored resin, used for wire and cable coatings, injection molding.

"Marlex" TR-603: Density 0.916 g/cc; melt index 1.2.

"Marlex" TR-618: Density 0.915-0.920 g/cc; melt index 6.5-10.5.

"Marlex" TR-623: Density 0.921-0.925 g/cc; melt index 6.5-10.5.

"Marlex" TR-822: Density 0.923 g/cc; melt index 22.1.

"Marmax." ⁵¹ Trademark for specially compounded oils for use where wet conditions would wash off straight mineral oil. They emulsify readily with water and are used where excessive condensation exists or where water is unavoidably added.

Marme's reagent. A reagent used for testing for alkaloïds. It is made by dissolving 20 parts of potassium iodide and 10 parts of cadmium iodide in 80 parts of water.

"Maroleum." ⁵¹ Trademark for a high quality, light colored, marine general purpose lime-base grease. Consistency suitable for application by hand or grease gun.

"Marplan." ¹⁹⁰ Trademark for a brand of isocarbonyl (q. v.).

marrubium (horehound; hoarhound).

Derivation: Dried leaves and tops of Marrubium vulgare.

Habitat: Europe, central Asia and United States.

Grades: Technical.

Containers: Bales.

Uses: Medicine, confectionery.

Shipping regulations: None.*

Mars brown. See Mars pigments.

marsh gas. See methane.

marshmallow. See althea.

"Marsild" Phosphate. ¹⁹⁰ Trademark for a brand of iproniazid phosphate (q. v.).

Mars orange. See Mars pigments.

Mars pigments. Five pigments obtained by adding milk of lime to a solution of ferrous sulfate and calcining the precipitate formed. The different shades are obtained according to the temperature at which the calcination is conducted. These pigments are termed respectively Mars yellow, Mars orange, Mars brown, Mars red, and Mars violet. The Mars pigments are characterized by fine hues and great permanence.

Mars red. See Mars pigments. See also iron oxide reds.

Mars violet. See Mars pigments.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Mars yellow. See Mars pigments.

martensite. The chief constituent of hardened carbon tool steels. It is a solution of C or Fe_3C in beta-iron, or an exceedingly fine-grained alpha-iron with C or Fe_3C in atomic or molecular dispersion. Carbon content up to 1%. Easily obtained by quenching small bodies of hypereutectoid steel in cold water. More difficult to obtain in low-carbon steels.

Martin's cement. See gypsum cements.

"Marvibond Process." ²⁴⁸ A patented process for laminating decorative and protective "Marvinol" and other vinyls to metallic and non-metallic sheet by a high speed continuous method.

"Marvinol." ²⁴⁸ Trademark for polyvinyl chloride thermoplastic resins.

Properties: White, odorless, tasteless nonhygroscopic powders; resistant to water and corrosive elements; light and heat stable, properties vary with selection of stabilizer, plasticizer, pigment and filler.

Grades: Thirteen types for calendering, molding, extrusion, and coating including high, medium, and low molecular weight resins, plastisol resins and copolymer resins. Also includes a line of rigid, electrical, flexible extrusion and injection molding compounds.

Mary-bud. See calendula.

Maryland pink. See spigelia.

maser. The term is a condensation of the phrase "microwave amplification by stimulated emission of radiation." A maser emits radiation of very specific character as a consequence of resonance between the maser and the radiation it is absorbing, a response analogous to that of a tuning fork to sound waves of resonance frequency. In optical masers a suitable crystal (such as a synthetic ruby) is used to absorb and emit the radiation. The emitted light is of an extremely narrow frequency range, while the incident light may be of a range of frequencies. Radio masers consist of appropriate electronic circuitry and absorb and emit radio waves. Masers not only generate energy of narrow frequency range, but can serve to detect and greatly amplify minute quantities of incident frequencies if properly tuned.

mash. Mixture of malted barley (or other grain) and water used for preparing wort in brewing operations. Also mixture of grain, etc., prepared for fermentation in distilling, e. g., "sour mash whiskey."

"Masonite." ⁹² Trademark for composition hardboard made by defibrating wood chips into the fibrous state in the presence of steam at high pressure, refining the fibers, forming the fibers into (fibrous) mats, and compressing the mats into dense rigid panels in heated presses. The fiber

is waterproofed with an emulsion having a paraffin base.

masonry cement. A group of special cements more workable than Portland cement and more plastic. Used as masonry mortars. Some are similar to waterproofed Portland cement while others are Portland cement mixed with hydrated lime, crushed limestone, diatomaceous earth, or granulated slag. Small additions of calcium stearate, petroleum and highly colloidal clays are sometimes made.

mass. The quantity of matter contained by a body, regardless of its location. Mass is constant, and is distinguished from weight, since the latter is affected by the distance of a body from the earth, i. e., by gravitation.

masseculte. A term applied in the sugar industry to the mixture of sugar and molasses prior to the removal of the molasses.

massicot.

1. Natural lead monoxide, PbO . Contains 92.8% lead. Found in United States (Colorado, Idaho, Nevada, and Virginia).
2. This term was formerly used in metallurgy to designate an oxide of lead corresponding to the same formula as litharge (PbO) but having a different physical state. It is formed by the oxidation of a bath of metallic lead at a temperature of about 345°C so that the oxide formed is not melted; sp. gr. 9.3, m. p. 600°C . If the oxide is melted, it is converted into litharge.

mass number. The number of neutrons and protons in the nucleus of an atom. Thus the mass number of ordinary helium is 4, that of ordinary carbon is 12, of ordinary oxygen 16, and ordinary uranium 238. A given nuclide (kind of nucleus) is characterized by its atomic number, equivalent to the number of protons which gives it its charge and thus determines the kind of element, and the number of neutrons which make up the remainder of its mass. Helium has two protons and two neutrons, mass number 4 and atomic number 2. Protons and neutrons each have very close to unit mass, and since the mass change associated with binding the particles together into the nucleus is also very small, the mass number is always within one-tenth unit of the atomic weight of the nuclide.

"Mastalone." ²⁹⁹ Trademark for an agricultural product containing oxytetracycline hydrochloride, oleandomycin, neomycin sulfate, and prednisolone. Used in veterinary medicine.

masterbatch. A quantity of rubber (usually synthetic) which has had non-rubber components added during the process of synthesis or other early states of the production of the rubber. Common non-rubber components are carbon black and various oils and similar extenders. Use of masterbatches achieves uniform mixtures without

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

the cost of incorporation of additives by milling. Advantageous properties are sometimes achieved.

mastic. Same as mastic gum.

mastic gum (pistachia galls; mastiche; mastix; mastic). Solid resinous exudations of the tree *Pistacia lentiscus*.

Properties: Moderate yellow to pale greenish yellow, transparent tears with a dusty, glass-like luster; brittle; balsamic odor, turpentine taste. About 90% soluble in alcohol, 97% soluble in ether.

Habitat: Mediterranean islands.

Grades: N. F. XI; technical.

Containers: Bags.

Uses: Medicine; condiment; tooth cements; chewing gum; adhesive; lacquers; medical plasters; incense.

Shipping regulations: None.*

mastiche. See mastic gum.

mastic oil.

Properties: Colorless essential oil, characteristic, strongly balsamic odor. Soluble in 4-10 vols of 90% alcohol; in 0.2-2 vols of 95% alcohol.

Chief known constituent: Pinenes.

Constants: Sp. gr. 0.857-0.903 (15°C); b. p. 155-160°C, optical rotation +22 to +34°; refractive index 1.468-1.476; acid value up to 5; ester value 2.5-19, after acetylation 17-21.

Derivation: By distillation of mastic.

Use: Medicine.

Shipping regulations: None.*

mastix. See mastic gum.

"Mastolyn." ²⁶⁶ Trademark for a pale, hard, tough, phenolic-modified resin.

masurium Ma. Discarded name and symbol for technetium.

mata-perro. See condurango.

"Matawan." ⁷² Cleaners containing one or more of the usual sodium compounds such as the carbonate, silicate, phosphate, aluminate, borate, or caustic soda, as well as soaps or synthetic detergents and wetting agents.

matte. A product containing a metal sulfide, as obtained after roasting and fusion of sulfide minerals. Oxides or metals may also be present. Common examples are copper matte and nickel matte.

max. Abbreviation for maximum.

"Maxad." ¹²³ Trademark for magnesium oxide for adsorption application.

"Maxade." ¹⁰⁸ Trademark for a free-flowing, dust free, white granular dish-machine compound designed for high speed, heavy soil installations in hard or soft water areas.

Containers: 125-, 350-lb drums.

"Maxipen." ²⁹⁹ Trademark for potassium phenethicillin.

may apple. See podophyllum.

May blossom. See convallaria.

Mayer's reagent. See mercuric potassium iodide.

May lily. See convallaria.

"M-B-C" Fumigant. ⁸⁸ Trademark for a methyl bromide fumigant with chloropicrin added.

MBMC. Abbreviation for monobutyl-meta-cresol. See tert-butyl-meta-cresol.

"3M Brand Fluorochemicals." ¹⁵⁸ See "Fluorochemicals." ¹⁵⁸

"3M Brand Paper Chemical FC-805." ¹⁵⁸

A paper sizing agent consisting of a chromium complex of a long chain fluorochemical in isopropyl alcohol solution.

Properties: Dark green liquid; sp. gr. 1.005; flash point, 70°F (isopropyl alcohol); soluble in water and short chain aliphatic alcohols, but on drying, becomes water resistant, insoluble and non-volatile.

Containers: 5-gal pail, 15-gal or 55-gal drums.

Uses: Imparts oil and water resistance to paper and paper board.

"3M Brand Perfluoro Carboxylic Acids." ¹⁵⁸ See "Perfluoro Carboxylic Acids."

MBT. Abbreviation for mercaptobenzothiazole.

"MBTS." ²⁸ Trade designation for (2-benzothiazolyl disulfide) ($C_6H_4SCN)_2S_2$.

Properties: Pale yellow powder or grains; sp. gr. 1.54, m. p. 155°C min, insoluble in benzene, ethylene dichloride, acetone, water and gasoline.

Containers: 50-lb bags.

Use: To accelerate and improve the vulcanization of natural and synthetic rubber and latex compounds.

"MC-3." ²⁰⁴ Trademark for a special blend of mild alkalies, complex phosphates, and wetting agents. Especially designed for dairy plant and farm equipment. Sequesters hardest water. Packaged in 5-lb cans, 125-, and 350-lb drums.

MCA. Abbreviation for Manufacturing Chemists' Association, Inc. This organization publishes a booklet of Warning Labels (Manual L-1), frequently revised, which are suggested for use in handling chemicals. The labels do not take the place of those required by law, but have achieved general recognition because of the care with which they have been prepared. The organization also publishes Chemical Safety Data Sheets, which give properties and information on specific chemicals for safe handling and use.

"Mc Namee Clay." ⁶⁹ Trademark for a proprietary product, a soft kaolin clay.

Properties: White to cream; sp. gr. 2.62 ± .03; fineness (through 325 mesh) 99.7%.

Uses: Filler for rubber.

MCP (2-methyl-4-chlorophenoxyacetic acid) $CH_3ClC_6H_4OCH_2COOH$.

Properties: White crystalline solid;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

m. p. 118-119°C. Free acid insoluble in water but sodium and amine salts are soluble.

Grades: Emulsifiable concentrates.

Use: Selective herbicide for control of weeds in cereal crops.

Warning! Irritating to eyes, nose, and throat. MCA warning label.

Md. Symbol for mendelevium (q. v.).

MDA. Abbreviation for metal deactivator. See "Ethyl."

"M. D. A." ¹³⁸ Trade name for methylene disalicylic acid.

Properties: Non-hygroscopic light tan, coarse powder; stable in air (darkens in light); tends to decarboxylate at very high temperatures.

Containers: 100-, 250-lb fiber drums.

Uses: In alkyd resins and modified phenolic compositions for paints and varnishes, an intermediate for dyestuffs and the printing ink industry.

MDAC. Abbreviation for 4-methyl-7-diethylaminocoumarin (q. v.).

MEA. Abbreviation for monoethanolamine. See ethanolamine.

meadow crocus. See colchicum.

meadow green. See copper acetoarsenite.

meadow saffron. See colchicum.

"Mearlite." ²⁷⁰ Trademark for a synthetic nacreous pigment which contains no lead compounds. Mearlite G consists of a bis-muth salt in the form of thin, plate-like crystals. Available both in the form of a suspension in conventional liquid vehicles and as a dry powder. See nacreous pigment.

Containers: 1-, 4-lb glass jars; 50-lb steel cans.

"Mearlmaid." ²⁷⁰ Trademark for natural pearl essence. See nacreous pigment. Containers: 1-lb glass jars; 40-lb aluminum cans.

"Mebaral." ¹⁶² Trademark for mephobarbital.

mecamylamine hydrochloride (3-methyl-aminoisocamphane hydrochloride; N, 2, 3, 3-tetramethyl-2-norcamphanamine hydrochloride)

Properties: White crystalline powder; almost odorless, m. p. 245°C with some decomposition; soluble in water, alcohol, chloroform; somewhat soluble in benzene, isopropyl alcohol; insoluble in ether.

Grade: USP XVI.

Use: Medicine.

Mecca balsam. See balm of Gilead.

Mecca galls. See galls.

mechanical pulp process. See wood pulp.

mechlorethamine hydrochloride [methyl-bis-(2-chloroethyl)amine hydrochloride]

$\text{CH}_3\text{N}(\text{CH}_2\text{CH}_2\text{Cl})_2\cdot\text{HCl}$. A nitrogen mustard.

Properties: White, crystalline, hygroscopic powder; poisonous, a nasal irritant and a vesicant; soluble in water; m. p. 108-111°C.

Grades: U. S. P. XVI.

Use: Medicine.

meclizine hydrochloride $\text{C}_{25}\text{H}_{27}\text{ClN}_2\cdot 2\text{HCl}\cdot\text{H}_2\text{O}$. (1-para-Chlorobenzhydryl-4-methylbenzyl-piperazine dihydrochloride).

Properties: White or yellowish powder or crystals; slight odor, insoluble in water and ether; very soluble in chloroform, pyridine, and acid-alcohol-water mixtures; slightly soluble in dilute acids and alcohol.

Grade: U. S. P. XVI.

Use: Medicine.

meconic acid $\text{HC}_5\text{O}(\text{OH})(\text{COOH})_2\cdot 3\text{H}_2\text{O}$.

Properties: White crystals; lose water of crystallization at 100°C; slightly soluble in water, alcohol and ether, acetone; gives reddish color with ferric chloride solution containing hydrochloric acid.

Derivation: From opium.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

meconin (opianyl) $\text{C}_{10}\text{H}_{10}\text{O}_4$. White crystals, soluble in hot water, alcohol, chloroform, essential oils. The lactone of meconinic acid; m. p. 102-103°C. A neutral principle of opium, occurring also in hydrastis; may be synthesized from guaiaicol or by the oxidation of narcotine.

Shipping regulations: None.*

"Mecostrin." ⁴¹² Trademark for dimethyl tubocurarine chloride (q. v.).

MECSA. Abbreviation for (mono)octadecyl carboxymethylmercaptosuccinate.

"Medialan." ³⁰⁷ Trademark for surfactants.

"Medialan" LL-33.

Properties: Pale yellow liquid; soluble in water. Good foaming agent. Composition: 31% sodium N-lauroyl sarcosinate.

Uses: Surfactant with good lathering and cleansing properties suitable for a mild shampoo and other cosmetic preparations.

"Medialan" LL-99. Purified dry form of material described above; 94% active.

"Medi-Calgon." ¹⁰⁸ Trademark for a gleaming white, powdered, sodium hexametaphosphate which has the ability to form a firm coagulum with tissue exudates.

Containers: 7-oz bottles, 5-lb cans.

Use: Medicine (topical applications).

Mediterranean squill. See squill.

medium yellow. See chrome yellows.

"Medo-Green." ⁵⁸ Trademark for silage grade sodium metabisulfite $\text{Na}_2\text{S}_2\text{O}_5$.

Uses: Used in putting up grass silage to prevent bacterial decay, which causes fermentation and decay. Insures a sweet smelling silage of green color and high

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

carotene content and good palatability.
Containers: 100-lb bags.

medroxyprogesterone acetate (17 alpha-hydroxy-6 alpha-methyl progesterone acetate) $C_{24}H_{34}O_4$.

Properties: Crystals; m.p. 205-209°C.
Use: Medicine.

meerschaum (sepiolite) $H_4Mg_2Si_3O_{10}$, with partial replacement of Mg by Cu and Ni. A tough compact, natural hydrous magnesium silicate. Color, white, grayish-white, sometimes yellow or reddish. Constants: Sp. gr. 2.0; hardness 2-2.5. Occurrence: Turkey, Spain, Greece, Morocco, Czechoslovakia. Uses: Tobacco pipes; used as a soap in Algeria and as a building stone in Spain.

mega-. Prefix meaning 10^6 units (symbol M).
E.g., 1 megagram = 1,000,000 grams.

megass. See bagasse.

megilp. A linseed oil-mastic varnish mixture. Used as an ingredient of artists' oil paints.

melonite. See wernerite.

MEK. See methyl ethyl ketone.

"Mekomask."¹⁸⁸ Brand name for an industrial odorant especially effective when used with methyl ethyl ketone.

melaconite. See tenorite.

melamine (cyanuramide; 2,4,6-triamino-sym-triazine) $H_2NCNC(NH_2)NC(NH_2)N$.

A cyclic trimer of cyanamide.

Properties: Pure white, monoclinic crystals. Sparingly soluble in water, glycol, glycerol, pyridine; very slightly soluble in ethanol; insoluble in ether, benzene, carbon tetrachloride. Sp. gr. 1.573 (250°C); m.p. 250°C.

Derivation: From cyanamide, dicyandiamide, or cyanuric chloride.

Method of purification: Recrystallization from water.

Grade: 99% minimum.

Containers: 80-lb bags; fiber drums.

Uses: Synthetic resins, organic syntheses.

Shipping regulations: None.*

melamine resins. Synthetic resins of the thermosetting type, made from melamine and formaldehyde. These resins are very versatile and widely used. The first step in resin formation is the production of trimethylol melamine, $C_3N_3(NHCH_2OH)_3$, the molecules of which contain a ring with 3 carbon and 3 nitrogen atoms, and have the $-NHCH_2OH$ groups attached to the carbon atoms of the ring. This molecule can combine further with others of the same kind through splitting-off of water from the hydrogen atom attached to nitrogen and the OH group of another molecule. If present, excess formaldehyde or excess melamine can also react with the trimethylol melamine or its polymers, so that there are endless possibilities of

chain growth and cross-linking. The nature and degree of polymerization depends upon pH, but heat is always needed for curing. The lower molecular weight, uncured melamine resins are water soluble syrups. The higher molecular weight materials are less soluble or insoluble and are usually available as powders. These are often easily dispersible in water. The resins are very widely used as molding compounds with alpha-cellulose, wood flour or mineral powders as fillers, and with coloring materials also incorporated. Typical molding techniques are used to produce items such as utensils, containers, dishes, coffee makers, and items such as buttons, handles, lamp pedestals, fuse and switch boxes and various industrial and household objects. The resins are also used for laminating, for boilproof adhesives, for increasing wet strength of paper, and for textile treatment to achieve crease and wrinkle resistance, etc., and in leather processing.

Typical properties of molded objects are sp. gr. 1.5; tensile strength 7500 psi; compressive strength 45,000 psi; mold shrinkage 0.008; continuous heat resistance 210 to 230°F; heat distortion temperature 400°F; dielectric strength 320 volts per mil at 25°C, water absorption 0.1 to 0.6% in 24 hours. The finished resins do not discolor easily and are resistant to weathering, handling, scratching, and effects of ordinary water solutions.

Butylated melamine resins are formed by incorporating butyl or other alcohols during resin formation, whereupon the $NHCH_2OH$ groups become converted to $NHCH_2OC_4H_9$. These resins are soluble in paint and enamel solvents and lead to uses of melamines in surface coatings, often in combination with alkyds. These melamine surface coating resins give exceptional curing speed, hardness, wear resistance, and resistance to solvents, soaps, and foods.

Melamine-acrylic resins are water soluble and are used for formation of water-base industrial and automotive finishes.

Melamine Resins.⁵⁷ Typical examples of melamine resins:

- No. 245-8: Solids 50%; solvent, butanol-xytol; color (Gardner) 1 max; viscosity (Gardner-Holdt) L-O at 25°C; hydrocarbon solvent tolerance 200; acid number, solid resin 1 max, approximately 8.3 lbs/gal.
- No. 243-3: Solids 60%; solvent, petroleum spirits; color (Gardner) 1 max; viscosity (Gardner-Holdt) V-Y at 25°C; hydrocarbon solvent tolerance 300; acid number, solid resin 1 max; approximately 8.5 lbs/gal.
- No. 248-8: Solids 55%; solvent, butanol-xytol; color (Gardner) 1 max; viscosity (Gardner-Holdt) N-Q at 25°C; hydrocarbon solvent tolerance 175; acid number, solid resin 1 max; approximately 8.4 lbs/gal.
- No. 247-10: Solids 60%; solvent, butanol; color (Gardner) 1 max; viscosity

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

(Gardner-Holdt) T-W at 25°C; hydrocarbon solvent tolerance 1000; acid number, solid resin 1 max; approximately 8.4 lbs/gal.

Uses: See melamine resins.

melampyrite. See dulcitol.

melaniline. See diphenylguanidine.

melanin. A brownish-black pigment that occurs normally in the retina, skin, and hair of higher animals with the exception of albinos. Formed from tyrosine by the action of tyrosinase.

"Melaqua." ⁵⁷ Trademark for water-soluble melamine acrylic coating resins.

"Meleline." ⁷⁸ Trademark for a plasticized aliphatic triamide with surface tension reducer used for inhibiting against fume fading on acetate dyed fabrics.

meletin. See quercetin.

"Melhi." ²⁶⁶ Trademark for a dark, brittle, polymerized resin supplied in three types: Type 2, softening point (Hercules drop method) 115-120°C. Type 3, softening point (Hercules drop method) 115-120°C. Type 4, softening point (Hercules drop method) 130°C.

Uses: Printing inks; adhesives; core oils; box toes; coal-tar emulsions; rubber compounding; varnishes.

"Mellitolin." ¹⁹ Trademark for benzodihydropyrone (q. v.).

melin. See rutin.

melissic acid (triacontanoic acid)

$\text{CH}_3(\text{CH}_2)_{28}\text{COOH}$. A long-chain fatty acid.

Properties: Hard crystalline solid, n. p. 94°C; soluble in benzene and hot alcohol, insoluble in water.

Derivation: By oxidation of 1-triacontanol, occurs in minor amounts in many plant and insect waxes and in montan wax.

Use: Biochemical research.

melissyl alcohol. See 1-triacontanol and 1-hentriacontanol. The term melissyl alcohol, which has been used for both by various authorities, should be dropped.

melitose. See raffinose.

melitriose. See raffinose.

"Mellene." ¹⁸⁸ $\text{CH}_3\text{C}_5\text{H}_4(\text{O})(\text{OH})$. Trademark for 2-hydroxy-3-methyl-2-cyclopenten-1-one. Maple licorice flavor. Used in flavors and perfumes to lend a soft character.

"Mellotone." ¹⁸⁸ $\text{CH}_3\text{C}_5\text{H}_2\text{O}(\text{O})(\text{OH})$. Trademark for 3-hydroxy-2-methyl-1,4-pyrone. Caramel-butterscotch flavor; used in perfumes and flavors for a soft, malt-like effect.

"Melmac." ⁵⁷ Trademark for certain products molded from melamine-formaldehyde resins.

"Melonal." ²²⁷ Trademark for 2,6-dimethyl hepten-2-al-7, $(\text{CH}_3)_2\text{CCH}(\text{CH}_2)_2\text{CHCH}_2\text{CHO}$; minimum 85% pure.

Properties: Yellow liquid; moderately stable, but not likely to cause discoloration. Sp. gr. (25/25°C) 0.845-0.855; refractive index (20°C) 1.441 to 1.447. Clearly soluble in 2 parts of 70% alcohol.

Used for its melon odor.

"Melostrength" Resin. ⁵⁷ Trademark for a melamine-formaldehyde paper resin designed to improve wet and dry strength properties of paper. It is a pulp additive.

"Melsan." ²⁸ Trademark for fungicide based on ethyl mercury phosphate and sodium pentachlorophenate.

Containers: 150-lb drums.

Uses: For prevention of surface molds and blue-stain organisms on freshly sawn lumber.

melting point. The temperature at which solid and liquid forms of a substance are in equilibrium. In common usage the melting point is taken as the temperature at which liquid forms as a small sample has its temperature increased gradually. A pure substance will melt sharply and completely over a narrow temperature range, while a mixture will melt gradually over a wide temperature range. Various special methods are required to obtain melting points for special purposes.

"Meltopax." ³³⁷ Trade name for a proprietary sodium zirconium silicate with approximately 54% ZrO_2 , 26% SiO_2 , 14% Na_2O . A white-cream powder with sp. gr. 3.9; bulk density 72 lb/cu ft; m. p. 2600°F; average particle size 44 microns max; insoluble in water and alkalies; slightly soluble in dilute mineral acids and hot concentrated sulfuric acid; soluble in hydrofluoric acid. Used in enamel frits, ceramic colors, special glasses.

Containers: 80-lb paper bags; 550-lb barrels; 30,000-lb carloads.

"Melurac" Resins. ⁵⁷ Trademark for urea-melamine-formaldehyde condensation products used mainly as adhesives for bonding of veneers for the production of exterior grade plywood or for the assembly of wooden structures for outdoor use.

"Mema." ¹⁵⁰ Trademark for a liquid seed disinfectant which contains 11.4% methoxyethylmercury acetate.

Containers: 1-gal jugs.

Uses: Controls seed-borne diseases of wheat, barley, and oats, cotton, flax and sorghum. Protects against seed rot and seedling blight.

MENA. Abbreviation for the methyl ester of naphthaleneacetic acid. See alpha-naphthaleneacetic acid, methyl ester.

menaccanite. See ilmenite.

menadiol sodium diphosphate (tetrasodium 2-methyl-1,4-naphthalenediol diphosphate)

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: White to pink powder with characteristic odor; hygroscopic; solutions neutral or slightly alkaline to litmus. Very soluble in water; insoluble in alcohol.

Grade: USP XVI.

Use: Medicine.

menadione (2-methyl-1,4-naphthoquinone, menaphthone; vitamin K₃) $\text{C}_{10}\text{H}_7\text{CH}_3\text{O}_2$.

Properties: Yellow, crystalline powder; nearly odorless; m. p. 105-107°C; affected by sunlight. Soluble in alcohol, benzene, and vegetable oils; moderately soluble in chloroform and carbon tetrachloride; insoluble in water.

Derivation: Oxidation of beta-methylnaphthalene.

Grades: U. S. P. XVI.

Containers: Dark glass vials or bottles; fiber cans.

Use: Medicine; fungicides.

Caution: Menadione powder is irritating to the respiratory tract and to the skin. An alcohol solution has vesicant properties.

Shipping regulations: None.*

menadione sodium bisulfite

Properties: White, crystalline, odorless, hygroscopic powder; sensitive to light, soluble in water; slightly soluble in alcohol, almost insoluble in ether and benzene.

Derivation: Reaction of sodium bisulfite with menadione.

Grade: U. S. P. XVI; technical.

Use: Medicine.

Shipping regulations: None.*

menaphthone. See menadione.

mendelevium (element 101) Md. Synthetic radioactive element produced in a cyclotron by bombarding einsteinium with alpha particles. The element is named for D. I. Mendeleev. At the time of discovery, only seventeen atoms were prepared and identified. Mendelevium decays by spontaneous fission with a half-life of about a half hour. It is believed to have chemical properties similar to those of the rare earth thulium.

menhaden oil (pogy oil, mossbunker oil).

Properties: A yellowish-brown or reddish-brown liquid; characteristic odor. Soluble in ether, benzene, naphtha, and carbon disulfide. Sp. gr. 0.927-0.933, saponification value 191-196, iodine value 139-180, refractive index 1.480.

Derivation: By cooking or pressing the body of the menhaden (mossbunker) fish. Winter oils are made by chilling which separates stearin.

Method of purification: Filtration and bleaching with fuller's earth.

Grades: Prime crude; brown strained, strained; bleached; winter oil; bleached winter white oil. Also sometimes graded: A, extra pale; B, pale, C, brown; D, dark brown.

Containers: Drums; tank cars.

Uses: Leather dressing; substitute for linseed oil in making patent leather; chamois tanning; making fats by hydrogenation; soap making, after hydrogenation; tempering steel; adulterating codliver oil; printing and lithographic inks (linseed oil substitute in paints and linoleum).

Shipping regulations: None.*

dl-para-mentha-1,8-diene. See dipentene.

methanediimine

A primary alicyclic diamine; also a tert-alkylamine; a low viscosity liquid.

Containers: Drums; tank cars.

Uses: Curing agent for epoxy resins; chemical intermediate.

para-menthane hydroperoxide.

Properties: A clear, pale yellow liquid; sp. gr. 0.910-0.925 (15.5/4°C), refractive index 1.460-1.475 (20°C).

Use: Catalyst for rubber and polymerization reactions; coatings.

Shipping regulations: Oxidizing material.

Yellow label.*

menthol (hexahydrothymol, methylhydroxyisopropylcyclohexane; peppermint camphor) $\text{CH}_3\text{C}_6\text{H}_5(\text{C}_3\text{H}_7)\text{OH}$.

Properties: White crystals with strong minty-cooling odor and taste, constants will vary according to grade; m. p. from 32.5 to 43°C; congealing temperatures from 27 to 41°C; soluble in alcohol, ether, chloroform, light petroleum solvents, glacial acetic acid, liquid petrolatum and fixed or volatile oils, slightly soluble in water.

Derivation: By freezing from peppermint oil, by synthesis from citronellal and by other syntheses.

Grades: Technical, U. S. P. XVI, Brazilian, Japanese (levo, from peppermint oil; levo or racemic, synthetically).

Containers: Glass bottles; tins; lined fiber cans, cases.

Uses: Medicine, perfumery, confectionery, liqueurs.

Shipping regulations: None.*

menthol acetic ester. See menthyl acetate.

menthol valerate (menthyl isovalerate)

Properties: Colorless liquid, mild pleasant odor, cooling, faintly bitter taste; sp. gr. 0.907 (15/4°C); insoluble in water, soluble in alcohol, chloroform, ether, and oils.

Derivation: By the action of valeric acid on menthol.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

menthone $\text{C}_{10}\text{H}_{18}\text{O}$.

Properties: Colorless, oily, mobile liquid; slight peppermint odor, slightly soluble in water; soluble in organic solvents. Sp. gr. 0.897 (15°C), b. p. 207°C.

Derivation: A ketone found in oil of peppermint.

Containers: Glass bottles, tins.

Shipping regulations: None.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

menthyl acetate (menthol acetic ester)

Properties: Colorless liquid. Menthol-like odor. Slightly soluble in water, miscible with alcohol and ether. B. p. 227 to 228°C; sp. gr. 0.922-0.927; optical rotation -72° 47' to -73° 18'; refractive index 1.447.

Derivation: (a) By boiling menthol with acetic anhydride in the presence of sodium acetate. (b) Found in peppermint oil.

Grades: Technical.

Containers: Glass bottles.

Use: Perfumery, flavoring.

menthyl ethoxyacetate. See menthyl ethylglycolate.**menthyl ethylglycolate** (menthyl ethoxyacetate)

Properties: Colorless oily liquid, odorless.

Decomposed by alkalis with release of menthol. Less irritating to mucous membranes than menthol. Soluble in alcohol and ether; slightly soluble in water.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

menthyl isovalerate. See menthol valerate.**menthyl salicylate** $C_6H_4(OH)COOC_{10}H_{19}$

Properties: Colorless liquid; miscible with alcohol, ether, chloroform, and fatty oils in all proportions. Insoluble in water, soluble in organic solvents.

Containers: Glass bottles.

Use: Medicine, sunscreen preparations.

homo-menthyl salicylate. A homolog of menthyl salicylate.

Properties: Light yellow almost odorless oil, neutral and non-irritating to the skin. Absorbs to a great extent the rays in sunlight causing skin burning (about 2940 to 3200 Å). Insoluble in water, soluble in alcohol, chloroform and ether.

Containers: Glass bottles; iron drums.

Uses: Ultraviolet filter for anti-sunburn creams and oils; analgesic properties for relieving sunburn.

Shipping regulations: None.*

"Mentor."⁵¹ Trademark for non-viscous oils of the mineral seal type, used mainly as absorption media in vapor recovery systems, such as those recovering coal-tar solvents and casing-head gasoline.

"Mentor" Beads.⁵⁶ Trademark for an alkylarylsulfonate detergent.

Uses: Bleaching assistant; detergent; dyeing and carbonizing assistant; emulsifying; kier-boiling; wetting; dispensant; wool scouring; acid fulling.

MEP. Abbreviation for methyl ethyl pyridine.

mepazine acetate (10-[(1-methyl-3-piperidyl)-methyl]phenothiazine acetate)

Grade: N. N. D.

Use: Medicine.

mepazine hydrochloride (10-[(1-methyl-3-piperidyl)methyl]phenothiazine hydrochloride)

Properties: Crystals; photosensitive; slightly bitter taste. Very slightly soluble in water; soluble in absolute ethanol, chloroform; practically insoluble in ether, benzene.

Grade: N. N. D.

Use: Medicine.

mepenzolate methylbromide

1-Methyl-3-piperidyl benzilate methylbromide.

Grades: N. N. D.

Use: Medicine.

meperidine hydrochloride (isonipecaine hydrochloride; pethidine hydrochloride)

Ethyl-1-methyl-4-phenylpiperidine-4-carboxylate hydrochloride. Properties: Fine, white, odorless, crystalline powder, m. p. 186-189°C; stable in air; very soluble in water, soluble in alcohol; sparingly soluble in ether; aqueous solutions acid to litmus.

Grade: U. S. P. XVI.

Use: Medicine.

mephenesin (3-ortho-toloxyl-1,2-propanediol;

ortho-cresyl-alpha-glyceryl ether)

Properties: Crystalline white powder with faint odor and bitter taste; m. p. 70-73.5°C. Freely soluble in alcohol, chloroform and ether; sparingly soluble in benzene and water. pH (saturated solution) about 6.

Grade: N. F. XI.

Use: Medicine.

mephenesin carbamate (3-ortho-toloxyl-1,2-propanediol-1-carbamate)

Properties: White crystals; m. p. 93°C, hemihydrate m. p. 80-84°C; sparingly soluble in water; slightly soluble in chloroform; freely soluble in alcohol.

Grade: N. N. D.

Use: Medicine.

mephenoxalone ("Trepidone"; 5-(ortho-methoxyphenoxymethyl)-2-oxazolidinone)

Properties: M. p. 139-141°, insoluble in water.

Use: Medicine.

mephentermine (N, alpha, alpha-trimethylphenethylamine) $C_6H_5CH_2C(CH_3)_2NHCH_3$

Properties: Clear, colorless to pale yellow liquid with a fishy odor; very soluble in alcohol; practically insoluble in water.

Grade: N. N. D.

Use: Medicine.

mephentermine sulfate (N, alpha, alpha-trimethylphenethylamine sulfate)

Properties: White, odorless crystals or crystalline powder; solutions are acid to litmus. Soluble in water; slightly soluble in alcohol; practically insoluble in chloroform.

Grade: U. S. P. XVI.

Containers: Bottles.

Use: Medicine.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

mephobarbital (5-ethyl-1-methyl-5-phenyl-barbituric acid) $C_{13}H_{14}N_2O_3$.

Properties: White, tasteless, odorless crystals; m. p. 177-181°C. Soluble in chloroform; slightly soluble in alcohol and ether; very slightly soluble in water. Dissolves in fixed alkali hydroxides and carbonates.

Grades: U. S. P. XVI.

Use: Medicine.

meprobamate (2-methyl-2-n-propyl-1,3-propanediol dicarbamate)
 $H_2NCOOCH_2C(CH_3)(C_3H_7)CH_2OOCNH_2$.

Properties: White powder, m. p. 103-107°C; characteristic odor and bitter taste; slightly soluble in water and ether; soluble in alcohol and acetone.

Grade: U. S. P. XVI.

Use: Medicine.

meprylicaine hydrochloride (2-methyl-2-propylaminopropyl benzoate hydrochloride)
 $C_6H_5COOCH_2C(CH_3)_2NHCH_2CH_2CH_3 \cdot HCl$.

Properties: White, odorless, crystals; m. p. 150-152°C, soluble in water, alcohol, chloroform; slightly soluble in acetone.

Grade: N. F. XI.

Use: Medicine.

"MER/29." Chemical name: 1-[para-(beta-diethylaminoethoxy)phenyl]-1-(para-tolyl)-2-(para-chlorophenyl)ethanol. Stated to be a cholesterol inhibitor.

"Merac." ²⁰⁴ Trademark for a rubber latex accelerator.

Properties: Dark brown liquid, sp. gr. (20/20°C) 1.025-1.035; viscosity, 9.78 cps at 25°C, flash point 185°F, freezing point -25°C (max); soluble in water, methanol, acetone, and ethyl acetate, insoluble in ethyl ether, benzene, and hexane.

Use: Water-soluble rubber latex accelerator.

meralluride. Methoxyhydroxymercuripropylsuccinylurea ($C_9H_{16}HgN_2O_6$) and theophylline ($C_7H_8N_4O_2 \cdot H_2O$) in approximately molecular proportions.

Properties: White to slightly yellow powder, affected slowly by light, soluble in glacial acetic acid and solutions of alkali hydroxides; slightly soluble in water; moderately soluble in hot water. Saturated solution is acid to litmus.

Grade: U. S. P. XVI.

Use: Medicine.

"Merantine." ²³² Brand name for a series of Brilliant acid dyestuffs of good fastness to washing and moderate fastness to light.

merbromin (dibromohydroxymercurifluorescein disodium salt; 2,7-disodiumdibromo-4-hydroxymercurifluoroscein)
 $C_{20}H_6Br_2HgNa_2O_6$.

Properties: Iridescent, green scales or granules; odorless; soluble in water; insoluble in alcohol, acetone, chloroform, or ether.

Derivation: From dibromofluorescein and mercuric acetate.

Grades: Technical, N. F. XI.

Containers: 25-, 100-lb drums.

Use: Medicine.

"Mercadium." ²⁶⁶ Trademark for group of insoluble cadmium, mercury sulfide pigments. Brilliant, light-fast, chemically stable colors ranging in shade through orange, red, and maroon.

Uses: Plastics; rubber; protective coatings; and printing inks.

mercaptamine. See cysteamine.

mercaptans. A group of organic compounds resembling alcohols but having the oxygen of the hydroxyl group replaced by sulfur, as, ethyl mercaptan, C_2H_5SH . They have a particularly strong disagreeable odor.

mercaptoacetic acid. See thioglycolic acid.

beta-mercaptoalanine. See cystein.

2-mercaptobenzoic acid. See thiosalicylic acid.

mercaptobenzothiazole (MBT)

Properties: Yellowish powder. Slight odor (depends on degree of purification). Non-toxic. Soluble in dilute caustic, alcohol, acetone, benzene, chloroform, insoluble in water and gasoline. Sp. gr. 1.42; m. p. 179°C.

Grades: Technical.

Containers: 1-, 5- and 10-lb fiber cans, 55-lb drums; multiwall paper sacks.

Uses: One of the most widely used accelerators for rubber vulcanization; improves resistance of rubber to oxidation and abrasion, generally used in tire treads and carcasses, mechanical specialties, etc. Also used as a fungicide and as a corrosion inhibitor.

mercaptoethanol $HSCH_2CH_2OH$.

Properties: Water-white, mobile liquid with characteristic odor, sp. gr. 1.1168 (20/20°C), 9.29 lbs/gal (20°C), b. p. 157.1°C (760 mm); vapor pressure 1.0 mm (20°C); viscosity 3.43 cps (20°C), completely soluble in water, benzene, ether, and most organic solvents; flash point 165°F, possesses a sulphydryl group and a hydroxyl group, thus sharing the chemical reactivity of a mercaptan and an alcohol. Has the ability to add certain types of unsaturated compounds to form stable hydroxyethyl sulfides. F. p., sets to a glass below -100°C; refractive index (n 20/D) 1.5011.

Containers: 1-, 5-, and 10-lb fiber cans; 55-lb drums, multiwall paper sacks.

Uses: Used as a solvent for dyestuffs, as an intermediate for producing dyestuffs, pharmaceuticals, rubber chemicals, flotation agents, insecticides, plasticizers, textile assistants and other compounds, as a water-soluble reducing agent; as a non-nitrogenous sulphydryl reagent in the investigation of proteins.

Shipping regulations: None.*

beta-mercaptoethylamine hydrochloride
 $HS(CH_2)_2NH_2 \cdot HCl$.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Hygroscopic white powder, m. p. 69°C; very soluble in water and ethyl alcohol.

2-mercapto-4-hydroxypyrimidine. See thiouracil.

mercaptomerin sodium $C_{16}H_{25}HgNNa_2O_6S$. Disodium N-[3-(carboxymethylmercapto-mercuri)-2-methoxypropyl]-alpha-camphoramate.

Properties: Hygroscopic white powder or amorphous solid; freely soluble in water, soluble in alcohol; slightly soluble in ether and chloroform, practically insoluble in benzene.

Grade: U. S. P. XVI.

Use: Medicine.

beta-mercaptopropionic acid $HSCH_2CH_2CO_2H$. Properties: M. p. 16.8°C; b. p. 110.5-111.5°C (15 mm).

6-mercaptopurine (6-MP) $C_5H_4N_4S$. A sulfur-containing purine base not found in animal nucleoproteins.

Properties: Yellow, crystalline powder, m. p. 308°C (decomposes), nearly odorless, insoluble in water, acetone, ether, soluble in hot alcohol and dilute alkali solutions, slightly soluble in dilute H_2SO_4 .

Grade: U. S. P. XVI.

Use: Medicine.

mercaptosuccinic acid. See thiomalic acid.

2-mercaptothiazoline C_3H_4NSSH . Creamy-white crystals.

Use: Synthesis of pharmaceuticals.

mercerized cotton. Cotton which has been passed through a cold bath of sodium hydroxide and afterwards washed with hot and cold water. The process causes a shrinking of the fiber with an increased attraction for coloring matter and imparts a luster to the fiber.

mercerizing assistants. Compounds used to increase the penetration of mercurizing baths. Cresylic acid compounds and derivatives, special sulfonated oils and other wetting agents are typical materials used.

"Mercote." ¹²³ Trademark for vitamin products.

mercuric acetate (mercury acetate)

$Hg(C_2H_3O_2)_2$.

Properties: White, crystalline powder, poisonous! Soluble in alcohol and water; sensitive to light. Sp. gr. 3.2544.

Method of purification: Crystallization.

Grades: Technical, C. P.

Containers: Glass bottles, 25-lb jars.

Uses: Medicine, catalyst in organic synthesis.

Shipping regulations: Poison, class B.

Poison label. *

mercuric-ammonium chloride (mercury-ammonium chloride) $HgCl_2 \cdot 2NH_4Cl \cdot 2H_2O$.

Properties: White powder; soluble in water; slightly soluble in alcohol. Poisonous!

Use: Medicine.

Shipping regulations: Poison, class B.

Poison label. *

See also mercury, ammoniated.

mercuric arsanilate. See mercury atoxylate.

mercuric arsenate (mercury arsenate)

$HgHAsO_4$.

Properties: Yellow powder; poisonous! Soluble in hydrochloric acid; slightly soluble in nitric acid; insoluble in water.

Grades: Technical.

Uses: Medicine, waterproof paints; anti-fouling paints.

Shipping regulations: Poison, class B.

Poison label. *

mercuric-barium bromide (barium-mercury bromide, mercury-barium bromide)

$HgBr_2 \cdot BaBr_2$.

Properties: Colorless, crystalline mass.

Very hygroscopic. Poisonous! Soluble in water.

Shipping regulations: Poison, class B.

Poison label. *

mercuric-barium iodide (barium-mercury iodide, mercury-barium iodide)

$HgI_2 \cdot BaI_2 \cdot 5H_2O$.

Properties: Reddish or yellow, crystalline mass, unstable; deliquescent. Poisonous! Soluble in alcohol and water.

Grades: Technical.

Uses: Micro-analysis (testing for alkaloids); preparing Rohrbach's solution.

Shipping regulations: Poison, class B.

Poison label. *

mercuric benzoate (mercury benzoate)

$Hg(C_7H_5O_2)_2 \cdot H_2O$.

Properties: White crystals, poisonous, m. p. 165°C; sensitive to light. Soluble in solutions of sodium chloride and ammonium benzoate, slightly soluble in alcohol and water.

Derivation: By the interaction of a mercuric salt and sodium benzoate.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: Class B poison.

Poison label. *

mercuric biniodide. See mercuric iodide.

mercuric bromide (mercury bromide) $HgBr_2$.

Properties: White, rhombic crystals, poisonous! Sensitive to light. Soluble in alcohol and ether, sparingly soluble in water.

Sp. gr. 5.74, m. p. 235°C; b. p. 322°C.

Derivation: By adding potassium bromide to a solution of a mercuric salt and crystallizing.

Method of purification: Recrystallization.

Grades: Technical; C. P.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: Class B poison.

Poison label. *

mercuric chloride (corrosive sublimate; mercury bichloride, mercury chloride, corrosive) $HgCl_2$.

Properties: White crystals or powder;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

very poisonous! May be fatal if swallowed. Do not breathe dust. Soluble in water, alcohol, ether, pyridine, glycerine and acetic acid ester. Sp. gr. 5.32; m. p. 265°C; b. p. 303°C.

Derivation: (a) Direct combination of chlorine with mercury heated to volatilizing point; (b) by subliming mercuric sulfate with common salt.

Method of purification: Recrystallization and sublimation.

Impurities: Mercurous chloride.

Grades: Technical; lump, crystals; granular; powder, C. P., N. F. XI.

Containers: Glass bottles; 25-lb boxes; 200- to 250-lb kegs; multiwall paper sacks, drums.

Uses: Manufacture of calomel and other mercury compounds, organic synthesis (catalyst in polyvinyl chloride production and in brominating); analytical reagent; medicine; metallurgy (metal coating, electroplating aluminum, manufacture of tin and zinc alloys of fine structure, bronzing steel); tanning; fungicide, insecticide and wood preservative; embalming fluids, textile printing; dry batteries; photography; process engraving and lithography.

Danger: May be fatal if swallowed. MCA warning label.

Shipping regulations: Class B poison. Poison label. *

mercuric chloride, ammoniated. See mercury, ammoniated.

mercuric-cuprous iodide (copper-mercury iodide; mercury-copper iodide)
 $\text{HgI}_2 \cdot 2\text{CuI}$.

Properties: Dark red, crystalline powder; sp. gr. 6.12; poisonous! Insoluble in alcohol and water.

Grades: Technical.

Use: Thermoscopy (detecting overheating of machine bearings) by reversible color change.

Shipping regulations: Poison, class B. Poison label. *

mercuric cyanate. See mercury fulminate.

mercuric cyanide (mercury cyanide) $\text{Hg}(\text{CN})_2$.

Properties: Colorless, transparent prisms, darkened by light; poisonous! Soluble in water and alcohol. Sp. gr. 4.018; m. p. decomposes.

Derivation: By the interaction of mercuric oxide and an aqueous solution of hydrocyanic acid.

Method of purification: Crystallization.

Grades: Technical; C. P.

Containers: Amber glass bottles; wooden kegs; fiber drums.

Uses: Medicine; germicidal soaps; manufacturing cyanogen gas; photography.

Shipping regulations: Class B poison. Poison label. *

mercuric dichromate. See mercury dichromate.

mercuric dioxysulfate. See mercuric subsulfate.

mercuric fluoride (mercury fluoride) HgF_2 .

Properties: Transparent crystals; sp. gr.

4.00; m. p., decomposes; moderately soluble in water and alcohol; poisonous!

Derivation: Mercuric oxide and hydrofluoric acid.

Uses: Synthesis of organic fluorine compounds.

Shipping regulations: Poison, class B. Poison label. *

mercuric iodate (mercury iodate) $\text{Hg}(\text{IO}_3)_2$.

Properties: Amorphous, white powder; poisonous! Soluble in hydrochloric acid, hydrobromic acid, hydriodic acid, water (containing sodium chloride or potassium iodide); insoluble in alcohol and water.

Containers: Glass bottles; fiber cans.

Use: Medicine.

Shipping regulations: Poison, class B. Poison label. *

mercuric iodide (mercuric biniodide; mercury biniodide; mercury iodide, red; mercury iodide, yellow) HgI_2 . Poisonous!

Properties: (a) Red, tetragonal crystals; turn yellow when heated to 150°C, returning to red on cooling; (b) Yellow, rhombic crystals. Soluble in boiling alcohol, and in solutions of sodium thiosulfate or potassium iodide or other hot alkali chloride solutions; almost completely insoluble in water.

Sp. gr. (a) 6.2-6.35, (b) 5.91-6.06; m. p. (a) 241-257°C, (b) 241°C; b. p. (a) 349°C, (b) 349°C.

Derivation: (a) By the direct union of mercury and iodine. (b) As a precipitate by adding potassium iodide to a solution of a mercuric salt. Yellow form precipitates from alcoholic solutions.

Grades: Technical; reagent; N. F. XI.

Containers: Bottles, drums.

Use: Medicine; analytical reagents (Nessler's reagent, Mayer's reagent).

Shipping regulations: Solid and solution: poison, Class B. Poison label. *

See also mercuric potassium iodide.

mercuric lactate $\text{Hg}(\text{C}_3\text{H}_5\text{O}_3)_2$.

Properties: White crystalline powder; soluble in water; decomposed by heat.

Use: Medicine.

Shipping regulations: Poison, Class B. Poison label. *

mercuric nitrate (mercury nitrate; mercury pernitrate) $\text{Hg}(\text{NO}_3)_2 \cdot \text{H}_2\text{O}$.

Properties: Colorless crystals or white deliquescent powder; poisonous! Sp. gr. 4.3; m. p. 79°C; decomposed by heat.

Soluble in water and nitric acid; insoluble in alcohol.

Derivation: By the action of hot nitric acid on mercury.

Method of purification: Crystallization.

Impurities: Mercurous nitrate.

Grades: Technical; C. P.

Containers: 1-, 5-lb bottles; 10-, 25-lb jars; 100-lb kegs.

Uses: Nitration of aromatic organic compounds; medicine; felt manufacture; manufacture of mercury fulminate.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Fire hazard: Dangerous.

Shipping regulations: Oxidizing material.
Yellow label and poison label.*

mercuric nitrate ointment. See citrine ointment.

mercuric oleate (mercury oleate)

Properties: Yellowish to red liquid, semi-solid or solid mass; poisonous! Slightly soluble in fixed oils; insoluble in water.

Derivation: By mixing yellow mercuric oxide with oleic acid.

Grades: Technical; N. F. XI.

Containers: Glass bottles.

Uses: Medicine; antiseptic; antifouling paints.

Shipping regulations: Poison, Class B.
Poison label.*

mercuric oxide, red (red precipitate; mercury oxide, red) HgO .

Properties: Heavy, bright, orange-red powder, very poisonous! Soluble in acids; soluble in dilute hydrochloric and nitric acids; slightly soluble in water, more so after boiling; insoluble in alcohol and ether. Sp. gr. 11.00-11.29 (11.21 for finely ground); m. p. decomposes.

Derivation: By heating mercurous nitrate.

Grades: Technical; C. P.

Containers: 1-lb bottles, 1-, 5-, 25-lb boxes; 200-lb kegs, 50-lb drums.

Uses: Chemicals (oxidizing agent, mercury salts, desulfurization of organic compounds); paint pigment, perfumery and cosmetics; pharmaceuticals, ceramics (pigment); batteries, polishing compounds, analytical reagent; antifouling paints.

Shipping regulations: Class B poison. Poison label.*

mercuric oxide, yellow (mercury oxide, yellow, yellow precipitate) HgO . Differs from red mercuric oxide in the fineness of its particles.

Properties: Light, amorphous, orange-yellow powder; odorless, stable in air but turns dark on exposure to light; finer powder than the red form; sp. gr. 11.03 (27.5°C); m. p., decomposes. Slightly soluble in cold water, more so after boiling; soluble in dilute hydrochloric and nitric acids, potassium iodide solution, concentrated solutions of alkaline-earth chloride, magnesium chloride, insoluble in alcohol.

Derivation: (a) By the action of either potassium hydroxide or sodium hydroxide on mercuric chloride. (b) By the action of sodium carbonate upon mercuric nitrate solution.

Grades: C. P.; technical, N. F. XI.

Containers: Bottles; 25-, 50-, 100-lb drums.

Use: Medicine; see mercuric oxide, red.

Shipping regulations: Poison, Class B.
Poison label.*

mercuric oxycyanide $\text{HgO} \cdot \text{Hg}(\text{CN})_2$.

Properties: White crystalline powder; sp. gr. 4.44; explodes on heating; poisonous! Moderately soluble in water.

Use: Medicine.

Shipping regulations: Class B poison. Poison label.*

mercuric phosphate (normal mercuric phosphate; neutral mercuric phosphate; trimeric orthophosphate; mercuric phosphate, tertiary, mercury phosphate) $\text{Hg}_3(\text{PO}_4)_2$.

Properties: Heavy, white or yellowish powder, poisonous. Soluble in acids; insoluble in alcohol, water.

Use: Medicine.

Shipping regulations: Poison, Class B.
Poison label.*

mercuric phosphate, neutral. See mercuric phosphate.

mercuric phosphate, normal. See mercuric phosphate.

mercuric phosphate, tertiary. See mercuric phosphate.

mercuric-potassium cyanide (mercury-potassium cyanide) $\text{Hg}(\text{CN})_2 \cdot 2\text{KCN}$.

Properties: Colorless crystals; very poisonous! Soluble in water and alcohol.

Derivation: By mixing mercuric and potassium cyanides and crystallizing.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Wooden kegs, fiber drums.

Use: Silvering glass in mirror manufacture.

Shipping regulations: Class B poison. Poison label.*

mercuric-potassium iodide (Mayer's reagent; potassium mercuric iodide) See also Nessler's reagent. K_2HgI_4 or $2\text{KI} \cdot \text{HgI}_2$.

Properties: Odorless, yellow crystals, deliquescent in air. Crystallizes with either 1, 2, or 3 molecules of water. The commercial product is the anhydrous form containing about 25.5% mercury. Sp. gr. 4.29. Neutral or alkaline to litmus. Very soluble in water; soluble in alcohol, ether and acetone.

Derivation: (a) By evaporating Nessler's reagent. (b) By the action of hydrochloric acid and potassium iodide on mercuric cyanide or mercuric chloride. (c) By the action of potassium iodide on mercuric oxide.

Grades: C. P.

Containers: 1-lb and 5-lb bottles.

Uses: Medicine, chemical analysis.

Shipping regulations: Class B poison.
Poison label.*

mercuric salicylate (salicylated mercury).

Properties: White powder, yellow or pink tinge. A compound of mercury and salicylic acid of somewhat varying composition, mercury replacing both phenolic and carboxylic hydrogen. Contains not less than 54% nor more than 59.5% mercury. Odorless; tasteless; poisonous! Soluble in solutions of the fixed alkalis or their carbonates, and in warm solutions of the alkali halides, almost insoluble in water and alcohol.

Derivation: By gently heating freshly precipitated yellow mercuric oxide and

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

salicylic acid in presence of water.
Containers: Ampules, capsules; 1-lb bottles.

Use: Medicine.

Shipping regulations: Class B poison.
Poison label.*

mercuric-silver iodide (mercury-silver iodide; silver-mercury iodide) $\text{HgI}_2 \cdot 2\text{AgI}$.

Properties: Yellow powder; becomes red at 40-50°C. Sp. gr. 6.08; soluble in solutions of potassium cyanide or potassium iodide; insoluble in acids (dilute), and water.

Grades: Technical.

Containers: Glass bottles, fiber cans.

Use: Thermoscopy (detecting overheating in journal bearings).

Shipping regulations: Poison, class B.
Poison label.*

mercuric stearate (mercury stearate)

$(\text{C}_{17}\text{H}_{35}\text{CO}_2)_2\text{Hg}$.

Properties: Yellow, granular powder; soluble in fatty oils, slightly soluble in alcohol.

Uses: Medicine; germicide.

Shipping regulations: Poison, class B.
Poison label.*

mercuric subsulfate (basic mercuric sulfate; mercuric dioxysulfate; turpeth mineral, turbith mineral) $\text{Hg}(\text{HgO})_2\text{SO}_4$.

Properties: Heavy, lemon-yellow powder or bright-yellow scales. Poisonous! Turns red and brown on heating, yellow on cooling. Volatile at red heat, decomposing into mercury, mercurous sulfate, oxygen and sulfur dioxide. Soluble in sulfuric acid, dilute hydrochloric acid, dilute nitric acid, acetic acid, very slightly soluble in water, more so in hot water. Sp. gr. 6.444.

Derivation: Addition of water to normal mercuric sulfate.

Containers: Glass bottles; fiber cans.

Use: Medicine.

Shipping regulations: Class B poison.
Poison label.*

mercuric succinimide. See hydrargol.

mercuric sulfate (mercury persulfate, mercury sulfate) HgSO_4 .

Properties: White, crystalline powder; poisonous! Soluble in acids; insoluble in alcohol. Sp. gr. 6.466; m. p., decomposes at red heat.

Derivation: By the action of sulfuric acid on mercury, with subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical; C. P.

Containers: 1-, 5-lb bottles; 25-lb jars; 100-lb kegs; fiber drums.

Uses: Medicine; producing calomel and corrosive sublimate; catalyst in the conversion of acetylene to acetaldehyde, extracting gold and silver from roasted pyrites; galvanic batteries.

Shipping regulations: Class B poison.
Poison label.*

mercuric sulfate, basic. See mercuric subsulfate.

mercuric sulfide, black (ethiops mineral; mercury sulfide, black) HgS .

Properties: Black powder; poisonous! Soluble in sodium sulfide solution; insoluble in water, alcohol, and nitric acid. Sp. gr. 7.55-7.70; m. p., sublimes at 446°C.

Derivation: By passing hydrogen sulfide gas into a solution of a mercury salt or the reaction of mercury with sulfur.

Grades: Technical; C. P.

Containers: 1-lb bottles; wooden kegs; fiber drums.

Use: Pigment for coloring horn.

Shipping regulations: Poison, class B.
Poison label.*

mercuric sulfide, red (vermilion; quicksilver vermilion; Chinese vermilion; red mercury sulfide; artificial cinnabar; red mercury sulfuret) HgS .

Properties: Fine, bright scarlet powder; poisonous! Insoluble in water and alcohol. Sp. gr. 8.06-8.12; m. p., sublimes at 446°C.

Derivation: By heating mercury and sulfur, with subsequent recovery by sublimation. A precipitated form is known as English vermilion (q. v.).

Method of purification: Resublimation.

Grades: Technical; C. P.

Containers: Wooden kegs; glass bottles; fiber drums.

Uses: Medicine; paint pigment; rubber pigment; plastics (pigment); coloring sealing wax.

Shipping regulations: Poison, class B.
Poison label.*

mercuric sulfocyanate. See mercuric thiocyanate.

mercuric sulfocyanide. See mercuric thiocyanate.

mercuric thiocyanate (mercuric sulfocyanate; mercuric sulfocyanide; mercury sulfocyanate; mercury thiocyanate) $\text{Hg}(\text{SCN})_2$.

Properties: White powder; poisonous! Soluble in alcohol; slightly soluble in water. M. p. decomposes.

Derivation: By precipitation of mercuric nitrate with ammonium sulfocyanate and subsequent solution in a large amount of hot water and crystallizing.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Glass bottles.

Uses: Photography; producing "Pharoah's serpents."

Shipping regulations: Class B poison.
Poison label.*

"Mercurochrome." ³⁴⁸ Trademark for merbromin (q. v.).

Use: As a general antiseptic, most commonly in the form of a 2% aqueous solution. It is relatively non-irritating and non-toxic.

mercurol (mercury nucleate).

Composition: Contains 20% mercury.
Poison!

Properties: Brown powder. Soluble in water; insoluble in alcohol.

Use: Medicine.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Shipping regulations: Poison, class B.
Poison label.*

mercurorophylline. Mixture of sodium salt of N-[3-(hydroxymethyl)-2-methoxypropyl]-camphoramic acid and theophylline in approximately molecular proportions.

Properties: White or slightly yellow, odorless powder; somewhat hygroscopic; slowly darkens in light; solutions are alkaline to litmus; soluble in water and in alcohol; insoluble in ether and mineral oils.

Grade: N. F. XI.
Use: Medicine.

mercurous acetate (mercury proto-acetate; mercury acetate) $\text{Hg}_2\text{C}_2\text{H}_3\text{O}_2$.

Properties: Colorless scales or plates.

Decomposed by boiling water and by light into mercury and mercuric acetate. Poisonous! Slightly soluble in water; insoluble in alcohol and ether; soluble in dilute nitric acid.

Derivation: Reaction of sodium acetate with mercurous nitrate solution acidified with nitric acid.

Grades: Technical.

Shipping regulations: Poison, class B.
Poison label.*

mercurous arsenite (mercury arsenite).

Properties: Brown powder; variable composition. Unstable. Soluble in nitric acid; insoluble in water. Poisonous!

mercurous bromide (mercury bromide)

HgBr or Hg_2Br_2 .

Properties: White powder or colorless crystals. Odorless, tasteless. Becomes yellow on heating, returning to white on cooling. Darkens on exposure to light.

Soluble in fuming nitric acid (prolonged heating), hot concentrated sulfuric acid, hot ammonium carbonate or ammonium succinate solutions; sparingly soluble in water; insoluble in alcohol and ether.

Constants: Sp. gr. 7.307; sublimes at 340-350°C; m. p. 405°C.

Derivation: (a) Action of potassium bromide on solution of mercurous nitrate in dilute nitric acid. (b) Sublimation from mixture of mercury and mercuric bromide. (c) Cooling a hot solution of the salt in mercurous nitrate.

Containers: Glass bottles; fiber cans.

Use: Medicine.

Shipping regulations: Class B poison.
Poison label.*

mercurous chlorate (mercury chlorate)

$\text{Hg}_2(\text{ClO}_3)_2$.

Properties: White crystals. Explodes with combustible substances. Caution! Keep away from light! Sp. gr. 6.409; m. p. 250°C (decomposes). Soluble in alcohol and water.

Shipping regulations: Oxidizing material.
Yellow label. Poison, class B. Poison label.*

mercurous chloride (mercury monochloride; mercury protochloride; mercury chloride, mild; calomel) Hg_2Cl_2 .

Properties: White, rhombic crystals or crystalline powder; non-poisonous. Odorless, stable in air, but darkens on exposure to light. For the natural product, see calomel, native. Insoluble in water, ether, alcohol and cold dilute acids. Sp. gr. 6.993; m. p. 302°C; b. p. 384°C. Decomposed by alkalis. Poisonous if taken internally in quantity.

Derivation: By heating mercuric chloride and mercury, with subsequent sublimation.

Method of purification: Sublimation.

Impurities: Mercuric chloride.

Grades: Technical; C. P.; N. F. XI.

Containers: Bottles; 25-, 50-, 100-lb drums.

Uses: Medicine; pyrotechnics; fungicide.

Shipping regulations: None.*

mercurous chromate (mercury chromate)

Hg_2CrO_4 .

Properties: Brick-red powder. Variable composition. Decomposes on heating.

Soluble in nitric acid (conc.); insoluble in alcohol and water.

Grades: Technical.

Use: Ceramics (coloring green).

mercurous gluconate.

Shipping regulations: Poison, class B.
Poison label.*

mercurous iodide (mercury protoiodide)

HgI or Hg_2I_2 .

Properties: Bright yellow, amorphous powder, becoming greenish on exposure to light due to decomposition into metallic mercury and mercuric iodide. Becomes dark yellow, orange and orange-red on heating. Undergoes same color change in opposite order on cooling. Odorless and tasteless. Soluble in castor oil, liquid ammonia, aqua ammonia; insoluble in water, alcohol, and ether. Sp. gr. 7.6445-7.75; sublimes at 110-120°C, m. p. 290°C (with partial decomposition).

Derivation: (a) Action of potassium iodide on a mercurous salt. (b) Boiling a solution of mercurous nitrate containing nitric acid with excess of iodine.

Grades: Technical.

Containers: Bottles; jars, kegs; drums.

Use: Medicine (external).

Shipping regulations: Class B poison.
Poison label.*

mercurous nitrate, ammoniated (Hahnemann's soluble mercury; black precipitate; ammoniated mercury nitrate) Composition uncertain.

Properties: Black to grayish-black powder; poisonous! Sensitive to light. Soluble in acids; insoluble in water and alcohol.

Derivation: By adding ammonium hydroxide to a solution of mercuric nitrate.

Grades: Technical.

Containers: Dark amber glass bottles.

Use: Medicine.

Shipping regulations: Class B poison.
Poison label.*

mercurous nitrate, hydrated $\text{HgNO}_3 \cdot \text{H}_2\text{O}$.

Properties: Short prismatic crystals;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

effloresces and becomes anhydrous in dry air. Sensitive to light. Soluble in small quantities of warm water (hydrolyzes in larger quantities), water acidified with nitric acid, boiling carbon disulfide, methylamine; slightly soluble in benzotrile; insoluble in liquid ammonia. Sp. gr. 4.785 (3.9°C); m. p. 70°C, decomposes.

Derivation: By the action of cold dilute nitric acid upon an excess of mercury and warming slightly.

Grades: Technical; C. P.

Containers: Bottles; jars, kegs; fiber drums.

Uses: Medicine; cosmetics; analytical agent.

Shipping regulations: Class B poison. Poison label.*

mercurous oxide Hg_2O .

Properties: Black powder, sp. gr. 9.8; decomposes at 100°C; soluble in acids; insoluble in water.

Derivation: Action of sodium hydroxide on mercurous nitrate.

Shipping regulations: Poison, class B. Poison label.*

mercurous phosphate (mercurous phosphate, neutral, mercurous phosphate, normal; mercury phosphate, mercurous phosphate tertiary; trimercurous orthophosphate) Hg_3PO_4 .

Properties: Heavy, white powder; variable composition. Sensitive to light. Soluble in nitric acid; insoluble in alcohol, phosphoric acid, and water.

Use: Medicine.

mercurous phosphate, neutral. See mercurous phosphate.

mercurous phosphate, normal. See mercurous phosphate.

mercurous phosphate, tertiary. See mercurous phosphate.

mercurous sulfate Hg_2SO_4 .

Properties: White to yellow crystalline powder; soluble in hot sulfuric acid, dilute nitric acid; almost insoluble in water. Sp. gr. 7.56.

Derivation: (a) Dissolving mercury in sulfuric acid (2:3) and heating gently. (b) Adding sulfuric acid to mercurous nitrate solution.

Grades: Technical; C. P.

Containers: 1-, 5-lb bottles.

Uses: Chemical (admixed with sulfuric acid as a catalyst, in oxidation of naphthalene to phthalic acid); laboratory batteries (Clark cell, Weston cell).

Shipping regulations: Class B poison. Poison label.*

mercury (quicksilver; hydrargyrum) Hg.

Element with atomic number 80, group IIB of the periodic table.

Properties: A silvery, liquid, metallic element, sometimes found native; poisonous! Insoluble in hydrochloric acid; soluble in sulfuric acid upon boiling; readily and completely soluble in nitric acid. Insoluble in water, alcohol, and ether. Sp. gr. 13.59; m. p. -38.85°C; b. p. 357.33°C.

Derivation: By heating cinnabar in air, or with lime.

Method of purification: Distillation. An important proportion of used mercury is recovered by redistillation.

Grades: Technical; N. F. XI; virgin; redistilled.

Containers: 1-, 5-, 10-lb bottles or jugs; larger amounts in 76-lb flasks only.

Uses: Mercury cells and other electrical apparatus; mercury vapor boilers; mercury vapor lamps; barometers; thermometers; mercurials for medicine and pesticides; dental preparations; amalgams; antifouling paint; catalyst.

Shipping regulations: None.*

mercury acetate. See mercuric acetate; mercurous acetate.

mercury para-aminophenyl arsenate. See mercury atoxylate.

mercury, ammoniated (mercuric chloride, ammoniated; ammonobasic mercuric chloride; ammoniated mercury chloride; white precipitate, white precipitate, fusible; aminomercuric chloride; mercury cosmetic; Lemery's white precipitate) HgNH_2Cl .

Properties: White, pulverulent lumps or powder; earthy, metallic taste; odorless; stable in air; darkens on exposure to light; poisonous! Soluble in ammonium carbonate and sodium thiosulfate solutions and in warm acids; insoluble in water and alcohol.

Derivation: By precipitating mercuric chloride with ammonium hydroxide in excess.

Grades: U.S.P. XVI; technical.

Containers: 1-, 5-, 25-, 50-lb boxes; 100-lb kegs, 200-lb barrels or fiber drums.

Use: Medicine.

Shipping regulations: Class B poison. Poison label.*

See also mercuric ammonium chloride.

mercury-ammonium chloride. See mercuric-ammonium chloride.

mercury arsenate. See mercuric arsenate.

mercury arsenite. See mercurous arsenite.

mercury atoxylate (mercury para-aminophenylarsenate; mercuric arsenilate) $\text{Hg}[\text{OOAs}(\text{OH})\text{C}_6\text{H}_4\text{NH}_2]_2$.

Properties: White powder containing 31.8% mercury; very slightly soluble in water. Used as a 10% suspension in olive oil, or as a 5% ointment.

Use: Medicine.

Shipping regulations: Poison, Class B. Poison label.*

mercury-barium bromide. See mercuric-barium bromide.

mercury-barium iodide. See mercuric-barium iodide.

mercury benzoate. See mercuric benzoate.

mercury bichloride. See mercuric chloride.

mercury bichromate. See mercury dichromate.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

mercury biniodide. See mercuric iodide.

mercury bromide. See mercuric bromide and mercurous bromide.

mercury-cathode cell. An electrolytic cell for the production of caustic soda and chlorine from sodium chloride brine. Continuously fed brine is decomposed in one compartment between graphite anodes, where chlorine is liberated, and a mercury cathode, where a sodium amalgam is formed. The amalgam flows continuously or intermittently to a second compartment where it is decomposed with water, forming a caustic solution. The decomposition is usually performed electrolytically by making the amalgam anodic with respect to an iron or graphite cathode. Pure water is supplied to the decomposition compartment at such a rate as to maintain a constant concentration of caustic in the product. With respect to the diaphragm cell, the mercury cathode cell has the advantages of producing a very pure caustic and, generally, a more concentrated solution (50-70%); it has the disadvantages of a higher operating voltage and lower efficiency (52-55%), and a high capital investment in mercury. For examples of mercury-cathode cells, see Castner cell and DeNora cell.

mercury chlorate. See mercurous chlorate.

mercury chloride. See mercuric chloride and mercurous chloride.

mercury chloride, ammoniated. See mercury, ammoniated.

mercury chloride, corrosive. See mercuric chloride.

mercury chloride, mild. See mercurous chloride.

mercury chromate. See mercurous chromate.

mercury, colloidal.

Properties: Clear, dark-brown liquid. Faint alkaline reaction. Contains 1% colloidal mercury. Caution! Do not subject to bright light or to wide temperature variations.

Use: Medicine.

mercury-copper iodide. See mercuric-cuprous iodide.

mercury, cosmetic. See mercury, ammoniated.

mercury cyanide. See mercuric cyanide.

mercury dichromate (mercuric dichromate, mercury bichromate) HgCr_2O_7 .

Properties: Heavy, red, crystalline powder; soluble in acids; insoluble in water.

mercury fluoride. See mercuric fluoride.

mercury fulminate (mercuric cyanate) $\text{Hg}(\text{CNO})_2$.

Properties: Gray crystalline powder; explodes when dry under the slightest friction or shock; must be kept moist until used. Soluble in alcohol, ammonium hydroxide and hot water; slightly soluble in cold

water. Sp. gr. 4.42; m. p., explodes.

Derivation: By treating mercury with strong nitric acid and alcohol.

Grades: Technical.

Containers: Canvas bags in stone crocks filled with water; in lots of five pounds in glass bottles.

Uses: Manufacture of caps and detonators for producing explosions for military, industrial and sporting purposes.

Fire hazard: Dangerous; high explosive.

Shipping regulations: In dry form: Forbidden explosive. Not accepted by common carrier. Wet: Explosive, class A. Initiating explosive label. Not accepted by express.*

mercury, horn. See calomel, native.

mercury imidosuccinate. See hydrargol.

mercury iodate. See mercuric iodate.

mercury iodide, red. See mercuric iodide.

mercury iodide, yellow. See mercuric iodide.

mercury monochloride. See mercurous chloride.

mercury naphthenate.

Properties: A dark amber liquid; soluble in lubricating oils and mineral spirits.

Wt./gal 10.4 lbs.

Grades: 25% mercury.

Containers: 80-lb drums.

Uses: Mildew-resistance promoter in paints; antiknock compound.

Shipping regulations: Poison, class B. Poison label.*

mercury nitrate. See mercuric nitrate.

mercury nitrate, ammoniated. See mercurous nitrate, ammoniated.

mercury nucleate. See mercuriol.

mercury oleate. See mercuric oleate.

mercury oxide, red. See mercuric oxide, red.

mercury oxide, yellow. See mercuric oxide, yellow.

mercury oxycyanide. See mercuric oxycyanide.

mercury pernitrate. See mercuric nitrate.

mercury persulfate. See mercuric sulfate.

mercury phosphate. See mercurous phosphate and mercuric phosphate.

mercury-potassium cyanide. See mercuric-potassium cyanide.

mercury protoacetate. See mercurous acetate.

mercury protochloride. See mercurous chloride.

mercury protiodide. See mercurous iodide.

mercury, salicylated. See mercuric salicylate.

mercury-silver iodide. See mercuric-silver iodide.

mercury stearate. See mercuric stearate.

mercury sulfate. See mercuric sulfate.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

mercury sulfide, black. See mercuric sulfide, black.

mercury sulfide, red. See mercuric sulfide, red.

mercury sulfocyanate. See mercuric thiocyanate.

mercury sulfuret, red. See mercuric sulfide, red.

mercury thiocyanate. See mercuric thiocyanate.

merethoxylline procaine. Consists of a mixture of one mole of the procaine salt of merethoxylline and 1.4 moles of theophylline. It is prepared by dissolving the merethoxylline and procaine in water and adding the theophylline. It is not isolated from solution.

Merethoxylline is a mercuric compound, $C_{15}H_{19}HgNO_6$, or ortho-(N-gamma-hydroxymercuri-beta-hydroxyethoxypropylcarbamido)phenoxyacetic acid. It is a white powder, m. p. 138-141°C, practically insoluble in water; soluble in alkaline solutions.

Grade: N. N. D.
Use: Medicine.

"Merez" Metal Resinates. ²⁹⁶ Trademark for zinc calcium metal resinates in grades "Merez" A, B, C, and D having typical melting points (capillary tube) 167°C, 157°C, 147°C, and 136°C respectively. Used in paint, varnish, and printing ink.

"Mergamma." ¹⁵⁰ Trademark for wireworm killer and seed disinfectant containing a combination of 40% gamma isomer of benzene hexachloride and 1.93% phenylmercury urea.

Containers: 12-oz or 3-lb tins; 40-lb drums.

"Merlon." ⁵⁸ Trademark for a line of textile treating resins based on vinyl acetate, styrene, or vinyl butyral, or other synthetic polymers.

"Merol-S." ²⁹⁶ Trade name for a zinc resinates in mineral spirits solution. Used in paint, varnish, and printing ink.

"Merox" Process. ⁴¹⁶ Patented process for extracting easily removed mercaptans and converting the remaining mercaptans in naphthas to disulfides, thereby yielding a product sweet by the doctor test. The combination of extraction and sweetening is applicable to gasoline and lighter hydrocarbons, and the sweetening step to many jet fuels and kerosines.

Process employs caustic soda which is regenerated by blowing with air in the presence of a metal chelate catalyst, to oxidize the mercaptans to disulfides. Disulfides are decanted from the caustic in the extraction application, while in the sweetening application they remain in the hydrocarbon.

"Merpertine." ²⁸ Trademark for a surface-active agent, a red-brown liquid with good wetting and solvent properties.

Use: As a wetting and scouring agent in the yarn-dyeing and leather industries.

"Merphos." ⁴⁰ Proprietary name for tributylphosphorotrithioite ($C_4H_9S_3$)₃P.

Properties: Technical grade is a nearly colorless liquid; insoluble in water; soluble in a variety of organic solvents. B. p. (0.08 mm) 115-134°C; sp. gr. (20°C) 1.02; refractive index (25°C) 1.542.

Derivation: Reaction of butyl mercaptan with phosphorus trichloride.

Purity: 95%.

Use: Active ingredient of cotton defoliant "Folex."

"Merpel." ²⁸ Trademark for a line of wetting, scouring, and dyeing assistants used principally in the textile, paper, and leather industries.

mersalyl (ortho-[(3-hydroxymercuri-2-methoxypropyl)carbamy]phenoxyacetic acid, sodium salt, mersalyl sodium)
 $NaOOCCH_2OC_6H_4CONHCH_2CH(OCH_3)CH_2-HgOH$.

Properties: White or almost white, somewhat deliquescent, crystalline powder, odorless with a bitter taste; decomposed gradually by light; soluble in water and alcohol, insoluble in chloroform and ether.

Grade: N. F. XI.
Use: Medicine.

mersalyl sodium. See mersalyl.

"Mersize." ⁵⁸ Trademark for a paper sizing agent in paste and dry form.

Containers: Liquid form: 6000-, 8000-, and 10,000-gal tank cars, 500-lb drums.
Dry form: 50-lb bags.

Use: In manufacture of water-resistant paper.

"Mersolite-1." ⁸¹ Trademark for phenylmercuric hydroxide (q. v.).

"Mersolite-2." ⁸¹ Trademark for phenylmercuric chloride (q. v.).

"Mersolite-7." ⁸¹ Trademark for phenylmercuric nitrate (q. v.).

"Mersolite-8, -88, -94." ⁸¹ Trademark for phenylmercuric acetate (q. v.).

"Mersolite-90." ⁸¹ Trademark for phenylmercuric borate (q. v.).

"Mertax." ⁵⁸ Trade name for purified 2-mercaptobenzothiazole.

Properties: Light yellow powder, m. p. 175°C min, mercaptobenzothiazole content 97% min, sp. gr. 1.42.

Uses: Rubber accelerator.

"Merthiolate." ¹⁰⁰ Trademark for thimerosal, N. F.
Use: Medicine.

"Mertone." ⁵⁸ Trademark for a colloidal silica precoat for blueprint and other reproduction papers.

Properties: Liquid; 15% and 30% colloidal dispersion of silica in water; odorless.

Containers: 55-gal lined steel drums.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

mescaline (3,4,5-trimethoxyphenethylamine) $(\text{CH}_3\text{O})_3\text{C}_6\text{H}_2\text{CH}_2\text{CH}_2\text{NH}_2$. A poisonous alkaloid from mescal buttons (the flowering heads of certain types of cactus).

Properties: Crystals; m. p. $35-36^\circ\text{C}$, b. p. 180°C , soluble in water, alcohol, chloroform, benzene; nearly insoluble in ether; takes up carbon dioxide from the air.

Use: Biochemical and medical research; non-lethal incapacitating drug.

mesitylene (1,3,5-trimethylbenzene; sym-trimethylbenzene) $\text{C}_6\text{H}_3(\text{CH}_3)_3$. A colored liquid; sp. gr. 0.863; m. p. -52.7°C ; b. p. 164.6°C ; insoluble in water; soluble in alcohol and ether. Derived from coal tar.

Use: Intermediate.

mesityl oxide (isopropylideneacetone, methyl isobutenylketone, 4-methyl-3-penten-2-one) $(\text{CH}_3)_2\text{C}:\text{CHCOCH}_3$.

Properties: Oily, colorless liquid. Honey-like odor. Partially soluble in water, miscible with alcohols, ethers.

Constants: Sp. gr. 0.8569 ($20/20^\circ\text{C}$), b. p. $130-131^\circ\text{C}$ (760 mm), vapor pressure 8.7 mm (20°C), toluene dilution ratio 3.8; flash point 90°F , wt/gal 7.1 lbs (20°C); coefficient of expansion 0.00107 (20°C); freezing point -46.4°C , viscosity 0.0060 poise (20°C).

Typical specifications: Sp. gr. 0.852-0.856 ($20/20^\circ\text{C}$); boiling range $123-132^\circ\text{C}$ (760 mm); acidity not more than 0.01% (as acetic).

Derivation: By the dehydration of acetone or diacetone alcohol.

Grades: Technical.

Containers: 1-gal cans; 5-, 55-gal drums; carloads, tank cars.

Caution: Keep away from heat and open flame. Avoid breathing of vapor. Avoid contact with skin. MCA warning label.

Uses: Solvent for cellulose esters and ethers, oils, gums, resins, lacquers, roll-coating inks, stains, ore flotation, paint and varnish-removers; insect repellent.

Shipping regulations: None.*

meso-. A prefix meaning middle or intermediate, specifically:

1. An optical isomer which is inactive as a result of internal compensation.
2. An intermediate hydrated form of an inorganic acid.
3. Designating a middle position in certain cyclic organic compounds, or
4. A ring system characterized by a middle position of certain rings.

meso-inositol. See inositol.

meson. The name given to any of the group of fundamental particles (q. v.) whose masses are intermediate between the mass of an electron and the mass of a nucleon.

mesoxalylurea. See alloxan.

mesquite gum.

Properties: Irregular, colorless or dark amber-brown round pieces. Resembles gum arabic in solubility.

Derivation: From *Prosopis juliflora* DC., found in New Mexico, Texas and southwestern United States.

Uses: Cattle food; source of tannin.

Shipping regulations: None.*

"Mestinon" Bromide.¹⁹⁰ Trademark for a brand of pyridostigmin bromide (q. v.).

mesyl chloride. See methanesulfonyl chloride.

meta-. A prefix. For definition of meta-compounds see under ortho-. In this dictionary, meta- is disregarded in the alphabetizing; e. g., for meta-cresol, see cresol.

metabolite. An intermediate material produced and used in the processes of a living cell or organism. Metabolites are used for replacement and growth in living tissue, and are also broken down to be a source of energy in the body. Examples are nucleic acids, enzymes, glucose, cholesterol, and many similar substances.

metabutethamine hydrochloride (2-isobutyl-aminoethyl meta-aminobenzoate hydrochloride)

$\text{H}_2\text{NC}_6\text{H}_4\text{COOCH}_2\text{CH}_2\text{NHCH}_2\text{CH}(\text{CH}_3)_2 \cdot \text{HCl}$.

Properties: White, odorless, crystalline solid, m. p. $181-184^\circ\text{C}$, soluble in water; slightly soluble in alcohol, acetone, chloroform.

Grade: N. F. XI.

Use: Medicine.

metabutoxycaine hydrochloride (2'-diethyl-aminoethyl 3-amino-2-butoxybenzoate hydrochloride)

$\text{C}_6\text{H}_3(\text{NH}_2)(\text{OC}_4\text{H}_9)(\text{COOCH}_2\text{CH}_2\text{N}(\text{C}_2\text{H}_5)_2 \cdot \text{HCl}$.

Properties: White, odorless, crystals; m. p. $117-120^\circ\text{C}$; very soluble in water, alcohol; slightly soluble in acetone, chloroform; very slightly soluble in ether.

Grade: N. F. XI.

Use: Medicine.

metacetone. See diethylketone.

metacinnabarite. A mineral of the same composition as cinnabar (q. v.) but black in color. Occurs with cinnabar. A variety, guadalcazarite, contains some selenium and zinc. Used as a source of mercury.

"Metadelphene".²⁶⁶ Trademark for N,N-diethyl-meta-toluamide (q. v.).

metaformaldehyde. See sym-trioxane.

"Metafos."¹⁶⁴ Trademark for a sodium phosphate glass commonly called sodium hexametaphosphate (q. v.), a linear polymer containing a minimum of 67% P_2O_5 . Soluble in water, insoluble in organic solvents.

Grades: Beads, granular, powder.

Containers: Bags, fiber drums.

Uses: In general, as a sequestering, dispersing and deflocculating agent; specifically, to sequester alkaline earth and heavy metal ions; to prevent scaling and corrosion of pipes; to soften water; to disperse pigments and clays in paper making and oil well drilling.

"Metalate."²⁴⁴ Trade name for a white, crystalline material containing 29.8%

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

total Na_2O .

Containers: 125-lb and 325-lb net drums; 325-lb net barrels.

Uses: Laundry builder and break compound; also used for miscellaneous cleaning.

metal deactivator. Substance that is added to gasoline motor fuels to neutralize the catalytic effect of copper in promoting fuel oxidation. See following article for a typical commercial material.

Metal Deactivator. ²⁸ A 78% solution of $\text{N,N}'$ -disalicylidene 1,2-diaminopropane and related compounds, in an aromatic solvent.

Properties: Brown liquid at temperatures above -15°C ; sp. gr. 1.076; miscible in gasoline in all proportions above 20°C and greater than 1% at -30°C . Also miscible in most gasoline antioxidants in all proportions above 0°C .

Containers: 30-gal steel drums.

Use: For improving the storage stability of petroleum distillates containing dissolved copper. Concentration required: 0.0005-0.002% by weight.

metaldehyde $(\text{CH}_3\text{CHO})_n$. A polymer of acetaldehyde, in which n usually is 4 or 6. Properties: White prisms, partial regeneration of acetaldehyde when heated above 80°C . Soluble in benzene, chloroform; slightly soluble in alcohol, ether; insoluble in water.

Constants: Sublimes 112 - 115°C ; m. p. 246°C .

Use: As a fuel to replace alcohol; to destroy snails.

metal dyes. Aluminum may be dyed by first producing on its surface an oxide film, which then adsorbs dyestuff in a subsequent operation. Steel may be similarly treated. Alizarin Cyanin RR, Alizarin Green S, Nigrosine 2Y and Naphthalene Blue RS have been mentioned as suitable for these purposes.

"Metalflake." ²³³ Trademark for precision-cut particles of metallic foil used in paint for automotive finishes, or incorporated in paper, plastics, leathers and fabrics.

"Metallac." ³⁰⁹ Trademark for zinc stearate (q. v.).

metallic fiber. Generic name for a manufactured fiber composed of metal, plastic-coated metal, metal-coated plastic, or a core completely covered by metal (Federal Trade Commission). A common type is aluminum filament covered with cellulose acetate butyrate. It may be colored by a dye in the plastic or by gold or silver glitter. Used as a decorative yarn.

metallized dyes. Soluble dyes including any one of a variety of metals chemically combined, applied to wool in an acid bath, by use of sodium chloride to salt out the dye onto the fiber.

metallography. Study of the structure of metals and alloys, principally by use of the microscope.

metal protection. See cadmium plating, calorizing, chromium plating, clad metal; copper plating, galvanized iron, lead coating, lead lining, lead burning, metal spraying, nickel plating, rubber-plated metal, sherardizing.

metals, fusible. See fusible alloys.

metals, powdered. Metals are produced in powdered form for a variety of uses in several industries. In this form they are the raw materials for the broad processing field known as powder metallurgy. Metal powders range in size from -325 mesh (0.045-0.060 mm "diameter") to +100 mesh, and are available in practically all industrial metals. They are produced by machining, milling, shooting, granulation, atomizing, condensation, reduction, chemical precipitation or electrodeposition. The properties and purities of the powders vary with the method of preparation.

Uses: In the electric, automotive, machinery, tool and refractory-metal industries; metallic paint pigments; flares and incendiary bombs; brazing materials; calorizing, metal-spraying, metallurgical agents; heat generating agents; catalysts, etc.

Caution: When finely divided as in a powder, even ordinary metals are often subject to spontaneous heating and combustion, and their dust may constitute an explosive hazard. Appropriate information and precautions should be used to suit each specific case.

See also powder metallurgy.

metal spraying. A method of spraying metal through a gun for the purpose of coating different objects. The gun commonly used is the gas gun. In this gun the metal to be sprayed is introduced in the form of wire through a central tube. Through an annular space surrounding this tube a gaseous mixture, either hydrogen or acetylene with oxygen or air, is passed, which upon burning at the orifice melts the wire in the inner part of the conical flame. Compressed air or other gas is passed through an outer annular space for the purpose of atomizing and spraying the metal as it is melted.

"Metalyn." ²⁶⁶ Trademark for the distilled methyl ester of tall oil; amber liquid; acid number 5 max; viscosity 70-100 seconds (Saybolt Universal, at 100°F).

"Metandren." ³⁰⁵ Trademark for methyltestosterone U. S. P.
Use: Medicine.

metanilic acid (meta-sulfanilic acid; meta-aminobenzenesulfonic acid) $\text{C}_6\text{H}_4(\text{NH}_2)\text{SO}_3\text{H}$.

Properties: Small colorless needles. Soluble in water, alcohol, and ether.

Derivation: By the reduction of meta-nitrobenzenesulfonic acid. Nitrobenzene is sulfonated until the product is soluble in water. The mixture is then poured into water and reduced with iron, made alkaline with lime and the lime salt dissociated with sodium carbonate.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Grades: Technical.

Containers: 250-, 300-lb barrels; drums.

Uses: Dyes; medicine.

Shipping regulations: None.*

"**Metaphen.**" ³ Trademark for nitromersol (q. v.).

metaraminol bitartrate (1-meta-hydroxy-norephedrine bitartrate)

$\text{HOC}_6\text{H}_4\text{CH}(\text{OH})\text{CH}(\text{CH}_3)\text{NH}_2 \cdot \text{C}_4\text{H}_6\text{O}_6$.

Properties: White, practically odorless, crystalline powder; melting range 170-176°C; soluble in water; somewhat soluble in alcohol; insoluble in ether and in chloroform; pH of 5% solution 3.2 and 3.5.

Grade: N. F. XI.

Use: Medicine.

"**Metasap.**" ³⁰⁹ Trademark for a series of polyvalent metal and lithium soaps of higher fatty acids having a general use in the industrial arts.

"**Metasol.**" ⁴⁵² A line of mercury derivatives used as bactericides and fungicides. They are diphenylmercuric ammonium propionates.

"**Meta-Systox R.**" ¹⁸¹ Trademark for O, O-dimethyl-S-2-(ethylsulfinyl)ethyl phosphorothioate (q. v.).

"**Metavis.**" ³⁰⁹ Trademark for a metallic soap composition (as, aluminum tristearate) for thickening oils and for producing lubricating greases.

meter. The basic unit of length of the metric system. It is 39.37 inches long. It was originally defined as exactly one ten-millionth of the distance from the equator to the North Pole. The practical standard was and is a carefully preserved platinum-iridium meter bar kept at Paris under terms of an international treaty. A meter is now defined as 1,650,763.73 wave lengths of the orange-red line of the isotope krypton 86. This standard based on recent scientific advances, is practical, exact, and invariable.

"**Methac.**" ⁶⁵ Trademark for a series of blends of methyl acetate with methanol in varying proportions. Used in lacquer solvents, paint removers, organic synthesis.

methacetin (acetanisidine; para-methoxy-acetanilide) $\text{CH}_3\text{OC}_6\text{H}_4\text{NHCOCH}_3$.

Properties: White, crystalline powder, feebly bitter taste. Soluble in alcohol, acetone and dilute acids; insoluble in a water. M. p. 127.1°C.

Derivation: By the acetylation of para-anisidine.

Grades: Technical, pure.

Containers: Tins; glass bottles.

Use: Medicine.

Shipping regulations: None.*

methacholine bromide (acetyl-beta-methylcholine bromide)

$\text{CH}_3\text{COOCH}(\text{CH}_3)\text{CH}_2\text{N}(\text{CH}_3)_3\text{Br}$.

Properties: White, crystalline, very hygroscopic powder with slight fishy odor.

M. p. 147-150°C. Readily soluble in alcohol and water; insoluble in benzene and ether. pH (5% solution) about 5.

Grade: N. F. XI.

Use: Medicine.

methacholine chloride (acetyl-beta-methylcholine chloride)

$\text{CH}_3\text{COOCH}(\text{CH}_3)\text{CH}_2\text{N}(\text{CH}_3)_3\text{Cl}$.

Properties: Colorless or white crystals or white crystalline powder; odorless or very slight odor; very deliquescent; very soluble in water; freely soluble in alcohol and chloroform; insoluble in benzene and ether. Solutions neutral to litmus paper; m. p. 170-173°C.

Grade: N. F. XI.

Use: Medicine.

"**Methacrol.**" ²⁸ Trademark for a line of thermoplastic resin dispersions that are used as finishing agents in the textile and leather industries.

methacrolein (methacrylaldehyde)

$\text{CH}_2=\text{C}(\text{CH}_3)\text{CHO}$.

Properties: Liquid; sp. gr. 0.8474 (20/20°C); b. p. 68.0°C (760 mm); flash point 5°F (Cleveland open cup); solubility in water at 20°C 5.9% by weight. Shipped with 0.1% hydroquinone as polymerization inhibitor.

Uses: Copolymers, resins.

Shipping regulations: Flammable liquid. Red label.*

methacrylaldehyde. See methacrolein.

methacrylate esters. Esters of methacrylic acid having the formula $\text{CH}_2=\text{C}(\text{CH}_3)\text{COOR}$, where R is usually methyl, ethyl, isobutyl, or n-butyl-isobutyl (50-50). They are supplied commercially as the polymers. See acrylate resins.

methacrylate resins. See acrylate resins.

methacrylatochromic chloride.

$\text{H}_2\text{C}=\text{C}(\text{CH}_3)\text{C}(\text{O} \cdot \text{CrCl}_2\text{OH} \cdot \text{CrCl}_2\text{O})$.

Properties: Water-soluble solid.

Process: Reaction of methacrylic acid with basic chromic chloride.

Uses: Water repellent; nonadhesive; insolubilizer for vinyl polymers.

methacrylic acid (monomer) (alpha-methacrylic acid) $\text{CH}_2=\text{C}(\text{CH}_3)\text{COOH}$.

Properties: Colorless liquid; m. p. 15-16°C; b. p. 161-162°C, sp. gr. 1.015 (20°C).

Soluble in water, alcohol, ether, most organic solvents. Undergoes polymerization readily to give water-soluble polymers.

Derivation: Reaction of acetone cyanohydrin and dilute sulfuric acid, oxidation of isobutylene.

Grades: 40% Aqueous solution, b. p. 76-78°C (25 mm), crude monomer 85% pure; glacial (98%).

Containers: 13 1/2-gal carboys; 55-gal drums; tank cars.

Uses: Monomer for large-volume resins and polymers; organic synthesis. Many of the polymers are based on esters of the acid, as the methyl, butyl, or isobutyl esters. See acrylate resins.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

beta-methacrylic acid. Name sometimes used for trans form of crotonic acid (q. v.).

"Methadone." ³ Trademark for *dl*-6-dimethyl-amino-4,4-diphenyl-3-heptanone.

Derivation: Reaction of diphenylacetoneitrile with *l*-di-methylamino-2-chloro-propane.

Use: Medicine.

methadone hydrochloride (*dl*-6-dimethyl-amino-4,4-diphenyl-3-heptanone hydrochloride)

$(C_6H_5)_2C(COC_2H_5)CH_2CH(CH_3)N(CH_3)_2 \cdot HCl$.

Properties: A crystalline substance with bitter taste; no odor; m. p. 232-235°C; soluble in water and alcohol; slightly soluble in isopropanol, and chloroform; practically insoluble in ether and glycerol. pH (1% aqueous solution) 4.5-6.5.

Grade: U. S. P. XVI.

Use: Medicine.

methadrine. A non-lethal incapacitating drug.

"Methalate 'C'." ¹⁸⁸ Brand name for a proprietary product. Possesses an odor similar to methyl salicylate for which it is an effective substitute.

Uses: Fly sprays; also can be used as a low-priced aromatic for covering objectionable odors present in mixtures of fixed oils, animal or vegetable, especially such oils as are used in the paint industry and in low-grade soaps.

methallenestril (beta-ethyl-6-methoxy-alpha, alpha-dimethyl-2-napthalenepropionic acid) $CH_3OC_{10}H_4CH(C_2H_5)C(CH_3)_2COOH$.

Properties: Crystals; m. p. 132.5°C.

Soluble in ether, vegetable oils.

Grade: N. N. D.

Use: Medicine.

methallyl acetate. See methylallyl acetate.

methallyl alcohol. See 2-methyl-2-propen-1-ol.

methallyl chloride. See methylallyl chloride.

methaminodiazepoxide. See chlordiazepoxide hydrochloride.

methamphetamine hydrochloride (deoxyephedrine hydrochloride; 1-phenyl-2-methylaminopropane hydrochloride)

$C_6H_5CH_2CH(CH_3)NHCH_3 \cdot HCl$.

Properties: White crystals or white crystalline powder; m. p. 171-175°C; odorless, aqueous solution acid to litmus paper; soluble in water, alcohol, and chloroform; very slightly soluble in absolute ether.

Grade: N. F. XI.

Use: Medicine.

methanal. See formaldehyde.

methanamide. See formamide.

methandrostenolone (17 alpha-methyl-17 beta-hydroxyandrost-1,4-dien-3-one). An anabolic hormone; anabolic steroid.

Use: Medicine (deposition, synthesis, utilization of protein).

methane (marsh gas, methyl hydride) CH_4 .
The first member of the aliphatic

hydrocarbons series.

Properties: Colorless, odorless, tasteless, flammable gas; lighter than air, practically inert toward sulfuric acid, nitric acid, alkalis, and salts but reacts with chlorine and bromine in light (explosively in direct sunlight). Forms explosive mixture with air or oxygen; b. p. -161.6°C; m. p. -182.5°C; density of vapor 0.554 (0°C) (760 mm, air = 1); critical temperature -82.1°C; critical pressure 672 psia; explosive limits in air 5.3-14.0 per cent by volume; heating value 1009 Btu/cu ft. Soluble in alcohol, ether; slightly soluble in water.

Occurrence: Chief component of most natural gas and of marsh gas; a major component of coal gas; present to some extent in air in coal mines.

Derivation: From natural gas by absorption or adsorption methods; specially pure methane is obtained by supercooling and distillation.

Containers: High pressure pipe lines; high pressure cylinders.

Grades: Research, 99.65%; pure, 99%; technical, 95%; Btu grade must have heating value of 1000 \pm 3 Btu/cu. ft. at 60°F and 30 inches Hg pressure.

Uses: A source of petrochemicals by its conversion to hydrogen and carbon monoxide by steam cracking or partial oxidation. Important products are methanol, acetylene, hydrogen cyanide. Chlorination produces carbon tetrachloride, chloroform, methylene chloride, and methyl chloride. In the form of natural gas, methane is used as a fuel, and is also the source of carbon black.

Shipping regulations: Flammable gas. Red gas label.*

methanearsonic acid, disodium salt. See disodium methylarsonate.

methanecarboxylic acid. See acetic acid.

methanedicarbonic acid. See malonic acid.

methanesulfonyl chloride (mesyl chloride) CH_3SO_2Cl .

Properties: Pale yellow liquid; b. p. 164°C; f. p. -32°C; soluble in most organic solvents, insoluble in water (slowly hydrolyzes).

Containers: 5-gal, 55-gal drums.

Grades: 98%; 99+%.

Uses: Intermediate.

methanethiol. See methyl mercaptan.

methanethiomethane. See dimethyl sulfide.

methanoic acid. See formic acid.

methanol (methyl alcohol, wood alcohol) CH_3OH .

Properties: Clear, colorless, mobile, volatile, flammable liquid; poisonous! Soluble in water, alcohol, and ether; sp. gr. 0.7924; m. p. -97.8°C; b. p. 64.5°C; wt/gal 6.59 lbs (20°C); refractive index 1.329 (20°C); surface tension 22.6 dynes/cm (20°C); viscosity 0.00593 poise (20°C);

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

vapor pressure 92 mm (20°C); specific heat (vapor) 0.39 cal/g (77°C); latent heat of evaporation 262.8 cal/g at b. p.; heat of fusion 23.6 cal/g; heat of combustion 170.9 kg cal/mol; flash point (open cup) 60°F; dielectric constant 31.2 (20°C); critical pressure 78.7 atm; critical temperature 240°C; average coefficient of cubical expansion 0.0012 from 0-61°C.

Derivation: (a) By high pressure catalytic synthesis from carbon monoxide and hydrogen. (b) Through partial oxidation of natural gas hydrocarbons. (c) By purification of the pyroigneous acid resulting from destructive distillation of wood.

Method of purification: Rectification.

Containers: Various, up to 8000-gal tank cars.

Grades: Technical; C. P. Electronic (used to cleanse and dry components).

Uses: (in approximate order of volume):

Production of formaldehyde; automotive antifreeze; chemical synthesis (methyl amines, methyl chloride, methyl methacrylate, etc.); general solvent (including surface coatings, paint removers, inks, and adhesives); aviation fuel (for water injection); denaturant for ethyl alcohol, rocket fuel, dehydrator for natural gas.

Danger: Flammable, vapor harmful. May be fatal (or cause blindness) if swallowed. Cannot be made non-poisonous. MCA warning label.

Shipping regulations: Flammable liquid. Red label.*

methantheline bromide $C_{21}H_{26}BrNO_3$. beta-Diethylaminoethyl-9-xanthene carboxylate methobromide.

Properties: White or nearly white, practically odorless, microcrystalline powder with very bitter taste, m. p. 171-177°C; very soluble in water, freely soluble in alcohol and chloroform; practically insoluble in ether. Water solution decomposes on standing.

Grade: N. F. XI.

Use: Medicine.

methaphenilene hydrochloride (N,N-dimethyl-N'-(alpha-phenyl)-N'-phenylethylenediamine hydrochloride) $C_{15}H_{20}N_2S \cdot HCl$.

Properties: White to pale yellow, crystalline powder with faint odor; m. p. 184-189°C. Soluble in water; sparingly soluble in alcohol and chloroform, practically insoluble in ether. pH (2% solution) 5-7.

Use: Medicine.

methapyrilene (2-[(2-dimethylaminoethyl)-2-thienylamino]pyridine)

$C_4H_3SCH_2N(C_2H_4N)CH_2CH_2N(CH_3)_2$. Properties: Liquid, b. p. (0.45 mm) 125-135°; b. p. (3 mm) 173-175°.

Derivation: Prepared by condensing 2-(2-thienylmethyl)aminopyridine with dimethylaminoethyl chloride in presence of sodamide, or by condensing N,N-dimethylaminoethyl-alpha-aminopyridine with 2-thienylmethyl chloride.

Use: Medicine (more widely used in combination with other drugs and

as various salts, especially the hydrochloride).

methapyrilene fumarate $C_{14}H_{19}N_3S \cdot 1\frac{1}{2}C_4H_4O_4$.

Properties: White, crystalline powder with a faint aromatic odor. M. p. 133-136°C. Soluble in water, slightly soluble in alcohol, and insoluble in ether. An aqueous solution is acidic.

Containers: 25-lb, 100-lb fiber drums.

Use: Medicine.

methapyrilene hydrochloride

$C_4H_3SCH_2N(C_2H_4N)CH_2CH_2N(CH_3)_2 \cdot HCl$, or $C_{14}H_{19}N_3S \cdot HCl$.

Properties: White, crystalline powder with faint odor. M. p. 159-163°C. Very soluble in water; freely soluble in alcohol and chloroform; practically insoluble in benzene and ether. pH (5% solution) 5-6.

Containers: Drums.

Grades: N. F. XI.

Use: Medicine.

"**Methar**." ⁴⁹ Trade name for a disodium methyl arsenate selective crabgrass killer.

metharbital (5,5-diethyl-1-methylbarbituric acid) $(C_2H_5)_2C(CO)N(CH_3)C(O)NHCO$.

Properties: A white, crystalline powder with faint aromatic odor, m. p. 151-155°C, slightly soluble in alcohol and ether, very slightly soluble in water.

Grade: N. F. XI.

Use: Medicine.

"**Methasan**." ⁵⁸ Trademark for zinc dimethyldithiocarbamate.

"**Methasol**." ²⁰⁶ Brand name of proprietary line of spirits-soluble coloring matters.

"**Methazate**." ²⁴⁸ Trademark for zinc dimethyldithiocarbamate.

Properties: White powder; sp. gr. 1.68; m. p. 240-255°C, only slightly soluble in acetone, benzol, ethylene dichloride, gasoline, and water.

Uses: For wire insulation, proofing, footwear; latex, dispersions; cements and sundries.

methazolamide $CH_3CON:CSC(SO_2NH_2)NNCH_3$ (5-acetylmino-4-methyl-delta-1,3,4-thiadiazoline 2-sulfonamide).

Properties: Solid, m. p. 213-4°C, can be recrystallized from water.

Use: Medicine.

"**Methedrine**." ³⁰¹ Trademark for methamphetamine hydrochloride, used in medicine.

methenamine. U. S. P. name for hexamethylenetetramine (q. v.).

methenamine mandelate. U. S. P. name for hexamethylenetetramine mandelate (q. v.).

methenamine salicylate. U. S. P. name for hexamethylenetetramine salicylate.

methenyl tribromide. See bromoform.

methetharimide. See bemegride.

methimazole (1-methyl-2-mercaptoimidazole) $N(CH_3)C(SH)NCHCH$.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: White to pale buff, crystalline powder; almost no taste and a very faint odor; sensitive to light; m. p. 144-147°C; soluble in water, alcohol, and chloroform; slightly soluble in ether. Aqueous solution neutral to litmus.

Grade: U. S. P. XVI.

Use: Medicine.

methiodal sodium (sodium iodomethanesulfonate) $\text{ICH}_2\text{SO}_3\text{Na}$.

Properties: A white crystalline powder; odorless with slight salty taste followed by sweetish after-taste. Decomposes on exposure to light; solutions are neutral to litmus; soluble in water; very soluble in methanol; slightly soluble in alcohol; practically insoluble in acetone, ether and benzene.

Derivation: From sodium sulfite and methylene iodide.

Grade: N. F. XI.

Use: Medicine (as radiopaque contrast medium).

methionine $\text{CH}_3\text{SCH}_2\text{CH}_2\text{CH}(\text{NH}_2)\text{COOH}$.

An optically active essential sulfur-containing amino acid important in biological trans-methylation processes. The levo form is the biologically active form.

Properties (of DL racemic mixtures):

White, crystalline platelets or as powder. Faint odor. Soluble in water, dilute acids, and alkalies, very slightly soluble in alcohol, practically insoluble in ether. pH (1% aqueous solution) 5.6-6.1.

Derivation: Hydrolysis of protein, organic synthesis.

Containers: Glass vials, 1-, 5-, 10-lb glass bottles, 5-, 10-lb fiber cans; 55-lb fiber drums.

Grade: N. F. XI, feed, 98%.

Use: Pharmaceuticals; cosmetics, nutrition and biochemical studies, food and feed supplement.

Shipping regulations: None.*

methionine hydroxy-analog calcium

$(\text{CH}_3\text{SCH}_2\text{CH}_2\text{CHOHCOO})_2\text{Ca}$. Calcium salt of DL-alpha-hydroxy-gamma-methyl-mercaptobutyric acid. Free methionine hydroxy analog is a metabolite in methionine utilization.

Use: Feed supplement.

methocarbamol $\text{C}_{11}\text{H}_{15}\text{NO}_5$. Chemical name is 3(-ortho-methoxyphenoxy)-1,2-propanediol 1-carbamate.

Properties: M. p. 92-94°C, soluble in water, alcohol and propylene glycol.

Use: Medicine.

"Methocel." ²³³ Trademark for methylcellulose (q. v.). Available for use as a thickening, emulsifying and dispersing agent. Also as a grease-proofing and gloss ink improvement agent.

methohexital (alpha-dl-5-allyl-1-methyl-5-(1-methyl-2-pentynyl)barbituric acid) $\text{C}_{14}\text{H}_{18}\text{N}_2\text{O}_5$.

Properties: White crystalline powder; essentially odorless; m. p. 91.5°-96°C. Soluble

in alcohol, chloroform and dilute alkalies; insoluble in water.

Containers: Fiber drums with polyethylene bags.

Use: Medicine.

methotrexate (amethopterin; 4-amino-10-methylfolic acid)

$\text{C}_6\text{N}_4\text{H}(\text{NH}_2)_2\text{CH}_2\text{N}(\text{CH}_3)\text{C}_6\text{H}_4\text{CONHCH}(\text{COOH})\text{CH}_2\text{CH}_2\text{COOH}$, or $\text{C}_{20}\text{H}_{22}\text{N}_8\text{O}_5$.

Properties: Orange-brown crystalline powder. Insoluble in water, alcohol, chloroform, ether. Slightly soluble in dilute hydrochloric acid; soluble in dilute solutions of alkali hydroxides and carbonates. Folic acid antagonist.

Grade: U. S. P. XVI.

Caution: Extremely poisonous.

Use: Medicine.

methoxamine hydrochloride

$(\text{CH}_3\text{O})_2\text{C}_6\text{H}_3\text{CH}(\text{OH})\text{CH}(\text{CH}_3)\text{NH}_2 \cdot \text{HCl}$.

beta-Hydroxy-beta-(2,5-dimethoxyphenyl) isopropylamine hydrochloride.

Properties: Colorless or white, plate-like crystals or white, bitter, crystalline powder; odorless or very slight odor; m. p. 212-216°C; freely soluble in water and alcohol, very slightly soluble in ethyl acetate; almost insoluble in chloroform and ether.

Grade: U. S. P. XVI.

Use: Medicine.

"Methoxone." ¹⁵⁰ Trademark for a selective weed killer containing 23% sodium salt of 2-methyl-4-chlorophenoxyacetic acid. Used for control of broad-leaved weeds in rice, oats, etc.

Containers: 5-, 30- and 55-gal drums.

"Methox" Plasticizer. ⁵⁵ Trademark for dimethoxyethyl phthalate.

Properties: Nearly water-white oily liquid; soluble in most other organic liquids; insoluble or limited solubility in glycerin, glycols, and certain amines.

Typical specifications: Sp. gr. 1.171 ± 0.003 (20/20°C); f. p. -45°C (stiff gel), boiling range 190-203°C (4 mm), acidity 0.03% (max) as acetic acid; odor mild, flash point 380°F; fire point 440°F, vapor pressure < 0.25 mm (150°C); refractive index 1.500 (25°C); viscosity 53 cps (20°C); surface tension 3 dynes per cm (20°C); thermal expansion 0.00076 from 10-40°C, 9.5 lbs/gal.

Containers: 5-gal cans (50-lbs net), 55-gal steel drums (530 lbs net).

Uses: Primary plasticizer, especially for cellulose acetate, imparts stability to ultra-violet light, low oil extraction, and permanent flexibility.

methoxsalen (8-methoxypsoralen)

$\text{OCH}_3\text{CH}_2\text{C}(\text{C}(\text{OCH}_3)_2)\text{C}(\text{C}(\text{H})\text{CH}:\text{CHC}(\text{O})\text{O})$.

Properties: White to cream colored, odorless, crystalline solid. Slightly soluble in alcohol, practically insoluble in water.

Grades: N. N. D.

Use: Medicine (suntan accelerator, sunburn protector).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

para-methoxyacetanilide. See methacetin.

methoxyacetic acid $\text{CH}_3\text{OCH}_2\text{COOH}$.

Properties: Liquid, having a m. p. (min) 7.7°; boiling range (733) (min) 197-198°C; sp. gr. (25/4°C) 1.1738; refractive index (25°C) 1.415; flash point 260°F; fire point 260°F; acid number (min) 612.
Use: Synthesis.

para-methoxyacetophenone (para-acetoanisole;

para-acetylanisole) $\text{CH}_3\text{OC}_6\text{H}_4\text{COCH}_3$.

Properties: Crystalline tablets; b. p. 258°C; congealing point 36.5°C. Soluble in alcohol and ether.

Derivation: Interaction of anisole and acetyl chloride in the presence of aluminum chloride and carbon disulfide.

Grades: Technical.

Use: Perfumery, for floral odors.

methoxyacetyl-para-phenetidine

$\text{CH}_3\text{OCH}_2\text{CONHC}_6\text{H}_4\text{OC}_2\text{H}_5$.

Properties: White needles; tasteless but becoming bitter on chewing. Soluble in alcohol, ether, chloroform, volatile oils, and boiling water; much less so in cold water. M. p. 98°C.

Derivation: By heating methoxyacetic acid and para-phenetidine.

Use: Medicine.

Shipping regulations: None.*

ortho-methoxyaniline. See ortho-anisidine.

para-methoxyaniline. See para-anisidine.

para-methoxybenzaldehyde. See anisaldehyde.

methoxybenzene. See anisole.

para-methoxybenzoic acid. See anisic acid.

para-methoxybenzyl acetate. See anisyl acetate.

para-methoxybenzyl alcohol. See anisic alcohol.

para-methoxybenzyl formate. See anisyl formate.

3-methoxybutanol $\text{CH}_3\text{CH}(\text{OCH}_3)\text{CH}_2\text{CH}_2\text{OH}$.

Properties: Liquid, sp. gr. 0.9229; b. p. 161.1°C, vapor pressure (20°C) 0.9 mm; sets to glass at -85°C, soluble in water.

Uses: High-boiling lacquer solvent; coupling agent for brake fluids; intermediate for plasticizers, herbicides; film-forming additive in PVA emulsions; solvent for pharmaceuticals.

methoxychlor (methoxy DDT, DMDT)

$\text{Cl}_3\text{CCH}(\text{C}_6\text{H}_4\text{OCH}_3)_2$. 2,2-Bis(para-methoxyphenyl)-1,1,1-trichloroethane; dimethoxydiphenyl trichloroethane.

Properties: White, crystalline solid, m. p. 89°C; insoluble in water. Less toxic than DDT to higher animals. Not compatible with alkaline materials.

Derivation: Reaction of methyl phenyl ether and chloral hydrate.

Containers: Drums.

Grades: Technical.

Use: Insecticide, effective against mosquito larvae and house flies. Especially recommended for use around dairy barns.

methoxy DDT. See methoxychlor.

2-methoxyethanol. See ethylene glycol monomethyl ether.

2-(beta-methoxyethoxyl) ethanol. See diethylene glycol monomethyl ether.

2-methoxyethylmercury acetate

$\text{CH}_3\text{OCH}_2\text{CH}_2\text{HgOOCCH}_3$. Toxic! A fungicide and disinfectant used in treating seeds.

methoxyethyl oleate

Properties: Oily liquid, mild odor. F. p. below -18°C; sp. gr. 0.898 (25°C); boiling range 180-206°C (4 mm Hg); flash point (open cup) 385°C; viscosity, 8 cp (25°C).

Uses: Plasticizer and solvent.

methoxyethyl stearate

Properties: Oily liquid, mild odor; f. p. 19 to 24°C; boiling range 186-205°C (4 mm Hg); flash point (open cup) 378°C; viscosity 9 cp at 25°C.

Uses: Plasticizer and solvent.

3-methoxy-4-hydroxybenzaldehyde. See vanillin.

methoxyhydroxymercuripropylsuccinyl urea

$\text{C}_9\text{H}_{16}\text{HgN}_2\text{O}_6$.

Properties: Bitter crystals, m. p. 198.5°C.

Derivation: Made by the mercuriation of allylsuccinylurea. See meralluride.

4'-methoxy-2-(para-methoxyphenyl) aceto-phenone. See desoxyanisoin.

2-methoxy-5-methylaniline. See cresidine.

4-methoxy-4-methylpentanol-2 ("Pent-Oxol")

$\text{CH}_3\text{C}(\text{CH}_3)(\text{OCH}_3)\text{CH}_2\text{CH}_2\text{OHCH}_3$.

Properties: Liquid. Boiling range 163.8-167°C.

Use: Solvent for resin coating formulation.

4-methoxy-4-methylpentanone-2 ("Pent-Oxone")

$\text{CH}_3\text{C}(\text{CH}_3)(\text{OCH}_3)\text{CH}_2\text{COCH}_3$.

Properties: Water-white liquid; boiling range 147-163°C, flash point 141°F.

Derivation: Diacetone alcohol.

Use: Solvent for a variety of resin coatings.

methoxymethyl salicylate. See salicylic acid methoxymethyl ester.

2-methoxynaphthalene. See beta-naphthyl methyl ether.

1-methoxy-4-nitrobenzene. See para-nitroanisole.

methoxyphenamine hydrochloride

$\text{CH}_3\text{OC}_6\text{H}_4\text{CH}_2\text{CH}(\text{CH}_3)\text{NHCH}_3 \cdot \text{HCl}$.

2-(ortho-Methoxyphenyl) isopropyl-methylamine hydrochloride.

Properties: Crystalline, white powder which is odorless and bitter; m. p. 124-128°C; freely soluble in alcohol, chloroform, and water; slightly soluble in ether and benzene; pH (5% solution) 5.3-5.7.

Grade: N. N. D.

Use: Medicine.

4-methoxyphenol (para-methoxyphenol). See hydroquinone monomethyl ether.

ortho-methoxyphenol. See guaiacol.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

3-(ortho-methoxyphenoxy)-1, 2-propanediol 1-carbamate. See methocarbamol.

1-(para-methoxyphenyl)-1-penten-3-one.
See "Ethone."

methoxypolyethylene glycols. A series of compounds with properties similar to the polyethylene glycols of comparable molecular weight. Slightly viscous liquids to soft wax-like solids. Used for manufacture of detergents and emulsifying and dispersing agents through the preparation of the mono-fatty-acid derivatives.

methoxypromazine maleate $C_{18}H_{22}N_2O_5 \cdot C_4H_4O_4$. [2-Methoxy-10-(3'-dimethylaminopropyl)-phenothiazine maleate].

Properties: M. p. 141-145°C; slightly soluble in water, methanol, soluble in chloroform, dimethylformamide.

Uses: Medicine.

para-methoxypropenylbenzene. See anethole.

para-methoxypropiophenone $C_2H_5COC_6H_4OCH_3$.

Properties: Clear, colorless liquid; distillation range 110-140°C at 3 mm Hg pressure; refractive index, 1.543 to 1.545 (25°C).

3-methoxypropylamine $CH_3OCH_2CH_2CH_2NH_2$.

Properties: Colorless liquid, b. p. 116°C (760 mm); sp. gr. 0.8615 (30°C); refractive index (n_D²⁵) 1.4153; flash point 90°F. Tag open cup; miscible with water, ethanol, toluene, acetone, carbon tetrachloride, hexane, and ether.

Use: Organic intermediate.

8-methoxypsoralen. See methoxsalen.

methoxytriethylene glycol acetate. See methoxytriglycol acetate.

methoxytriglycol $CH_3O[C_2H_4O]_3H$.

Properties: Sp. gr. 1.0494; b. p. 193.6°C; flash point 245°F; infinitely soluble in water.

methoxytriglycol acetate (methoxytriethylene-glycol acetate) $CH_3COO[C_2H_4O]_3CH_3$.

Properties: Practically colorless liquid with pleasant fruity odor; sp. gr. 1.0940 (20/20°C); 9.2 lbs/gal (20°C); b. p. 244.0°C (760 mm).

Uses: As an "anti-dusting agent" for finely powdered materials, especially as an "anti-sneeze" for certain dyestuffs. Low volatility suggests its use as water-soluble plasticizer for resins, casein, etc.

methscopolamine bromide (scopolamine methylbromide; epoxytropine tropate methylbromide) $C_{17}H_{21}NO_4 \cdot CH_3Br$.

Properties: White, odorless, bitter, crystalline powder, sparingly soluble in alcohol, freely soluble in water; pH of 1% water solution is 7.2-7.8.

Grade: N. N. D.

Use: Medicine.

methscopolamine nitrate (scopolamine methyl-nitrate; epoxytropine tropate methyl nitrate) $C_{18}H_{24}N_2O_4$, or $C_7OH_3N^+(CH_3)_2OCOCH(CH_2OH)C_6H_4 \cdot NO_3^-$.

Properties: White, odorless, tasteless, crystalline powder; freely soluble in alcohol and in water; pH (0.05% in water) is 5.0-5.4.

Grades: N. N. D.

Use: Medicine.

methyclothiazide, 6-Chloro-3-chloromethyl-2-methyl-7-sulfamyl-3,4-dihydro-1,2,4-benzothiadiazine-1,1-dioxide.

Properties: White crystalline solid; m. p. 220-222°C; readily soluble in sodium hydroxide solution.

Use: Medicine.

methyl abietate $C_{19}H_{29}COOCH_3$.

Properties: Colorless to yellow liquid; sp. gr. 1.033-1.043 (20°C); refractive index 1.525-1.535, flash point 180-220°C; b. p. 365°C. Miscible with most organic solvents.

Containers: Drums, carloads.

Grades: Technical.

Uses: Solvent and plasticizer; lacquers, varnishes; linoleum, coating compositions.

N-methylacetanilide $C_6H_5N(CH_3)COCH_3$.

Properties: Needles or long tablet-like crystals; soluble in hot water and dilute alcohol. B. p. 240-250°C; m. p. 101°C. Derivation: By heating acetylchloride and methylaniline.

Use: Medicine.

Shipping regulations: None.*

methyl acetate $CH_3CO_2CH_3$.

Properties: Colorless, volatile, flammable liquid, fragrant odor. Miscible with the common hydrocarbon solvents; partially soluble in water. Sp. gr. 0.92438; m. p. -98.05°C, b. p. 54.05°C; flash point -16°C, refractive index 1.3619 (20°C); wt/gal 7.76 lbs (20°C).

Typical specifications, technical grade:

Methyl acetate 82-85%; acidity as acetic 0.01% (max); boiling range 52-58°C; water: substantially dry; color water-white; chlorides none, iron none; dryness test 10 volume; sp. gr. 0.904-0.914 (20°C); wt/gal 7.54 lbs (20°C).

Typical specifications, C. P. grade:

Methyl acetate 97% min; acidity as acetic 0.005% (max); boiling range 55-58°C; water: substantially dry; color water-white; chlorides none; iron none; dryness test 20 volume; sp. gr. 0.930-0.940 (20°C); wt/gal 7.76 lbs (20°C).

Derivation: By heating methyl alcohol and acetic acid in presence of sulfuric acid and distilling.

Method of purification: Rectification.

Grades: Technical; C. P.

Containers: 5-gal cans, 55-gal drums; tank cars.

Uses: Solvent; extracts; perfumery; artificial leather; plastics, solvent for nitrocellulose and acetyl cellulose, cellulose esters; paints, varnishes and lacquers.

Fire hazard: Dangerous.

Shipping regulations: Flammable liquid.

Red label.*

methylacetic acid. See propionic acid.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

methyl acetoacetate $\text{CH}_3\text{COCH}_2\text{CO}_2\text{CH}_3$.

Properties: Colorless liquid; soluble in alcohol; sp. gr. 1.0785 (20/20°C), b. p. 171.7°C; vapor pressure 0.7 mm (20°C), flash point 180°F; wt/gal 9.0 lbs (20°C); f. p. -31.9°C.

Typical specifications: Acidity not more than 0.03% (as acetic); sp. gr. 1.074-1.079 (20/20°C); boiling range, below 91°C (50 mm) not more than 10%, from 90-95°C not less than 85%; purity not less than 95%; color not darker than 8 mg $\text{K}_2\text{Cr}_2\text{O}_7$ in 1 liter of water; solubility complete in alcohol, ether, and ethyl acetate; average wt/gal 8.96 lbs (20°C).

Grades: Technical.

Containers: 1-gal glass jugs; 5-, 12-gal glass carboys, 55-gal drums.

Uses: Solvent for cellulose ethers; ingredient of solvent mixtures for cellulose esters, organic synthesis.

methyl acetone (not a true chemical compound).

Properties: A water-white, anhydrous liquid, consisting of various mixtures of acetone, methyl acetate, and methanol. Miscible with hydrocarbons, oils, and water.

Derivation: A byproduct in the wood-distillation industry.

Grades: Technical (natural and synthetic).

Containers: 1-, 5-gal cans, 55-gal drums, tank cars.

Uses: Solvent for nitrocellulose, cellulose acetate, rubber, gums, resins, lacquers, paint and varnish removers, rubber goods, plastics, cements; artificial leather; gas mantles, extracts, extracting perfumes, dewaxing natural gums.

Shipping regulations: Flammable liquid. Red label.*

methylacetophenone (methyl tolyl ketone).

Properties: Colorless or pale-yellow liquid, fragrant, coumarin odor. Soluble in 7 parts of 50% alcohol. Sp. gr. 1.001-1.004, refractive index 1.533-1.535.

Derivation: Action of acetic anhydride on toluene.

Use: Perfumery.

Shipping regulations: None.*

methylacetylene (propyne) $\text{CH}_3\text{C}\equiv\text{CH}$.

Properties: Available as liquefied gas, b. p. -23.1°C; freezing point -101.5°C, specific volume 9.7 cu ft/lb (70°F).

Uses: Specialty fuel, chemical intermediate.

Shipping regulations: (15-20% propadiene mixture) Flammable gas. Red gas label.*

methyl acetylricinoleate

Properties: A clear, pale yellow, low viscosity, oily liquid, mild odor; sp. gr. 0.938 (25/25°C); saponification value 301, iodine value 75; solidifies at -26°C.

Soluble in most organic liquids, insoluble in water.

Derivation: Castor oil, methyl alcohol and acetic anhydride.

Grade: Technical.

Containers: 5-gal cans; 55-gal drums, tank cars.

Uses: Plasticizer; lubricant; protective coatings; synthetic rubbers; vinyl compounds.

methyl acetylsalicylate $\text{CH}_3\text{COOC}_6\text{H}_4\text{COOCH}_3$.

Properties: White crystals; m. p. 52°C; b. p. 134-136°C (9 mm).

Derivation: By heating methyl salicylate with a slight excess of acetic anhydride, adding alcohol, then water, and separating the precipitate.

Use: Medicine; synthesis.

beta-methylacrolein. See crotonaldehyde.

methyl acrylate $\text{CH}_2=\text{CHCOOCH}_3$.

Properties: Colorless, mobile, volatile liquid; b. p. 80.5°C; m. p. -76.5°C; vapor pressure (20°C) 65 mm; sp. gr. (20/20°C) 0.9574; wt/gal 8.0 lbs, slightly soluble in water; readily polymerized.

Derivation: (a) Ethylene cyanohydrin, methanol, and dilute sulfuric acid; (b) Oxo reaction of acetylene, carbon monoxide, and methanol in the presence of nickel or cobalt catalyst.

Grades: Technical (inhibited).

Containers: 1-gal cans, 5-, 55-gal drums; tank cars.

Uses: Polymers; amphoteric surfactants; vitamin B₁; chemical intermediate.

See also acrylate resins.

beta-methylacrylic acid. See crotonic acid.

methylal (dimethoxymethane, formal)

Properties: Colorless, volatile, flammable liquid, chloroform-like odor; pungent taste; m. p. -104.8°C, sp. gr. 0.86 (20/4°C); b. p. 42.3°C; soluble in water at 20°C to extent of 32 wt %; completely soluble in alcohol, ether, and hydrocarbons; flash point (open cup) 0°F (approx.).

Typical specifications: Methylal content 97% (min), boiling range 42.0-43.5°C; refractive index (n_D 20/D) 1.3525-1.3545, aldehydes, % by weight 0.10% (max); water content, % by weight 1.50% (max), acidity as acetic, % by weight 0.10% (max), sp. gr. 0.860-0.863 (20/4°C).

Containers: Glass bottles; steel drums.

Uses: Solvent, starting material for organic synthesis, for perfumes, adhesives and protective coatings, as a special fuel.

Fire hazard: Dangerous.

Shipping regulations: Flammable liquid.

Red label.*

methyl alcohol. See methanol.

methylallyl acetate $\text{CH}_2=\text{C}(\text{CH}_3)\text{CH}_2\text{OOCCH}_3$.

Properties: Colorless liquid, sp. gr. 0.9162 (20°C), wt/gal 7.6 lbs.

Uses: Monomer; preparation of methylallyl derivatives.

methylallyl chloride (methylallyl chloride; MAC)

Properties: A colorless volatile liquid; disagreeable odor; b. p. 72°C; flash point 14°F; m. p. below -80°C; sp. gr. 0.926.

Uses: Insecticide; fumigant; synthesis.

Containers: 1 gal and 30-gal cans; 5-, and

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

55-gal drums; tank cars.

Shipping regulations: Flammable liquid.

Red label. *

methylaluminum sesquibromide $(\text{CH}_3)_3\text{Al}_2\text{Br}_3$.

Properties: Cloudy yellow liquid at 25°C; f. p. -4°C; b. p. (extrapolated, at 760 mm Hg) 166°C; density 1.514 g/ml (25°C).

Uses: Catalyst for polymerization of olefins; catalyst for hydrogenation of aromatics; chemical intermediate.

Caution: Flames instantly on contact with air; reacts violently in contact with water.

Shipping regulations: Flammable liquid.

Red label. *

methylaluminum sesquichloride $(\text{CH}_3)_3\text{Al}_2\text{Cl}_3$.

Properties: Clear, colorless liquid at 25°C; f. p. 22.8°C; b. p. (extrapolated, at 760 mm Hg) 143.7°C; density 1.1629 g/ml (25°C), 9.705 lb/gal (25°C).

Uses: Catalyst for polymerization of olefins; catalyst for hydrogenation of aromatics.

Caution: Flames instantly on contact with air; reacts violently on contact with water.

Shipping regulations: Flammable liquid.

Red label. *

methylamine (monomethylamine) CH_3NH_2 .

Properties: Flammable gas. Strong, ammoniacal odor, b. p. -6.79°C, m. p. -92.5°C; flash point of 30% solution (Tag open cup) 34°F; soluble in water, alcohol ether.

Derivation: Interaction of methanol and ammonia over a catalyst at high temperature. The mono-, di-, and trimethylamines are all produced, and yields are regulated by conditions.

Grades: Technical (anhydrous; 30-40% aqueous solutions).

Containers: 1-gal bottles; 55-gal steel drums; tank cars; cylinders (anhydrous).

Uses: Intermediate for vulcanization accelerators, dyes, pharmaceuticals, insecticides, fungicides, surface active agents, tanning; dyeing of acetate textiles, fuel additive; polymerization inhibitor; component of paint removers; solvent; photographic developer, rocket propellant.

Shipping regulations: Gas: flammable gas.

Red gas label. Solution: flammable liquid. Red label. *

methylaminoacetic acid. See sarcosine.

methylaminobenzoate. See methyl anthranilate.

methyl ortho-aminobenzoate. See methyl anthranilate.

methylaminodimethylacetal

$(\text{CH}_3\text{O})_2\text{CHCH}_2\text{NHCH}_3$.

Properties: Water-white to slightly yellow, clear liquid having a sharp ammoniacal odor; refractive index 1.406-1.409 (n 20/D); sp. gr. 0.924 (25°/25°C).

1-methylaminoethanolcatechol. See epinephrine.

para-methylaminoethanolphenol tartrate. See phenylephrine tartrate.

2-(methylamino)glucose. See N-methylglucosamine.

methyl-meta-amino-para-hydroxybenzoate

(orthoform; orthoform-new)

$\text{CH}_3\text{OOCCH}_6\text{H}_3(\text{NH}_2)(\text{OH})$.

Properties: White powder, odorless, tasteless; soluble in alcohol; almost insoluble in water; m. p. 141-143°C.

Use: Medicine.

3-methylaminoisocamphane hydrochloride. See mecamlamine hydrochloride.

2-methylamino-6-methyl-5-heptene. See isometheptene.

N-methyl-para-aminophenol

$\text{CH}_3\text{NHC}_6\text{H}_4\text{OH}$.

Properties: Colorless needles; poisonous! Solutions have irritating effect on the skin. Soluble in water, alcohol and ether. M. p. 87°C.

Derivation: (a) By the interaction of hydroquinone and methylamine. (b) By the methylation of para-aminophenol hydrochloride.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Wooden barrels; glass bottles; fiber drums; multiwall paper sacks.

Uses: Organic synthesis; photographic developer.

Shipping regulations: None. *

N-methyl-para-aminophenol sulfate

$\text{HOC}_6\text{H}_4\text{NHCH}_3 \cdot \frac{1}{2}\text{H}_2\text{SO}_4$.

Properties: Colorless needles, m. p. 250-260°C with decomposition; soluble in water and alcohol; insoluble in ether. Discolors in air.

Derivation: By methylation of para-aminophenol and conversion of the resulting methylated base by neutralization with sulfuric acid.

Method of purification: Recrystallization from water.

Grades: C. P.; photographic.

Containers: Kegs; bottles; barrels; fiber cans.

Use: Photographic developer.

Shipping regulations: None. *

methylamyl acetate (methylisobutyl carbinol acetate) $\text{CH}_3\text{COOCH}(\text{CH}_3)\text{CH}_2\text{CH}(\text{CH}_3)_2$.

Properties: Colorless liquid. Mild, agreeable odor. Sp. gr. 0.8595 (20/20°C); b. p. 146.3°C; vapor pressure 3 mm (20°C); flash point 105°F; wt/gal 7.1 lbs (20°C); nitrocellulose-toluene dilution ratio, 1.7; f. p. -63.8°C.

Typical specifications: Acidity not more than 0.02% (as acetic); purity not less than 95% methyl amyl acetate, sp. gr. 0.855-0.860 (20/20°C); boiling range (760 mm) below 140°C none, above 150°C none, not more than 5% distills below 143°C, not less than 95% distills below 148°C; color water-white; dryness, miscible with 19 vol 60° Be. gasoline (20°C); average wt/gal 7.14 lbs (20°C).

Grades: Technical.

Containers: 1-, 5-gal cans; 55-gal (non-returnable) drums; tank cars.

Uses: Solvent for nitrocellulose lacquers.

Caution! Keep away from heat and open

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

flame. Avoid breathing vapor. Avoid contact with skin. MCA warning label. Shipping regulations: None.*

methylamyl alcohol (methylisobutyl carbinol; MIBC; 4-methylpentanol-2)
 $(\text{CH}_3)_2\text{CHCH}_2\text{CH}(\text{CH}_3)\text{OH}$.

Properties: Colorless, stable liquid. Miscible with most common organic solvents, water. B. p. 131.8°C; sp. gr. 0.8079 (20/20°C); wt/gal 6.72 lbs (20°C), refractive index 1.4089 (25°C); vapor pressure 3.8 mm Hg (20°C); flash point 120°F.

Typical specifications: Acidity not more than 0.01% (as acetic); color water-white; sp. gr. 0.806-0.811 (20/20°C); boiling range (760 mm) below 125°C none, above 135°C none; dryness, miscible with 19 vol 60° BÉ. gasoline (20°C); average wt/gal 6.72 lbs (20°C)

Grades: Technical.

Containers: 1-gal cans, 5-gal cans, 55-gal drums; tank cars.

Uses: Solvent for various dyestuffs, oils, gums, resins, waxes, lacquers; organic synthesis.

Caution: Keep away from heat and open flame. Avoid breathing vapor. Avoid contact with skin. MCA warning label.

Shipping regulations: None.*

methyl-n-amyl carbinol (heptanol-2, heptyl alcohol) $\text{CH}_3(\text{CH}_2)_4\text{CHOHCH}_3$.

Properties: Stable colorless liquid, mild odor; miscible with common organic liquids.

Sp. gr. 0.8187 (20/20°C); b. p. 160.4°C (760 mm), vapor pressure 1.0 mm (20°C), flash point 160°F; wt/gal 6.8 lbs (20°C).

Typical specifications: Sp. gr. 0.816-0.821 (20/20°C), boiling range (760 mm) 155 to 165°C, acidity not more than 0.03% (as acetic).

Grades: Technical.

Containers: 1-gal cans, 5-gal drums, 55-gal drums; tank cars.

Uses: Solvent for synthetic resins, frothing agent in ore flotation.

Shipping regulations: None.*

methyl-n-amyl-ketone (2-heptanone)
 $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{COCH}_3$.

Properties: Water-white liquid. Stable.

Slightly soluble in water, miscible with the usual organic lacquer solvents.

Constants: Sp. gr. 0.8166 (20/20°C); b. p. 150.6°C (760 mm); vapor pressure 2.6 mm (20°C), flash point 120°F; refractive index 1.4110 (20°C), wt/gal 6.8 lbs (20°C) nitrocellulose-toluene dilution ratio 3.9; f. p. -26.9°C.

Typical specifications: Acidity not more than 0.05% (as acetic); purity not less than 95%; color water-white, odor mild, non-residual; sp. gr. 0.816-0.821 (20/20°C); boiling range (760 mm) below 147°C none, above 154°C none, below 149°C not more than 5%, below 152°C not less than 95%, dryness, miscible with 19 vol 60° BÉ. gasoline (20°C), non-volatile matter not more than 0.005 g/100 cc, average wt/gal 6.81 lbs (20°C).

Grades: Technical.

Containers: 1-, 5-gal cans; 55-gal drums; carloads

Caution: Keep away from heat and open flame. Avoid prolonged breathing of vapor, or prolonged or repeated contact with skin. MCA warning label.

Uses: Solvent for nitrocellulose; lacquers; inert reaction medium.

Shipping regulations: None.*

N-methylaniline $\text{C}_6\text{H}_5\text{NH}(\text{CH}_3)$.

Properties: Colorless to reddish-brown, oily liquid; discolors on standing. Soluble in alcohol, ether, water and chloroform.

Sp. gr. 0.991; m. p. -57°C; b. p. 190-191°C.

Derivation: By heating methyl iodide with aniline and subsequent distillation.

Method of purification: Rectification.

Grades: Technical.

Containers: Iron drums; tank cars.

Use: Organic synthesis; solvent, acid acceptor.

Shipping regulations: None.*

alpha-methylanisalacetone. See "Ethone."

5-methyl-ortho-ansidine (methylcresidine)
 $\text{C}_6\text{H}_3(\text{NH}_2)(\text{OCH}_3)(\text{CH}_3)$.

Properties: Light amber to pink egg-sized lumps, with unpleasant aromatic odor; f. p. 50.5-51.8°C; darkens somewhat on storage.

Grade: 99% min.

Containers: 270-lb polyethylene-lined fiber drums.

Use: Intermediate.

methylanisole. See methyl-para-cresol.

1-methylantracene. See alpha-methylantracene.

alpha-methylantracene (1-methylantracene)
 $\text{C}_{15}\text{H}_{12}$ or $\text{C}_6\text{H}_4(\text{CH}_2)\text{C}_6\text{H}_3\text{CH}_3$ (a tricyclic aromatic).

Properties: Colorless leaflets. Soluble in alcohol, insoluble in water. Sp. gr. 1.101; b. p. 200°C; m. p. 86°C.

Grades: Technical.

Use: Organic synthesis.

methyl anthranilate (methyl ortho-aminobenzoate) $\text{H}_2\text{NC}_6\text{H}_4\text{CO}_2\text{CH}_3$.

Properties: Colorless to pale-yellow liquid with bluish fluorescence; grape-type odor; sp. gr. 1.167-1.175 (15°C); refractive index (n_D 20) 1.5820-1.5840; b. p. 135°C; congealing point 23.8°C (min); soluble in 5 volumes or more of 60% alcohol; soluble in ether, benzyl benzoate, diethyl phthalate, fixed oils, propylene glycol, volatile oils; slightly soluble in water, mineral oil; insoluble in glycerin.

Derivation: By heating anthranilic acid and methyl alcohol in presence of sulfuric acid, with subsequent distillation. Occurs naturally in many flower oils.

Method of purification: Recrystallization.

Grades: Technical.

Containers: 1-, 5-, 10-lb bottles; 25-lb tins, 50-lb cases; 100-lb drums.

Uses: Flavoring; perfume in cosmetics and pomades.

Shipping regulations: None.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

methylanthraquinone $\text{CH}_3\text{C}_6\text{H}_3(\text{CO})_2\text{C}_6\text{H}_4$ (tricyclic).

Properties: White needles; soluble in ether and benzene; very slightly soluble in alcohol; insoluble in water. M. p. 177°C ; b. p. sublimes.

Derivation: By heating anthraquinone and methyl alcohol in presence of sulfuric acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Wooden barrels.

Use: Organic synthesis.

Shipping regulations: None.*

methyl arachidate (methyl eicosanoate)

$\text{CH}_3(\text{CH}_2)_{18}\text{COOCH}_3$. The methyl ester of arachidic acid.

Properties: Waxlike solid, m. p. 45.8°C ; b. p. 284°C (100 mm), 216°C (10 mm); refractive index 1.4352 (50°C). Insoluble in water, soluble in alcohol and ether.

Derivation: Esterification of arachidic acid with methanol and vacuum distillation.

Grades: Purified (99.8%+).

Use: Special synthesis; intermediate for pure arachidic acid; reference standard for gas chromatography; medical research.

methyl arecaidine. See arecoline.

methylated spirits. A variety of denatured alcohol (q. v.), containing 5 gallons methanol per 100 gallons 190 proof ethyl alcohol.

methylated trimethylolmelamine

$\text{C}_3\text{N}_3(\text{NHCH}_2\text{OH})_2(\text{NHCH}_2\text{OCH}_3)$ (cyclic).

A melamine derivative proposed for use on cotton fabrics to increase wrinkle resistance. May be used in partly polymerized form, and as di- and trimethylated as well as in the monomethylated form shown here. Chlorine bleach reacts with the hydrogen atoms attached to nitrogen.

methyl behenate (methyl docosanoate)

$\text{CH}_3(\text{CH}_2)_{20}\text{COOCH}_3$. The methyl ester of behenic acid.

Properties: Waxlike solid; m. p. 53.2°C , b. p. 215.5°C (3.75 mm), refractive index 1.4262 (80°C). Insoluble in water, soluble in alcohol and ether.

Derivation: Esterification of behenic acid with methanol followed by fractional distillation.

Grades: Purified (99.8%+).

Use: Special synthesis; intermediate for pure behenic acid; biochemical and medical research, reference standard in gas chromatography.

methylbenzaldehydes. See tolyl aldehydes.

methylbenzene. See toluene.

methylbenzethonium chloride

$(\text{CH}_3)_3\text{CCH}_2\text{C}(\text{CH}_3)_2\text{C}_6\text{H}_3(\text{CH}_3\text{O})(\text{CH}_2)_2\text{O}-$
 $(\text{CH}_2)_2\text{N}(\text{CH}_3)_2(\text{CH}_2\text{C}_6\text{H}_5\text{Cl})\cdot\text{H}_2\text{Q}$.

Benzyl dimethyl(2-[2-(para-1, 1, 3, 3-tetra-methylbutylcresoxy) ethoxy] ethyl) ammonium chloride.

Properties: Colorless, odorless crystals with bitter taste; m. p. $161-163^\circ\text{C}$; readily soluble in alcohol, hot benzene,

"Cellosolve," chloroform, and water; insoluble in carbon tetrachloride and ether.

Grade: U. S. P. XVI.

Use: Medicine (bactericide).

methyl benzoate (niobe oil) $\text{C}_6\text{H}_5\text{CO}_2\text{CH}_3$.

Properties: Liquid of fragrant odor. Colorless. Oily. Sp. gr. 1.085-1.088; refractive index 1.514; m. p. -12.3°C ; b. p. 198.6°C . Soluble in 3 parts of 60% alcohol, soluble in ether; very slightly soluble in water.

Derivation: (a) By heating methyl alcohol and benzoic acid in presence of sulfuric acid.

(b) Passing dry hydrogen chloride through a solution of benzoic acid in methanol. (c) Occurs naturally in oils of clove, ylang ylang, tuberose.

Method of purification: Rectification.

Grades: Technical.

Containers: 5-, 10-lb bottles; 40-lb tins; drums.

Uses: Perfumery, solvent for cellulose esters and ethers, resins, rubber.

Shipping regulations: None.*

methylbenzoic acid. See ortho-, meta-, and para-toluic acid.

methylbenzol. See toluene.

methyl ortho-benzoylbenzoate

$\text{C}_6\text{H}_5\text{COC}_6\text{H}_4\text{COOCH}_3$.

Properties: Sp. gr. 1.190 (25°C); refractive index 1.587 (25°C); vapor pressure 4.0 mm (175°C); b. p. 351°C ; m. p. 40°C ; flash point, 175°C ; very slightly soluble in water.

Use: Plasticizer.

methylbenzoylcegonine. See cocaine.

methyl benzoylsalicylate (benzoylsalicylic acid, methyl ester) $\text{C}_6\text{H}_5\text{COOC}_6\text{H}_4\text{COOCH}_3$.

Properties: White, acicular crystals; m. p. 85°C , incompatible with acids or highly acid salts. Soluble in alcohol and chloroform, slightly soluble in ether, insoluble in water.

Use: Medicine.

alpha-methylbenzyl alcohol. See styrallyl alcohol.

alpha-methylbenzylamine $\text{C}_6\text{H}_5\text{CH}(\text{CH}_3)\text{NH}_2$.

Properties: Water-white liquid, mild ammoniacal odor, sp. gr. 0.9535 ($20/20^\circ\text{C}$), refractive index 1.5366 (20°C); b. p. 188.5°C (760 mm); vapor pressure 0.5 mm (20°C); f. p., sets to a glass below -65°C ; flash point, 175°F (Cleveland open cup); soluble in most organic solvents and hydrocarbons; somewhat soluble in water.

Uses: Synthesis; emulsifying agent.

alpha-methylbenzylidethanolamine

$\text{C}_6\text{H}_5\text{CH}(\text{CH}_3)\text{N}(\text{C}_2\text{H}_4\text{OH})_2$.

Properties: Dark amber liquid, ammonia-like odor; sp. gr. 1.0812 (20°C); b. p. 244°C (50 mm); vapor pressure less than 0.01 mm (20°C); sets to glass at -7°C ; moderately soluble in water.

Grade: Technical.

Uses: Emulsifying agents, textile specialties, quaternaries.

Shipping Regulations: None.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

alpha-methylbenzylidimethylamine

Properties: Sp. gr. 0.9044 (20/20°C); b. p. 195.6°C (760 mm); vapor pressure 0.6 mm (20°C); f. p., sets to a glass below -70°C; refractive index 1.5024 (20°C); viscosity 1.85 cps (20°C); slight solubility in water.

Use: Polymerization catalyst.

alpha-methylbenzyl ether

Properties: Straw yellow, mobile liquid with faint odor; sp. gr. 1.0017 (20/20°C); b. p. 286.3°C (760 mm); vapor pressure less than 0.01 mm (20°C); f. p., sets to a glass below -30°C; very slightly soluble in water; flash point 275°F (Cleveland open cup); soluble in most organic solvents.

Uses: Solvent; styrenating agent; softener for synthetic rubbers.

methyl-bis-(2-chloroethyl)amine hydrochloride.

See mechlorethamine hydrochloride.

methyl blue. Sodium triphenyl-para-rosaniline sulfonate, a dark blue powder or dye used in medicine as an antiseptic and in biological and bacteriological stains.

methyl borate. See trimethyl borate.

methyl bromide (bromomethane) CH_3Br .

Properties: Colorless, transparent, easily liquefied gas, or volatile liquid, burning taste; chloroform-like odor. Nonflammable. Poisonous! Miscible with most organic solvents; forms a voluminous crystalline hydrate with cold water. Sp. gr. 1.732 (0°C); b. p. 4.6°C; vapor pressure 1250 mm (20°C); m. p. -84°C.

Derivation: By the action of bromine on methyl alcohol in presence of phosphorus, with subsequent distillation.

Method of purification: Rectification.

Grades: Technical, pure (99.5% min).

Containers: Steel cylinders.

Uses: Organic synthesis; low-boiling solvent; refrigerant, fire-extinguishing agent, soil and grain fumigant.

Danger: Causes burns, vapor extremely hazardous; highly volatile. MCA warning label.

Shipping regulations: Class B poison. Poison label.*

methyl bromoacetate $\text{BrCH}_2\text{COOCH}_3$.

Properties: Colorless to straw-colored liquid; f. p. below -50°C; b. p. 145.0-146.7°C, sp. gr. 1.655 (25/25°C); refractive index 1.456 (25°C), very slightly soluble in water, soluble in methanol, ether.

Uses: Synthesis of weed killers, dyes, vitamins, pharmaceuticals; lachrymator.

2-methyl-1,3-butadiene. See isoprene.

3-methyl-1,3-butadiene. See isoprene.

2-methylbutane. See isopentane.

2-methyl-2-butanethiol. See tert-amyl mercaptan.

2-methyl-1-butanol (amyl alcohol, primary, active; sec-butyl carbinol) $\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)\text{CH}_2\text{OH}$. The active alcohol

from fusel oil. The synthetic product is a racemic mixture of both dextro- and levo-rotatory compounds and, therefore, not optically active.

Properties: Colorless liquid; sp. gr. 0.81-0.82 (20°C), f. p., less than -70°C; b. p. 128°C; refractive index (20°C) 1.41.

Slightly soluble in water; miscible with alcohol and ether.

Derivation: Occurs in fusel oil (q. v.); is made synthetically by fractional distillation of the mixed alcohols resulting from the chlorination and alkaline hydrolysis of pentane.

Containers: 1- and 5-gal cans; 55-gal drums.

Uses: Solvent; organic synthesis (introduction of active amyl group); lubricants; plasticizers, additives for oils and paints.

Fire hazard: Flash point (open cup) 120°F.

Shipping regulations: None.*

2-methyl-2-butanol. See tert-amyl alcohol.

3-methyl-1-butanol. See isoamyl alcohol, primary.

3-methyl-2-butanone. See methyl isopropyl ketone.

methylbutanoyl chloride. See isovaleroyl chloride.

2-methyl-1-butene C_5H_{10} or $\text{H}_2\text{C}=\text{C}(\text{CH}_3)\text{CH}_2\text{CH}_3$.

Properties: Colorless, very volatile flammable liquid, disagreeable odor, b. p. 31.11°C, refractive index 1.378 (n_D 20/D); sp. gr. 0.650 (20/20°C); f. p. -137.52°C; flash point -48°C, soluble in alcohol; insoluble in water.

Derivation: Refinery gas.

Grades: 95%, 99%, and research.

Containers: Bottles, drums.

Shipping regulations: Flammable liquid. Red label.*

2-methyl-2-butene. See 3-methyl-2-butene.

3-methyl-1-butene (isopropylethylene, alpha-isoamylene) C_5H_{10} or $\text{H}_2\text{C}=\text{CHCH}(\text{CH}_3)_2$.

Properties: Colorless extremely volatile liquid; disagreeable odor, b. p. 20.1°C, refractive index 1.3643 (n_D 20/D); sp. gr. 0.6272 (20°C), f. p. -168.5°C; flash point -57°C, soluble in alcohol; insoluble in water.

Derivation: Cracking of petroleum; a component of refinery gas.

Grades: Research, 99% min.; technical 95% min.

Containers: Cylinders under pressure.

Uses: Organic synthesis; high-octane fuel manufacture.

Shipping regulations: Flammable liquid. Red label.*

3-methyl-2-butene (2-methyl-2-butene; trimethylethylene; beta-isoamylene) C_5H_{10} or $\text{H}_3\text{CCH}=\text{C}(\text{CH}_3)_2$.

Properties: Colorless volatile flammable liquid, disagreeable odor; b. p. 38.51°C; refractive index 1.387 (n_D 20/D); sp. gr. 0.6623 (20/4°C); f. p. -133.83°C; flash point -46°C, soluble in alcohol; insoluble in water.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: Cracking of petroleum; a component of refinery gas.

Grades: 90%, 95% (technical), 99% (pure), and research.

Containers: Bottles; drums; tank cars.

Uses: Organic synthesis; dental and surgical anesthetic; high octane fuel manufacture.

Shipping regulations: Flammable liquid. Red label. *

2-methyl-2-butenic acid. See angelic acid.

methylbutenol (2-methyl-3-buten-2-ol)

Properties: Clear, colorless liquid, b. p.

96-97.5°C; freezing point -30.5°C, sp. gr.

(20/20°C) 0.8249; refractive index (n_D 20/D)

1.4163; soluble in water and miscible with

acetone, benzene, carbon tetrachloride, and kerosene.

Containers: 7-, 35- and 380-lb drums.

Uses: Chemical intermediate, for perfumes, pharmaceuticals.

2-methyl-1-buten-3-yne. See isopropenylacetylene.

5-(1-methylbutyl) barbituric acid

Properties: A crystalline powder, usually white (sometimes pale pink); m. p. 165.0°-168.0°C.

1-methyl-4-tert-butylbenzene (para-tert-butyltoluene) $(\text{CH}_3)_3\text{CC}_6\text{H}_4\text{CH}_3$.

Properties: Sp. gr. (20/20°C), 0.857-0.863; b. p. 192.8°C; insoluble in water.

Grades: Technical.

Containers: Tank cars, drums.

Uses: Solvent; intermediate.

methyl butyl ketone (propylacetone)

Properties: B. p. 127.2°C (760 mm), sp. gr.

0.830 (20/20°C); refractive index 1.4024

(20°C), vapor pressure 10 mm (20°C);

soluble in water, alcohol, ether.

Grades: Technical.

Use: Solvent.

Shipping regulations: None. *

2-methyl-6-tert-butylphenol

Properties (typical): Crystalline solid, light

straw color, m. p. 28°C; density 0.9618

(30°C), b. p. 230°C, flash point (open cup)

107°C, soluble in methyl ethyl ketone,

ethyl alcohol, benzene, isooctane; insoluble in water.

alpha-methyl-beta-(para-tert-butylphenyl) propionaldehyde. See "Lilial."

methylbutynol $\text{HC}:\text{CCOH}(\text{CH}_3)_2$. 2-Methyl-3-butyne-2-ol.

Properties: Colorless liquid. B. p. 104-

105°C; m. p. 2.6°C, sp. gr. (20/20°C)

0.8672; refractive index (n_D 20/D) 1.4211;

flash point (Tag open cup) 77°F. Miscible with water; soluble in most organic solvents.

Containers: 7-, 35-, 385-lb drums, tank trucks and tank cars.

Uses: Stabilizer in chlorinated solvents, viscosity reducer and stabilizer;

electroplating brightener; intermediate in synthesis of hypnotics and isoprenoid chemicals such as vitamin A, ionone and perfume alcohols; solvent for alcohol-soluble nylon and polyamide resins.

Shipping regulations: Flammable liquid. Red label. *

methyl butyrate $\text{CH}_3\text{CH}_2\text{CH}_2\text{COOCH}_3$.

Constants: Sp. gr. 0.898 (20°C); b. p. 102°C.

Grades: Technical.

Uses: Solvent for ethylcellulose; solvent mixture for nitrocellulose; "Celluloid."

methyl caprate (methyl decanoate)

Properties: Colorless liquid; sp. gr. 0.8733

(20/4°C); m. p. -13.3°C; b. p. 224°C

(760 mm), 130.6°C (30 mm); refractive

index 1.4237 (25°C). Insoluble in water,

soluble in alcohol and ether.

Derivation: Esterification of capric acid with methanol or alcoholysis of coconut oil;

purified by fractional vacuum distillation.

Grades: Technical, 99.8% pure.

Use: Intermediate for detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers, textiles.

methyl caproate (methyl hexanoate)

The methyl ester of caproic acid.

Properties: Colorless liquid; sp. gr. 0.8850

(20/4°C), m. p. -71°C, b. p. 151.2°C

(760 mm), 63.0°C (30 mm), refractive in-

dex 1.4049 (20°C), insoluble in water,

soluble in alcohol and ether.

Derivation: Esterification of caproic acid with

methanol or alcoholysis of coconut oil.

Method of purification: Vacuum fractional

distillation.

Grades: Technical, 99.8+%.

Uses: Intermediate for caproic acid, detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers, textiles.

methyl caprylate (methyl octanoate)

The methyl ester of caprylic acid.

Properties: Colorless liquid; sp. gr. 0.8784

(20/4°C); m. p. -37.3°C, b. p. 192°C

(759 mm), 98.3 (30 mm), refractive index

1.4152 (25°C). Insoluble in water; soluble

in alcohol and ether.

Derivation: (a) Esterification of caprylic acid with methanol, (b) alcoholysis of coconut oil.

Method of purification: Vacuum fractional distillation.

Grades: Technical; 99.8%.

Containers: 55-gal drums.

Uses: Intermediate for caprylic acid, detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers, textiles.

methyl "Carbitol." ²¹⁴ Trademark for di-

ethylene glycol monomethyl ether

methyl carbonate (dimethyl carbonate)

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Colorless liquid. Pleasant odor. Miscible with acids and alkalis. Stable in the presence of water. Soluble in most organic solvents; insoluble in water. Sp. gr. 1.0718 (20°C); b. p. 90.6°C; m. p. -0.5°C.

Derivation: Interaction of phosgene and methyl alcohol.

Grades: Technical.

Use: Organic synthesis.

Shipping regulations: None.*

methylcatechol. See guaiacol.

methyl "Cellosolve." ²¹⁴ Trademark for ethylene glycol monomethyl ether, $\text{CH}_3\text{OCH}_2\text{CH}_2\text{OH}$ (q. v.).

methyl "Cellosolve" acetate. ²¹⁴ Trademark for ethylene glycol monomethyl ether acetate $\text{CH}_3\text{COOCH}_2\text{CH}_2\text{OCH}_3$ (q. v.).

methylcellulose. A methyl ether of cellulose.

Properties: Grayish white, fibrous powder, aqueous suspensions neutral to litmus. Swells in water and produces a clear to opalescent, viscous, colloidal solution. Insoluble in alcohol, ether and chloroform; soluble in glacial acetic acid; unaffected by oils and greases, stable up to about 300°C; flammable when ignited; stable to light.

Derivation: From cellulose by conversion to alkali cellulose and then reacting this with methyl chloride, dimethyl sulfate, or methyl alcohol, and dehydrating agents. The proportions of the reacting materials are varied to control the properties of the product, such as water solubility and viscosity of the water solutions.

Grades: U.S.P. XVI; technical.

Containers: 45-, 50-lb cartons, bags, car loads.

Uses: Medicine; as dispersing, thickening, emulsifying and sizing agent, and as an adhesive.

methylcellulose, propylene glycol ether.

See hydroxypropylmethylcellulose.

methyl cerotate (methyl hexacosanoate) $\text{CH}_3(\text{CH}_2)_{24}\text{COOCH}_3$. The methyl ester of cerotic acid.

Properties: Waxlike solid. Insoluble in water, soluble in alcohol and ether; m. p. 62.9°C; b. p. 237°C (1.95 mm), refractive index 1.4301 (80°C).

Derivation: Esterification of cerotic acid with methanol.

Grades: Purified (99%).

Uses: Intermediate in special synthesis, medical research; reference standard for gas chromatography.

methyl chavicol. See estragole.

methyl chloride (chloromethane) CH_3Cl .

Properties: Colorless, non-corrosive, liquefiable gas which is transparent in both the gaseous and the liquid state. Faintly sweet, ethereal odor; non-irritant but poisonous; sp. gr. 0.92 (20°C); b. p. -23.7°C (760 mm); m. p. -97.6°C; flash point below 32°C; refractive index

1.3712 (-23.7°C); critical temperature, 143°C; critical pressure 970 psi absolute; specific heat ($C_p = 0.24$, $C_v = 0.20$) $C_p/C_v = 1.20$; wt/gal 7.68 lbs (20°C); soluble in water, alcohol, chloroform, benzene, carbon tetrachloride, glacial acetic acid.

Derivation: Chlorination of methane; action of hydrochloric acid on methyl alcohol in presence of sulfuric acid.

Grades: Pure (99.5% min), technical, and 2 refrigerator grades.

Containers: 60-, 70-, 100-, 145, 300-lb cylinders, and in tank cars (10,000 gal).

Uses: Catalyst carrier in low temperature polymerization as of synthetic rubber, silicones; refrigerant; medicine; as a fluid for thermometric and thermostatic equipment, as a methylating agent in organic synthesis, such as methylcellulose; and as an extractant and a low-temperature solvent; propellant in high pressure aerosols.

Explosive hazard: Moderate; explosions stated to be practically impossible in household refrigeration installations.

Warning! Flammable liquid and gas under pressure. Vapor harmful. MCA warning label.

Shipping regulations: Flammable gas. Red gas label.*

methyl chloroacetate $\text{ClCH}_2\text{COOCH}_3$.

Properties: Colorless liquid; sp. gr. 1.236 (20/4°C); m. p. -32.7°C, b. p. 131°C, slightly soluble in water; miscible with alcohol and ether.

Use: Solvent.

methylchloroform. See 1,1,1-trichloroethane.

methyl chloroformate ClCOOCH_3 .

Properties: Colorless liquid. Decomposed by hot water. Stable to cold water. Caution! Very irritant! Soluble in methyl alcohol, ether, and benzene. Sp. gr. 1.23 (15°C), b. p. 71.4°C, vapor density 3.9 (air = 1).

Derivation: Reaction between methyl alcohol and carbonyl chloride.

Grades: Technical (95% min).

Uses: Military poison gas (lachrymator); organic synthesis; insecticides.

Shipping regulations: Corrosive liquid. White label.*

methylchloromethyl ether $\text{ClCH}_2\text{OCH}_3$.

Properties: Liquid, sp. gr. 1.0625 (10/4°C); m. p. -103.5°C, b. p. 59.5°C; decomposes in water; soluble in alcohol and ether. **Shipping regulations:** Flammable liquid. Red label. Not accepted by express.*

2-methyl-4-chlorophenoxyacetic acid. See MCP.

2-methyl-4-chlorophenoxypropionic acid $\text{CH}_3\text{C}_6\text{H}_3\text{ClOCH}_2\text{CH}_2\text{COOH}$. Similar to 2,4-D.

Use: Weed killer.

methyl chlorosilanes. These compounds are used as intermediates in the formation of silicones or siloxanes. They also have the property of reacting with hydroxyl

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

groups on many types of surfaces to produce a permanent thin surface film of silicone that confers water-repellent properties on the surface. The common examples are methyltrichlorosilane, dimethylchlorosilane, and trimethylchlorosilane (q. v.).

methyl chlorosulfonate $\text{CH}_3\text{OSO}_2\text{Cl}$.

Properties: Colorless liquid. Pungent odor. Decomposed by water. Caution! Very irritant! Soluble in alcohol, carbon tetrachloride, chloroform; insoluble in water. Sp. gr. 1.492 (10°C); b. p. 133-135°C (dec); m. p. -70°C, vapor density 4.5 (air = 1). Derivation: Interaction of sulfuryl chloride and methyl alcohol. Containers: Steel bottles. Grades: Technical. Uses: Organic synthesis; military poison gas.

methyl cinnamate $\text{C}_6\text{H}_5\text{CH}:\text{CHCOOCH}_3$.

Properties: White crystals; strawberry-like odor. Soluble in alcohol and ether; insoluble in water. Sp. gr. 1.0415; m. p. 34°C, b. p. 259.6°C. Derivation: By heating methyl alcohol, cinnamic acid and sulfuric acid, with subsequent distillation. Method of purification: Recrystallization. Grades: Technical. Containers: 1-, 5-, 10-lb bottles, 25-lb tins. Uses: Perfumes; flavoring confectionery. Shipping regulations: None.*

methyl cinnamyl ketone. Benzylideneacetone.

methylcoumarin $\text{C}_{10}\text{H}_8\text{O}_2$.

Properties: White crystals with a vanilla flavor, exists as alpha and beta forms, m. p. (alpha) 90°C, (beta) 82°C, both forms are soluble in alcohol. Uses: Perfumes; flavoring.

methyl-para-cresol (methylanisole; para-cresyl methyl ether) $\text{CH}_3\text{C}_6\text{H}_4\text{OCH}_3$. (The synonyms illustrate better nomenclature.)

Properties: Colorless liquid with a strong floral odor. Sp. gr. 0.967-0.969; refractive index 1.512-1.514. Soluble in 7 parts of 70% alcohol. Containers: Glass bottles. Use: Perfumery. Shipping regulations: None.*

cis-alpha-methylcrotonic acid. See angelic acid.

trans-alpha-methylcrotonic acid. See tiglic acid.

methyl cyanide. See acetonitrile.

methyl cyanoacetate (malonic methyl ester nitrile) $\text{CNCH}_2\text{COOCH}_3$.

Properties: Colorless liquid, b. p. 203°C (115°C at 16 mm); m. p. -22.5°C; sp. gr. 1.1225 (15/4°C); soluble in water, alcohol and ether. Derivation: Esterification of cyanoacetic acid with methanol; reaction of an alkali cyanide and chloroacetic methyl ester. Method of purification: Vacuum distillation.

Containers: 55-gal tinlined steel drums, 15-gal tinlined steel drums; 50-lb boxed tins; 25-, 5-lb bottles.

Uses: Organic synthesis; pharmaceuticals; dyes.

Shipping regulations: None.*

methyl cyanofornate CNCOOCH_3 .

Properties: Colorless liquid. Etheral odor. Decomposed by alkalis and water. Soluble in alcohol, benzene, ether. Sp. gr. (approx) 1.00 (20°C); b. p. 100°C. Derivation: Methylchloroformate is dissolved in methanol and subjected to the action of (hot) sodium or potassium cyanide. Containers: Glass bottles. Use: Organic synthesis. Shipping regulations: None.*

methylcyclohexane (hexahydrotoluene) C_7H_{14} .

Properties: Colorless liquid; sp. gr. 0.769; b. p. 100.8°C; m. p. -126.9°C; refractive index 1.42312; flash point -6°C. Source: Petroleum. Grades: Technical (95%), 99%, and research. Containers: Glass bottles; drums. Uses: Solvent for cellulose ethers; organic synthesis. Shipping regulations: Flammable liquid. Red label.*

methylcyclohexanol (hexahydromethyl phenol; hexahydrocresol) $\text{CH}_3\text{C}_6\text{H}_{10}\text{OH}$ or $\text{C}_7\text{H}_{14}\text{O}$.

Properties: Colorless, viscous liquid; aromatic, menthol-like odor, non-explosive; slightly toxic. Derivation: (a) A mixture of three isomeric (ortho, meta and para) cyclic secondary alcohols made by the hydrogenation of cresol, (b) catalytic oxidation of methylcyclohexane. Grades: Technical. Containers: 1-, 5-gal cans, 55-gal drums. Uses: Solvent for cellulose esters and ethers for lacquers, antioxidant for lubricants, blending agent for special textile soaps and detergents. Caution: Vapor harmful. MCA warning label. Shipping regulations: None.*

methylcyclohexanol acetate (heptalin acetate) $\text{C}_7\text{H}_{13}\text{OOCCCH}_3$.

Properties: Colorless, non-explosive, non-flammable, non-toxic, non-corrosive liquid. Has an ester-like odor. Has a slower rate of evaporation than amyl acetate. B. p. 176-193°C, sp. gr. 0.941, flash point 65°C; toluene dilution ratio 2.5. Derivation: Catalytic hydrogenation and esterification of cresols by means of acetic acid.

methylcyclohexanone $\text{CH}_3\text{C}_5\text{H}_9\text{CO}$.

Properties: Water-white to pale-yellow liquid. Acetone-like odor. It is a mixture of cyclic ketones. Closely resembles cyclohexanone in physical properties, miscibility, tolerance for non-solvents, and solvent action. Constants: B. p. 160-170°C, sp. gr. 0.925; flash point 130°C; benzene dilution ratio 5.5; toluene dilution ratio 5.5; xylene

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- dilution ratio 7.0.
 Derivation: By high-temperature, catalytic hydrogenation of cresols or by the dehydrogenation of methylcyclohexanol.
 Grades: Technical.
 Containers: Glass bottles; 1- and 5-gal cans, 55-gal drums.
 Uses: Solvent; lacquers.
 Caution: Vapor harmful. MCA warning label.
 Shipping regulations: None.*
- methylcyclohexanone glyceryl acetal**
 $\text{CH}_3\text{C}_6\text{H}_{10}\text{O}_2\text{C}_3\text{H}_5\text{OH}$ (spiro rings).
 Properties: Sp. gr. 1.074 (20°C); refractive index 1.474 (20°C); b. p. 130-140°C (20 mm); flash point, 113°C; insoluble in water.
 Use: Plasticizer.
- methylcyclohexanyl oxalate** $(\text{CH}_3\text{C}_6\text{H}_{10}\text{OOC})_2$.
 Properties: Colorless, odorless, neutral, anhydrous, stable liquid comprising a mixture of isomers. Miscible with most lacquer solvents and diluents.
- 4-methylcyclohexene-1** $\text{C}_6\text{H}_9\text{CH}_3$.
 Properties: Sp. gr. 0.804 (60/60°F); initial b. p. (of available commercial grade) 216.7°F; vapor pressure 0.20 psia (100°F); flash point approx. 30°F.
 Containers: Bottles; 5-gal drums.
 Grade: Technical.
 Shipping regulations: Flammable liquid. Red label.*
- 6-methyl-3-cyclohexene carboxaldehyde**
 $\text{CH}_3\text{CHCH}_2\text{CH}=\text{CHCH}_2\text{CHCHO}$.
 Properties: Sp. gr. 0.9484, b. p. 175.4°C, f. p. -39.0°C, solubility in water, 0.3% by weight at 20°C.
 Use: Intermediate for chemical synthesis.
- N-methyl-5-cyclohexenyl-5-methylbarbituric acid.** See hexobarbital.
- N-methylcyclohexylamine** $\text{C}_6\text{H}_{11}\text{NHCH}_3$.
 Properties: Water white liquid, sp. gr. 0.86 (20°C); soluble in alcohol and ether; slightly soluble in water.
 Typical specification: Purity 99%; distillation range, 5-95 cc within 2°C, including 149°C, corrected to 760 mm.
 Uses: Intermediate; solvent; acid acceptor.
- methylcyclopentadiene dimer** (methyl-1,3-cyclopentadiene) $\text{C}_{12}\text{H}_{16}$.
 Properties: Sp. gr. 0.9341 (20/4°C); b. p. 78-183°C. Insoluble in water; very soluble in alcohol, benzene and ether.
 Uses: High energy fuels; plasticizers; resins, surface coatings; perfumes; pharmaceuticals; stabilizers; dyes, additives.
- methylcyclopentadienyl manganese tricarbonyl**
 $\text{CH}_3\text{C}_5\text{H}_4\text{Mn}(\text{CO})_3$.
 Derivation: Methylcyclopentadiene with manganese carbonyl.
 Use: Gasoline additive; a promotor for the antiknock action of tetraethyl lead. See "Ethyl" Motor 33 Mix, under "Ethyl."
- methylcyclopentane** $\text{C}_5\text{H}_9\text{CH}_3$.
 Properties: Colorless liquid. Sp. gr. 0.750;
- m. p. -142.5°C; aniline equivalent 4; refractive index 1.40983 (20°C); b. p. 72°C (742 mm); C. S. T. aniline 34.0°C; flash point -27°C.
 Grades: Technical (95%), 99%, and Research.
 Containers: Glass bottles; cans; steel drums.
 Use: Organic synthesis.
 Shipping regulations: Flammable liquid. Red label.*
- methylcytosine** $\text{C}_5\text{H}_7\text{N}_3\text{O}$. 5-Methyl-2-oxy-4-aminopyrimidine. A pyrimidine found in deoxyribonucleic acids, nucleotides, and nucleosides.
 Properties: Crystallizes in prisms from water (may contain $\frac{1}{2}$ molecule H_2O). M. p. 270° (dec); soluble in water.
 Derivation: Isolation following hydrolysis of certain deoxyribonucleic acids; also synthetically.
 Use: Biochemical research.
- methyl decanoate.** See methyl caprate.
- methyl dichloroacetate** $\text{Cl}_2\text{CHCOOCH}_3$.
 Properties: Liquid; sp. gr. 1.3759-1.3839 (20/20°C); refractive index (n_D 20/D) 1.4374-1.4474.
 Grades: 99.0% pure.
 Containers: 5-, 13-gal carboys; 55-gal drums.
 Use: Organic intermediate.
- methyldichloroarsine** CH_3AsCl_2 .
 Shipping regulations: Poison, class A. Poison gas label by freight. Not accepted by express.*
- methyldichlorosilane** $\text{CH}_3\text{SiHCl}_2$.
 Properties: Colorless liquid; b. p. 41°C; sp. gr. 1.10 (27°C).
 Derivation: Byproduct from reaction of methyl chloride with silicon and copper.
 Uses: Manufacture of siloxanes.
 Shipping regulations: Flammable liquid, red label.*
- methyl dichlorostearate** $\text{C}_{17}\text{H}_{33}\text{Cl}_2\text{COOCH}_3$ (approx).
 Properties: Light yellow, oily liquid with a slight fatty odor. Completely miscible with most organic solvents; freezing range +7 to -5°C; b. p. decomposes 250°C; sp. gr. 0.997 (15.5/15.5°C); refractive index 1.4599 (n_D 25/D); flash point 181°C; fire point 210°C.
 Containers: 55-gal steel drums.
 Uses: Intermediate; plasticizer extender.
- methyldiethanolamine** $\text{CH}_3\text{N}(\text{C}_2\text{H}_4\text{OH})_2$.
 Properties: Colorless liquid with amine-like odor. Miscible with benzene, water. Sp. gr. 1.0418 (20°C), b. p. 247.2°C (760 mm), wt/gal 8.7 lb; coefficient of expansion 0.00073, vapor pressure < 0.01 mm (20°C); f. p. -21.0°C, viscosity 1.01 poise (20°C); refractive index 1.4699.
 Grades: Technical.
 Containers: Glass bottles; 1-, 5- and 10-gal cans; 55-gal non-returnable drums.
 Use: Intermediate in manufacture of textile auxiliaries, resins, dyestuffs, insecticides, emulsifying agents, corrosion inhibitors and for the absorption of

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

acidic gases.

Shipping regulations: None.*

4-methyl-7-diethylaminocoumarin

$\text{CH}_3\text{C}_9\text{H}_4\text{O}(\text{O}(\text{C}_2\text{H}_5)_2)$.

Properties: Granular; light tan color; m. p. 68–72°C; gives a bright blue-white fluorescence in very dilute solutions in either daylight or ultraviolet light; soluble in aqueous acid solutions, resins, varnishes, vinyls and nearly all common organic solvents such as alcohols, esters, ketones, ethers, glycols, etc., slightly soluble in aliphatic hydrocarbons.

Uses: Optical bleach in textile industry; in overprint and clay casein coatings for paper, labels, book covers, etc., to lighten plastics, resins, varnishes and lacquers, as an invisible marking agent.

6-methyldihydromorphinone hydrochloride.

See metopon hydrochloride.

2-methyl-3-dimethylaminopropiophenone

hydrochloride $\text{C}_6\text{H}_5\text{COCH}(\text{CH}_3)\text{CHN}(\text{CH}_3)_2 \cdot \text{HCl}$.

An off-white crystalline powder, m. p. not less than 150.0°C.

methyl N-3, 7-dimethyl-7-hydroxyoctylidene-anthranilate. See "Aurantioil."

methyldioxolane (2-methyl-1,3-dioxolane)

$\text{OCH}_2\text{CH}_2\text{OCH}(\text{CH}_3)$.

Properties: Water-white liquid. Soluble in water. Sp. gr. 0.982 (20/20°C); b. p. 81°C

Grades: Technical.

Uses: As extractant and solvent for oils, fats, waxes, dyestuffs and cellulose derivatives, especially cellulose acetate.

1-N-methyl-1, 2-diphenyl-2-hydroxyethylamine hydrochloride. See ephenamine.

methyldipropylmethane. See 4-methylheptane.

methyl docosanoate. See methyl behenate.

methyl dodecanoate. See methyl laurate.

methyl elcosanoate. See methyl arachidate.

methyl elaidate

$\text{CH}_3(\text{CH}_2)_7\text{CH}:\text{CH}(\text{CH}_2)_7\text{COOCH}_3$. The methyl ester of elaidic acid (trans-octadec-9-enoic acid).

Properties: Colorless liquid, insoluble in water, soluble in most organic solvents. Sp. gr. 0.8702 (25°C), m. p. < 15°C, b. p. 213.5°C (15 mm), refractive index 1.4462 (25°C).

Derivation: Prepared by elaidinization and esterification.

Use: Pure grade (99+%) used in biochemical research.

N, N'-methylenebisacrylamide

$\text{CH}_2(\text{NHCOCH}=\text{CH}_2)_2$

Properties: Colorless, crystalline solid; m. p. 185°C; sp. gr. 1.235 (30°C).

Uses: Organic intermediate, cross linking agent.

4,4'-methylenebis(2-chloroaniline). See "Moca."

2,2'-methylenebis(4-chlorophenol). See dichlorophene.

4,4'-methylenebis(2,6-di-tert butylphenol)

$[(\text{C}_4\text{H}_9)_2\text{C}_6\text{H}_2(\text{OH})_2]_2\text{CH}_2$.

Properties: Light yellow powder; m. p. 309°F; b. p. 553°F (40 mm); flash point (open cup) 424°F. Insoluble in water and 1.0 N sodium hydroxide.

Uses: Oxidation inhibitor and antiwear agent for motor oils, aviation piston engine oils, and industrial oils.

methylenebis(phenylene isocyanate). See diphenylmethane diisocyanate.

2,2'-methylenebis(3,4,6-trichlorophenol).

See hexachlorophene.

methylene blue (methylthionine chloride)

$\text{C}_{16}\text{H}_{18}\text{N}_3\text{SCl} \cdot 3\text{H}_2\text{O}$. (medicinal); $(\text{C}_{16}\text{H}_{18}\text{N}_3\text{SCl})_2 \cdot \text{ZnCl}_2 \cdot \text{H}_2\text{O}$ (dye).

Properties: Dark green crystals or powder with bronze-like luster; odorless or slight odor; stable in air. Soluble in water, alcohol, chloroform. Water solutions are deep blue.

Derivation: By oxidation of para-aminodimethylaniline with ferric chloride in the presence of hydrogen sulfide. The dye is the zinc chloride double salt of the chloride; the medicinal product is the hydrochloride of the base.

Grades: U. S. P. XVI; technical.

Containers: Bottles, 25-, 100-lb drums.

Uses: Medicine, dyeing cotton and wool, biological and bacteriological stains; reagent in oxidation-reduction titrations in volumetric analysis, indicator.

Shipping regulations: None.*

methylene bromide (dibromomethane) CH_2Br_2 .

Properties: A clear, colorless liquid, sp. gr. 2.47, solidifies -52°C, b. p. 97°C; slightly soluble in water; miscible with alcohol, ether, chloroform and acetone.

Containers: 5-gal carboys.

Uses: Organic synthesis; solvent; heavy gauge liquid.

methylene chloride (methylene dichloride, dichloromethane) CH_2Cl_2 .

Properties: Colorless, volatile liquid, penetrating ether-like odor, poisonous when inhaled! Soluble in alcohol and ether; insoluble in water. Sp. gr. 1.335 (15/4°C), m. p. -97°C, b. p. 40.1°C; 11.07 lbs/gal (20°C), refractive index (n_D 20/D) 1.4244; viscosity (20°C) 0.430 cps.

Derivation: By the chlorination of methyl chloride and subsequent distillation.

Method of purification: Rectification.

Grades: Technical, paint remover.

Containers: Glass bottles, 55-gal drums; 8,000 and 10,000-gal tank cars, tank trucks.

Uses: Component of paint removers; in manufacture of special photographic film; fumigant, solvent for alkaloids, bitumens, crude rubber, oils, resins, waxes, and many organic compounds; solvent mixtures; solvent mixtures for cellulose esters and ethers, textile and leather coatings; lacquers; fire-extinguishing compositions; refrigeration, local anesthetic in dentistry; extraction of oils, fats, perfumes, flavors, and drugs; spotting agent; degreasing;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

dewaxing; chemical (organic synthesis); as a propellant for aerosols.

Caution: Avoid prolonged or repeated contact with skin, breathing of vapor. MCA warning label.

Shipping regulations: None.*

methylene chlorobromide. See bromochloromethane.

methylenecitrosalicylic acid (salicitrin)

$C_{21}H_{16}O_{11}$.

Properties: White, crystalline powder.

Soluble in alkaline solutions and alcohol, almost insoluble in water. M. p. 150-152°C.

Use: Medicine.

methylene cyanide. See malonic dinitrile.

4,4'-methylenedianiline $NH_2C_6H_4CH_2C_6H_4NH_2$.

Properties: Yellow to light brown crystalline solid with faint amine-like odor; f. p.

89.0°C (min); almost insoluble in water and carbon tetrachloride; soluble in acetone and methanol.

Use: Intermediate for adhesives, including 4,4'-methylenediphenyl diisocyanate.

methylene dichloride. See methylene chloride.

3,4-methylenedioxypropylbenzene

$C_9H_8O_2$.

Properties: Sp. gr. 1.065 (25/25°C), somewhat soluble in alcohol.

Uses: Essential oil compositions.

methylene ditannin. See tannoform.

methylene iodide (diiodomethane) CH_2I_2 .

Properties: Yellow liquid. Soluble in alcohol and ether; insoluble in water. Sp. gr. 3.33; m. p. 6°C; b. p. 180°C.

Derivation: By heating iodoform with an alcoholic solution of sodium acetate and subsequent distillation.

Method of purification: Rectification.

Grades: Technical, C. P.

Containers: Steel drums, glass bottles.

Uses: Separating mixtures of minerals; organic synthesis.

Shipping regulations: None.*

methylene-para-toluidine. See formaldehyde-para-toluidine.

methylegonovine maleate

$C_{14}H_{11}NHNHCH_3CONHCH(C_2H_5)CH_2OH$.— $H_2C_4H_2O_4$.

Properties: White to pinkish tan powder; odorless; bitter taste; unstable to light and to heat, soluble in water, alcohol; very slightly soluble in chloroform, ether, pH of solution (1 in 5000) is between 4.4 and 5.2.

Grade: N. F. XI.

Use: Medicine.

N-methylethanolamine $CH_3NHC_2H_4OH$.

Properties: Liquid; sp. gr. 0.9414; b. p. 159.5°C; vapor pressure 0.7 mm (20°C); f. p. -4.5°C; flash point 165°F, soluble in water.

Containers: Cans; drums.

Uses: Textile chemicals; pharmaceuticals.

methyl ether. See dimethyl ether.

4-methyl-7-ethoxycoumarin. See "Maraniol."

methylethylcarbinol. See sec-butyl alcohol.

methyl ethyl diketone. See acetyl propionyl.

2-methyl-2-ethyl-1,3-dioxolane

$(CH_3)(C_2H_5)COCH_2CH_2O$.

Properties: Sp. gr. 0.9392; b. p. 117.6°C; f. p. -81.96°C; flash point 74°F; solubility in water 2.2% by weight.

Shipping regulations: Flammable liquid. Red label.*

methylethylene glycol. See propylene glycol.

However, in Europe this term, written methyl ethylene glycol, is regarded as synonymous with ethylene glycol monomethyl ether.

sym-methylethylethylene. See n-beta-amylene.

3,3-methylethylglutarimide. See bemegride.

methylethylglyoxal. See acetyl propionyl.

methyl ethyl ketone (ethyl methyl ketone; 2-butanone; MEK) $CH_3COC_2H_5$.

Properties: Colorless liquid; acetone-like odor; flammable, b. p. 79.6°C; sp. gr. 0.8255 (0/4°C), 0.805 (20/4°C), and 0.7997 (25/4°C); refractive index 1.379 (20°C); sp. heat 0.549 cal/g, m. p. -86.4°C; heat of combustion 14520 Btu/lb; heat of vaporization 191 Btu/lb, viscosity 0.40 cps (25°C); solubility in water 22.6 wt %, solubility of water 9.9 wt %, coefficient of expansion 0.0013/°C (approx); flash point 24°F, 6.71 M., gal (20°C). Soluble in water, alcohol and ether, miscible with oils.

Typical specifications: Specific gravity 0.805-0.807 (20/20°C), color water-white; acidity (acetic acid) 0.002% (max); moisture — clear with 19 vols of naphtha; distillation — initial 79°C (min), dry point 81.5°C (max); non-volatile matter 2 mg/100 cc; purity 98.0% wt (min); residual odor — none.

Derivation: From mixed n-butylenes and sulfuric acid to cause hydrolysis, followed by distillation to separate sec-butyl alcohol, which is dehydrogenated; by controlled oxidation of butane.

Method of purification: Rectification.

Grades: Technical.

Containers: Cans, 1 and 5 gal; drums, 55

gal; tank wagons up to 2000 gal; tank cars 6000 or 8000 gal.

Uses: Lacquers, dewaxing of lubricating oil; paint removers; cements and adhesives; celluloid; dopes; organic synthesis; manufacture of smokeless powder; solvent; artificial leather dressings; dyes; cleaning fluids; shoe manufacture; printing.

Warning! Flammable. MCA warning label.

* Shipping regulations: Red label *

methyl ethyl ketone peroxide. See "Lupersol DDM."

2-methyl-5-ethylpyridine (MEP; aldehydine; aldehyde collidine; 5-ethyl-2-picoline) $CH_3C_5H_3NC_2H_5$.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Colorless liquid; sharp penetrating odor; sp. gr. 0.921 (20/20°); b. p. 178.3°C (760 mm); f. p. -70.3°C; flash point 165°F (Cleveland open cup); refractive index (n 20/D) 1.4970; slightly soluble in water.

Derivation: Paraldehyde is treated with ammonia under high pressure and in the presence of ammonium acetate as a catalyst. Picolines and other substituted pyridines are byproducts.

Method of purification: Fractional distillation.

Grades: Technical.

Containers: Drums; tank cars.

Uses: Nicotinic acid and nicotinamide; vinyl pyridines for copolymers; intermediates for germicides and textile finishes, corrosion inhibitor for chlorinated solvents.

Shipping regulations: None.*

N-methylformanilide $C_6H_5N(CH_3)CHO$.

Properties: Colorless to light yellow liquid; refractive index 1.5570-1.5600 (n 25/D); distillation range 127-131°C (16 mm).

Grade: 95% min.

Containers: 30-, 55-gal steel drums.

Use: Organic synthesis.

methyl formate $HCOOCH_3$.

Properties: Colorless, flammable liquid; agreeable odor. Saponified by water or alkaline solutions. Soluble in water, alcohol and ether.

Constants: Sp. gr. 0.950-0.980 (20/20°C), m. p. -99.8°C; b. p. 31.8°C; flash point -32°C (-25.6°F); vapor pressure 0°C 195.0 mm, 10°C 309.4 mm, 20°C 476.4 mm, 30°C 707.9 mm; wt/gal 8.03 lbs (68°F); electric conductivity 3.6×10^{-5} reciprocal ohm (25°C); refractive index 1.3431 (20°C).

Derivation: By heating methyl alcohol with sodium formate and hydrochloric acid, with subsequent distillation.

Method of purification: Rectification.

Grades: Technical, refined.

Containers: Iron drums; tank cars.

Uses: Organic synthesis, cellulose acetate solvent; making military poison gases; fumigant; larvicides.

Fire hazard: Dangerous.

Shipping regulations: Flammable liquid.

Red label.*

2-methylfuran $C_4H_6OCH_3$.

Properties: Colorless, mobile liquid, ether-like odor, m. p. -88.68°C, b. p. 63.2-65.6°C (760 mm), sp. gr. 0.913 (20/4°C); refractive index: 1.4320 (20/D); flash point -16°F (Tag open cup). Practically insoluble in water, 0.3 g/100 g water. Infinitely miscible with most organic solvents. Forms a binary azeotrope with methanol, a ternary azeotrope with methanol-water.

Containers: 1-, 5-, 55-gal containers; net weight: 7.35, and 375 lbs, respectively.

Use: Chemical intermediate.

Shipping regulations: Flammable liquid.

Red label.*

methyl furoate $C_4H_5OCO_2CH_3$.

Properties: Colorless liquid, turning yellow in light. Pleasant odor. Practically insoluble in water; soluble in alcohol and ether. Sp. gr. 1.1739 (15/15°C); b. p. 181.3°C (corr); refractive index 1.4860 (20°C/D).

Derivation: By the usual esterification methods for furoic acid.

Containers: Amber-glass bottles; 1-, 5- and 10-gal tins.

Uses: Solvent, organic synthesis.

Shipping regulations: None.*

N-methylglucamine

$CH_2OH(CHOH)_4CH_2NHCH_3$.

Properties: White crystals; m. p. 128°C.

Soluble in water; slightly soluble in alcohol.

Preparation: From glucose and methylamine.

Uses: Detergents, pharmaceuticals, dyes.

methylglucamine diatrizoate (diatrizoate methylglucamine; 3,5-diacetylamino-2,4,6-triiodobenzoic acid, methylglucamine salt) $(CH_3CONH)_2C_6I_3COOH \cdot CH_3NHCH_2(CHOH)_4CH_2OH$.

Properties: Available in solution for injection as a clear, colorless to pale yellow, slightly viscous liquid with a pH between 6.0-7.6.

Grade: U. S. P. XVI.

Use: Medicine (radiopaque medium).

methylglucamine iodipamide (iodipamide bis(N-methylglucamine) salt)

$C_{20}H_{14}I_6N_2O_6 \cdot 2C_7H_{11}NO_5$. 3,3'-(Adipoyldi-imino)bis-2,4,6-triiodobenzoic acid, methylglucamine salt.

Properties: Crystals; soluble in water.

Solutions are radio-opaque.

Grades: U. S. P. XVI (solution for injection).

Use: Roentgenographic contrast medium.

methyl-alpha-D-glucopyranoside. See methyl glucoside.

N-methyl-L-glucosamine (2-methylamino glucose) $CH_2OH(CHOH)_4CH(NHCH_3)CHO$ (this formula only approximate). A hexosamine found in streptomycin.

Properties (of hydrochloride): Crystals with m. p. 160-163°. Freely soluble in water. Exhibits mutarotation in solution.

Derivation: Hydrolysis of streptomycin.

methyl glucoside (methyl alpha-D-glycopyranoside) $CH_2OHCH(CHOH)_3CHOCH_3$.

Properties: Odorless, white crystals. M. p. 168°C; b. p. 200°C (0.2 mm); specific optical rotation (aqueous solution) +158.9° (20°C); sp. gr. (30/4°C) 1.46. Soluble in water and 80% alcohol; slightly soluble in methanol; insoluble in ether.

Derivation: (a) By treating dextrose with methanol in the presence of hydrochloric acid or cation exchange resin; (b) enzymatic synthesis from yeast.

Grades: Technical.

Containers: 100-lb multiwall paper bags.

Uses: Alkyd resins, drying oils; plasticizer for phenolic, amine, and alkyd resins; nonionic surfactants.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

methyl glyccoll. See sarcosine.

methyl glycol. See propylene glycol. However, in Europe this term is regarded as synonymous with ethylene glycol monomethyl ether.

methylglyoxalidine. See lysidine.

(alpha-methylguanido)acetic acid. See creatine.

N-methyl-N-guanylglycine. See creatine.

methyl heneicosanoate $\text{CH}_3(\text{CH}_2)_{19}\text{COOCH}_3$.

The methyl ester of heneicosanoic acid.

Properties: White waxlike solid. Insoluble in water, soluble in alcohol and ether.

M. p. $48-9^\circ\text{C}$; b. p. 207°C (3.75 mm).

Grades: Purified 96%, 99.5%.

Uses: Intermediate in organic synthesis; medical research.

methyl heptadecanoate (methyl margarate)

$\text{CH}_3(\text{CH}_2)_{15}\text{COOCH}_3$. The methyl ester of heptadecanoic acid (margaric acid).

Properties: White waxlike solid. Insoluble in water, soluble in alcohol and ether.

M. p. 29°C , b. p. $184-7^\circ\text{C}$ (760 mm); 130°C (1 mm).

Grades: Purified 96%, 99.5%.

Uses: Intermediate in organic synthesis; medical research.

2-methylheptane $(\text{CH}_3)_2\text{CH}(\text{CH}_2)_4\text{CH}_3$. Also known as isooctane (q. v.).

Properties: Colorless liquid; sp. gr. 0.6979 (20°C); f. p. -109°C ; b. p. 117.6°C (760 mm), refractive index (20/D) 1.3949. Insoluble in water, soluble in alcohol and ether.

Use: Organic synthesis.

3-methylheptane $\text{C}_2\text{H}_5\text{CH}(\text{CH}_3)(\text{CH}_2)_3\text{CH}_3$.

Properties: Colorless liquid; m. p. -120.5°C , b. p. 118.927°C , sp. gr. 0.70582 ($20/4^\circ\text{C}$), refractive index 1.39849 (n 20/D).

Grades: 99%, 95%.

Use: Calibration; organic synthesis.

4-methylheptane (methyldipropylmethane)

C_8H_{18} or $\text{CH}_3(\text{CH}_2)_2\text{CHCH}_3(\text{CH}_2)_2\text{CH}_3$.

Properties: Colorless liquid. Soluble in alcohol and ether; insoluble in water.

Sp. gr. 0.7161; b. p. 122.2°C .

Grades: Technical.

Use: Organic synthesis.

methylheptenone (6-methyl-5-hepten-2-one)

$(\text{CH}_3)_2\text{C}=\text{CH}(\text{CH}_2)_2\text{COCH}_3$. Constituent of lemon grass oil and many other essential oils.

Properties: Colorless liquid; insoluble in water but miscible with alcohol or ether. Sp. gr. 0.860 (20°C); m. p. -67.1°C ; b. p. $173-174^\circ\text{C}$.

Derivation: From oil of lemon grass or by controlled oxidation of corresponding secondary alcohol.

Containers: Glass bottles; tins.

Uses: Organic synthesis; inexpensive perfumes.

Shipping regulations: None.*

methyl heptine carbonate $\text{CH}_3(\text{CH}_2)_4\text{C}:\text{CCOOCH}_3$.

See also "Folione."

Properties: Colorless liquid, having an extremely strong violet-type odor. Sp. gr. 0.919-0.923; refractive index 1.446-1.450. Soluble in 4 parts of 70% alcohol.

Derivation: From heptaldehyde.

Containers: Glass bottles; tins.

Use: Perfumery, particularly for violet-type odors.

Shipping regulations: None.*

methyl hexacosanoate. See methyl cerotate.

methyl hexadecanoate. See methyl palmitate.

methylhexamine. See 4-methyl-2-hexylamine.

2-methylhexane (ethylisobutylmethane) C_7H_{16} or $(\text{CH}_3)_2\text{CH}(\text{CH}_2)_2\text{CH}_2\text{CH}_3$.

Properties: Colorless liquid. Soluble in alcohol; insoluble in water. Sp. gr. 0.6789; b. p. 90.0°C ; f. p. -118.5°C ; refractive index 1.38498 (20°C); C. S. T. aniline 73.6°C .

Grades: Technical.

Containers: Glass bottles; 1-, 5-, and 10-gal tins; 55-gal drums.

Use: Organic synthesis.

3-methylhexane $\text{H}_3\text{CCH}_2\text{CH}(\text{CH}_3)\text{CH}_2\text{CH}_2\text{CH}_3$.

Properties: Colorless liquid, b. p. 92°C ; sp. gr. 0.692 ($60/60^\circ\text{F}$); refractive index 1.388 (n 20/D), flash point -4°C .

Grades: Technical 95%.

Containers: Bottles and 5-gal drums.

Shipping regulations: Flammable liquid.

Red label.*

methylhexanamine. See 4-methyl-2-hexylamine.

methyl hexanoate. See methyl caproate.

5-methyl-2-hexanone. See methyl isoamyl ketone.

1-methyl-2-hexylamine. See 2-aminoheptane.

4-methyl-2-hexylamine. (2-amino-4-methylhexane; methylhexanamine; methylhexamine) $\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)\text{CH}_2\text{CH}(\text{NH}_2)\text{CH}_3$.

Properties: Colorless to pale yellow liquid with amine odor, b. p. $130-135^\circ\text{C}$; density 0.762 to 0.765; refractive index 1.4150 to 1.4175 (n 25/D). Very slightly soluble in water; soluble in alcohol, chloroform, ether, dilute acids.

Grade: N. N. D.

Use: Medicine.

methylhexylcarbinol. See 2-n-octanol.

methyl hexyl ketone (2-octanone) $\text{CH}_3\text{COC}_6\text{H}_{13}$.

Properties: Colorless liquid with pleasant odor, camphor taste; sp. gr. 0.82 ($20/4^\circ\text{C}$), m. p. -20.9°C ; b. p. 173.5°C ; distillation range $166-173^\circ\text{C}$; refractive index 1.416 (20°C); insoluble in water; soluble in alcohol, hydrocarbons, ether, esters, etc.

Preparation: By distilling sodium ricinoleate with caustic soda.

Containers: Glass bottles; 1-, 5- and 10-gal tins; 55-gal drums.

Uses: Perfumes; high-boiling solvent, especially for epoxy resin coatings; a major constituent in leather finishes; odorant; as an anti-blushing agent for

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

nitrocellulose lacquers.

Shipping regulations: None.*

methylhydrazine CH_3NHNH_2 .

Properties: Colorless hygroscopic liquid; sp. gr. 0.874 (25°); m. p. -52.4°C; b. p. 87.5°C. Slightly soluble in water; soluble in alcohol and ether.

Uses: Missile propellant; intermediate, solvent.

Shipping regulations: Flammable liquid.

Red label.*

methyl hydride. See methane.

methyl hydrogen sulfate. See methylsulfuric acid.

17-alpha-methyl-17-beta-hydroxyandrosta-1,4-dien-3-one. See methandrostenolone.

methyl-para-hydroxybenzoate. See methylparaben.

methylhydroxybutanone (3-methyl-3-hydroxy-2-butanone) $(\text{CH}_3)_2\text{COHCOCH}_3$.

Properties: Clear, colorless liquid with sweet, camphor-like odor; b. p. 140.3°C; freezing point -86.5°C; sp. gr. (20/20°C) 0.9553, refractive index (n_D 20/D) 1.4153; miscible with water, acetone, benzene, mineral spirits.

Containers: 7-, 40- and 440-lb drums.

Uses: Specialty solvent; chemical intermediate; flavor formulations.

1-methyl-2-hydroxy-4-isopropyl benzene

$\text{C}_6\text{H}_3(\text{CH}_3)(\text{OH})(\text{isoC}_3\text{H}_7)$. Used in food packaging. See isopropylcresols.

methylhydroxylisopropylcyclohexane. See menthol.

methyl 12-hydroxystearate. $\text{C}_{17}\text{H}_{34}\text{OHCOOCH}_3$.

Properties: White, waxy solid in the form of short flat rods; m. p. 48°C; acid value 4; saponification value 177; iodine value 5; insoluble in water, limited solubility in organic solvents.

Uses: Adhesives, inks; cosmetics; greases.

3-methylindole. See skatole.

beta-methylindole. See skatole.

methyl iodide (iodomethane) CH_3I .

Properties: Colorless liquid; turns brown on exposure to light; sp. gr. 2.24-2.27 (25/25°C), m. p. -66.1°C; b. p. 42°C, refractive index 1.526-1.527 (25°C). Soluble in alcohol and ether, insoluble in water.

Derivation: By the interaction of methyl alcohol, sodium iodide and sulfuric acid, with subsequent distillation.

Method of purification: Rectification.

Grades: Technical.

Containers: Amber-glass bottles and carboys, 90 lbs net, 120 lbs gross.

Caution: Burns skin; avoid contact.

Uses: Medicine; organic synthesis; in microscopy and in testing for pyridine.

methylionone (irone) $\text{C}_{14}\text{H}_{22}\text{O}$.

Properties: Colorless to amber-yellow liquid, with soft violet odors.

Grades: Several isomers are available, as alpha, beta, delta, gamma, and mixtures

of such. The constants vary according to the content of these isomers, but fall approximately within the following limits: Sp. gr. 0.926-0.939; refractive index 1.501-1.504; b. p. 144 (16 mm); soluble in alcohol; insoluble in water.

Derivation: Oil of orris.

Containers: Glass bottles, cans; drums.

Use: Perfumery.

Shipping regulations: None.*

gamma-methylionone. See "Cetone Alpha."

methyl isoamyl ketone (5-methyl-2-hexanone)

$\text{CH}_3\text{COC}_2\text{H}_4\text{CH}(\text{CH}_3)_2$.

Properties: Colorless, stable liquid; pleasant odor. Sp. gr. 0.8132 (20/20°C); b. p. 144°C; f. p. -73.9°C; wt/gal 6.77 lbs; flash pt. 110°F (open cup). Slightly soluble in water, miscible with most organic solvents.

Containers: Drums; tank cars.

Uses: Solvent for nitrocellulose, cellulose, acetate butyrate, acrylics, and vinyl copolymers.

methylisobutenylketone. See mesityl oxide.

methylisobutyl carbinol. (MIBC) See methylamyl alcohol.

methylisobutyl carbinol acetate. See methylamyl acetate.

methyl isobutyl ketone (hexone; 2-methyl-4-pentanone) $(\text{CH}_3)_2\text{CHCH}_2\text{COCH}_3$.

Properties: Colorless, stable liquid. Pleasant odor. Slightly soluble in water; miscible with most organic solvents. Sp. gr. 0.8042 (20/20°C); b. p. 115.8°C; f. p. -80.4°C; wt/gal 6.68 lbs (20°C); vapor pressure 15.7 mm (20°C); refractive index 1.3959 (20°C); surface tension 25.4 dynes/cm (25°C); viscosity 0.0059 poise (20°C); specific heat 0.496 cal/g (25°C); latent heat of evaporation 86.0 cal/g at b. p.; flash point 23°C (74°F), coefficient of expansion 0.00114 (per °C) to 20°C, 0.001170 (per °C) to 55°C; explosive limits % by volume in air: lower 1.4%, upper 7.5%.

Typical specifications: Acidity not more than 0.02% (as acetic); purity not less than 95% by weight, sp. gr. 0.799-0.804 (20/20°C); color water-white, boiling range (760 mm) below 111°C none, above 117°C none; average wt/gal 6.71 lbs (60°F).

Derivation: Mild hydrogenation of mesityl oxide.

Grades: Technical, 98.5%.

Containers: 1-, 5-gal cans, 55-gal drums, tank cars.

Uses: Solvent for nitrocellulose, certain types of cellulose ethers, camphor, oils, fats, waxes, and various natural and synthetic gums and resins; solvent mixtures for cellulose acetate, lacquers, finishes; lacquers; extraction processes; organic synthesis.

Warning: Flammable. MCA warning label.

Shipping regulations: Flammable liquid.

Red label.*

methylisoeugenol (propenyl guaiacol)
 $\text{C}_9\text{H}_8\text{C}_6\text{H}_3(\text{OCH}_3)_2$.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Properties:** Colorless to light-yellowish liquid, with spicy odor. Sp. gr. 1.050-1.053; b. p. 262-264°C; refractive index 1.566-1.569. Soluble in 2 parts of 70% alcohol.
- Containers:** Glass bottles; drums.
- Use:** Perfumery, for carnation and other types.
- methyl isonicotinate** $C_5NH_4COOCH_3$.
Properties: Clear amber to red liquid, mild odor, f. p. 145°C; sp. gr. 1.15 (20/20°C).
Use: Intermediate for synthesis of isonicotinic acid hydrazide.
- methyl isopropenyl ketone** $CH_3COC(CH_3)=CH_2$.
Properties: Liquid, sp. gr. 0.854 (20°C); undergoes polymerization and copolymerization readily.
Use: Plastics.
Shipping regulations: Flammable liquid. Red label.*
- methylisopropoxyfluorophosphine oxide.** See Sarin.
- methyl isopropyl ketone** (3-methyl-2-butanone) $CH_3COCH(CH_3)_2$.
Properties: A colorless liquid; b. p. 93°C, m. p. -92°C, refractive index (n_D¹⁶) 1.38788; density 0.815 (15/4°C), very slightly soluble in water; soluble in alcohol, ether.
Derivation: Synthetic, and also a fermentation by-product.
Warning: Flammable. MCA warning label.
- 5-methyl-2-isopropylphenol.** See thymol.
- methyl-para-isopropylphenyl propyl aldehyde.** See cyclamen aldehyde.
- methyl lactate** $CH_3CHOHCOOCH_3$.
Properties: Liquid. Miscible with most organic liquids, water. B. p. 144.8°C, m. p. (approx) -66°C, refractive index 1.4156 (20°C); flash point 51.7°C (125°F), wt/gal 9 lb (68°F).
Typical specifications: Purity not less than 95% ester, by weight, sp. gr. 1.087-1.097 (20/20°C); acidity not more than 0.15%, calculated as lactic acid, water no turbidity when one volume is mixed with 19 volumes of 60° Bé. gasoline (20°C), color water-white, distillation range below 115°C none, between 141°C and 145°C not less than 60%, above 155°C none.
Grades: Technical.
Containers: 1-gal cans, 5-, 55-gal steel drums.
Uses: Solvent for cellulose acetate, nitrocellulose, cellulose acetobutyrate, cellulose acetopropionate; lacquers; stains.
Shipping regulations: None.*
- methyl lactonitrile.** See acetone cyanohydrin.
- methyl laurate** (methyl dodecanoate) $CH_3(CH_2)_{10}COOCH_3$. The methyl ester of lauric acid.
Properties: Water-white liquid; sp. gr. 0.8702 (20/4°C); m. p. 4.8°C; b. p. 262°C (766 mm), 160°C (30 mm), refractive index 1.4301 (25°C). Insoluble in water; non-corrosive.
Typical specifications: 95% methyl laurate, remainder methyl caprate and methyl myristate; acid value less than 1; saponification number 260.
Derivation: From coconut oil.
Method of purification: Vacuum fractional distillation.
Grades: 69, 74, 90, 96, 99.8%.
Containers: Cans; drums; tank cars.
Uses: Intermediate for detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers, textiles.
- methyl lauroleate** $CH_3CH_2CH=CH(CH_2)_7COOCH_3$. The methyl ester of lauroleic acid.
Properties: Colorless liquid, insoluble in water, soluble in common organic solvents.
Grades: Purified product, 99.5%.
Uses: In medical research, organic synthesis and as a reference standard for gas chromatography.
- methyl lignocerate** (methyl tetracosanoate) $CH_3(CH_2)_{22}COOCH_3$. The methyl ester of lignoceric acid.
Properties: Waxlike solid. Insoluble in water, soluble in alcohol and ether; m. p. 57.8°C, b. p. 232°C (3.75 mm); refractive index 1.4283 (80°C).
Derivation: Esterification of lignoceric acid with methanol followed by vacuum distillation.
Grades: Purified (99.8%+).
Uses: Intermediate in special synthesis, medical research; reference standard in gas chromatography.
- methyl linoleate** $CH_3(CH_2)_4CH=CHCH_2CH=CH(CH_2)_7COOCH_3$. The methyl ester of linoleic acid (cis, cis-octadec-9, 12-dienoic acid).
Properties: Colorless oil, insoluble in water, soluble in alcohol and ether. Sp. gr. 0.8886 (18/4°C); m. p. -35°C, b. p. 212°C (16 mm), refractive index 1.4593 (25°C).
Derivation: Urea fractionation and vacuum distillation of methyl esters of safflower oil.
Grades: Technical, purified (99+%).
Uses: Intermediate for detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers, textiles.
- methyl linolenate** $CH_3CH_2CH=CHCH_2CH=CHCH_2CH=CH(CH_2)_7COOCH_3$. The methyl ester of linolenic acid (cis, cis, cis-octadec-9, 12, 15-trienoic acid).
Properties: Colorless liquid, insoluble in water, soluble in alcohol and ether. Sp. gr. 0.892 (20/4°C), m. p. less than 15°C; b. p. 207°C (14 mm), refractive index 1.4632 (40°C).
Derivation: Esterification and vacuum fractional distillation.
Uses: Organic synthesis and biochemical and medical research.
- methylmagnesium bromide** CH_3MgBr .
Properties: Solutions in ether. Flammable liquid.
Derivation: Reaction of magnesium and methyl bromide.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: Glass bottles; 5- and 55-gal drums.

Uses: Alkylating agent in organic synthesis; Grignard reagent.

Warning! Flammable!

Shipping regulations: Flammable liquid. Red label. *

methylmagnesium iodide CH_3MgI .

Properties: Solutions in ether. Flammable liquid.

Derivation: Reaction of magnesium and methyl iodide.

Containers: Glass bottles, 5- and 55-gal drums.

Uses: Alkylating agent in organic synthesis; Grignard reagent.

Warning! Flammable!

Shipping regulations: Flammable liquid. Red label. *

methylmaleic acid. See citraconic acid.

methylmaleic anhydride. See citraconic anhydride.

methyl margarate. See methyl heptadecanoate.

methyl mercaptan (methanethiol) CH_3SH .

Properties: Water white liquid when below boiling point, or colorless gas; powerful unpleasant odor, highly flammable, toxic. M. p. -121°C , density 0.87 (20°C); flash point below 0°C , b. p. 7.6°C ; insoluble in water, soluble in alcohol, ether, petroleum naphtha.

Grades: 98.0% purity.

Containers: 180-lb cylinders; tank cars.

Use: Synthesis.

Shipping regulations: Flammable gas. Red gas label. *

1-methyl-2-mercaptoimidazole. See methimazole.

methylmercury dicyandiamide. See cyanomethylmercuri guanidine.

methylmercury oxyquinolinolate

$\text{C}_9\text{NH}_4\text{OHgCH}_3$.

Properties: Brown solution. Pure compound not isolated.

Use: Seed fungicide.

methyl metaborate CH_3BO_2 . Used in fire extinguishers.

methyl methacrylate $\text{CH}_2\text{C}(\text{CH}_3)\text{COOCH}_3$.

An important monomer.

Properties: Colorless, mobile, volatile liquid, b. p. 101°C ; m. p. -48.2°C , sp. gr. ($25/25^\circ\text{C}$) 0.940; flash point (open cup) 85°F , slightly soluble in water; readily polymerized.

Derivation: Acetone cyanohydrin, methanol, and dilute sulfuric acid.

Grades: Technical (inhibited).

Containers: 440-lb drums, tank cars.

Uses: Polymers and copolymers. See also acrylate resins.

Warning! Flammable, may cause skin irritation. MCA warning label.

Shipping regulations: Flammable liquid. Red label. *

methyl methacrylate resins. See acrylate resins.

methylmethane. See ethane.

N-methyl methyl anthranilate. See dimethyl anthranilate.

methyl beta-methylthiopropionate. Material occurring in pineapple. Essential in constituting true pineapple flavor.

methylmorphine. See codeine.

N-methyl morpholine $\text{CH}_2\text{CH}_2\text{OCH}_2\text{CH}_2\text{NCH}_3$.

Properties: Water-white liquid. Forms constant boiling mixture with water containing 25% water and boiling at 97°C .

Miscible with benzene, water. Sp. gr. 0.921 ($20/20^\circ\text{C}$); b. p. 115.4°C .

Grades: Technical.

Containers: Glass bottles; tins; drums.

Uses: Catalyst in polyurethane foams; extraction solvent; stabilizing agent for chlorinated hydrocarbons; self-polishing waxes; oil emulsions; corrosion inhibitors; pharmaceuticals.

methyl myristate (methyl tetradecanoate)

$\text{CH}_3(\text{CH}_2)_{12}\text{COOCH}_3$. The methyl ester of myristic acid.

Properties: Colorless liquid at room temperature, m. p. 17.8°C ; b. p. 186.8°C (30 mm), 157.5°C (1 mm); refractive index 1.4351 (25°C). Insoluble in water.

Derivation: (a) Esterification of myristic acid with methanol, (b) alcoholysis of coconut oil with methanol.

Method of purification: Vacuum fractional distillation.

Grades: Technical (93%); purified (99.8+%).

Containers: 55-gal drums.

Uses: Intermediate for myristic acid, detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers, textiles, animal feeds.

methyl myristoleate

$\text{CH}_3(\text{CH}_2)_3\text{CH}=\text{CH}(\text{CH}_2)_7\text{COOCH}_3$.

The methyl ester of myristoleic acid (cis-tetradec-9-enoic acid).

Properties: Colorless liquid, insoluble in water, soluble in alcohol and ether. B. p. 108.9°C (1 mm).

Uses: Purified product used in medical research and organic synthesis.

alpha-methylnaphthalene $\text{C}_{10}\text{H}_7\text{CH}_3$. Colorless liquid derived from coal tar.

Properties: Sp. gr. 1.025; m. p. -22°C ; b. p. $240-243^\circ\text{C}$, insoluble in water; soluble in alcohol and ether.

Uses: Primary reference fuel in standardization of Diesel engine fuels; organic synthesis.

beta-methylnaphthalene $\text{C}_{10}\text{H}_7\text{CH}_3$.

Properties: Solid; sp. gr. 0.994 ($40/4^\circ\text{C}$); b. p. $241-242^\circ\text{C}$, m. p. 35.1°C , insoluble in water; soluble in alcohol and ether.

Derivation: From coal tar.

Grades: Technical, 95% min.

Containers: 1-, 5-, 55-gal drums.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Use: Organic synthesis; insecticides.
Shipping regulations: None.*
- methyl-beta-naphtholate.** See beta-naphthyl methyl ether.
- 2-methylnaphthoquinone.** See menadione.
- methyl naphthyl ether.** See beta-naphthyl methyl ether.
- methyl naphthyl ketone** $C_{10}H_7COCH_3$.
Properties: White crystalline material, with a sweet orange-blossom odor. Soluble in 5 parts of 95% alcohol.
Constant: Congealing point 53°C.
Containers: Glass bottles, fiber cans.
Use: Perfumery.
Shipping regulations: None.*
- methyl nicotinate** $C_5H_4NCOOCH_3$.
Properties: White to straw-colored crystals, darkening and becoming reddish on standing, f. p. 37.5°C min, mild pleasant odor.
Purity: 95% minimum.
- methyl nitrate** CH_3NO_3 .
Properties: Explosive liquid. B. p. 66°C, sp. gr. 1.217 (15°C), slightly soluble in water; soluble in alcohol and ether.
Derivation: By reaction of nitric acid and methanol in the presence of urea.
Use: Rocket propellant.
- methylnitrobenzene.** See nitrotoluene.
- methylnitrobenzol.** See nitrotoluene.
- methyl nonadecanoate** $CH_3(CH_2)_{17}COOCH_3$.
The methyl ester of nonadecanoic acid.
Properties: White waxy solid, m. p. 39.5°C, b. p. 190.5°C (3.75 mm), insoluble in water; soluble in alcohol and ether.
Grades: Purified 96%, 99.5%.
Uses: Intermediate in organic synthesis; medical research.
- 2-methylnonane** (isodecane) $(CH_3)_2CH(CH_2)_6CH_3$.
Properties: Colorless liquid; sp. gr. 0.728; m. p. -74.7°C; b. p. 167°C.
- methyl nonanoate** (methyl pelargonate) $CH_3(CH_2)_7COOCH_3$. The methyl ester of pelargonic acid.
Properties: Colorless liquid, m. p. -35°C, b. p. 213.5°C (760 mm), 82-84°C (11 mm), sp. gr. 0.877 (18°C), refractive index 1.4302 (25°C). Insoluble in water; soluble in alcohol and ether.
Derivation: Esterification of nonanoic (pelargonic) acid with methanol followed by fractional distillation.
Grades: Purified (96+%).
Uses: Reference standard for gas chromatography; intermediate in organic synthesis, medical research.
- methyl 2-nonenoate.** See "Neofolione."
- methylnonylacetaldehyde** (aldehyde C-12 MNA) $CH_3(CH_2)_8CH(CH_3)CHO$.
Properties: Colorless liquid, with strong odor of fatty-orange character. Soluble in 3 volumes of 80% alcohol.
Constants: Sp. gr. 0.824-0.828; refractive index 1.432-1.435.
Containers: Glass bottles.
- Use: Perfumery.
Shipping regulations: None.*
- methyl nonyl ketone** (2-undecanone) $CH_3COC_9H_{19}$.
Properties: Only liquid, strong odor. Soluble in 2 parts of 70% alcohol.
Constants: Sp. gr. 0.822-0.826, b. p. 225°C; refractive index 1.429-1.433.
Derivation: A ketone found in oil of rue, also made synthetically.
Containers: Glass bottles.
Use: Perfumery.
Shipping regulations: None.*
- methyl octadecanoate.** See methyl stearate.
- methyl octanoate.** See methyl caprylate.
- methyl 2-octynoate.** See "Folione."
- methylol dimethylhydantoin** $(CH_3)_2CN(CH_2OH)CONHCO$.
Properties: A white, odorless crystalline solid; m. p. 99-103°C, soluble in water, methanol, acetone; slightly soluble in ethyl acetate; insoluble in hydrocarbons, trichloroethylene, carbon tetrachloride and diethyl ether.
Uses: Textile and paper finishing; neutral source of formaldehyde.
- methyl oleate** $CH_3(CH_2)_7CH:CH(CH_2)_7COOCH_3$.
The methyl ester of oleic acid (cis-octadec-9-enoic acid).
Properties: Clear to amber liquid. Faint fatty odor. Soluble in alcohols and most organic solvents; insoluble in water, sp. gr. 0.8739 (20°C), m. p. -19.9°C; b. p. 218.5°C (20 mm); refractive index 1.4505.
Derivation: Esterification of oleic acid, vacuum fractional distillation; solvent crystallization.
Grades: Technical; purified 99+%.
Uses: Technical grades as intermediate for detergents, emulsifiers, wetting agents, stabilizers, textile treatment; plasticizers for duplicating inks, rubber, waxes, etc. Purified grade in biochemical research; chromatographic reference standard.
Shipping regulations: None.*
- methylol riboflavin.** A mixture of methylol derivatives of riboflavin (q. v.) exhibiting the same activity.
Properties: Orange to yellow hygroscopic powder; nearly odorless, soluble in water; nearly insoluble in alcohol, benzene, chloroform, and ether. It is dextrorotatory. The dry powder is unstable and upon standing loses biological activity due to the liberation of formaldehyde.
Derivation: Formed by the action of formaldehyde on riboflavin in weakly alkaline solutions.
Grade: N. N. D.
Use: Nutrition, medicine.
- methylol urea** $H_2NCONHCH_2OH$.
Properties: Colorless crystals; m. p. 111°C; soluble in water and methanol; insoluble in ether; capable of polymerization to synthetic resin.
Derivation: Combination of urea and form-

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

aldehyde, in the presence of salts or alkaline catalysts.

Containers: Fiber cans and drums.

Uses: The first stage in the formation of urea-formaldehyde resins; in molding adhesives; and in treating textiles and wood.

Shipping regulations: None.*

See also urea-formaldehyde resins.

methylol ureas. See methylol urea and dimethylol urea.

"Methylon." ²⁴⁵ Trademark for resinous compositions made from condensation products of substituted aromatic hydrocarbons and aldehydes used in the surface coating and protective arts.

methyl orange (para-(para-dimethylamino phenylazo)-benzene sulfonate of sodium; Helianthine B; orange III, gold orange; tropeolin D) $(\text{CH}_3)_2\text{NC}_6\text{H}_4\text{NNC}_6\text{H}_4\text{SO}_3\text{Na}$.

Properties: Orange-yellow powder, soluble in water, insoluble in alcohol.

Use: Acid-base indicator, red in acid, yellow-orange in alkaline, pH range 3.1-4.4. See indicators.

methyl-orthophosphoric acid. See methylphosphoric acid.

methyl oxide. See dimethyl ether.

methyl palmitate (methyl hexadecanoate) $\text{CH}_3(\text{CH}_2)_{14}\text{COOCH}_3$. The methyl ester of palmitic acid.

Properties: Colorless liquid; m. p. 29.5°C, b. p. 211.5°C (30 mm), 180.5°C (10 mm); refractive index 1.4310 (45°C). Insoluble in water, soluble in alcohol and ether.

Derivation: Esterification of palmitic acid with methanol or alcoholysis of palm oil. Vacuum distillation.

Grades: 80%; pure (99.8%).

Uses: Intermediate for detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers, textiles, animal feeds, medical research.

methyl palmitoleate

$\text{CH}_3(\text{CH}_2)_5\text{CH}:\text{CH}(\text{CH}_2)_7\text{COOCH}_3$. The methyl ester of palmitoleic acid (cis-hexadec-9-enoic acid). Colorless liquid, m. p. <15°C; b. p. 140-141°C (5 mm). Soluble in alcohol and ether, insoluble in water. Purified product used in organic synthesis, medical and biochemical research. Prepared by crystallization and vacuum fractional distillation.

methylparaben (methyl para-hydroxybenzoate) $\text{C}_8\text{H}_8\text{O}_3$.

Properties: Colorless crystals, or white crystalline powder; m. p. 125-128°C; odorless or faint characteristic odor; slight burning taste; soluble in water, alcohol, ether; slightly soluble in benzene and in carbon tetrachloride.

Grades: U. S. P. XVI.

Use: Medicine, food additive (preservative).

methyl parathion (O,O-dimethyl O-paranitrophenylphosphorothioate) $(\text{CH}_3\text{O})_2\text{P}(\text{S})\text{OC}_6\text{H}_4\text{NO}_2$. The methyl homolog

of parathion and accepted as a generic name by the Ent. Soc.

Properties: White crystalline solid; m. p. 35-36°C; sp. gr. 1.358 (20/4°C); refractive index 1.5515 (35°C). Slightly soluble in water; miscible in all proportions with acids and alcohols, esters and ketones. Slowly decomposed by acid solutions, rapidly in dilute alkalis. Toxicity similar though less than parathion.

Grades: Emulsifiable concentrates, wettable powders and dusts.

Containers: Drums.

Uses: Control of insects under approved conditions.

Danger! MCA warning label. Poisonous by skin contact, inhalation or swallowing; rapidly absorbed through skin; repeated exposure may, without symptoms, be increasingly hazardous.

Shipping regulations (dry or liquid): Poison, class B. Poison label.*

methyl pelargonate. See methyl nonanoate.

methyl pentadecanoate $\text{CH}_3(\text{CH}_2)_{13}\text{COOCH}_3$.

The methyl ester of pentadecanoic acid.

Properties: Colorless liquid. Insoluble in water; soluble in alcohol and ether. Sp. gr. 0.8618 (25/4°C); m. p. 18.5°C; b. p. 199°C (30 mm); index of refraction 1.4374 (25°C).

Grades: Reagent 96% and 99.5%.

Uses: Intermediate in organic synthesis; medical research.

methylpentadiene C_6H_{10} . Numerous isomers are possible. Commercially available mixture contains 2- and 4-methyl-1,3-pentadiene.

Properties: Sp. gr. 0.7184 (20/4°C); b. p. 75-77°C, flash point -30°F; reactive with halogens, hydrohalogens, sulfur dioxide and maleic anhydride. Caution! Highly flammable.

Containers: Glass bottles.

Uses: Organic synthesis, alkyd resins and other polymers.

Shipping regulations: Flammable liquid. Red label.*

2-methylpentaldehyde $\text{C}_7\text{H}_{14}\text{O}$.

Properties: Sp. gr. 0.8092; b. p. 118.3°C; f. p. -100°C; solubility in water 0.42% by weight; flash point 68°F.

Uses: Intermediates for dyes, resins, pharmaceuticals.

Shipping regulations: Flammable liquid. Red label.*

2-methylpentane (isohexane) $\text{CH}_3(\text{CH}_2)_2\text{CH}(\text{CH}_3)_2$.

Typical specifications: F. p. -244.62°F; b. p. 140.1°F; refractive index 1.372 (20°C); sp. gr. 0.658 (60/60°F); flash point -10°F. Grades: 95%, 99% and research.

Containers: 1-gal bottles; 5-gal drums.

Shipping regulations: Flammable liquid. Red label.*

See also isohexanes.

3-methylpentane (diethylmethylmethane)

C_6H_{14} or $\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)\text{CH}_2\text{CH}_3$.

Properties: Colorless liquid. Soluble in alcohol; insoluble in water; slightly soluble

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

in ether.

Constants: Sp. gr. 0.676 (20/4°C); b. p. 64.0°C; refractive index 1.37662 (20°C), C. S. T. aniline 69.3°C.

Grades: Technical (95%); 99%; and research. Containers: Glass bottles; drums.

Use: Organic synthesis.

Shipping regulations: Flammable liquid.

Red label.*

2-methyl-1,3-pentanediol

$C_2H_5CH(OH)CH(CH_3)CH_2OH$.

Properties: Sp. gr. 0.9745; b. p. 220.3°C; f. p. -30°C; infinitely soluble in water.

Uses: Solvent; coupling agent.

See also hexylene glycol, which is a mixture of isomers.

2-methyl-2,4-pentanediol

$CH_3CHOHCH_2COH(CH_3)CH_3$.

Properties: Colorless liquid. Completely miscible with water and most organic solvents including lower aliphatic hydrocarbons.

Constants: Sp. gr. 0.9235 (20/20°C), b. p. 197.1°C; viscosity 34 cps (20°C); vapor pressure 10.8 mm (95.2°C), 334 mm (169.7°C); flash point 94°C (open cup); wt/gal 7.59 lbs (20°C).

Uses: Coupling agent; chemical synthesis.

See also hexylene glycol, a mixture of isomers.

4-methyl-2,4-pentanediol. See hexylene glycol, a mixture of isomers.

2-methylpentanoic acid.

$CH_3CH_2CH_2CH(CH_3)COOH$.

Properties: Water white liquid; sp. gr. 0.9242 (20/20°C), b. p. 196.4°C, vapor pressure 0.02 mm (20°C), f. p. sets to glass below -85°C. Solubility in water 1.3% by wt (20°C); solubility of water in, 2.9% by wt (20°C).

Uses: Suggested for synthetic lubricants; plasticizers, vinyl stabilizers; metallic salts; alkyd resins.

2-methyl-1-pentanol $C_3H_7CH(CH_3)CH_2OH$.

Properties: Sp. gr. 0.8252; b. p. 148.0°C, vapor pressure 1.1 mm Hg (20°C), solubility in water 0.31% by weight; flash point 135°F.

4-methyl-2-pentanol. See methylamyl alcohol.

2-methyl-4-pentanone. See methyl isobutyl ketone.

2-methyl-1-pentene (1-methyl-1-propylethylene) C_6H_{12} or $CH_2=C(CH_3)CH_2CH_2CH_3$.

Properties: Colorless liquid; sp. gr. 0.6820 (20/4°C); b. p. 62.2°C; f. p. -19.139°C; refractive index 1.3925 (n 20/D); soluble in alcohol, acetone, ether, petroleum, coal-tar solvents; insoluble in water.

Typical specifications: Sp. gr. 0.6805-0.6835 (20/4°C); b. p. 61-63°C; refractive index 1.3915-1.3940 (n 20/D).

Grades: 95%, 99%; research.

Containers: Bottles.

Uses: Organic synthesis; flavors; perfumes; medicines; dyes; oils; resins; plastics.

4-methyl-1-pentene $H_2C:CHCH_2CH(CH_3)CH_3$.

Properties: Liquid; f. p. -244.7°F; b. p. 128.4°F; sp. gr. 0.6640 (20/4°C); refractive index 1.38265 (n 20/D); flash point -25°F.

Grades: 95%, 99%; research.

Containers: Up to one gallon bottles.

Shipping regulations: Flammable liquid.

Red label.*

4-methyl-2-pentene cis,trans mixture

(1-isopropyl-2-methylethylene) C_6H_{12} or $CH_3CH:CHCH(CH_3)_2$.

Properties: Colorless liquid; sp. gr. 0.670 (20/4°C); b. p. 55°C; refractive index 1.388 (n 20/D); soluble in alcohol, acetone, ether, petroleum, coal-tar solvents; insoluble in water.

Typical specifications: Sp. gr. 0.668-0.672 (20/4°C); b. p. 54-56°C; refractive index 1.388 (n 20/D).

Use: Organic synthesis.

Shipping regulations: Flammable liquid.

Red label.*

cis-4-methyl-2-pentene (low boiling 4-methyl-2-pentene) $H_3CCH:CHCH(CH_3)_2$.

Properties: Liquid, f. p. -211.7°F; b. p. 133.2°F; sp. gr. 0.674 (60/60°F); flash point approximately -25°F.

Containers: Up to one gallon bottles.

Grades: 95%, 99%; research.

Shipping regulations: Flammable liquid.

Red label.*

trans-4-methyl-2-pentene (high boiling 4-methyl-2-pentene) $H_3CCH:CHCH(CH_3)_2$.

Properties: Liquid, f. p. -221.6°F; b. p. 137.1°F, sp. gr. pure compound 0.6688 (20/4°C); sp. gr. technical grade 0.674 (60/60°F), vapor pressure 7.1 psia, flash point -30°F.

Grades: 95%, 99%; research.

Containers: Up to one gallon bottles.

Shipping regulations: Flammable liquid.

Red label.*

methylpentynol $HC:CCOH(CH_3)CH_2CH_3$.

3-Methyl-1-pentyn-3-ol.

Properties: Colorless liquid; b. p. 121-122°C; m. p. -30.6°C; sp. gr. (20/20°C) 0.8721; refractive index (n 20/D) 1.4318, flash point (Tag open cup) 101°F. Moderately soluble in water; miscible with acetone, benzene, carbon tetrachloride, kerosene.

Containers: 7-, 35-, 385-lb drums.

Uses: Stabilizer in chlorinated solvents, viscosity reducer and stabilizer; electroplating brightener; intermediate in synthesis of hypnotics and isoprenoid chemicals such as vitamin A, ionone and perfume alcohols; solvent for alcohol-soluble nylon and polyamide resins.

methylphenethylamine. See amphetamine.

methylphenidate hydrochloride (methyl-alpha-phenyl-2-piperidineacetate hydrochloride)

$C_{14}H_{19}NO_2 \cdot HCl$.

Properties: Crystals; decompose 195°C.

Soluble in water.

Grade: N. N. D.

Use: Medicine.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

methylphenol, 2-, 3-, or 4-. See ortho-, meta- or para-cresol respectively.

methyl phenylacetate $C_6H_5CH_2COOCH_3$.

Properties: A colorless liquid having a fine honey-like odor. Soluble in 5 parts of 60% alcohol.

Constants: Sp. gr. 1.062-1.066; refractive index 1.506-1.509.

Containers: Glass bottles, 1-, 5- and 10-gal tins; 55-gal steel drums.

Uses: Perfumery; flavors for tobacco.

Shipping regulations: None.*

methyl phenyl carbinol. See styralyl alcohol.

methyl phenyl carbonyl acetate. See styralyl acetate; see also "Gardenol."

methylphenyldichlorosilane $CH_3(C_6H_5)_2SiCl_2$.

Properties: Colorless liquid; b. p. $82^\circ C$ (13 mm); sp. gr. 1.19.

Derivation: From chlorobenzene Grignard reagent and methyltrichlorosilane, or from benzene and methyldichlorosilane.

Uses: Manufacture of silicones.

methyl phenyl ether. See anisole.

3-methyl-3-phenylglycidic acid ethyl ester.

See ethyl methylphenyl glycidate.

2-methyl-2-phenylpropane. See tert-butylbenzene.

3-methyl-1-phenyl-5-pyrazolone. See 1-phenyl-3-methyl-5-pyrazolone.

6-methyl-2-phenylquinoline-4-carboxylic ethyl ester. See neocincophen.

N-methyl-2-phenylsuccinimide. See phen-suximide.

2-methyl-9-phenyl tetrahydro-1-pyridindene bitartrate. See phenindamine tartrate.

methylphloroglucinol (2,4,6-trihydroxytoluene) $C_6H_2(OH)_3CH_3$.

Properties: Cream to light tan, fine crystals, odorless; m. p. $210-214^\circ C$, soluble in water, alcohol, and ether; insoluble in benzene.

Containers: Bottles, fiber drums.

Uses: A very reactive coupling agent, potential dye and plastic intermediate.

Shipping regulations: None.*

methylphosphoric acid. (methyl orthophosphoric acid) $CH_3H_2PO_4$.

Properties: Pale straw-colored liquid, sp. gr. 1.42 ($25^\circ C$), can be neutralized with alkalis or amines to give water-soluble salts.

Purity: 97% with remainder being orthophosphoric acid and methyl alcohol.

Containers: Glass bottles; 1-, 5- and 10-gal tins; 55-gal steel drums.

Uses: Textile and paper processing compounds; catalysts in urea-resin formation; polymerizing agents for resin and oils; rust remover; soldering flux; chemical intermediate.

Shipping regulations: None.*

N-methyl piperazine $CH_3NCH_2CH_2NHCH_2CH_2$.

Properties: Liquid; sp. gr. 0.9038; b. p. $138.0^\circ C$, f. p. $-6.4^\circ C$; infinitely soluble in

water; flash point $108^\circ F$.

Uses: Intermediate for pharmaceuticals, surface agents, synthetic fibers.

2-methylpiperidine (2-pipecoline)

$C_5NH_{10}CH_3$.

Properties: Liquid; b. p. $118.2^\circ C$; f. p. $-4.2^\circ C$; sp. gr. 0.8401 ($20/20^\circ C$); refractive index 1.4457 ($n_{20/D}$); soluble in water in all proportions at $20^\circ C$.

6-alpha-methylprednisolone-21-acetate.

Properties: M. p. $205-208^\circ C$.

Use: Medicine (steroid).

methylprednisolone sodium succinate. A corticosteroid.

2-methylpropane. See isobutane.

2-methylpropanenitrile. See isobutyronitrile.

2-methyl-1-propanethiol. See isobutyl mercaptan.

2-methyl-2-propanethiol. See tert-butyl mercaptan.

2-methyl-1-propanol. See isobutyl alcohol.

2-methyl-2-propanol. See tert-butyl alcohol.

2-methylpropanoyl chloride. See isobutyroyl chloride.

2-methylpropene. See isobutene.

2-methyl-2-propen-1-ol (methallyl alcohol)

$H_2C=C(CH_3)CH_2OH$.

Properties: Colorless liquid; sp. gr. 0.8515 ($20/4^\circ C$); b. p. $110-116^\circ C$, soluble in water, alcohols, ethers.

Uses: Suggested as intermediate for pharmaceutical, insecticide, dyestuff; perfume, flavor, resin, plastics, and rubber products

methyl propionate $CH_3CH_2COOCH_3$.

Properties: Clear, colorless liquid. Soluble in most organic solvents, somewhat soluble in water.

Constants: Sp. gr. 0.937 ($4^\circ C$); boiling range $78.0-79.5^\circ C$, flash point $-2^\circ C$; wt/gal 7.58 lbs.

Grades: Technical.

Containers: 55-gal drums; tank cars.

Uses: Solvent for cellulose nitrate; solvent mixtures for cellulose derivatives, lacquers, paints, varnishes; coating compositions.

Shipping regulations: Flammable liquid.

Red label.*

2-methyl-2-propylaminopropyl benzoate hydrochloride. See meprylcaine hydrochloride.

methylpropylbenzene. See cymene.

methyl propyl carbinol. See 2-pentanol.

methyl propyl carbinol urethane. See hedonal.

methyl n-propyl ether $CH_3OCH_2C_2H_5$.

Properties: Colorless liquid; b. p. $37^\circ C$; sp. gr. 0.738 ($20^\circ C$); soluble in alcohol and ethyl ether. Slightly soluble in water.

Use: Of possible use as an anesthetic.

1-methyl-1-propylethylene. See 2-methyl-1-pentene.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

methyl propyl ketone (ethyl acetone, 2-pentanone; MPK) $\text{CH}_3\text{COC}_3\text{H}_7$.

Properties: Water-white liquid. The commercial material consists of a mixture of methyl propyl and diethyl ketones in the approximate ratio of 3 to 1 and contains at least 97% of these ketones, the balance being sec-amyl alcohol. Soluble in alcohol and ether; insoluble in water.

Constants: Sp. gr. 0.809 (20/20°C); b. p. 101.7°C; refractive index 1.3895 (20°C); viscosity 0.473 centipoise (25°C); flash point 45°F (7.2°C) (closed cup).

Typical specifications: Color water-white; water-miscible without turbidity with 19 vols of 60° Bé gasoline (20°C); acidity less than 0.003% (as acetic acid); distillation range more than 90% distills over between 100 and 103°C.

Grades: Technical.

Containers: Glass bottles, 1-, 5- and 10-gal tins; 55-gal steel drums.

Uses: Solvent; substitute for diethyl ketone.

Shipping regulations: Flammable liquid. Red label.*

2-methyl-2-n-propyl-1,3-propanediol dicarbamate. See meprobamate.

2-methylpyridine. See alpha-picoline.

3-methylpyridine. See beta-picoline.

4-methylpyridine. See gamma-picoline.

N-methylpyrrole $\text{C}_4\text{NH}_4\text{CH}_3$.

Properties: Liquid; b. p. 112°C, f. p. -57°C, density 0.914 (20°C), refractive index 1.4898 (n_D¹⁷), flash point 61°F; slightly soluble in water.

Grade: 98% min. purity.

Containers: 55-gal steel drums, 1-gal, 5-gal cans.

Use: Organic synthesis.

Shipping regulations: Flammable liquid. Red label.*

N-methylpyrrolidine $\text{CH}_3\text{N}(\text{CH}_2\text{CH}_2\text{CH}_2)\text{CH}_2$.

Properties: Colorless liquid, ammonia-like odor, refractive index 1.4200 to 1.4230 (25°C).

N-methyl-2-pyrrolidone $\text{CH}_3\text{N}(\text{CH}_2\text{CH}_2\text{CH}_2)\text{CO}$.

Properties: M. p. -24°C, b. p. 202°C; flash point 204°F; miscible in all proportions with water, various organic solvents, castor oil.

Derivation: High pressure synthesis from acetylene and formaldehyde.

Uses: Solvent for resins, acetylene; petroleum processing; spinning agent for polyvinyl chloride; intermediate.

alpha-methylquinoline. See quinaldine.

gamma-methylquinoline. See lepidine.

methyl red $(\text{CH}_3)_2\text{NC}_6\text{H}_4\text{NNC}_6\text{H}_4\text{COOH}$.

para-Dimethylaminoazobenzenecarboxylic acid.

Properties: Dark-red powder or violet crystals, m. p. 180°C; insoluble in water; soluble in alcohol, ether, glacial acetic acid.

Use: Acid-base indicator in the range pH

4.2-6.2 (red to yellow).

See indicators.

methylresorcinol. See orcin.

methyl ricinoleate

$\text{CH}_3(\text{CH}_2)_5\text{CH}(\text{OH})\text{CH}_2\text{CH}(\text{CH}_2)_7\text{COOCH}_3$.
The methyl ester of ricinoleic acid.

Properties: Colorless liquid, insoluble in water; soluble in alcohol and ether. Sp. gr. 0.9236 (22/4°C); m. p. -4.5°C; b. p. 245°C (10 mm); refractive index 1.4628.

Derivation: Esterification of ricinoleic acid or alcoholysis of castor oil; purification by vacuum distillation.

Grades: Technical; purified (99+%).

Containers: 5-gal cans; 55-gal drums.

Uses: Plasticizer, lubricant; cutting oil additive; wetting agent.

methylrosaniline chloride. U. S. P. XVI name for methyl violet (q. v.).

methyl salicylate. Methyl salicylate U. S. P.

XVI may be derived either synthetically or naturally, as below, and official synonyms include gaultheria oil, wintergreen oil, betula oil, and sweet-birch oil.

$\text{C}_6\text{H}_4\text{HCOOCH}_3$.

Properties: Colorless, yellowish, or reddish liquid oil; odor of wintergreen; refractive index 1.535-1.538, sp. gr. 1.180-1.185; m. p. -8.3°C, b. p. 222.2°C; soluble in 7 parts of 70% alcohol; soluble in ether and in glacial acetic acid; sparingly soluble in water.

Derivation: By heating methanol and salicylic acid in presence of sulfuric acid, or by distillation from leaves of Gaultheria procumbens or bark of Betula lenta.

Method of purification: Rectification.

Grades: Technical; U. S. P. XVI.

Containers: 1-, 5-lb bottles; 10-, 55-gal tin-lined drums.

Uses: Medicine; flavoring; perfumery, solvent for cellulose derivatives; insecticides; polishes; printing and copying inks.

Shipping regulations: None.*

"Methyl Selenac." ⁶⁹ Trademark for proprietary product, selenium dimethyldithiocarbamate $[(\text{CH}_3)_2\text{NC}(\text{S})_2]_4\text{Se}$.

Properties: Yellow powder (also supplied in "rodform"); sp. gr. 1.58±.03; melting range 140-172°C; slightly soluble in carbon disulfide, benzene, chloroform; insoluble in water, dilute caustic, gasoline.

Uses: Vulcanizing agent, for natural and butyl rubbers and SBR. Primary accelerator in natural and butyl rubber and SBR. Secondary accelerator (with thiazoles) in natural rubber and SBR.

methyl silicone. General term for the most common and important variety of silicones, having composition $[(\text{CH}_3)_2\text{SiO}]_x$, $[(\text{CH}_3)_2\text{SiO}_3]_y$, etc., and having properties of oils, resins, or rubber according to the molecular size and arrangement.
See silicones and siloxanes.

methyl stearate (methyl octadecanoate)
 $\text{CH}_3(\text{CH}_2)_{16}\text{COOCH}_3$. The methyl ester of

*See 'I. C. C. Shipping Regulations,' page xiii.

Reference numbers refer to name of manufacturer. See 'List of Manufacturers,' page v.

stearic acid.

Properties: Colorless crystals; m. p. 37.8°C; b. p. 234.5°C (30 mm), 204.5°C (10 mm); refractive index 1.4328 (50°C). Insoluble in water; soluble in ether and alcohol.

Derivation: Esterification of stearic acid with methanol or alcoholysis of stearin with methanol.

Method of purification: Vacuum fraction distillation.

Impurities: Most technical methyl stearate is 55% stearate and 45% methyl palmitate. Grades: Distilled; pressed; technical; pure 99.8+%.

Containers: 1-, 7-, 35-lb cans; 210-, 380-, 400-lb drums.

Uses: Intermediate for stearic acid, detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers and textiles.

alpha-methylstyrene $C_6H_5C(CH_3)CH_2$.

Properties: Colorless liquid, subject to polymerization by heat or catalysts, b. p. 165.38°C (760 mm), m. p. -23.21°C; sp. gr. 0.9062 (25/25°C); viscosity 0.940 cps (20°C); flash point 136°F; fire point (COC) 136°F; refractive index 1.5359 (25/25°C); slightly soluble in water; lower explosive limit, vol 0.90%.

Typical commercial sample: alpha-methylstyrene 98.5-99.5%. A polymerization inhibitor such as tert-butyl catechol is usually also present.

Derivation: From benzene and propylene by use of aluminum chloride and hydrogen chloride to yield cumene which is then dehydrogenated.

Hazard: Contact with skin and breathing of vapors must be avoided.

Containers: Glass bottles, steel drums.

Use: Polymerization monomer.

Shipping regulations: None.*

methyl styryl ketone. See benzylidene acetone.

methylsuccinic acid. See pyrotartaric acid.

methyl sulfate. See dimethyl sulfate.

methyl sulfide. See dimethyl sulfide.

methylsulfonyl. See sulfonethylmethane.

methylsulfuric acid (acid methyl sulfate, methyl hydrogen sulfate) CH_3OSO_2OH or CH_3HSO_4 .

Properties: Oily liquid. Soluble in anhydrous ether; slightly soluble in alcohol, water.

Constants: B. p. 188°C; sp. gr. 1.352, f. p. -27°C.

Derivation: Interaction of methyl alcohol and chlorosulfonic acid.

Shipping regulations: None.*

N-methyltaurine. Available in commercial quantities as an aqueous solution of the sodium salt, sodium N-methyltaurate, or $CH_3NHCH_2CH_2SO_3Na$.

Properties (of solution): Clear, light-colored liquid, about 34-36% sodium salt, sp. gr. 1.21 (25/4°C). At freezing point (-28°C average) becomes a suspension of white

crystals.

Uses: Intermediate for detergents, dyestuffs, pharmaceuticals, and other organics.

methyltestosterone $C_{26}H_{36}O_2$. 17-Methyltestosterone. A synthetic androgenic steroid.

Properties: White or creamy white crystals or crystalline powder; odorless; stable in air, slightly hygroscopic; affected by light; m. p. 163-168°. Soluble in alcohol, methanol, ether, and other organic solvents; sparingly soluble in vegetable oils; insoluble in water.

Derivation: By organic synthesis.

Grade: U. S. P. XVI.

Containers: 100-g bottles.

Use: Medicine.

methyl tetracosanoate. See methyl lignocerate.

methyl tetradecanoate. See methyl myristate.

2-methyltetrahydrofuran $C_4H_7OCH_3$.

Properties: Colorless, mobile liquid; ether-like odor; b. p. 80.2°C (760 mm); f. p. -136°C; sp. gr. 0.854 (20/4°C); refractive index 1.4025 (25/D), flash point 12°F (Tag closed cup). Solubility in water 15.1 g/100 g water (25°C). Solubility in water increases with a decrease in temperature. Infinitely soluble in most organic solvents.

Containers: 1-, 5-, and 55-gal drums weighing 7, 35, and 375 lbs, respectively.

Uses: Chemical intermediate; reaction solvent.

Shipping regulations: Flammable liquid. Red label.*

methyltheobromine. See caffeine.

methyl 2-thienyl ketone. See 2-acetylthiophene.

meta-(methylthio)aniline. See meta-methylthioniline.

meta-methylthioniline (meta-(methylthio)aniline) $H_2NC_6H_4SCH_3$.

Properties: Pale yellow oil. Sp. gr. 1.140 (25°C), b. p. 163-165°C (16 mm); f. p.

-3.0°C. Insoluble in water, soluble in alcohol, benzene, acetic acid.

Use: Pharmaceutical intermediate.

methylthionine chloride. See methylene blue.

6-methyl-2-thio-4-oxypyrimidine. See 6-methylthiouracil.

6-methyl-2-thiouracil (6MT; 6-methyl-2-thio-4-oxypyrimidine) $HNC(S)NHC(O)CH_2CH_3$.

Properties: White, odorless crystalline powder with pronounced bitter taste; m. p. 326-331°C (dec); sublimes readily when heated in platinum dish; very slightly soluble in water; sparingly soluble in alcohol; slightly soluble in ether and chloroform; practically insoluble in benzene; freely soluble in ammonia and solutions of alkali hydroxides. Stable on heating in alkaline solution.

Grade: U. S. P. XVI.

Use: Medicine.

methyl para-toluate $CH_3C_6H_4COOCH_3$.

Properties: White crystalline solid.

Use: Organic synthesis.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

methyl para-toluenesulfonate $\text{CH}_3\text{C}_6\text{H}_4\text{SO}_3\text{CH}_3$.

Properties: Solidification point 24°C ; b. p. 157°C (8 mm); decomposes 262°C (760 mm).

Grade: 96% min.

Uses: Accelerator; methylating agent.

Caution: May cause skin irritations when handled.

methyl tolyl ketone. See methyl acetophenone.

methyltrichlorosilane CH_3SiCl_3 .

Properties: Colorless liquid. B. p. 66.4°C , sp. gr. 1.270 (25/25°C); refractive index (n 25/D) 1.4085, flash point (Cleveland open cup) 47°F . Readily hydrolyzed by moisture, with the liberation of hydrochloric acid.

Derivation: By Grignard reaction of silicon tetrachloride and methylmagnesium chloride.

Grade: Technical.

Use: Intermediate for silicones.

Shipping regulations: Flammable liquid. Red label.*

methyl tricosanoate $\text{CH}_3(\text{CH}_2)_{21}\text{COOCH}_3$. The methyl ester of tricosanoic acid.

Properties: White waxlike solid. Insoluble in water, soluble in alcohol and ether.

M. p. $55-56^\circ\text{C}$.

Grades: Purified 96% and 99.5%.

Uses: Intermediate in organic synthesis, medical research.

methyl tridecanoate $\text{CH}_3(\text{CH}_2)_{11}\text{COOCH}_3$. The methyl ester of tridecanoic acid.

Properties: Colorless liquid. Insoluble in water, soluble in alcohol and ether; m. p. 5.5°C ; b. p. $130-132^\circ\text{C}$ (4 mm); refractive index 1.4327 (25°C).

Derivation: Esterification of tridecanoic acid with methanol followed by fractional distillation.

Grades: Purified 96% and 99.5%.

Uses: Intermediate in organic synthesis, medical research, reference standard in gas chromatography.

methyl trimethylolmethane. See trimethylol ethane.

methyl-1, 2, 2-trimethylpropoxyfluorophosphine oxide. See Soman.

methyltrinitrobenzene. See trinitrotoluene.

"Methyl Tuads." ⁶⁹ Trademark for tetramethylthiuram disulfide, $[(\text{CH}_3)_2\text{NC}(\text{S})\text{S}]_2$.

Properties: Buff to light gray solid (also supplied in "rodform"); sp. gr. $1.27 \pm .03$, melting range $142-156^\circ\text{C}$; soluble in benzene, carbon disulfide, chloroform, insoluble in water, dilute caustic, gasoline.

Uses: Vulcanizing agent and primary accelerator in natural, nitrile and butyl rubbers and in SBR. As secondary accelerator in natural and nitrile rubbers and SBR. Use in coated fabrics, extruded and molded goods, inner tubes, wire and cable.

beta-methylumbelliferone (7-hydroxy-4-methylcoumarin; BMU) $\text{C}_{10}\text{H}_8\text{O}_3$.

Properties: White to light tan powder; m. p. $186-188^\circ\text{C}$, soluble in concentrated sulfuric

acid; partly soluble in ethanol, isopropanol, 5% aqueous sodium carbonate solution; very slightly soluble in water and white mineral oil; very dilute aqueous alkaline solutions give a bright blue-white fluorescence in daylight or ultraviolet light.

Grade: Technical.

Containers: 100 lb fiber drums.

Uses: As an optical bleach in soaps, starches, and laundry products; effective sunscreen in suntan lotions.

methyl undecanoate $\text{CH}_3(\text{CH}_2)_9\text{COOCH}_3$. The methyl ester of undecanoic acid.

Properties: Colorless liquid. Insoluble in water, soluble in alcohol and ether; b. p. 123°C (10 mm), refractive index 1.4270 (25/4°C).

Derivation: Esterification of undecanoic acid with methanol followed by fractional distillation.

Grades: Purified 96%; 99.5%.

Uses: Organic intermediate for synthesis, medical research.

5-methyluracil. See thymine.

methylvinylidichlorosilane $(\text{CH}_3)(\text{C}_2\text{H}_5)\text{SiCl}_2$.

Properties: Liquid, b. p. 92°C , sp. gr. 1.08 (25°C).

Derivation: From methylchlorosilane and acetylene or vinyl chloride.

Use: Manufacture of silicones.

methyl vinyl ether. See vinyl methyl ether.

2-methyl-5-vinylpyridine $\text{CH}_3\text{C}_5\text{NH}_3\text{CH}=\text{CH}_2$.

Properties: Clear to faintly opalescent colorless liquid; sp. gr. $0.978-0.982$ (20/20°C); b. p. 181°C (760 mm); refractive index $1.5400-1.5454$ (20°C).

Containers: Drum, tank trucks; tank cars.

Use: Synthesis.

methyl violet (gentian violet, methylrosaniline chloride, crystal violet). This term is most frequently applied to mixtures containing hexa- and pentamethylpara-rosaniline hydrochloride. Sometimes refers specifically to the hexamethyl derivative $(\text{C}_{25}\text{H}_{30}\text{ClN}_3)$.

Properties: Dark green powder or crystals with metallic luster. Soluble in water, alcohol, glycerin, chloroform, insoluble in ether.

Derivation: Dimethyl aniline and phosgene, or dimethyl aniline, cupric chloride and phenol.

Grades: U. S. P. XVI, as methylrosaniline chloride.

Uses: An acid-base indicator for the range pH 2-3.1, yellow in acid, violet in alkali; in medicine, textile dye, pigment in ink, carbon paper, typewriter ribbons.

methyl yellow. See dimethylaminoazobenzene.

"Methyl Zimate." ⁶⁹ Trademark for zinc dimethyldithiocarbamate, $[(\text{CH}_3)_2\text{NC}(\text{S})\text{S}]_2\text{Zn}$.

• Properties: White powder (also supplied as white rods and as pink rods); sp. gr. 1.71 ± 0.3 ; melting range $242-257^\circ\text{C}$; moderately soluble in dilute caustic, benzene, carbon disulfide, chloroform; insoluble in water, gasoline.

Uses: Primary accelerator, secondary

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

accelerator (with thiazoles) in natural and butyl rubber and in SBR. For extruded and molded goods, wire and cable, footwear and general mechanical goods.

methypylon (3,3-diethyl-5-methyl-2,4-piperidinedione) $C_5NH_4(O)_2(C_2H_5)_2(CH_3)$.
Properties: Nearly white, crystalline powder; slight characteristic odor; bitter taste; melting range $74^\circ-77^\circ C$; soluble in water; very soluble in alcohol, in chloroform, in ether, and benzene.
Grade: N. F. XI.
Use: Medicine.

"Meticortelone." ³²¹ Brand name for prednisolone (q. v.).

"Meticorten." ³²¹ Brand name for prednisone (q. v.).

"Metol." ¹³⁴ Trademark for methyl-para-aminophenol sulfate (q. v.).

metopon hydrochloride (6-methyldihydro-morphinone hydrochloride) $C_{18}H_{21}O_3N \cdot HCl$. A morphine derivative.
Properties: White, odorless, crystalline powder; very soluble in water, sparingly soluble in alcohol; slightly soluble in chloroform; very slightly soluble in ether, insoluble in benzene.
Use: Medicine.

"Metrazol." ⁹ Trademark for pentylenetetrazol (pentamethylenetetrazol).

"Metron." ⁸⁸ Trademark for an emulsible solution containing methyl parathion.

"Metso." ²⁰¹ Trademark for sodium metasilicate, sesquisilicate, orthosilicate and detergent mixtures based on these.

"Metubine Iodide." ¹⁰⁰ Trade name for dimethyl-tubocurarine iodide (O-methyl-d-tubocurarine iodide).
Properties: A white to pale yellow, odorless, crystalline powder; decomposes at $257^\circ C$; slightly soluble in water, dilute hydrochloric acid and dilute NaOH; very slightly soluble in alcohol, practically insoluble in benzene, chloroform, and ether.
Use: Medicine.

"Metycaine." ¹⁰⁰ Trademark for piperocaine hydrochloride, U. S. P.

mev. See electron volt.

Mexican scammony resin. See ipomea resin.

Mexican scammony root. See ipomea.

mexico seed. See ricinus.

Mg. Symbol for magnesium.

mg. Abbreviation for milligrams.

MH. See maleic hydrazide.

"MH-30." ²⁴⁸ Trademark for a 30% solution of maleic hydrazide (q. v.).
Properties: Water-soluble liquid containing 30% by weight of maleic hydrazide as the diethanolamine salt. Contains 3 lbs of maleic hydrazide per gallon.
Uses: To prevent sucker development on

tobacco; to control wild onions and garlic; to temporarily inhibit growth of grasses along highways; weed control on cranberries; to reduce freeze injury to citrus trees; chemical pruning of citrus trees; chemical thinning of peaches; as a preharvest spray to prevent potato sprouting in storage.

"MHA." ⁵⁸ Trademark for methionine hydroxy analogue, calcium salt (q. v.).

MHD generator. See magnetohydrodynamic generator.

MHM. Abbreviation for monohydroxymethane. See methanol.

miazine. See pyrimidine.

MIBC. Abbreviation for methylisobutyl carbino. See methylamyl alcohol.

mica. A group of silicates of varying chemical composition, but with similar physical properties and atomic structure. They all have an excellent cleavage, and can be split into very thin flexible elastic sheets. All contain hydroxyl, an aluminum silicate group, and an alkali. They are common in igneous and metamorphic rocks, and in some sedimentary rocks.
Commercially, mica usually refers to muscovite or phlogopite (q. v.).
See also lepidolite and vermiculite.

"Micabond." ²⁸¹ Trademark for an electrical insulation material consisting primarily of mica with electrical insulating binders.
Forms: Tape; tubing; segments; plate; fabricated parts.
Uses: Motors, insulation against heat.

"Micarta." ³⁰⁸ Trademark. A group of laminated plastics used as sheets, rods, tubes, and special molded shapes.
Properties: Various colors—usually black or brown; sp. gr. 1.25-1.80, tensile strength 8000-20,000 psi; compression strength 25,000-70,000 psi; dielectric strength up to 700 volts/ml. Insoluble and resistant to water, organic solvents, dilute alkalies, and non-oxidizing acids.
Composition: Paper or fabric of cellulose, glass, asbestos, or synthetic fibers bonded with phenolic or melamine resins and cured at elevated temperature and pressure.
Uses: Plating barrels; rayon-manufacturing equipment, pickling tanks, electric and thermal insulation; oil-handling equipment; steel rolling-mill bearings; chemical-handling valve bodies, paper-mill suction box covers and equipment.

mica schist. A variety of laminated metamorphic rock composed of mica with quartz, feldspar, and other silicate minerals. Sometimes used as a refractory material or to make ground mica for roofing.

mica, synthetic. Usually fluorophlogopite (a fluorine derivative of phlogopite), made by (a) treating potassium fluosilicate with alumina, under pressure and heat, or (b) melting basic oxides, fluorides and feldspar together. The product has higher

- temperature stability than natural mica, and its dielectric properties and machinability are about the same.
Uses: Electrical-electronic field.
- "Micatex."** ²³⁶ Brand name for mica prepared for addition to drilling fluids to reduce water loss to the formation and for overcoming mild losses of circulation. An effective seal is formed over mildly permeable formations when the mud in which it is entrained forces the material against the formation. Will not disintegrate appreciably, nor will it corrode or abrade slush-pump liners or other metal or moving parts of the mud system.
- Michler's hydrol.** See tetramethyldiaminobenzhydrol.
- Michler's ketone.** See tetramethyldiaminobenzophenone.
- "Micratized."** ³⁰⁹ Trademark for a vitamin-containing product for fortifying foods and feeds with vitamins.
- "Micris."** ¹⁰¹ Trademark for petroleum hydrocarbon waxes that are selectively processed from residual petroleum stocks to produce amorphous type microcrystalline waxes.
Uses: Waterproofing, insulating, sealing, and preserving coatings in the paper, textile, electrical and packaging trades; components of paint, ink, and polish.
- micro-** Prefix meaning 10^{-6} units (symbol μ).
 E. g., 1 microgram = 0.000001 grams.
- microballoons.** Tiny vinyl plastic spheres which are used to form a protecting layer over liquid surfaces, such as oils in big tanks, to reduce evaporation.
- "Micro-Cel."** ²⁴⁷ Trademark for line of finely divided hydrated synthetic calcium silicates.
Properties: White to light gray color range dependent on grade. Density (apparent) 5-10 lbs/cu ft, pH 7-10, absorption (water) 300-600%.
Uses: Inert extenders, absorbents; bulking agents; pesticide-carrier inerts.
- microchemistry.** The branch of chemistry that deals with procedures that require the handling of very small quantities of materials. Various common chemical operations such as weighing, preparation and purification, analysis, testing, are carried out on a scale ten to thousands of times smaller than is possible by ordinary laboratory procedures.
- microcidine.** See sodium beta-naphtholate.
- microcosmic salt.** See sodium-ammonium phosphate.
- microcrystalline waxes.** See waxes, microcrystalline.
- microcurie.** See curie.
- "Micro-dritomic."** ⁵⁰ Trademark for a micron-fine wettable sulfur agricultural fungicide.
- microencapsulation.** The production of a material in very small capsules, about 20 to 150 microns in diameter. Gelatin is widely used as the encapsulating agent. The process is used for adhesives, carbon for carbon paper, and many volatile, toxic, or odorous substances. The advantage is that the capsules remain stable and inert until broken down by heat or pressure.
- microfractor.** A type of multistage molecular fractionation apparatus.
- microlite** $(\text{Na}, \text{Ca})_2\text{Ta}_2\text{O}_6(\text{O}, \text{OH}, \text{F})$. A natural hydrous oxide of sodium, calcium and tantalum, found in pegmatites. Commonly contains some niobium also.
Properties: Color yellow, brown, red, green; streak yellowish or brownish; luster vitreous; hardness 5-5.5; sp. gr. 4.2-4.4. Isomorphous with pyrochlore.
Occurrence: New Mexico, California, Connecticut, Virginia, Europe.
Use: Ore of tantalum.
- "Microliths."** ⁴⁴³ Trade name for pigment dispersions for organic coatings, inks and plastics.
- "Micromet."** ¹⁰⁸ Trademark for a specially formulated phosphate glass, slowly soluble in water, and used to inhibit scale, corrosion, and red water in water systems and air conditioning systems.
- micron.** Short unit of length in the metric system. One millionth of a meter; 10^{-4} centimeter, 10^{-3} millimeter (a meter is 39.37 inches).
- "Micronex."** ¹³³ Trademark for series of impingement carbon blacks produced from natural gas. Used to obtain good tensile strength and abrasion resistance, cracking and tear resistance and safe processing. Used primarily in natural rubber truck treads and carcasses, mining cable covers and wire jacket compounds, camel back and heavy duty footwear. Grades available are Standard Micronex (medium processing channel); Micronex W-6 (easy processing channel). Available in 25- and 50-lb bags and hopper cars.
- microscopic cross section.** See cross section; see also macroscopic cross section.
- "Microsols."** ⁴⁴³ Trade name for pigment dispersions for aqueous applications.
- "Microthene."** ¹⁹² Trademark for a series of finely divided polyethylene resins. Used for coating and molding.
- "Microthion."** ⁴¹² Trademark for thiostrepton (q. v.).
- Microtraps.** ²⁴¹ Tailored zeolites. A family of crystalline aluminosilicates with a three dimensional network structure of silica and alumina tetrahedra characterized by a repeating three dimensional network of large, open aluminosilicate "cages" interconnected by smaller uniform sized pores. This structure makes the Microtraps excellent desiccants, with capacities less

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

sensitive to relative saturation and elevated temperatures than most common adsorbents.

This structure also provides the unique ability to adsorb small molecules within the "cages" while excluding larger molecules that will not pass through the pores. They can effect sharp, selective separation of molecules on the basis of size or shape.

Three types, with pores of 4A, 5A, and 13A are available in various forms:

4-8 and 8-12 mesh beads, 8-14 and 14-30 mesh granules, and fine powder.

Containers: 5-, 25-, 50-, 100-lb air tight cans.

middle chrome. See chrome yellows.

middle oil. See carboic oil.

middlings. The granular part of the interior of the wheat berry obtained in the process of milling. This product, when reduced by grinding to the desired fineness, produces the finest quality of flour. See also sharps.

"Midicel." ³³⁰ Trademark for sulfamethoxy-pyridazine (q. v.).

Grade: U. S. P.

Use: Medicine.

"Migral." ³⁰¹ Trademark for a combination of ergotamine tartrate chlorcyclizine hydrochloride and caffeine (q. v.).

migration area. A term used in nuclear technology as a measure of the moderation or slowing down of neutrons. It is one sixth of the mean square distance a neutron travels before thermal capture.

"Mike" Sulfur. ²³³ Brand name for agricultural sulfur with average particle size 3 to 4 microns.

mil. One thousandth (0.001) of an inch.

mildew preventives. Compounds used to prevent the growth of parasitic fungi, usually stain-producing, on such organic materials as textiles, leather, paper, farinaceous products, etc. Compounds most widely employed include cresols, phenols, benzoic acid, formaldehyde and organic derivatives or salts of copper, zinc and mercury.

milfoil. See achillea.

"Milibis." ¹⁶² Trademark for glycobarsol.

milk acid. See lactic acid.

milk glass. Translucent or nearly opaque milk-colored glass produced by adding calcium fluoride and alumina to an ordinary glass.

milk of bismuth. See magma.

milk of iron. See magma.

milk of lime. Calcium hydroxide suspended in water. See magma.

milk of magnesia. See magnesia magma; magnesium hydroxide.

milk of sulfur. See sulfur, lac.

milk sugar. See lactose.

"Millicot." ⁵¹ Trademark for lubricating oils primarily designed for packaging machinery and textile mill equipment requiring an economical, non-spattering, non-creeping product. Several grades contain special film strength additive.

"Millical." ²⁴⁴ Brand name for calcium carbonate.

Properties: Oil absorption, 58-62; density as shipped, 38-42 lbs/cu ft; wt/solid gal, 22.07 lbs; color, light cream white; particle size, 1 micron approx.

Derivation: Precipitated calcium carbonate. Containers: Multi-wall paper bags, 50 lbs net.

Uses: Rubber, plastics, drawing compounds.

millicurie. See curie.

milliliter. A thousandth of a liter, which is the volume occupied by one kilogram of pure water at 4°C and 760 mm pressure. One milliliter (ml) equals 1.000027 cubic centimeters (cc).

millimicron (mμ). One-thousandth of a micron, or 10 angstrom units.

Millon's reagent. A reagent used in analytical work as a test for albumin. It is prepared by dissolving mercury in an equal weight of nitric acid of sp. gr. 1.41, diluting the solution to twice its volume, allowing to stand and then decanting the liquid from the precipitate.

millstone. See buhrstone.

"Milontin." ³³⁰ Trademark for phensuximide (q. v.).

milorganite. An activated sludge marketed in dry granular form by the Milwaukee sewage disposal plant. Contains 5-10% moisture, 6.5-7.5% ammonia, 2.5-3.5% available phosphoric acid, 3-4% total phosphoric acid.

Use: Fertilizer.

Milori blue. A name applied loosely to any of a number of the varieties of iron blue pigments. See iron blues.

mimetite $Pb_3(AsO_4)_3Cl$. A natural chloride and arsenate of lead.

Properties: Color yellow to yellowish brown, streak white, luster resinous to subadamantine, sp. gr. 7.24, hardness 3.5-4. Forms a continuous series with pyromorphite.

Occurrence: California, Arizona, Nevada, Europe.

Use: A minor ore of arsenic.

mimosa bark. See wattle bark.

min. Abbreviation for minimum.

"Minecoat." ³²³ Trademark for a coal tar coating for mine interiors.

"Mine Gel." ⁴¹³ Brand name applied to a series of semi-gelatin dynamites. Containers: Packaged in cartridges of 7/8" diameter and up, in 50-lb. shipping

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

cases.

Uses: Underground mining; quarrying; construction and general blasting.

Fire hazard: Dangerous.

Shipping regulations: Explosives. Red label.*

mineral black. Black pigments made by grinding and/or heating black slate, shale, slaty coal, coke and coal. Pigment for various inks, coatings, surface coatings, leather finishes, plastics, etc.

mineral blue. Applied loosely to any of a number of varieties of iron blue pigments, usually containing considerable extender such as alumina.

mineral butter. See antimony trichloride.

mineral caoutchouc. See elaterite.

mineral charcoal. See fusain.

mineral cotton. See mineral wool.

"Mineralead." ⁴¹ Trade name for a hot-pour, sulfur-based compound used to joint cast iron bell and spigot pipe.

mineral fat. See petrolatum.

mineral graphite. See talc.

mineral green. See copper carbonate.

mineral jelly. See petrolatum.

mineral oil. Any liquid product of petroleum within the viscosity range of products commonly called oils.

mineral oil, white. Synonym for petrolatum, liquid (q. v.).

mineral pitch. See asphalt.

mineral rouge. See rouge (1) and iron oxide reds.

mineral rubber.

1. A term applied to asphaltites such as gilsonite (q. v.) and grahamite (q. v.).

2. Blown asphalts (q. v.).

Constants: Sp. gr. 1.00; m. p. about 100°F.

Uses: Rubber compounding, flux for asphaltites; ingredient of protective coatings; paints.

mineral seal-oil. A distilled and refined oil, having a boiling range higher than kerosine, but lower than gas oil.

mineral spirits. See naphtha, painters'.

"Mineral Spirits No. 10." ²⁰⁰ Trade name for a petroleum solvent.

Properties: Water-white color; boiling range 310-377°F; sp. gr. 0.779 (60°F); wt/gal 6.49 lbs (60°F); flash point 103°F.

Containers: Drums, tank wagon, tank car.

Uses: Paint, varnish and enamel thinner, metal cleaning, degreasing, herbicidal spray.

mineral superphosphate. See superphosphate.

mineral thinner. See naphtha, painters'.

mineral turpentine. See naphtha, painters'.

mineral wax. See ozocerite and ceresin wax.

mineral wool (mineral cotton; silicate cotton; slag wool; rock wool). A mass of fine intertwined fibers formed by blowing air or steam through molten rock or slag. Poor conductor of heat and sound; fire- and insect-proof. Used for insulation, as a binder and filler for synthetic resin-, bonded panels; used for special structural and insulating purposes, filtering medium, fireproofing material.

minium Pb_3O_4 . Natural red oxide of lead. Found in Colorado, Idaho, Utah, Wisconsin. See also lead oxide, red.

minium, iron. A name sometimes given to hematite or ferric oxide.

"Min-U-Sil." ⁴³⁶ Trade name for micron-sized silica.

Properties: High silica, low iron content (99.9% pure SiO_2); closely controlled particle size distribution.

Grades: Available in four uniform grades; 5, 10, 15 and 30 micron.

Containers: 50-lb multiwall paper bags.

Uses: Semi-reinforcing filler in silicone rubber; improved ceramic raw material and filler in plastics, paints, wood fillers, etc.

"Mikon Sodium." ³²⁹ Trademark for sodium dipotrizoate (q. v.), a water-soluble x-ray contrast medium.

MIPA. Abbreviation for monoisopropanolamine. See isopropanolamine.

mirabilite $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$. A natural hydrated sodium sulfate corresponding to the crystallized sulfate sold commercially as Glauber's salt. White or faintly greenish color, vitreous luster. Contains 19.3% Na_2O , 24.8% SO_3 , balance water.

Constants: Sp. gr. 1.48, hardness 1.5-2.

Occurrence: United States (Indiana, Utah), Russia, Spain, Sicily, Chile, England, Italy.

Uses: See Glauber's salt.

"Mirasol Resins." ²²³ Proprietary products consisting of alkyd type resins. Epoxy resin esters are also marketed under this name.

Types: Available in all modifications including drying oils, semi-drying oils, non-drying oils, natural and phenolic resins.

Uses: Air-drying and baking finishes including architectural, lacquer, wrinkle, hammer and other industrial enamels; also printing inks and textile finishes.

"Miravar." ²²³ Proprietary products consisting of oleoresinous varnishes.

Uses: Industrial finishes and wrinkle enamels.

mirbane essence. See nitrobenzene.

mirbane oil. See nitrobenzene.

misch metal. The primary commercial form of mixed rare earth metal, prepared by the electrolysis of fused rare earth chloride mixtures. Misch metal contains 94-99% rare earth metals plus traces of calcium,

*See "I. C. C. Shipping Regulations," page xlii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

carbon, aluminum, silicon and iron.

A typical composition is 52% cerium, 18% neodymium, 5% praseodymium, 1% samarium, 24% others, including lanthanum. Lanthanum-enriched misch metal contains about 27% lanthanum. Some grades are nearly free of cerium. Ferrocium is an alloy of misch metal and iron.

Properties: Sp. gr. about 6.67; m. p. about 1200°F.

Form: Waffle-like plates weighing 40 to 60 lbs packed in oiled paper, immersed in oil, or painted with vinyl paint.

Uses: Lighter flints; in ferrous and non-ferrous alloys, imparting good low temperature impact resistance, reducing forge cracking and improving rolling properties when added to steels; improving fluidity, hot workability, oxidation resistance and strength when added to cast iron; increasing high temperature strength when added to aluminum and magnesium alloys; improving high temperature oxidation resistance when added to nickel alloys; and acting as a deoxidizer when used in copper and copper alloys, as a getter alloy.

"Misco 18-8." ²⁰⁹ Trade name for iron-based alloys with principal elements: nickel 10%, chromium 20%, silicon 1.25%, manganese 0.6%. Available in 5 grades. Carbon contents vary with the grades and for two of the grades an addition of 2.75% molybdenum is made.

"Misco CF 3": 0.03% max carbon, 0.50% max molybdenum.

"Misco CF 8": 0.08% max carbon, 0.50% max molybdenum.

"Misco CF 3M": 0.03% max carbon, 2.75% molybdenum.

"Misco CF 8M": 0.08% max carbon, 2.75% molybdenum.

"Misco CF 8C": 0.08% max carbon, columbium 10 x carbon %.

These alloys are used for castings in corrosion resistant service at sub zero, normal, and elevated temperatures. Each has its own particular advantages. CF3 is a low carbon grade (suitable for welding without heat treatment) with good corrosion resistance to strongly oxidizing corrosive media such as nitric acid. CF8 is commonly used for service at temperatures below -400°F, where it retains high impact resistance. CF3M and CF8M have good resistance to reducing corrosive media and enhanced resistance to sea water corrosion and pitting. CF3M and 8M are more resistant to weakly oxidizing media than the alloy without molybdenum. CF8C is used where welding in the field is necessary or for service at prolonged elevated temperatures in the range 800-1600°F, where columbium acts as a stabilizer for the carbon present in the alloy.

"Misco 20." ²⁰⁹ Trade name for a complex iron base alloy which contains the following alloying elements: 20% chromium, 29% nickel, 2.25% molybdenum, 3% copper. It has corrosion resistance to sulfuric

acid, in all concentrations, and to strongly reducing chemicals, superior to the 18-8 grades. It is also superior in hot chloride salt solutions and weak acids. Its resistance to nitric acid is similar to the 18-8 grades.

"Misco CA15." ²⁰⁹ Trade name for an iron base alloy with 12% chromium as the alloying element, with 0.15% carbon, 0.60% manganese, and 10% silicon as minor constituents.

The alloy has a ferritic structure and is hardenable to 350° Brinell and has good resistance to many organic media in relatively mild service. Varying carbon ranges are available and the alloy has some heat resistant applications.

"Misco CE30." ²⁰⁹ Trade name for an iron base alloy with 29% chromium, 9% nickel as alloys, 1% silicon, and 0.25% carbon as minor constituents. Good corrosion resistant alloy to such media as nitric acid, sulfuric acid, and most oxidizing acids. It is a two phase alloy as cast and can be used in the range 800°-1400°F without loss of corrosion resistance exhibited by 18-8 at these temperatures. Particularly adaptable to paper mill corrosion resistant castings.

"Misco HH." ²⁰⁹ Trade name for an iron base alloy with 25% chromium, 12% nickel as alloys, and 0.40% carbon, 0.60% manganese, and 1.5% silicon as minor constituents. Used primarily for high temperature applications up to 2000°F for its resistance to sulfur compounds in furnace gases originating from high sulfur fuels. Available in two grades:

Type 1, a partially ferritic grade, has good ductility at 1800°F;

Type 2, a fully austenitic alloy, has greater strength at high temperature but lower ductility.

"Misco HT." ²⁰⁹ Trade name for an iron base alloy with 35% nickel, 15% chromium as alloys, and 0.60% carbon, 0.60% manganese, and 1.75% silicon as minor constituents. Used in high temperature applications for temperatures up to 2050°F where strength and resistance to oxidation at those temperatures are required. Its use is restricted to nonhigh sulfur compound atmospheres.

"Misco HUC." ²⁰⁹ Trade name for an iron base alloy with 38% nickel, 18% chromium, and 1.5% columbium as alloys, and 0.50% carbon, 0.60% manganese, 1.50% silicon as minor constituents. It is used for greater strength applications than the HT grade with greater resistance to oxidation. Other elements may be added to increase the hot strength and the usual limit in temperature is 2100°F.

"Misco HW." ²⁰⁹ Trade name for a nickel base alloy with 60% nickel, 12% chromium, with 0.50% carbon, 0.60% manganese, and 20% silicon as minor constituents. The iron

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

content is approx 25%. It is used at high temperature and has good oxidation resistance up to 2050°. It is superior to HT alloy in its resistance to thermal shock. The alloy is magnetic. It is not recommended for high sulfur gas media.

"Misco HX." ²⁰⁹ Trade name for a nickel base alloy with 66% nickel, and 17% chromium, with 0.50% carbon, 0.60% manganese and 2.0% silicon as minor constituents. It is used in high temperature applications and has good oxidation resistance up to 2100°F. It is superior to HT alloys in its resistance to thermal shock. The alloy is nonmagnetic and is not recommended for high sulfur applications.

"Misco K." ²⁰⁹ An iron-base alloy which in addition to iron contains the following principal elements: nickel 20%; chromium 25%; silicon 1.5%; carbon 0.30%. This alloy finds usefulness as a general heat-resisting material showing excellent oxidation resistance at temperatures up to 2000°F together with excellent strength.

"Misco XM." ²⁰⁹ Trade name for an iron base alloy with 18% nickel, 16% cobalt, 22.5% chromium, 2.5% molybdenum, 2% tungsten, 0.5% columbium as alloys, and 0.6% manganese, 1.0% silicon, and 0.20% carbon as minor elements. Used for high strength requirements at temperatures up to 2200°F; is not so susceptible to sulfur compound attack as the nickel base alloys. It has approximately twice the strength of HT alloy at elevated temperatures.

"Miscrome 4." ²⁰⁹ An iron-chromium alloy, containing in addition to iron the following principal elements: chromium 12.5%; nickel under 0.80%, silicon 1.4%; manganese 1.0%, carbon 0.12%. This alloy exhibits good corrosion resistance to the milder types of environment such as atmospheric corrosion, oxidation resistance up to 1200°F, mild oxidizing acids, etc. It is useful as a material of construction where high room temperature strength and hardness is required in addition to corrosion resisting properties.

mispickel. See arsenopyrite.

"Mistron." ³⁸ Trademark for ultra-fine particle size magnesium silicates available in a variety of grades ranging in both chemical purity and particle size. Used in paints as an extender pigment for viscosity and gloss control. Finer grades used as a partial replacement for titanium dioxide in both paints and paper coatings. Excellent brightness, nonabrasiveness and ease of dispersion. Compatible in both oleo-resinous and latex emulsion coatings.

Uses: White reinforcing pigment in natural and synthetic rubbers; in blends with carbon black in rubber compositions.

miticide. A substance which kills mites, small animals of the spider class, among them

the European red mite and the common red spider which infest fruit trees.

mitis green. See copper acetoarsenite.

"Mitox." ²⁵³ Brand name for para-chlorobenzyl para-chlorophenyl sulfide. Used as a specific miticide or acaricide product.

mixed acid (nitrating acid). Any mixture of sulfuric and nitric acids used for nitrating, e.g., in the manufacture of explosives, plastics, etc. Standard mixed acid consists of 36% nitric acid and 61% sulfuric acid.

Danger: Causes severe burns; vapor extremely hazardous; may cause nitrous gas poisoning; spillage may cause fire or liberate dangerous gas. MCA warning label.

Shipping regulations: Corrosive liquid. White label.*

mixed lead alkyls. Mixtures containing various methyl and ethyl derivatives of tetraethyl lead and tetramethyl lead. Thus methyl triethyl lead, dimethyl diethyl lead and ethyl trimethyl lead may all be present with or without tetraethyl and tetramethyl lead. Used as antiknock agents in motor fuels.

mixture. A kind or sample of matter containing two or more substances that are not chemically united, and can therefore be separated by taking advantage of differences in their physical properties, such as solubility in a solvent, difference in boiling point or freezing point, etc.

MKP. Abbreviation for monopotassium phosphate. See potassium phosphate, monobasic.

ml. Abbreviation for milliliter.

MLA. Abbreviation for mixed lead alkyls (q.v.).

mm. Abbreviation for millimeter.

Mn. Symbol for manganese.

MnEBD. Abbreviation for manganese ethylene-bisdithiocarbamate. See maneb.

Mo. Symbol for molybdenum.

"Mobilcer." ³³¹ Brand name for a line of wax emulsions.

Uses: Sizes for paper, paperboard, particle board, textiles and cordage; binders in ceramics; carriers for pesticides; coating of fruits and vegetables; plasticizing of laundry starch; treatment of nursery stock; end-checking treatments for timber and lumber; in the manufacture of foam rubber and polymeric latex products; curing of concrete.

"Mobil-Kote." ³³¹ Brand name for a light oil used as a temporary corrosion-resistant film. Not suitable for outdoor storage or heavy-duty service.

"Mobilpar." ³³¹ Brand name for a number of emulsified, or emulsifiable petroleum products.

Uses: In the lubrication of textile fibers; as plasticizers for starch formulas in

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

the textile industry; as softeners and wetting-out agents in the paper and textile industries; and as foam control agents in aqueous processes.

"Mobil Sorbead Desiccants." ³³¹ Brand name for a line of bead desiccants.

Uses: For the removal of moisture from gases in static and dynamic systems; for the recovery of hydrocarbons from natural gas streams.

"Mobilwax." ³³¹ Brand name for petroleum waxes of both the paraffinic and micro-crystalline types.

"Moca." ²⁸ Trademark for methylene-bis-ortho-chloroaniline, $\text{CH}_2(\text{C}_6\text{H}_4\text{ClNH}_2)_2$.

Properties: Tan colored, coarsely-ground lumps; sp. gr. 1.39; m. p. 100-105°C; soluble in hot methyl ethyl ketone, acetone. Containers: 50-lb drums.

Use: Curing agent for "Adiprene" L urethane rubber, other urethane rubbers, and epoxy resins.

modacrylic fiber. Generic name for a manufactured fiber in which the fiber-forming substance is any long chain synthetic polymer composed of less than 85% but at least 35% by weight of acrylonitrile units, $-\text{CH}_2\text{CH}(\text{CN})-$ (Federal Trade Commission). Other chemicals such as vinyl chloride are incorporated as modifiers. Uses: Deep pile and fleece fabrics, industrial filters; carpets; underwear, blends with other fibers. See "Dynel."

"Mod-Epoxy." ⁵⁸ Trademark for modifier for epoxy resins. Reduces viscosity of liquid epoxy resins, accelerates cure, improves strength, electrical and adhesive characteristics. Used in tool and die manufacture; electric potting compounds; encapsulations; adhesives; surface coatings and body solders.

Containers: 5- and 55- gal drums.

moderator. A substance of low atomic weight such as beryllium, carbon (graphite) or deuterium (in heavy water) which is capable of reducing the speed of neutrons but which has little tendency toward neutron absorption. The neutrons lose speed when they collide with the atomic nuclei of the moderator. Moderators are used to adjust the speed of neutrons in nuclear fission reactors since slow neutrons are most likely to produce fission. A typical graphite-moderated reactor may contain 50 tons of uranium for 472 tons of graphite.

"Modicol." ³⁰⁹ Trademark for stabilizers for natural and synthetic latex, including:

"Modicol N." A nonionic, liquid fatty amide condensate used to improve chemical resistance and viscosity uniformity.

"Modicol S." An anionic, liquid sulfonated fatty product used to improve mechanical stability and resistance to acids.

modified sodas. See sodas, modified.

"Modiphats." ²⁵⁹ Trade name for the polyhydric alcohol esters of a series of fatty

acids.

Uses: Textile processing; plasticizers.

"Modulex" (HMF). ²⁸⁵ Proprietary brand name for high modulus furnace carbon black.

Properties: Sp. gr. 1.77; free-flowing pellets, (also available in fluffy, unpeletted form as "Modulex-UC"); bulk density 35 lbs/cu ft; particle diameter 65 millimicrons; pH 10.0; ash 0.75% max; 99.9% thru 325 mesh screen; color (Nigrometer) 95-96.

Containers: 50-lb paper bags or bulk.

Uses: As a reinforcing ingredient for compounding in natural and most synthetic rubbers, contributing to abrasion resistance, good tensile and tear strength; as a black coloring agent in rubber, paper, plastics, paint and ink.

"MODX." ⁹⁴ A proprietary mixture of inorganic and organic acetates containing 25% diphenylethylenediamine.

Properties: Cream colored granules, odorless; sp. gr. 1.34, m. p. indefinite - fluxes at milling temperature; ash 31-37%. Activates aldehyde amines, thiazoles and dithiocarbamates, imparts high modulus; stains very light-colored stock to slight extent, improves aging.

Containers: 300-lb drums.

Uses: As an activator and age resistor in compounding mechanicals, tire, tubes, heels, and soles, vulcanization leveler and activator with age-resisting properties for natural rubber, GR-S and Buna-N.

moellon degreas. See degreas, moellon.

"Mogul." ²⁷⁵ Trade name for a series of channel long-flow carbon blacks for use in inks. Available as:

"Mogul." Blackest mass-tone and high jet strength.

"Mogul Special." Longer flow and higher loading capacity than "Mogul."

"Mogul A." Longest flow black.

Mohr's salt. See ferrous-ammonium sulfate.

Mohs' scale. A scale of hardness of minerals, running from one to ten, with talc as the softest and diamond as the hardest. The hardness of a mineral is determined by which minerals of the scale will scratch it, and vice versa.

1. talc	6. orthoclase
2. gypsum	7. quartz
3. calcite	8. topaz
4. fluorite	9. corundum
5. apatite	10. diamond

Other useful hardnesses are: fingernail, a little over 2, penny, about 3, pocket knife, a little over 5, window glass 5.5; and a steel file 6.5.

The difference in hardness between corundum, H = 9, and diamond, H = 10, is greater than the difference between talc, H = 1, and corundum. A modified scale has been proposed in which quartz is 8, topaz 9, garnet 10, fused alumina 12, silicon carbide 13, boron carbide 14, and diamond 15.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

mol. Abbreviation for molecular.

"Molacco." ¹³³ Trademark for furnace carbon black characterized by blue tone and high loading capacity. Available in powdered and bead forms. Used in protective and decorative coatings and printing inks. Containers: In powdered form, 25-lb bags; bead form, 25- and 50-lb bags.

molar.

1. A molar solution is one that contains one molecular weight in grams (one mole) of its dissolved substance in one liter of solution.
2. Molar quantities are quantities proportional to the molecular weights of the substances concerned.

molasses. The definition of molasses varies in different countries, and in the United States it is not the same in the cane-sugar industry as in the beet-sugar industry.

In the raw cane-sugar industry in the United States molasses is defined as the syrupy mother liquor which is left after sucrose has been removed from sugar-cane juice by concentration, crystallization, and separation of the sugar crystals (usually in centrifugals). If only one crop of crystals has been removed, the mother liquor is termed "first molasses", if a second crop has been removed after reconcentration of the first mother liquor, the resulting product is termed "second molasses," and so on. The final mother liquor from which no more sugar can be extracted in factory practice by the above process is termed "final molasses," "blackstrap molasses," or briefly "black-strap."

The final mother liquor obtained in cane-sugar refineries is not termed molasses, but "refiner's syrup," or "barrel syrup."

In the United States beet-sugar industry only the final mother liquor, obtained after concentration, crystallization, and centrifugation of beet juice is termed "molasses." If the Steffen process of desugarization is practiced, the final mother liquor is known as "Steffen molasses."

There are large variations in the composition of different kinds of molasses or final mother liquors. Typical analyses, in round figures, are about as follows.

Per Cent	Cane Blackstrap	Beet Molasses	Barrel Syrup
Sucrose	30	50	35
Reducing sugars	20	trace	25
Ash	10	10	6
Organic non-sugars	20	20	14
Water	20	20	20

Uses: Food; feed; raw material for acetone and butanol, for citric acid, and especially for ethyl alcohol.

molasses, beet. See molasses.

molasses, lactose. Molasses obtained from the preparation of milk sugar.

molding sand. See foundry sand.

mole. A unit quantity in chemistry. An amount of a substance in grams (gram mole) or pounds (pound moles) which corresponds to the sum of the atomic weights of all the atoms appearing in the molecule. The spelling mol is also used but does not have official sanction.

molecular distillation (high vacuum distillation). Distillation at low pressures of the order of 0.001 mm. A molecular distillation is distinguished by the fact that the distance from the surface of the liquid being vaporized to the condenser is less than the mean free path (the average distance traveled by a molecule between collisions) of the vapor at the operating pressure and temperature. This distance is usually of the order of magnitude of a few inches. This process is useful in separation of extremely high boiling and heat-sensitive materials such as glycerides and some vitamins.

molecular formula. See formula, chemical.

molecular sandwich. A type of molecular structure in which a transition metal (one from the central part of the periodic table) lies between two aromatic rings such as $C_5H_5^-$, as in ferrocene.

See dicyclopentadienyl compounds.

molecular sieves. Zeolites or similar materials whose atoms are arranged in a crystal lattice in such a way that there are a large number of small cavities interconnected by smaller openings or pores of precisely uniform size. Normally these cavities contain water molecules, but upon heating, this water is driven off without any change in the remaining crystal lattice. The network of cavities and pores may occupy 50% of the total volume of the crystals.

Molecular sieves have a strong tendency to readsorb water. In the absence of water they will adsorb other molecules that are small enough to pass through the pores. These small molecules may thus be separated from a mixture with larger molecules.

A few natural zeolites exhibit molecular sieve characteristics to a limited degree. Synthetic zeolites are available in two sizes (pore openings 4 and 5 angstrom units in diameter) with high capacity for adsorption and regeneration even when used at elevated temperatures.

Uses: Drying gases such as air, hydrogen, natural gas, refinery gas, ethylene; drying liquids such as benzene, alcohols, hydrocarbons, fluorocarbons; separation of ethylene from carbon dioxide, carbon dioxide from annealing gas, hydrogen sulfide from natural gas, removal of normal paraffins from light naphthas. Also as a carrier for volatile, toxic, odoriferous, or reactive compounds, which can then be released by heat or displacement at the desired time and place. Materials that have been so

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

carried include organic and metallo-organic compounds, halogen elements, acid gases, water, perfume, catalysts, pesticides, fumigants, ripening agents, radioactive isotopes, blowing agents, antioxidants in rubbers and plastics.

molecular weight. The sum of the atomic weights of the atoms in a molecule. Thus the molecular weight of methane gas CH_4 is 16, the atomic weights being $\text{C}=12$, $\text{H}=1$. The chemical formula used in such a calculation must be the true molecular formula of the substance designated. For example, the molecular formula of ordinary oxygen is O_2 , and the molecular weight is 32 (atomic weight of $\text{O}=16$). For ozone the proper molecular formula is O_3 , and the molecular weight is 48. The true molecular weight of a gas or vapor is found in the case of a brand new compound by measuring the volume of a given weight and then calculating the weight of 22.4 liters at 0°C and 760 mm. For liquids and solids more complicated means must be used. Once the molecular weight is known, the correct molecular formula can be written.

"Molex" Process. ⁴¹⁶ Patented process employing molecular sieves to separate normal paraffins from mixtures with isoparaffins and other types of hydrocarbons. Products consist of a normal paraffin stream of high purity and a second stream containing the remaining hydrocarbons in the original mixture. The normal paraffins are excellent components of jet fuels or as raw materials for further chemical synthesis. The denormalized stream, if within the gasoline boiling range, will have higher antiknock quality than the original mixture containing the normal paraffins.

"Mollescal CA." ³⁰⁷ Brand name for a leather chemical; a combination of mild organic bases, wetting and antiseptic agents.

Properties: Clear, thin, brown liquid; sp. gr. 1.13-1.15; readily soluble in water.

Uses: Used in the leather trade to facilitate the soaking of dry hides and skins. This product retards putrefaction, aids in the emulsification and removal of fat, results in leather of smoother grain and firmer flanks.

"Mollisan AS." ³²⁸ A multipurpose lubricant and softener for textile finishing providing improved tear strength and abrasion resistance when used as an additive or topping treatment for urea or melamine resin finishes. It is effective as an anti-static agent for synthetics and enhances the sewability of resin-finished fabrics. Also a non-yellowing full-bodied softener for cottons; a yarn lubricant and anti-static; a napping assistant.

molucca grains. See tigilium.

"Moly." ⁶⁷ Trademark for a series of molybdenum-containing compounds used for seed treatment as a foliar spray, fertilizer

additive and for similar related uses.

molybdate chrome orange. See molybdate orange.

molybdate orange (molybdenum orange; molybdate chrome orange). An inorganic pigment which is a solid solution of lead chromate, lead molybdate, and lead sulfate. **Properties:** Fine dark orange or light red powder.

Derivation: By adding solutions of sodium chromate, sodium molybdate and sodium sulfate to a lead nitrate solution under carefully controlled conditions and filtering off the precipitate.

Containers: Barrels.

Uses: Printing inks; paints; plastics.

molybdenite (molybdenum glance) MoS_2 .

Natural molybdenum sulfide found in igneous rocks and metallic veins.

Properties: Color, bluish-lead gray; streak gray-black, luster metallic; one perfect cleavage; greasy feel, hardness 1-1.5; sp. gr. 4.6-4.8. Similar in appearance to graphite. Soluble in sulfuric and strong nitric acids.

Occurrence: Colorado, Utah, New Mexico; Canada, Europe; Australia; Mexico.

Use: Principal ore of molybdenum.

molybdenite concentrate. Commercial molybdenite ore after the first processing operations. Contains about 90% molybdenum disulfide along with quartz, feldspar, water, and processing oil.

molybdenum Mo. Metallic element of atomic number 42, in group VI of the periodic table.

Properties: Gray metal or black powder; of wide but not abundant distribution. It is a necessary trace element for some crops. See molybdenite and wulfenite. Insoluble in hydrochloric or hydrofluoric acid, ammonia, sodium hydroxide, or dilute sulfuric acid; soluble in hot concentrated sulfuric or nitric acids; insoluble in water. Sp. gr. 10.2, m. p. 2620°C ; high strength at very high temperatures.

Derivation: By aluminothermic, hydrogen, or electric furnace reduction of molybdic anhydride.

Forms available: Rods, wire, powder; ingots (from powder), high ductility sheets; concentrates; also as large single crystals.

Purity: Rods and wire 99.9%; powder 95%.

Containers: Wooden barrels; cartons.

Uses: Metallurgy (alloy steels); as wire (windings for electric resistance furnaces, construction of spider which supports tungsten filaments in some incandescent lamps, welded to "Pyrex" glass in construction of plate standards, grids and filament supports in radiotrons); as sheet in manufacture of some types of radiotrons; substitute for platinum in contact-making and breaking devices; points for spark plugs; certain parts of x-ray tubes and equipment; in molybdenum compounds, for plating other metals, and especially as

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

lubricants and catalysts, but also in fertilizers, pigments and dyes, metal finishing compounds, ceramic enamels and glazes, drugs, and reagents.

See also heteromolybdates.

Shipping regulations: None.*

molybdenum acetylacetonate $\text{Mo}(\text{C}_5\text{H}_7\text{O}_2)_n$.

Crystalline powder. Slightly soluble in water. Resistant to hydrolysis. A chelating non-ionizing compound.

molybdenum aluminide. A cermet which can be flame-sprayed.

molybdenum anhydride. See molybdenum trioxide.

molybdenum boride MoB . Powder used extensively by electronics industry for metal brazing.

molybdenum dioxide MoO_2 .

Properties: Lead-gray, non-volatile powder, insoluble in hydrochloric and hydrofluoric acids; sparingly soluble in sulfuric acid and in bases; sp. gr. about 6.4.

Derivation: Reduction of molybdenum trioxide or molybdates by hydrogen; partial oxidation of metallic molybdenum.

molybdenum disilicide MoSi_2 . A cermet.

Powder, not affected by air up to 3000°F, not attacked by most inorganic acids, including aqua regia. Has high stress-rupture strength. Available as cylinders, lumps, granules and powder, may be coated on materials by vapor deposition and by flame spraying. Forms oxidation-resistant coatings. Used in electrical resistors.

molybdenum disulfide (molybdc sulfide, molybdenum sulfide) MoS_2 . See also molybdenite.

Properties: Black, lustrous powder; sp. gr. 4.80, m. p. 1185°C; soluble in aqua regia, sulfuric acid (conc), insoluble in water.

Derivation: Purification of molybdenite, by the reaction of sulfur or hydrogen sulfide on molybdenum trioxide.

Uses: Lubricants in greases, oil dispersions, resin-bonded films, dry powders, etc., especially for use at extreme pressures and high vacua, also used as a hydrogenation catalyst.

molybdenum glance. See molybdenite.

molybdenum hexacarbonyl $\text{Mo}(\text{CO})_6$.

Properties: White shiny crystals, decomposing at 150°C without melting, sp. gr. 1.96, b. p. about 155°C; vapor pressure at 20°C about 0.1 mm Hg, at 101°C about 43 mm Hg; insoluble in water; soluble in ceresin, paraffin oil, benzene, aminoanthraquinone; slightly soluble in ether and other organic solvents.

Derivation: From molybdenum pentachloride by reaction with zinc dust and carbon monoxide in ether at high pressures.

Uses: Plating molybdenum, i. e., molybdenum mirrors.

Shipping regulations: None.*

molybdenum hexafluoride MoF_6 .

Properties: White crystalline compound; m. p. 17.5°C; b. p. 35°C; sp. gr. (liq.) about 2.5. Reacts readily with water.

Derivation: Direct action of fluorine on molybdenum metal.

Uses: Important in the separation of molybdenum isotopes.

molybdenum lakes. See phosphomolybdic pigments.

molybdenum orange. See molybdate orange.

molybdenum III oxide. See molybdenum sesquioxide.

molybdenum oxides. See molybdenum sesquioxide; molybdenum dioxide; molybdenum trioxide.

molybdenum pentachloride MoCl_5 .

Properties: Green-black solid; dark red as liquid or vapor; m. p. 194°C; b. p. 268°C; sp. gr. 2.9. Hygroscopic, reacting with water and air; soluble in dry ether, dry alcohol, and other anhydrous organic solvents.

Derivation: Direct action of chlorine on finely divided molybdenum metal.

Uses: Intermediate in preparation of molybdenum hexacarbonyl which in turn is used for making molybdenum mirrors; as general intermediate; as catalyst; for spraying molybdenum coatings.

molybdenum sesquioxide (dimolybdenum trioxide, molybdenum III oxide) Mo_2O_3 . Known only in the hydrated form, $\text{Mo}(\text{OH})_3$, although commonly assigned the formula Mo_2O_3 . A compound formed by a dry reaction of molybdenum and oxygen which approximates the composition of the sesquioxide is probably a mixture of molybdenum and molybdenum dioxide.

Properties: Gray-black powder; slightly soluble in acids, insoluble in alkalis and water.

Derivation: Zinc reduction of acid solutions of molybdc acids and molybdates; electrolytic deposition from acid solutions of molybdates.

Uses: Catalyst in organic synthesis, decoration and protection for metal articles; feed additive.

molybdenum silicide. Alloy of 60% molybdenum, 30% silicon, and 10% iron, used as means of introducing molybdenum into steel.

molybdenum steels. Molybdenum in steel has the following effects:

1. Raises grain-coarsening temperature of austenite (refines grain).
2. Deepens hardening.
3. Counteracts tendency toward temper brittleness.
4. Raises hot and creep strength, red hardness.
5. Enhances corrosion resistance in stainless steel.
6. Forms abrasion-resisting particles.

Iron-molybdenum alloys containing 6 to 30% molybdenum can be age-hardened.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Minimizes temper embrittlement in low-alloy steel. The most effective metal that can be added to increase strength at elevated temperatures; increases creep resistance. Used as substitute for tungsten in high-speed steels on the basis of 1 part molybdenum to 2 parts tungsten. Molybdenum high-speed steels have greater tendency to surface decarburization when heated in oxidizing atmospheres, which has restricted their application.

In engineering steels, molybdenum rarely exceeds one per cent, in tool steels may be 10%, stainless steels 3%.

See also ferromolybdenum.

molybdenum sulfide. See molybdenum disulfide.

molybdenum trioxide (molybdenum anhydride, molybdic oxide, molybdic acid anhydride) MoO_3 .

Properties: White at ordinary temperatures, yellow at elevated temperatures, sp. gr. 4.69, m. p. 795°C , b. p. 1264°C . Sparingly soluble in water, very soluble in excess alkali with formation of molybdates, soluble in concentrated mixtures of nitric and hydrochloric acids or nitric and sulfuric acids. Two hydrates are known: $\text{MoO}_3 \cdot \text{H}_2\text{O}$ and $\text{MoO}_3 \cdot 2\text{H}_2\text{O}$. Readily combines with acids and bases to form a series of polymeric compounds.

Derivation: Roasting of molybdenite, by ignition of the metal, the sulfides, the lower oxides, and of molybdic acids.

Purification: Sublimation.

Grades: Technical, pure, reagent, A. C. S. **Containers:** Bottles, boxes, kegs, drums, carload lots.

Uses: Source material for preparation of molybdenum compounds, agriculture (as source of needed molybdenum in soil), analytical chemistry, manufacture of metallic molybdenum, introduction of molybdenum in alloys, corrosion inhibitor, ceramic glazes, enamels, pigments, catalyst in petroleum industry; medicine.

Shipping regulations: None.*

molybdic acid. Molybdic acid of commerce is either an ammonium molybdate (molybdic acid 85%) or molybdenum trioxide. The use of the term interchangeably for either of these compounds has caused confusion.

Solutions of molybdic acid are very complex chemically since they show a great tendency to polymerize into di-, tri-, tetra-, poly-, etc., molybdates.

Containers: Drums.

molybdic acid, anhydride. See molybdenum trioxide.

molybdic ocher. See ferrimolybdate.

molybdic oxide. See molybdenum trioxide.

molybdic sulfide. See molybdenum disulfide.

molybdate. See ferrimolybdate.

moly-blacks. Black, lustrous decorative coatings consisting mainly of molybdenum. The coatings are usually applied electrolytically from a bath containing soluble

molybdates. However in certain cases some may be applied by immersion. The coatings are used commercially for blackening zinc or zinc-base alloys.

"Moly-Gro." ⁴³³ Trademark for molybdenum compounds used to correct molybdenum deficiency in fertilizers, soils and crops.

"Molykote." ¹⁹⁹ Trademark for lubricants containing a highly purified molybdenum disulfide powder which resembles graphite in appearance, but contains none. Used in friction problems which involve galling, welding and seizing, recommended for friction problems at high or low temperatures, in dusty atmospheres, radiation, vacuum, and liquid oxygen environment. Also used for similar mating metals; fretting; high starting friction, and rubber on metal. Available as powder, greases, dispersions, sticks and bonded lubricant coatings.

"Molynamel." ²⁸⁹ Trademark for resin-bonded molybdenum disulfide lubricating enamels. A variety of "Liquid-Moly."

molysite. See ferric chloride, anhydrous.

"Moly-Sulfide." ⁶⁷ Trademark for molybdenum disulfide.

Uses: Lubricant; lubricant additive; filler.

"Monacide." ⁴⁰⁵ Brand name for a series of insecticides, especially with designation "5% DDVP" a spray for tobacco warehouses. DDVP is an O-dimethyl-2,2-dichlorovinyl phosphate.

"Monad." ⁸⁶ Trademark for series of detergents available as:

"Monad" G: Neutral sulfated monoglyceride.

"Monad" SF, High A.I.: Neutral sulfated monoglyceride, salt free.

Uses: Wetting, emulsifier, lime soap dispersant; softening agent.

"Monalit." ⁴⁰⁵ Trade name for a series of yarn conditioning compounds, used in spinning and weaving mills, to set the twist of the yarn after spinning or twisting to facilitate more perfect weaving.

"Monamid." ⁴⁰⁵ Trademark for a series of surface active agents known as "Super" amides, having an amide content up to 93%. Made by condensing fatty acids and esters and ethanalamines to form alkylolamides.

Properties: Most grades are practically odorless, light color. Foam boosters, stabilizers, and viscosity builders. Several grades are:

150-L: Lauric acid and diethanolamine.

150-AD: Coconut fatty acid and diethanolamine.

150-M: Myristic acid and diethanolamine.

Uses: Shampoos, bubble baths; liquid industrial and household cleaning and chemical specialty compounds.

"Monamine." ⁴⁰⁵ Trademark for a series of surface active agents known as fatty acid amine condensates.

Properties: Commonly amber color with slight odor. Good foamers, detergents.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

and emulsifiers. Soluble in water; soluble or dispersible in aromatic and chlorinated aliphatic solvents. Several grades are:

AD-100: Coconut fatty acid, 98-99% active material.

AA-100: Distilled coconut fatty acid, 96-98% active material.

ACO-100: Lauric acid, 98-99% active material.

Uses: Dish and glass cleaners; car wash; floor cleaner; liquid hand soap; paper and textile softeners.

"Monamulse." ⁴⁰⁵ Trademark for a series of compounded emulsifiers for paints, plastics, graphic arts, agricultural sprays and other fields.

"Monaquest." ⁴⁰⁵ Trademark for a series of organic amino polycarboxylic acid sequestering agents useful in complexing, chelating or sequestering of hard water salts and other polyvalent metals.

"Monarch." ²⁶⁶ Brand name for group of insoluble phthalocyanine pigments producing bright shades of blue and green. Light-fast, high strength.

Uses: Protective coatings; paper, textiles, inks.

"Monarch." ²⁷⁵ Trade name for series of channel carbon blacks for use in paints, plastics and paper. Available as:

"Monarch 71." High color channel black.

"Monarch 74." Medium color channel black.

"Monarch 81." Regular color all-purpose channel black.

monarda oil. See horsemint oil.

"Monastral." ²⁸ Trademark for a line of insoluble phthalocyanine pigments producing extremely bright shades of blue and green with excellent fastness properties and high tinctorial strength. Used in the lake, wallpaper, paper, textile, and other industries.

"Monastrip." ⁴⁰⁵ Trade name for a solvent-stripper for uncured and cured epoxy, polyester, and silicone rubber potting, casting, and encapsulating compounds.

"Monawet." ⁴⁰⁵ Brand name for sodium dioctyl, sodium di-hexyl and sodium di-iso-butyl sulfosuccinates, a group of surfactants with unusually fast wetting characteristics. 5/100th of 1% - 1 second Draves sinking time. Used for fast wetting, spreading and penetration, also for polymerization emulsions.

monazite Ce, La, Th(PO₄). A natural phosphate of the rare earth metals, principally the cerium and lanthanum metals, usually with some thorium. Yttrium, calcium, iron, and silica are frequently present. Monazite sand is the crude natural material and is usually purified from other minerals before entering commerce.

Properties: Color yellowish to reddish brown; luster vitreous to resinous; streak white; hardness 5-5.5; sp. gr. 4.9-5.3.

Occurrence. North Carolina, South Carolina,

Idaho, Colorado, Montana, Florida; Brazil; India; Australia; Canada.

Uses: Important source of thorium, cerium, and other rare earth metals and compounds.

Mond process for nickel. Mixed metallic ores obtained from roasting of crude ores are heated from 50-80°C in a stream of producer gas. Oxides other than nickel are reduced to the metallic state while nickel forms nickel carbonyl [Ni(CO)₄] which passes off as a vapor. The vapor is subsequently resolved into gaseous carbon monoxide and free nickel which is deposited in a lustrous, mirror-like form.

"Monel." ²⁸³ Trademark for an alloy containing approximately 66% nickel and 31% copper. Has good resistance to many corrosive environments and is tough and strong. Made in both cast and wrought forms. See also "K," "KR," "R" and "S" "Monel."

"Monex." ²⁴⁸ Trademark for tetramethylthiuram monosulfide.

Properties: Yellow powder; sp. gr. 1.40; m. p. 104-107°C; soluble in acetone, benzol, and ethylene dichloride; insoluble in water and gasoline.

Uses: Accelerator for natural rubber wire insulation; druggist sundries; mechanicals; proofing; footwear; sponge rubber and transparent pure gum stocks and for all types of GR-S.

monitoring. Periodic or continuous examination by means of suitable instruments to determine the amount of radiation or radioactive contamination present in a particular location or on an individual.

monkshood. See aconite.

mono- Prefix denoting single radical; see under specific compound; e. g., monoacetin, see acetin.

mono acid F. See 2-naphthol-7-sulfonic acid.

monoanhydrosorbitol. See sorbitan.

monoazo dyes. See azo dyes.

monobasic. Acids with one, two, and three replaceable hydrogen atoms per molecule are termed mono, di, and tribasic acids respectively. Monobasic, dibasic and tribasic salts are salts which are formed with displacement of one, two, and three hydrogen atoms respectively from the acid. These terms are commonly applied only to salts of tribasic acids, e. g. the orthophosphates.

"Monobed." ²³ Trademark for intimate mixtures of "Amberlite" cation and anion exchange resins.

Use: Complete removal of ionizable impurities from water and other solutions in a one-step treatment.

"Monobel." ²⁸ Trademark for low-velocity permissible dynamites furnished in six grades based upon velocity and cartridge count. Fair to poor water resistance. Use: For mining coal where lump coal is a factor.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

monobenzone (para-benzyloxyphenol; monobenzyl ether of hydroquinone)
 $C_6H_5CH_2OC_6H_4OH$.

Properties: White, odorless, crystalline powder; little taste; melting range 115-118°C; soluble in alcohol and acetone; insoluble in water.

Gradé: N. F. XI.

Use: Medicine.

"Monobromantin." ¹⁰⁹ Trade name for 3-bromo-5,5-dimethylhydantoin.

monobromated camphor. See camphor bromate.

monocalcium phosphate. See calcium phosphate, monobasic.

"Monochrome." ²³² Brand name for a series of chrome dyestuffs suitable for application to wool by the metachrome process.

"Monochrome." ³⁰⁷ (U. S. A.). Brand name of a series of mordant dyestuffs. Used for the dyeing of wool. Characterized by very good fastness properties.

"Monocite" H-100. ²⁸ Trademark for a special grade of methyl methacrylate monomer used in manufacture of cast acrylic sheets.

Containers: Insulated tank trucks.

"Monodral" Bromide. ¹⁶² Trademark for penthienate bromide.

"Monofrax." ⁴⁴² Trademark for fused cast refractory articles.

Properties: Extremely low permeability, high resistance to fluxes, slags, and glasses.

Uses: Blocks, bricks and shapes for very pure and highly refractory glass, chemical and metallurgical applications.

monoglycerides. Glycerol esters of fatty acids in which only one acid group is attached to the glycerol group. A typical formula is $RCOOCH_2CHOHCH_2OH$. Small amounts of monoglycerides occur naturally.

Derivation: Produced synthetically by the alcoholysis of fats with glycerol, yielding a mixture of mono-, di-, and tri-glycerides which is predominantly mono-glycerides.

Uses: Emulsifiers; cosmetics; lubricants. See glycerol monostearate, glycerol monolaurate, etc.

"Monolene." ²⁰³ Trademark for N-(2-hydroxypropyl)ethylenediamine. This product is a colorless to faint yellow liquid with a boiling point of 130°C at 22 mm. It is used as a chemical intermediate since it will undergo reaction with a wide range of functional organic compounds.

"Monolite." ²⁰⁶ Proprietary name of line of insoluble lake colors. Used for the manufacture of paint and printing inks, and for the printing of wallpapers and the preparation of coated papers.

monomer. A molecule or compound usually containing carbon and of relatively low molecular weight and simple structure, which is capable of conversion to polymers,

synthetic resins or elastomers by combination with itself or other similar molecules or compounds. Thus, styrene is the monomer from which polystyrene resins are produced; vinyl chloride and vinyl acetate are the monomers from which "Vinylite" resins are obtained. Other common monomers are methyl methacrylate for "Lucite" or "Plexiglas"; adipic acid and hexamethylenediamine for nylon; and styrene and butadiene for SBR synthetic rubber.

"Monopentek." ¹³⁸ Trade name for monopentaerythritol.

Containers: 50-lb multiwall bags.

Uses: For certain alkyds and other resins of low or special viscosity requirements.

"Monoplex." ²³ Trademark for monomeric, liquid plasticizers for polyvinyl chloride and other high polymers. Primarily esters, but also some epoxides which impart heat and light stability.

Use: Plasticizers, stabilizers, processing aids.

"Monopole Oil." ⁷⁸ Trademark for a double sulfonated castor oil used in the textile trade in bleaching, dyeing, finishing; as a dispersant for dye solutions in printing; also used for its solvent and detergent properties in hand cleaners, polishes, household preparations, bath oils, detergents, etc.

monopropellant. A propellant which combines fuel and oxidizer in one compound or mixture. Gunpowder is an example of a solid monopropellant. Liquid monopropellants, for rockets, include: methyl nitrate; nitromethane, a mixture of hydrocarbons with tetranitromethane, a mixture of methyl nitrate and methanol.

Warning! Very dangerous materials.

See also rocket propellants.

monosodium glutamate. See sodium glutamate.

"Monosol." ²⁰⁶ Brand name of proprietary line of soluble colors especially adapted for converting to insoluble pigments, which are used in the manufacture of printing inks and paints.

monostearin. See glycerol monostearate.

monosulfonic acid F. See 2-naphthol-7-sulfonic acid.

"Monosulph." ³⁰⁹ Trademark for an anionic penetrant and emulsifying agent, 68% highly sulfonated castor oil.

Uses: Textile dyeing assistant; fatliquor for suede leather; paper coating eveners; plasticizer for starch, glues; emulsifier for latex.

"Monotan." ⁷⁸ Trademark for a resinous type of synthetic tanning material used for all types of leather tannage, either alone or in combination with mineral, vegetable and other synthetic tanning compounds.

"Mono Thiurad." ⁵⁸ Trademark for tetramethylthiuram monosulfide.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Monsanto Detergent MXP." ⁵⁸ Trade name for a non-dusty, built detergent based on a non-ionic synthetic wetting agent.

Use: Detergent with controlled sudsing action.

Containers: 100-lb bags; 100-, 300-lb drums.

"Monsanto Fire Retardant A." ⁵⁸ Trade name for a substantially neutral mixture of ammonium phosphates containing a wetting agent to improve penetration.

Use: Flame-retardant treatment of wood and paper.

Containers: 100-lb bags; 100-, 200-lb fiber drums.

"Monsanto Penta." ⁵⁸ Trademark for pentachlorophenol, technical.

Monsel's salt. See ferric sulfate, basic.

Monsel's solution. See ferric sulfate, basic.

montan wax (lignite wax).

Properties: White, hard wax; crude product, dark brown, m. p. 80-90°C. Soluble in carbon tetrachloride, benzene, and chloroform; insoluble in water.

Derivation: By countercurrent extraction of lignite. American and German lignite are usual sources.

Method of purification: Distillation with superheated steam.

Grades: Crude, refined.

Containers: Bags.

Uses: Substitute for carnauba and beeswax, increasing hardness of wax compositions, shoe polishes, furniture polishes; phonograph records, roofing paints; rendering paints waterproof; adhesive pastes, candles; hardener for fat compositions; electric insulating compositions; paper-sizing compositions; carbon papers; wire coating; wax sprays.

"Montar." ⁵⁸ Trademark for a series of synthetic coal tar resins, available in several grades ranging in softening point, 120-250°C.

Mont Ceniz process. Ammonia synthesis process using relatively low pressures and temperatures, an iron cyanide catalyst, and obtaining relatively low yields.

monticellite. See olivine.

montmorillonite $\text{Al}_2\text{O}_3 \cdot 4\text{SiO}_2 \cdot \text{H}_2\text{O}$, with many variations. Generally about one-sixth of the aluminum atoms are replaced by magnesium atoms, and varying amounts of hydrogen, sodium, potassium, calcium, and magnesium are loosely combined. It is commonly found in bentonite.

Properties: Soft mineral that becomes clay-like or powdered after being wet.

Uses: Carrier (i. e., it absorbs various materials without swelling); diluent and extender for powdered materials; coagulation aid; coating agent; aid in bleaching or decolorizing oils and chemicals; filtering agent.

monuron. Coined name for 3-(para-chlorophenyl)-1,1-dimethylurea (q. v.).

moonstone. A gem stone which is a variety of orthoclase or albite or intermediary mixtures.

See feldspar.

Occurrence: United States (California, Virginia, Pennsylvania); Ceylon; Switzerland; Brazil; Australia; Canada.

"Morcowet." ²⁵⁸ Trademark for wetting agents for textile and general usage.

mordant dye. One that requires the use of a third substance (see mordants) to affix or bind the dye to the fiber. The mordant is usually a three-valent chromium derivative formed from chromate or dichromate, but metallic hydroxides, tannic acid and other substances are sometimes used. The mordant forms a lake with the dye and the color is altered according to the metal of the mordant.

"Mordantine." ¹⁶⁵ Trade name for liquid antimony lactate containing 11% available antimony oxide. Completely soluble in cold water. Recommended as a replacement for technical tartar emetic.

See also "Antilac."

mordanting assistants. Chemicals such as lactic, oxalic and sulfuric acids, tartrates, etc., used in conjunction with mordants to bring about a gradual decomposition of the latter, and to assist in producing a uniform deposition of the actual mordant upon and within textile materials.

mordant rouge (red liquor; red acetate). A solution of aluminum acetate in acetic acid used in dyeing and calico printing. It is made by dissolving aluminum hydroxide in acetic acid, or by decomposing lead or calcium acetates with aluminum sulfate or alum. Calcium acetate yields the best red liquor; that made from lead acetate is not entirely free from lead, which dulls the shade of delicate colors. It contains sulfate of the alkali metal when made from alum and decomposes more readily than when made from aluminum sulfate.

See also aluminum acetate.

mordants. Substances capable of uniting with both dyes and textile fibers so as to improve the bond between dye and textile and give improved textures.

The most important mordants are sodium dichromate or chromium complexes of various kinds. Copper compounds are sometimes used, and various other metals have the effect of aiding the action of the mordant. The mordant treatment may be applied before, along with, or subsequent to the application of the dye to its textile.

- Mordants are used with acid dyes, basic dyes, direct dyes and sulfur dyes, although the term metallizing may be used in some cases. Premetallized dyes contain chromium in the dye molecule.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Morecrop." ¹³⁹ Trademark for a dolomitic, hydrated lime having a neutralizing value reported as 166% in terms of calcium carbonate; used for adjusting soil pH and furnishing the elements magnesium and calcium.

"Morester." ²⁵⁸ Trademark for a line of saturated polyester resins for use in the synthesis of polyurethanes and rubbers.

"Morflex." ²⁵⁸ Trademark for a series of plasticizers for vinyl, other synthetic resins, and rubbers. These include adipates, phthalates, sebacates, azelates, polymers and other special products.
Containers: Drums, tank cars.

morganite. See beryl.

morin $C_{15}H_{10}O_7 \cdot 2H_2O$.

Properties: Colorless needles. One of the two coloring principles of old fustic (yellow Brazil-wood). Soluble in boiling alcohol, alkaline solutions, slightly soluble in water.

Derivation: By precipitation from an extract of old fustic.

Uses: Mordant dye; analytical reagent.

Shipping regulations: None. *

"Morlex." ²¹⁴ Trademark for corrosion inhibitors, for example:

Corrosion Inhibitor A (a mixture of 91% morpholine in water).

Properties: Water-white liquid. Ammoniacal odor. Sp. gr. 1.0185-1.0235 (20/20°C), wt/gal 8.5 lb (20°C), flash point 100°F.

Containers: 1-gal can; 5-, 55-gal drums (8, 5, 40, and 450 lb).

Uses: Corrosion inhibitor for steam boilers and steam heating systems.

"Mornidine." ⁷⁰ Trademark for brand of pipamazine, 10-[3-(4-carbamoylpiperidino)propyl]-2-chlorophenothiazine.
Use: Medicine.

"Mornop." ⁵¹ Trademark for oil-soluble cutting oil base of sulfurized type. It is blended with regular cutting fluids to permit difficult machining operations on units normally working on low, free cutting or medium carbon steels.

"Moroc." ²⁴⁴ Trademark for a silicate binder, containing $Na_2O \cdot 4SiO_2 \cdot 2H_2O$ + organic compounds.

Properties: Liquid, gravity 48-52°Bé; sp. gr. 1.50-1.60.

Grades: No. 1, 2, 3 and 4.

Containers: 5-gal pails; 55-gal drums.

Uses: Sand core and mold binder for foundries, cured with carbon dioxide.

Morocco gum. See arabic gum.

"Moroc" Core Paste. ²⁴⁴ Trademark for an accelerated air-setting adhesive.
Properties: Black, viscous liquid. Sp. gr. 1.62.

Containers: 5 gal pails, 55 gal drums.

Uses: Adhesives for foundry cores and molds.

"Morpasol." ¹⁷⁰ Trademark for a non-aqueous dispersion of polyvinyl chloride resins in

plasticizers plus heat-and-light stabilizers, fillers, colors and other special-purpose chemicals. Resin particles are solvated by the plasticizer when heated to 350°F and fuse into a homogeneous solid plastic without loss of weight. The cured plastic is abrasion resistant, fire-proof, grease-proof, water-proof, freeze resistant and electrically insulating. Viscosity is adjusted for use in rotary casting and slush molding, reverse roller coating, knife coating, cold dipping, flow coating, hot dipping, etc.

"Morpel." ²⁵⁸ Trademark for a series of synthesized petroleum sulfonates for lubricating oil additives and other uses.

morphine $C_{17}H_{19}NO_3 \cdot H_2O$.

Properties: White crystalline alkaloid; poisonous! Slightly soluble in water, alcohol and ether. M. p. 254°C.

Derivation: From opium by extraction and crystallization. Opium contains about 10% morphine.

Method of purification: Recrystallization.

Containers: $\frac{1}{8}$ -, 1-oz bottles; 5-oz tins, 100-oz cans.

Uses: Medicine (in form of acetate, hydrochloride, tartrate, and other soluble salts).

para-morphine. See thebaine.

morphine acetate $C_{17}H_{19}NO_3 \cdot C_2H_3O_2 \cdot 3H_2O$.

Properties: White, crystalline or amorphous powder, poisonous! Soluble in water and alcohol, insoluble in ether. M. p. 200°C.

Derivation: By heating morphine and acetic acid in presence of sulfuric acid.

Method of purification: Crystallization.

Grade: Technical.

Containers: $\frac{1}{8}$ -, 1-oz bottles, 5-oz tins.

Use: Medicine.

morphine benzyl ether hydrochloride. See peronine.

morphine bimeconate. See morphine meconate.

morphine hydrobromide $C_{17}H_{19}NO_3 \cdot HBr \cdot 2H_2O$.

Properties: Orthorhombic needles; light sensitive, soluble in water and alcohol.

Containers: To 100-oz cans.

Use: Medicine.

morphine hydrochloride $C_{17}H_{19}NO_3 \cdot HCl \cdot 3H_2O$.

Properties: Poisonous! White, needle-like crystals, white crystalline powder or as cubical masses. Odorless, affected by light and air; solutions are acid to litmus, soluble in water, alcohol, and glycerin; insoluble in chloroform and ether.

Derivation: By the action of hydrochloric acid on morphine.

Method of purification: Crystallization.

Grade: N. F. XI.

Containers: $\frac{1}{8}$ -, 1-oz bottles; 5-oz tins; 100-oz cans.

Use: Medicine.

morphine meconate (morphine bimeconate) $(C_{17}H_{19}NO_3)_2 \cdot C_7H_4O_7 \cdot 5H_2O$.

Properties: Yellowish-white, crystalline powder; poisonous! Soluble in water and alcohol.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: From opium by extraction.

Method of purification: Crystallization.

Grade: Technical.

Containers: $\frac{1}{8}$ -, 1-oz bottles; 5-oz tins.

Use: Medicine.

morphine methyl bromide. See morphosan.

morphine nitrate $C_{17}H_{19}NO_3 \cdot HNO_3$.

Properties: White powder; darkens when exposed to light; poisonous! Soluble in water.

Derivation: By the action of nitric acid on morphine.

Method of purification: Crystallization.

Grade: Technical.

Containers: $\frac{1}{8}$ -, 1-oz bottles; 5-oz tins.

Use: Medicine.

morphine sulfate $(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O$.

Properties: White, feathery, silky crystals, cubical masses of crystals, or as white crystalline powder, odorless; poisonous! M.p. 250°C, decomposes; soluble in water; slightly soluble in alcohol, insoluble in ether and chloroform. Affected by air and light.

Derivation: By the action of sulfuric acid on morphine.

Method of purification: Crystallization.

Grade: U. S. P. XVI.

Containers: $\frac{1}{8}$ -, 1-oz bottles, 5-oz and 100-oz tins, cubes in 1-oz bottles only.

Use: Medicine.

morpholine (tetrahydro-1,4-oxazine)

$\text{OCH}_2\text{CH}_2\text{NHCH}_2\text{CH}_2$, or C_4H_9ONH .

Properties: Colorless, mobile, hygroscopic liquid with a characteristic amine-like odor. A mild base. Miscible with water, soluble in alcohol and ether. B. p. 128.9°C, m. p. -4.9°C, sp. gr. (20/20°C) 1.002; wt/gal (20°C) 8.34 lbs, vapor pressure (20°C) 6.6 mm; viscosity (20°C) 2.23 cps, flash point (open cup) 100°F.

Derivation: By reaction of ethylene oxide and ammonia.

Grades: Technical, 98%.

Containers: 1-gal cans, 5-, 55-gal drums, tank cars.

Uses: Solvent for dyes, resins, waxes, making emulsifying agents, emulsifying agent; organic synthesis; additive to boiler water; water-resistant adhesives and polishes, corrosion inhibitor.

Warning! May cause eye burns and skin irritation. Absorbed through skin. MCA warning label.

Shipping regulations: None.*

morpholine ethanol (N-hydroxyethylmorpholine)

$C_4H_9ONCH_2CH_2OH$.

Properties: Colorless liquid, miscible with water; sp. gr. 1.0724; b. p. 225.5°C; flash point 210°F.

6-(N-morpholino)-4,4-diphenyl-3-heptanone hydrochloride (heptalgin)

$C_{24}H_{29}ONCH(CH_3)CH_2C(C_6H_5)_2COC_2H_5 \cdot HCl$.

Properties: M. p. 225°C (dec); (free base melts at 76°C); soluble in water, alcohol, methanol, chloroform, insoluble in acetone, benzene, ethyl acetate.

Use: Medicine.

morphosan (morphine methyl bromide)

$C_{17}H_{19}NO_3 \cdot CH_3Br$.

Properties: Needles; m. p. 265°C. Soluble in water.

Use: Medicine.

morrhua oil. See cod-liver oil.

"Morsperse." ²⁵⁸ Trademark for dispersing agents for pigments and similar uses.*

"Morton Soil Drench C." ⁴⁰¹ Trade name for a concentrate containing methylmercury dicyandiamide (2.2%).

Uses: As a soil drench for control of damping-off organisms; as a foliage spray and dip for cuttings, bulbs and corms to control fungal diseases.

Warning! This liquid is poisonous when inhaled, swallowed or absorbed through the skin. Do not breathe vapors. Do not get in eyes, on skin or on clothing. Handle carefully.

mosaic gold. See stannic sulfide.

moschus. See musk.

"Moskene." ²²⁷ Trademark for 1,1,3,3,5-pentamethyl-4,6-dinitroindane, $C_{14}H_{18}N_2O_4$.

Properties: Pale yellow crystals, odor resembles musk ketone, having power and depth; m. p. 132°C min; rather stable: may cause discoloration. Congealing point, min. 132.0°C. Soluble in 100 g of solvent, as follows: 4.19 g in methyl "Carbitol"; 16.7 g in benzyl benzoate, 24.2 g in diethyl phthalate, 25.9 g in dimethyl phthalate; 1.05 g in 95% alcohol.

Uses: Blends well with perfumes of a musk character, particularly in fougères and lavenders. Odor value lies between musk ketone and musk ambrette, but it has a more pronounced ambrette-seed character than either of these.

mosol flower oil. See ylang ylang oil.

mossbunker oil. See menhaden oil.

moose green. See copper acetoarsenite.

mother of coal. See fusain.

"Moth-Snub." ³⁰⁰ Trademark for dieldrin (q. v.).

motor spirits. See gasoline.

mountain blue (copper blue).

Derivation: The mineral azurite, in ground form.

Grades: Technical.

Containers: Kegs, boxes, fiber drums.

Use: Paint pigment.

Shipping regulations: None.*

mountain cork. See asbestos.

mountain paper. A variety of asbestos occurring in thin, flexible, tough sheets.

mountain tobacco. See arnica flowers.

mousse de chene. See oakmoss resin.

mowrah fat. A vegetable butter.

Properties: Yellow, semi-liquid fat, relatively unsaturated, bitter, aromatic taste;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

characteristic odor similar to that of cacao beans, soluble in ether, chloroform, light petroleum hydrocarbons and carbon disulfide; sp. gr. 0.894-0.898; m. p. 23-29°C; saponification value 188-194, iodine value 58-67.

Derivation: From the seeds of *Bassia latifolia*.

Habitat: India (northern provinces).

Grades: Crude; refined.

Containers: Wooden barrels.

Use: Soaps.

Shipping regulations: None.*

6-MP. Abbreviation for 6-mercaptapurine.

M. P. A. Abbreviation for Metal Powder Association.

MPA. Abbreviation for multipurpose additive. See "Ethyl."

"M-P-A." ²⁰² Trademark for a gelling agent used in paints and lacquers to prevent pigment settling and excess film flow. Paste form, 24% to 40% solids in choice of mineral spirits, xylene or toluene. Containers: 5-gal pails; 55-gal drums.

MPC black. Abbreviation for medium processing channel black. See channel black.

MPK. Abbreviation for methyl propyl ketone.

"MPS-500." ³⁰⁶ Trademark for a plasticizer consisting of a stabilized chlorinated fatty acid ester.

Properties: F. p. -39°C, fire point 252°C, sp. gr. 1.19 (25/15.5°C), flash point (open cup) 164°C; soluble in chlorinated hydrocarbons, aliphatics, aromatics, alcohols, esters, ketones, insoluble in water, not compatible with cellulose acetate, nitrocellulose, polyvinyl butyral. Imparts excellent electrical properties, high strength, flame retardance, and low-temperature flexibility.

Containers: 55-gal lacquer-lined steel drums; tank cars.

Uses: Plasticizer, sole or secondary, for resins and rubbers, especially for sheeting, wire covering, shoe soles, electrical extrusion compounds.

mrep. Abbreviation for milliroentgen equivalent physical. See roentgen.

"M-S." ²⁴¹ Trademark for a silica-alumina petroleum cracking catalyst (86.6-74.7% silica, 13.2-25% alumina). Marketed in five grades differing in particle size: F-3, F-2, F-1, C-1, C-2; sold in hopper cars or drums for use in cracking petroleum gas oil fractions.

MSG. Abbreviation for monosodium glutamate. See sodium glutamate.

MSP. Abbreviation for monosodium phosphate. See sodium phosphate, monobasic.

6 MT. Abbreviation for 6-methylthiouracil.

MT black. Abbreviation for medium thermal black. See thermal black.

"M & T Catalyst T-8." ²⁸⁸ Trade name for dibutyltin di-2-ethylhexoate.

Properties: Waxy white solid; sp. gr. 1.070 (25°C); m. p. 54-60°C.

Containers: 50- and 150-lb fiber drums with polyethylene liners.

Use: In the manufacture of polyether-based urethane foams via the "one-shot" method and in a silicone emulsion system for the treatment of textiles for water and stain repellency.

"M & T Catalyst T-9." ²⁸⁸ Trade name for a "stannous" type catalyst useful in "one-shot" polyether urethane foams.

Properties: Pale yellow liquid; sp. gr. 1.26 (25°C); lbs/gal 10.4, soluble in most organic solvents.

Containers: 55-gal steel drums; 6-gal steel containers; 1-gal metal containers.

"M & T Catalyst T-12." ²⁸⁸ Trade name for an organotin catalyst.

Properties: Oily liquid; solid below room temperature, yellow color, sp. gr. 1.05 (25°C), setting pt. 17 to 20°C.

Containers: 50- and 450-lb phenolic lined steel drums.

Uses: Extremely effective in the catalyst system for the production of "one-shot" polyether urethane foams.

"M & T Catalyst T-18." ²⁸⁸ Trade name for a liquid stannous oleate catalyst especially useful in "one-shot" polyurethane foams.

Properties: Light to medium yellow liquid, sp. gr. 1.03 (25°C), lbs/gal 8.6.

Containers: 55-gal steel drums; 6-gal steel containers, 5-qt metal containers.

MTD. Abbreviation for meta-tolylendiamine. See toluene-2,4-diamine.

"M & T Flame Retarder." ²⁸⁸ Trade name for an antimony-containing compound with a high degree of flame retardancy.

Properties: Fine white powder, sp. gr. 4.66 (25°C), refractive index 1.75 (25°C), insoluble in organic solvents; very slightly soluble in water.

Uses: In vinyls and other plastics.

"MTM." ³⁰³ Trademark for a mixture of tertiary C₁₂, C₁₄, and C₁₆ aliphatic mercaptans.

Properties: Boiling range 88-142°C (5 mm); sp. gr. 0.866 (60/60°F); refractive index 1.468 (n_D 20/D); flash point 96°C.

Containers: Drums and tank cars.

Uses: Polymer modifications.

Hazards: Flammable liquid.

Shipping regulations: None.*

muric acid (saccharolactic acid; tetrahydroxyadipic acid) HOOC(CHOH)₄COOH.

Properties: White crystalline powder; m. p. about 210°C (dec); soluble in water, insoluble in alcohol.

Derivation: By the oxidation of lactose or similar carbohydrates with nitric acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Tins.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Uses: Organic synthesis; substitute for tartaric acid.
Shipping regulations: None.*
- mucilage.** Originally a decoction of linseed, foenugreek seeds, and marshmallow root, but more generally applied to any adhesive paste.
- mucins.** Complex naturally occurring compounds consisting of amino sugars (such as glycosamine and galactosamine), glucuronic acid and sulfuric acid.
Use: Medicine.
- muguet, synthetic.** See hydroxycitronellal.
- "Mullfrax."** ²⁸⁰ Trademark for refractory products made from mullite produced in electric furnaces. Available as bonded refractories and refractory cements.
Properties: High refractoriness, chemical stability and strength at high temperatures, resistance to spalling.
Bonded refractories:
"Mullfrax." Electric furnace mullite. The heat transmission coefficient averages 15 Btu/sq ft/inch thickness/°F/hr; porosity, 22%; permeability, low.
Uses: Brick for piers, support arches and other load-bearing constructions in furnaces and kilns, glass-tank ports and glass-tank superstructures, linings for indirect-arc electric furnaces, shapes to fit special furnace and kiln requirements, burner blocks in powdered coal, oil and gas-fired furnaces and kilns.
"Mullfrax" C. The coefficient of thermal conductivity averages 12 to 14 Btu/sq ft/inch thickness/°F/hr.
Uses: Brick for linings of indirect-arc electric as well as fuel-fired direct and crucible type melting furnaces for non-ferrous metals and alloys, tuck stones, checker brick and superstructures in glass tanks; burner blocks for powdered coal, oil, or gas-fired furnaces; for load-bearing in kilns; supporting muffle walls and floors, and electric furnace roofs.
Refractory cements:
"Mullfrax." Electric furnace mullite refractory cements. Used in patching and monolithic linings, and in laying "Mullfrax" brick and other less refractory materials.
"Mullfrax" S. Converted kyanite refractory cements. Used for patching and monolithic linings of fuel-fired and electric furnaces, and in laying "Mullfrax" S brick.
- mullite** $3\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$. An aluminum silicate formed by heating other aluminum silicates (such as cyanite, sillimanite, and andalusite) to high temperatures, and the only stable member of the group. Also found in nature, but rare. It was at one time stockpiled by the government.
Properties: Colorless crystals; sp. gr. 3.15; m. p. 1810°C, insoluble in water.
Containers: 50-lb bags.
Uses: Refractories; glass. See also aluminum silicates.
- "Mulsor."** ⁸³ Brand name for a line of emulsifiers; chiefly long chain fatty acid esters of the glycols and related compounds.
- "Multifex MM."** ²⁴⁴ Brand name for ultra fine calcium carbonate:
Properties: Wt/solid gal 22.07 lbs; color, white; particle size, 0.04-0.06 microns.
Derivation: Precipitated calcium carbonate.
Containers: Multi-wall paper bags, 50 lbs net.
Uses: Paint, plastics, rubber, inks.
- "Multimet."** ²¹⁴ Trademark for an iron-base alloy. The wrought alloy is suitable for service up to 1500°F without the necessity of age-hardening; it can be drawn, spun, rolled, flanged, and dished cold. Used for rotors, turbine blading, bolts for high-temperature applications. The cast alloy (low carbon) is used for investment castings, sand castings, turbine blading, nozzles, and mandrels.
- "Multi-Sperse."** ¹⁴¹ Trade name for stir-in pulps compatible with all types of latex paints.
Properties: Disperse easily with simple stir-in techniques. Excellent compatibility; maximum stability; good alkali stability; good light resistance; contain non-ionic surfactants.
Grades: Yellows, oranges, reds, blues, greens, violets and black.
Uses: For all types of latex paints, including acrylic, butadiene-styrene types and polyvinyl acetate.
- mu meson.** See fundamental particles.
- muon.** A mu meson, one of the fundamental particles (q. v.).
- "Murano."** ²⁷⁰ Trademark for a synthetic nacreous pigment which has twin inherent colors, one being observed by reflected light and the second by transmitted light, the two colors being complementary. The pigment particles consist of a lead compound in the form of thin, plate-like crystals. The twin colors are usually seen simultaneously, since part of the light reaches the eye by direct reflection from the surface of the crystals and part of the light is reflected from within the crystal layer and is transmitted through the intervening crystals. (See nacreous pigment.)
Containers: 1-, 4-lb glass jars; 50-lb steel cans.
Uses: To produce a play of colors when coated on surfaces or incorporated in transparent plastics or plastic film.
- muriatic acid.** Old term for hydrochloric acid.
- murillo bark.** See quillaja.
- muscle adenylic acid.** See adenylic acid.
- muscle fibrin.** See syntonin.
- muscone.** See musk.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

muscovite (white mica, potassium mica, isinglass) $\text{KA}_2\text{AlSi}_3\text{O}_{10}(\text{OH})_2$. A natural hydrous potassium aluminum silicate of the mica group (q. v.).

Properties: Colorless, yellowish, brownish or reddish; luster vitreous to silky or pearly; hardness 2-2.5, sp. gr. 2.76-3.1; one perfect cleavage. Grades are based on color, size, and other physical properties. Muscovite is used as sheets and in ground form.

Occurrence: India, Brazil, North Carolina, New Hampshire, South Dakota, Georgia, Connecticut.

Uses: As a dielectric in electrical equipment in capacitors, coils, spark plugs, and radio tubes; in special gaskets; in metallurgical equipment as windows of furnaces and other items, in toasters and similar electrical appliances; as diaphragms in acoustic equipment; in heat-resistant applications in the form of sheets, tape and cloth; as ground mica in paints; filler in rubber, in roofing material, in oil-well muds, in coated fabrics; as a lubricant.

musk (moschus).

Properties: An unctuous brownish semiliquid when fresh, dried, in grains or lumps with color resembling dried blood. The odorbearing constituent is muskone or muskone, $\text{CH}_3\text{C}_{15}\text{H}_{27}\text{O}$, a 15-carbon ring with ketone oxygen. See also musk, synthetic.

Derivation: Secretion from preputial follicles of the musk deer, *Moschus moschiferus*.

Habitat: Northern Asia, Tonquin, and Tibet. **Grades:** Tonquin, Cabardine, Yeman, Assam or Nepal.

Containers: Metal boxes, fiber drums.

Uses: Medicine, perfumery; flavoring sweetmeats; toilet soaps, mothproofing agent. It is a powerful, but expensive, fixative in perfumery.

Shipping regulations: None.*

musk ambrette (2,6-dinitro-3-methoxy-4-tert-butyltoluene)
 $\text{CH}_3\text{C}_6\text{H}(\text{NO}_2)_2(\text{OCH}_3)\text{C}(\text{CH}_3)_3$.

Properties: White to yellow powder, with heavy musky odor of ambrette seed. Soluble in benzyl benzoate, diethyl phthalate, dimethyl phthalate, fixed oils, volatile oils, mineral oil and methyl "Carbitol", sparingly soluble in alcohol. Insoluble in water and glycerin.

Constants: Congealing point 83.4°C.

Containers: Tin cans; fiberboard containers; barrels.

Use: Perfumery (fixative).

Shipping regulations: None.*

musk ketone (3,5-dinitro-2,6-dimethyl-4-tert-butylacetophenone)
 $\text{CH}_3\text{OCC}_6(\text{NO}_2)_2(\text{CH}_3)_2\text{C}(\text{CH}_3)_3$.

Properties: White to yellow crystals, having a sweet musk odor. Soluble in benzyl benzoate, diethyl phthalate, dimethyl phthalate, fixed oils, volatile oils; somewhat soluble in methyl "Carbitol",

sparingly soluble in alcohol; insoluble in water, glycerin, propylene glycol.

Containers: Tin cans, fiberboard containers; barrels; drums.

Use: Perfumery (fixative).

Shipping regulations: None.*

muskmallow. See ambrette seed.

muskone. See musk.

musk-root. See sumbul.

musk seed. See ambrette seed.

musk, synthetic. A number of compounds are so called. They fall into two categories: (a) Macrocylic musks. These are ketones and lactones with large cycles (15- or 16-carbon rings), structurally resembling the odoriferous principles of natural musk, civet, and musky-type plants. Among these are ambrettolide, civetone, muskone, exaltolide. (b) Nitrated compounds, usually nitrated tert-butyltoluenes or xylenes or related compounds. The three most commonly used in perfumery are musk ambrette, musk ketone, and musk xylol or musk xylene.

"Musk Tibetene." 227 Trademark for 2,6-dinitro-3,4,5-trimethyl-tert-butylbenzene, $(\text{CH}_3)_3(\text{NO}_2)_2\text{C}_6\text{C}(\text{CH}_3)_3$, 5-tert-butyl-4,6-dinitrohemimellitene.

Properties: Pale yellow crystals, resembles the odor of musk ketone, but has a slightly heavier and sweeter character, stable; may cause discoloration. Congealing point, min 135.0°C. Soluble in 100 g solvent, as follows: 5.4 g in methyl "Carbitol"; 27.4 g in benzyl benzoate, 13.7 g in diethyl phthalate, 15.6 g in dimethyl phthalate; 1.39 g in 95% alcohol.

Uses: Used to impart a desired animal note to any perfume for lotions, powders, creams, or soaps. Is stable to light. Eliminates discoloration in soap, perfume, and powder containing stearates, or a bath salt containing sesquicarbonates.

musk xylol (musk xylene, 2,4,6-trinitro-1,3-dimethyl-5-tert-butylbenzene)
 $(\text{NO}_2)_3\text{C}_6(\text{CH}_3)_2\text{C}(\text{CH}_3)_3$.

Properties: White to yellow crystals, with powerful odor of musk.

Constants: Congealing point 111.7°C or 104-106°C. May have two congealing points.

Soluble in benzyl benzoate, diethyl phthalate and dimethyl phthalate, fixed oils and volatile oils, sparingly soluble in methyl "Carbitol", very slightly soluble in alcohol. Insoluble in water, glycerin, propylene glycol.

Containers: Tin cans, fiberboard containers, barrels, drums.

Uses: Perfumery (fixative).

Shipping regulations: None.*

mustard, black (*sinapis nigra*; mustard, brown).

Derivation: Seed of *Brassica nigra* or *Brassica juncea*.

Occurrence: United States, Europe, and Asia.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Grades:** Technical; N. F. XI.
Containers: Tins.
Uses: Medicine, condiment; mustard oil.
Shipping regulations: None. *
- mustard, brown.** See mustard, black.
- mustard gas.** See dichlorodiethyl sulfide.
- mustard oil, artificial.** See allyl isothiocyanate.
- mustard oil, black.** See mustard oil, volatile.
- mustard oils.** Organic compounds having the formula $R-N=C=S$, in which R is an alkyl or aryl radical, -NCS an isothiocyanate group. The name is derived from its best known member, allyl isothiocyanate, (q. v.) which is the characteristic ingredient of mustard oil.
- mustard oil, volatile** (black mustard oil; sinapis oil).
Properties: Colorless to pale yellow limpid liquid slowly changing to reddish-brown on exposure to light. Pungent, acrid odor and taste.
Chief known constituents. Allyl isothiocyanate, carbon disulfide, allyl cyanide.
Soluble. in 7 to 10 vols of 70% alcohol; in 2.5 to 3 vols of 80% alcohol, clear solutions in all proportions with 90% alcohol.
Constants: Sp. gr. 1.016-1.022 (rarely 1.030), refractive index 1.52681-1.52804, b. p. 148-154°C (760 mm).
Derivation: From the seeds of *Sinapis nigra*, L., and *Sinapis juncea*, L. These are ground, rendered free of their fatty oil content by hydraulic pressure, mixed with warm water, allowed to ferment and then distilled.
Containers: Bottles.
Use: Medicine, proprietary liniments.
Shipping regulations: None. *
- mustard, white** (*sinapis alba*, mustard, yellow).
Derivation. Seed of *Sinapis alba*.
Occurrence: United States, Europe, and Asia.
Grades. Technical.
Containers: Tins, bags.
Uses: Condiment.
- mustard, yellow.** See mustard, white.
- Muthmann's liquid.** See acetylene tetrabromide.
- Mv.** Symbol used for mendelevium, but not sanctioned by IUPAC.
- MVE.** Abbreviation for methyl vinyl ether. See vinyl methyl ether.
- "MX."** ²⁸⁰ Trademark for fiber-bonded abrasives.
Properties: High tensile strength and resistance to impact and heat shock, unusually resilient.
Uses: For finishing and polishing flutes of taps, drill end mills, reamers, etc., removing burrs from milling and drilling operations; breaking edges of cast aluminum parts, etc.; cleaning cast iron molds; removing flash from molded plastics.
- MXD6.** A type of nylon from meta-xylylene-diamine and adipic acid.
- "My-B-Den."** ²⁷² (Sodium salt of adenosine-5-monophosphoric acid) $C_{10}H_{14}N_5O_7P$.
Trade name for a biochemical substance prepared by enzymatic phosphorylation of adenosine from muscle sources and purified to give the crystalline free acid and its sodium salt. A5MP is concerned with numerous basic biochemical reactions, and is used in medicine and biochemical research.
- "Mycoban."** ²⁸ Trademark for sodium and calcium propionates. These salts inhibit the growth of many fungi and of some microorganisms, particularly *bacillus mesentericus*, for commercially significant periods of time. Because of this property they find application in many industries, particularly to inhibit mold and rope in bread, rolls (including "brown and serve"), pie crust, etc. However, the presence of the calcium ion in some cases restricts the use of "Mycoban" calcium propionate.
Containers: 250-lb fiber drums; cartons of six 10-lb paper bags (sodium type only).
- "Mycostatin."** ⁴¹² Trademark for nystatin (q. v.).
- MYL.** A powder used during World War II for the control of body lice which carry typhus fever. Its composition included:
 Pyrethrins (20% pyrethrum extract) 0.2%
 N-isobutylundecylenamide (synergist) 2.0
 2,4-dinitroanisole (ovicide) 2.0
 isopropyl and diisopropyl cresols (anti-oxidants) 0.25
 pyrophyllite (diluent) - to make 100%
- "Mylar."** ²⁸ Trademark for film of polyethylene terephthalate.
- "Mylase."** ¹⁷³ Trademark for a fungal amylase in powder form for sirup and dextrin conversions.
- "Myleran."** ³⁰¹ Trademark for 1,4-dimethanesulfonoxylbutane, (GT 41), used in medicine.
- mylone.** 3,5-Dimethyl-2H-1,3,5-tetrahydrothiadiazine-2-thione. A soil fumigant.
- myo-inositol.** See inositol.
- myrbane, essence of.** See nitrobenzene.
- "Myrcene-85."** ²⁹⁶ Brand name for a special grade of the triply unsaturated aliphatic hydrocarbon, $C_{10}H_{16}$, 7-methyl-3-methylene-1,6-octadiene. Used in preparation of flavor and odor chemicals.
- myrcia oil** (bay oil, bayleaf oil).
Properties: Essential oil, yellow color, becoming brown on exposure to air, pleasant, clove-like odor; pungent, spicy taste; phenol content 50-65%. Sp. gr. 0.950-0.990 (25/25°C), going as low as 0.939 for poor-quality oils; optical rotation 0 to -3°; refractive index 1.507-1.516 (20°C).
Soluble in 1-2 vols. of 70% alcohol (if

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

freshly distilled; solubility decreases rapidly with age).

Derivation: By distillation of the leaves of *Pimenta racemosa* (*Pimenta acris*). Note: Many of the species of the genera *Pimenta* and *Myrica* closely resemble one another. Thus, often, a mixture of the leaves is distilled unless great care is exercised in the gathering.

Adulteration: Kerosene; alcohol; clovestem oil.

Grades: N. F. XI.

Containers: Tins; glass bottles; drums.

Uses: Flavors; perfumes; bay rum.

Shipping regulations: None.*

myrica (candleberry; bayberry; wax myrtle; wax berry; tallow shrub). Bark of *Myrica cerifera* or *carolinensis*.

Habitat: Maryland to Florida, west to Texas and Arkansas.

Grades: Technical.

Containers: Bales; multi-wall paper sacks.

Uses: Medicine; source of bayberry wax.

Shipping regulations: None.*

myricyl alcohol. See 1-triacontanol and 1-hentriacontanol. The term myricyl alcohol, which has been used for both by various authorities, should be dropped.

myristica (nutmeg). Kernel of the ripe seed of *Myristica fragrans*.

Habitat: Southern Asia and Moluccas, cultivated in many tropical countries.

Grades: Technical; N. F. XI.

Containers: Bags.

Uses: Medicine, condiment; damaged seeds used as source of nutmeg oil.

Shipping regulations: None.*

myristic acid (tetradecanoic acid)

$\text{CH}_3(\text{CH}_2)_{12}\text{COOH}$.

Properties: Oily, white crystalline solid. Soluble in alcohol and ether; insoluble in water.

Constants: Sp. gr. 0.8739 (80°C), b. p. 326.2°C (760 mm), 204.3°C (20 mm), m. p. 54.4°C, refractive index 1.4310 (n_D 60/D).

Derivation: Fractional distillation of coconut acid.

Containers: Cans, bags; 55-gal drums; tank cars.

Grades: Technical, 99.8%.

Uses: Soaps, cosmetics, synthesis of esters for flavors and perfumes.

myristica oil. U. S. P. XVI name for nutmeg oil (q. v.).

myristoyl peroxide $(\text{C}_{13}\text{H}_{27}\text{CO})_2\text{O}_2$.

Properties: Soft granules; 90% peroxide.

Use: Catalyst for vinyl type monomers.

myristyl alcohol (1-tetradecanol) $\text{C}_{14}\text{H}_{29}\text{OH}$.

Properties: Sp. gr. 0.8355 at 20/20°C, b. p. (760 mm) 264.1°C, (20 mm) 177.1°C; m. p. 38°C; vapor pressure 0.01 mm

(20°C); flash point 285°F; wt 7.0 lbs/gal (20°C); coefficient of expansion 0.00083 (20°C); viscosity 0.366 poise (20°C). Insoluble in water; soluble in alcohol and ether.

Grades: Technical.

Containers: 1-gal cans; 5-, 55-gal drums.

Uses: Organic synthesis; plasticizer; anti-foam agent; intermediate; perfume fixative for soaps and cosmetics; base for the manufacture of wetting agents and detergents; ointments and suppositories.

myristyl chloride. See tetradecyl chloride.

myristyl mercaptan. See tetradecyl mercaptan.

"Myrj." ⁸⁹ Trademark for each of a series of nonionic, low-melting point, waxy surface-active agents, ranging from water-dispersible to water-soluble and varying in oil solubility. Essentially neutral polyoxyethylene derivatives of fat-forming fatty acids.

myrrh gum. The gum resin of *Commiphora myrrha* or other species of myrrh.

Habitat: Nubia, Somaliland and Arabia.

Partially soluble in water, alcohol and ether.

Grades: Technical, N. F. XI.

Containers: Bags, cases.

Uses: Dentifrices, perfumery; protective in pharmaceuticals.

Shipping regulations: None.*

myrrh oil.

Properties: Yellowish, rather viscid liquid, strong odor. Soluble in 80% alcohol.

Chief constituents: Cuminic aldehyde, eugenol, meta-cresol, pinene and dipentene.

Constants: Sp. gr. 0.988-1.007, b. p. 220-235°C.

Derivation: Distilled from the gum-resin, myrrh.

Grades: Technical.

Containers: Copper flasks, glass bottles.

Use: Medicine, perfumery.

Shipping regulations: None.*

myrtle oil.

Properties: Light, yellow liquid, agreeable aromatic odor. Soluble in 80% alcohol.

Chief known constituents: Cineole, borneol, d-pinene, dipentene.

Constants: Sp. gr. 0.89-0.92, optical rotation +10° to +30°.

Derivation: Distilled from the leaves of *Myrtus communis*.

Method of purification: Rectification.

Grades: Technical.

Containers: Iron drums, glass bottles.

Uses: Medicine, perfumery (fixative), flavors.

Shipping regulations: None.*

myrtle wax. See bayberry wax.

"Mysoline." ²⁰⁷ Trademark for pyrimidone, 5-ethyl-5-phenyl-hexahydropyrimidine-4,6-dione. Used in medicine.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

N

- N.** Symbol for the element nitrogen (q. v.). The names of certain compounds (such as N,N-dibutyl urea) contain this symbol as an indication that the group or groups appearing next in the name (i. e., the butyl groups in the example cited) are joined to the nitrogen atoms in the molecule of the compound under discussion. In this book the alphabetical arrangement ignores such N symbols appearing in the name of a compound. Thus N,N-dibutyl urea is found under D.
- N.** Abbreviation for normal, as used in analytical chemistry. See normal (2).
- n-** Abbreviation for normal. See normal (1). In this book the prefix n- is ignored in the alphabetical arrangement.
- Na.** Symbol for sodium.
- "NA-22."** ²⁸ Trade name for (2-mercaptoimidazole) $\text{CH}_2\text{CH}_2\text{NC}(\text{SH})\text{NH}$.
Properties: A white powder, sp. gr. 1.42, m. p. not lower than 195°C.
Containers: 125-lb drums.
Use: To accelerate and improve the vulcanization of neoprene.
- nabam** (disodium ethylenebisdithiocarbamate) $\text{NaSSCNHCH}_2\text{CH}_2\text{NHCSSNa}$.
Properties: Colorless crystals when pure, easily soluble in water.
Derivation: Addition of carbon disulfide to an alcoholic solution of ethylenediamine followed by neutralization with sodium hydroxide; or by reaction of ethylenediamine with carbon disulfide in aqueous sodium hydroxide.
Grades: Usual commercial form is a 19% aqueous solution.
Caution: (For 19% solutions and over). May cause skin irritation. Avoid contact with skin and eyes. In case of contact, flush with plenty of water; for eyes get medical attention. MCA warning label.
Uses: Plant fungicide, and starting material for formation of derivatives that are also plant pesticides.
- "Nabor."** ²⁴³ Trademark for basic dyes intended especially for dyeing acrylic fibers.
- "Nacan."** ²⁴³ Brand name for sodium meta-nitrobenzenesulfonate. A protective anti-reduction agent.
- "Naccogene."** ²⁴³ Trademark for azoic compositions.
- "Nacconate."** ²⁴³ Trade name for diisocyanates.
- "Nacconate 65."** ²⁴³ (TDI mixed isomers). A mixture of 65% 2,4-tolylene diisocyanate and 35% 2,6-tolylene diisocyanate.
Properties: Clear, faintly yellow liquid containing 99.5% tolylene diisocyanate isomers; b. p. 118-120°C (10 mm); sp. gr. at 20°, 1.22; soluble in acetone, benzene, carbon tetrachloride, chlorobenzene, kerosine and nitrobenzene.
Containers: 55- and 5-gal special lined drums.
Uses: In the manufacture of foams, coatings for wire and other polyurethane products.
Handling: Use protective clothing including goggles and gloves. In case of contact with skin wash with soap and water or alcohol followed by soap and water. Do not put water, solvent or other material into the container.
Shipping regulations: Poison, class B. Poison label.*
- "Nacconate 80."** ²⁴³ A mixture of 80% 2,4-tolylene diisocyanate and 20% 2,6-tolylene diisocyanate. For properties, etc., see "Nacconate 65."
- "Nacconate 100."** ²⁴³ (2,4-tolylene diisocyanate, TDI), $\text{CH}_3\text{C}_6\text{H}_3(\text{NCO})_2$.
Properties: Clear, faintly yellow liquid, solidifying at 20°C; b. p. 118-120°C (10mm); sp. gr. (20°C) 1.22, purity 99.5%.
Containers: 55- and 5-gal special lined drums.
Uses: Specialty casting resins.
Handling: See "Nacconate 65."
Shipping regulations: Poison, class B. Poison label.*
- "Nacconate 200."** ²⁴³ (3,3'-bitolylene-4,4'-diisocyanate; 3,3'-dimethylbiphenylene-4,4'-diisocyanate) $\text{OCN}(\text{CH}_3)\text{C}_6\text{H}_3\text{C}_6\text{H}_3(\text{CH}_3)\text{NCO}$.
Properties: Small, very pale yellowish flakes of 99.5% purity; solidification point 69.6°C; sp. gr. (80°C) 1.197; soluble in acetone, benzene, carbon tetrachloride, chlorobenzene, kerosine and nitrobenzene.
Containers: 275-lb fiber drums.
Uses: Urethane elastomers.
Handling: Use protective clothing including goggles and gloves with good ventilation. In case of contact with skin, wash with alcohol followed by soap and water. Do not put water, solvent or other material in container.
Shipping regulations: Poison, class B. Poison label.*
- "Nacconate 300."** ²⁴³ (diphenylmethane-4,4'-diisocyanate; methylene-di-para-phenylene isocyanate; 4,4'-diphenylene-methane diisocyanate; MDI) $\text{CH}_2(\text{C}_6\text{H}_4\text{NCO})_2$.

Properties: Fused light yellow solid; solidification point 37.2°C; sp. gr. (70°C) 1.197; soluble in acetone, benzene, carbon tetrachloride, chlorobenzene, kerosene and nitrobenzene.

Containers: 5-gal special lined drums.

Uses: Production of urethane elastomers, coatings, spandex-type fibers.

Handling: Use protective clothing, including goggles and gloves, with good ventilation. Wash with soap and water or alcohol followed by soap and water in case of contact. Do not put water, solvent or other material in container.

Shipping regulations: Poison, class B. Poison label.*

"Nacconol." ²⁴³ Trade name for a series of alkyl aryl sodium sulfonate detergents with wetting, emulsifying and dispersing properties. All available in technical grade in bags, fiber drums, steel drums. **Properties:** (Typical of solid forms). Solubility in water 9.0% at 25°C; 21% at 100°C, in 1% acetic acid 11.0% at 25°C, 23% at 100°C; in alkaline solution of pH 10.5, 7% at 25°C, 23% at 100°C, in common organic solvents 0.3 to 10%; barium and lead salts sparingly soluble; other metallic salts 0.5 to 10.0%, pH approximately 7.0 in 1% water solution. Stable to hard water, 15% boiling sulfuric acid, 10% boiling sodium hydroxide and moderate concentrations of oxidizing and reducing agents. Surface tension of 0.10% solution, 32.8 dynes/cm at 30°C. Slightly to highly hygroscopic, faint odor, bitter flavor.

Uses: Washing, scouring, wetting agents and dyeing assistants for textile fibers and fabrics, leather and paper. Washing and scouring agents for power laundering, rugs and upholstery, automobiles, refrigerators, glass, painted surfaces, city streets, etc. Used in conjunction with alkalis for metal cleaning, bottle washing in dairies, breweries, and carbonated beverage plants, commercial dishwashing, scouring powders, etc. Also used in adhesives, dyestuffs, buffing compounds, etc.

The solid forms described above include "Nacconol" Beads, DB, HG, NR, NRSF, SW, Z. Liquid forms include "Nacconol" 60S, SL, SZA. "Nacconol" 60S and SL are straw-colored, free-flowing, viscous liquids, used in detergents; SZA is an opaque acid type used as a metal cleaner.

Shipping regulations ("Nacconol" SZA): Corrosive liquid. White label.*

"Naccosol" A. ²⁴³ Brand name for a proprietary sulfonated alkylated aromatic compound, primarily a wetting agent. **Properties:** Light tan, dry powder; pH approx. 7 in 1% water solution, stable to hard water, 10% boiling sulfuric acid, 10% boiling sodium hydroxide, normally used concentrations of oxidizing and reducing agents; very soluble in water at 25°C; surface tension (1% solution) 35.5 dynes/cm (25°C); hygroscopicity very high, keep

containers covered; sp. gr. 0.51; odor faint. **Grades:** Technical.

Containers: Non-returnable 55-gal fiber drums, 250 lbs net.

Uses: A general surface-active agent especially useful as a solubilizing agent and as a wetting agent over a wide pH range.

Fire hazard: None.

Shipping regulations: None.*

"Naccotan" A. ²⁴³ Brand name for a proprietary alkyl aryl sodium sulfonate, an organic retanning agent.

Properties: Light brown, dry fine flakes; pH approx. 7.0 in 1% water solution; stable to hard water, 10% boiling sulfuric acid, and 10% boiling sodium hydroxide; very soluble in water at 25°C; hygroscopicity slight, keep containers covered; sp. gr. 0.36; odorless.

Grades: Technical.

Containers: Paper bags only, 75 lbs net.

Uses: Used in the retanning of chrome-tanned leather; useful in the dispersion of thick slurries.

Fire hazard: None.

Shipping regulations: None.*

"Naccufix." ²⁴³ Copper organo-complex for fixing direct dyes on cellulose fibers.

"Nacelan." ²⁴³ Trademark of water-insoluble dyes dispersed in water and forming solid solutions in synthetic fibers.

nack. See NaK.

"Naco." ²⁴¹ Brand name for mixed fertilizers.

nacreous pigment. Nacreous or pearly pigments are substances which produce a pearly luster. They may be applied as surface coatings, as in simulated pearls, or may be incorporated in plastics, as in plastic simulated mother-of-pearl shirt buttons. The pigment particle is generally a very thin crystalline platelet of high index of refraction. The crystals are readily oriented into parallel layers because of their shape. Being transparent, each crystal reflects only part of the incident light reaching it, and transmits the remainder to the crystals below. The nacreous effect is obtained from the simultaneous reflection of light from the many parallel microscopic layers.

Pearl essence, also known as natural pearl essence, is the original nacreous pigment in which the pigment particles are the guanine crystals obtained from fish scales and fish skin. The crystals are extremely thin plates in the form of elongated hexagons. Synthetic nacreous pigments, also known as synthetic pearl essence, are generally inorganic substances which are crystallized in the form of thin plates. These are generally lead or bismuth compounds.

Nacreous pigments are usually available in the form of suspensions in a liquid vehicle, which may be water, a plasticizer, resin, or lacquer, depending on the ultimate application in which the material is to be used.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Nacromer." ²⁷⁰ Trademark for synthetic nacreous pigments, consisting of lead salts crystallized in the form of extremely thin plates and suspended in a suitable liquid vehicle. Various grades, which range from a brilliance surpassing that of the natural pearl to a soft, velvety luster.

See nacreous pigment.

Containers: 1-, 4-lb glass jars, 50-lb steel cans.

NAD. See nicotinamide adenine dinucleotide.

"Nadic Anhydride." ²⁴³ Trademark for endo-cis-bicyclo[2.2.1]-5-heptene-2,3-dicarboxylic anhydride (4-endomethylenetetrahydrophthalic anhydride) $C_7H_6(CO)_2O$.

Properties: White crystals; m. p. 164-165°C, soluble in benzene, toluene, acetone, carbon tetrachloride, chloroform, ethanol, and ethyl acetate; slightly soluble in petroleum ether.

Containers: 250-lb fiber drums (35-gal).

Uses: Chemical intermediate in the manufacture of alkyd and polyester ester resins; curing agent for epoxies, modifying agent for drying oils for emulsion paints; copolymerizing agent with vinyl and vinylidene chlorides; intermediate for softening agents for rubber, plasticizers, wire enamel resins, surfactants, insecticides, high-boiling solvents, synthetic lubricants, textile assistants and penetrants.

"Nadic Methyl Anhydride." ²⁴³ $C_{10}H_{10}O_3$. Trademark for methylbicyclo[2.2.1]heptene-2,3-dicarboxylic anhydride isomers.

Properties: Clear, colorless to light-yellow viscous liquid, viscosity 175-225 cps (25°C), refractive index 1.500-1.506 (n_D 20/D), sp. gr. 1.200-1.250 (20/20°C). Miscible in all proportions with acetone, benzene, naphtha, and xylene.

Grades: Technical.

Containers: 15-, 55-gal metal drums.

Uses: Curing agent for epoxy resins, intermediate for polyesters, alkyd resins, and plasticizers.

"Nadone." ²⁴³ Trade name for cyclohexanone.

NADP. Abbreviation for nicotinamide adenine dinucleotide phosphate.

naepaine hydrochloride

$H_2NC_6H_4COOCH_2CH_2NHCH_2(CH_2)_3CH_3 \cdot HCl$. 2-Amylaminoethyl-para-aminobenzoate hydrochloride.

Properties: Fine white odorless powder which, when applied to the tongue, gives bitter taste followed by sensation of numbness. Soluble in water, sparingly soluble in alcohol; insoluble in benzene, chloroform, and ether. Free base (m. p. 65°C) separates as a solid from solution of the hydrochloride on the addition of sodium hydroxide or carbonate solution. The hydrochloride is dimorphic. The form which crystallizes from water melts at 153.5° while that crystallized from amyl alcohol melts at 176°. Aqueous

solutions are acid to litmus.

Grade: N. F. XI (m. p. 175° to 177°).

Use: Medicine (local).

NaK (sodium-potassium alloy; nack).

Properties: Soft silvery solid or liquid; must be kept away from air and moisture.

Very reactive!

Grades: (a) 78% K, 22% Na; m. p. -11°C;

b. p. 784°C; density 0.847 g/cc (100°C);

(b) 56% K, 44% Na; m. p. 19°C; b. p. 825°C; density 0.886 g/cc (100°C).

Containers: Stainless steel cans (3, 10, 25, 200 lbs); small glass ampules.

Uses: Heat exchange fluid; electric conductor, for organic synthesis and catalysis.

Shipping regulations: Flammable solid

Yellow label. *

"Nakta." ⁵¹ Trademark for lime-base greases made with highly refined mineral oil and suitable for low temperature dispensing and use. Available in a wide range of consistencies for all types of mine car plain and roller bearings.

"Nalan" RF Durable Water Repellent. ²⁸ Light cream-colored viscous paste dispersion.

Uses: Along with thermosetting resins as a softener modifier to obtain improved crease resistance and wash-and-wear properties on cotton fabric.

"Nalcite HCR." ¹⁸² Cation exchanger; sulfonated hydrocarbon of the styrene-base type.

"Nalcoag." ¹⁸² Colloidal silica sol for use as a bonding agent in ceramics.

"Nalline." ¹²³ Trademark for nalorphine.

nalorphine hydrochloride (N-allylnormorphine hydrochloride) $C_{19}H_{21}NO_3 \cdot HCl$, a derivative of morphine.

Properties: White or practically white, odorless, crystalline powder, m. p. 260-263°C; affected by light and air, soluble in water, slightly soluble in alcohol, insoluble in chloroform and ether, soluble in diluted alkali hydroxide solutions; pH (0.5% solution) 4.4-5.5.

Grade: U. S. P. XVI.

Use: Medicine.

"Nalzin N." ³⁰⁴ Trademark for a zinc organic vinyl stabilizer.

Properties: Clear straw-colored liquid, sp. gr. 0.95, refractive index 1.51.

Containers: 40- and 400-lb metal drums.

Uses: Adjunct for barium-cadmium stabilizers to impart sulfide stain resistance.

nandrolone phenpropionate $C_{27}H_{34}O_3$. 19-Nor-delta⁴-androstene-17 beta-ol-3-one-beta-phenyl propionate.

Use: Medicine.

Nankin yellow. See iron buff.

"Nahkor." ²³³ Trademark for organophosphorus compounds.

nano-. Prefix meaning 10⁻⁹ units (symbol n).
1 ng = 1 nanogram = 0.000000001 gram.

nantokite. See cuprous chloride.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

napalm. An aluminum soap of a mixture of oleic, naphthenic and coconut fatty acids.

Properties: Becomes viscous when shaken, makes gasoline thicken or jell.

Uses: In flame throwers and fire bombs; future possibility of use in preparing an almost solid gasoline for convenient storage, and of increasing the production of oil and gas wells by pumping in a mixture of crude oil, napalm and sand instead of using explosives and acids.

naphazoline hydrochloride $C_{14}H_{14}N_2 \cdot HCl$.

2-(1-Naphthylmethyl)imidazoline hydrochloride.

Properties: White, crystalline powder.

Odorless, with bitter taste; m. p. 253-258°C. Solutions are neutral to litmus paper. Freely soluble in water and alcohol; very slightly soluble in chloroform and practically insoluble in ether.

Grade: N. F. XI.

Use: Medicine.

naphtha.

1. The word is usually applied to a narrow-boiling-range fraction of petroleum with volatility somewhere between that of gasoline and kerosine. For specific naphthas derived from petroleum see naphtha, petroleum; naphtha, blending, naphtha, painters; rubber solvent.
2. Solvent naphtha, and heavy naphtha are terms applied to aromatic solvents derived from coal tar. See under the corresponding naphtha.

naphtha, blending. A petroleum fraction with volatility similar to the higher boiling fractions of gasoline. It is used primarily in blending with natural gasoline to produce a finished gasoline of proper volatility.

naphthacene (tetracene; 2,3-benzanthracene, rubene; chrysogen) $C_{18}H_{12}$. The molecule consists of four benzene rings fused together.

Properties: Orange solid; density 1.35; m. p. about 350°C; not easily soluble in any ordinary solvent; slight green fluorescence in daylight.

Occurrence: In commercial anthracene.

naphtha, cleaners'. A dry-cleaning fluid derived from petroleum and similar to Stoddard solvent (q. v.), but not necessarily meeting all its specifications.

naphtha, heavy (crude heavy solvent naphtha).

Properties: Deep amber to dark red liquid; a mixture of xylene and higher homologs, flammable. Sp. gr. 0.885-0.970, b. p. 160-220°C (about 90% at 200°C), flash point not above 100°F.; evaporation 303 minutes.

Derivation: (a) From coal-tar by fractional distillation. (b) From illuminating gas by scrubbing and distilling the resulting oil.

Grades: Technical.

Containers: Drums; tank cars.

Uses: Coumarone resins; solvent for dark-colored paints and enamels; solvent for asphalts, road tars, pitches, etc.; in saturating asbestos-board, brake linings,

and the like; cleansing compositions; illuminant; process engraving and lithography; rubber cements (solvent); naphtha soaps.

naphthalene (tar camphor; naphthalin) $C_{10}H_8$

or $\text{CHCHCHCHCHCHCHCHCHCH}$.

Properties: White crystalline, volatile flakes; strong coal-tar odor. Soluble in benzene, absolute alcohol and ether; insoluble in water. Sp. gr. 1.152; m. p. 80.05°C; b. p. 217.96°C.

Derivation: (a) From the coal-tar oils boiling between 170 and 230°C by crystallization and distillation. (b) From petroleum fractions after various catalytic processing operations.

Purification: Distillation, crystallization, hydrogenation, sodium treatment.

Grades: Flakes, balls; blocks; cubes; liquid; grains (rice); powder crushed; tablets; crude; C. P.

Containers: 1-lb bottles; 1-lb cans; 175-, 250-lb barrels, crude; 200-lb bags; tank trucks; cars.

Uses: Intermediate (phthalic anhydride, naphthal, "Tetralin," "Decalin," chlorinated naphthalenes, naphthyl and naphthol derivatives, dyes); moth repellent, fungicide; explosives; cutting fluid; lubricant; synthetic resins; synthetic tanning, preservative; solvent, textile chemicals; emulsion breakers, scintillation counters.

Shipping regulations: None.*

alpha-naphthaleneacetic acid (1-naphthylacetic acid) $C_{10}H_7CH_2COOH$.

Properties: White crystals, odorless, m. p. 132-135°C. Soluble in acetone, ether, and chloroform; slightly soluble in water and alcohol.

Grades: Usually supplied in dilute form, either as a powder or liquid solution ready for use.

Containers: Powder: fiber cans or multi-wall paper sacks, solution: glass bottles and carboys.

Uses: Used as a solution for inducing the rooting of plant cuttings, for spraying apple trees for prevention of early drop.

Fire hazard: None, unless a flammable carrier is used.

Shipping regulations: None.*

alpha-naphthaleneacetic acid methyl ester

(MENA) $C_{10}H_7CH_2COOCH_3$. A plant growth regulator or hormone, used for delaying sprouting of potatoes, weed control, thinning of peaches, etc.

naphthalene, chlorinated. See chloronaphthalene.

naphthalenediamine. See naphthylenediamine.

naphthalene-1,5-disulfonic acid (Armstrong's acid) $C_{10}H_6(SO_3H)_2$.

Properties: White crystalline solid; soluble in water.

Derivation: Sulfonation of naphthalene with oleum at low temperature and separation from the 1,6 isomer.

Method of purification: Recrystallization from water.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Grades: Technical.

Containers: Oak barrels.

Use: Intermediate for dyes.

Shipping regulations: None.*

naphthalene-2,7-disulfonic acid $C_{10}H_6(SO_3H)_2$.

Properties: White crystalline solid; soluble in water.

Derivation: Sulfonation of naphthalene at high temperature and separation from 2,6-isomer.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Oak barrels; fiber drums.

Use: Intermediate for dyes.

Shipping regulations: None.*

alpha-naphthalenesulfonic acid

$C_{10}H_7SO_3H \cdot H_2O$.

Properties: Deliquescent crystals; soluble in water, alcohol, and ether. M. p. 90°C.

Derivation: By the interaction of naphthalene and sulfuric acid.

Method of purification: Crystallization.

Containers: Wooden barrels; kegs.

Grades: Technical.

Uses: Starting point in the manufacture of alpha-naphthol, alpha-naphtholsulfonic acid, alpha-naphthylaminesulfonic acid; solvent (sodium salt) for phenol in the manufacture of disinfectant soaps.

Shipping regulations: None.*

beta-naphthalenesulfonic acid $C_{10}H_7SO_3H$ or $C_{10}H_7SO_3H \cdot H_2O$.

Properties: Non-deliquescent, white plates; m. p. 124-125°C. Soluble in water, alcohol, and ether.

Derivation: By the sulfonation of naphthalene.

Method of purification: Crystallization.

Grades: Technical.

Containers: Wooden barrels; fiber drums.

Uses: Starting point in the manufacture of beta-naphthol, beta-naphtholsulfonic acid, beta-naphthylaminesulfonic acid; etc.

Shipping regulations: None.*

1,3,6-naphthalenetrisulfonic acid, trisodium salt $C_{10}H_3(SO_3Na)_3$.

Properties: Fine buff crystals.

Grades: Technical.

Containers: Fiber drums, 200 lbs net, 220 lbs gross; bottles.

Use: Diazo type stabilizer.

Shipping regulations: None.*

naphthalic acid. See phthalic acid.

naphthalin. See naphthalene.

"Naphthanil." ²⁸ Trademark for a series of dye bases; products used in combination with the various "Naphthanil" prepares to form insoluble azo dyes. Prior to coupling the bases must first be diazotized to form the diazo salt. Widely used on cotton and rayon textiles.

naphtha, painters' (naphtha, V. M. & P.; varnish makers' naphtha; petroleum spirits; petroleum thinner; mineral spirits; turpentine substitute; mineral thinner; mineral turpentine.)

Any of a number of narrow-boiling-range

fractions of petroleum with boiling points of about 200 to 300°F according to the specific use. Used as thinners in paints and varnish.

Note: The term "turpentine substitute" is misleading and should not be used.

Fire hazard: Flammable. MCA warning label.

Shipping regulations: Flammable liquid. Red label. Legal label name: "turpentine substitute."*

naphtha, petroleum. A generic term applied to refined, partly refined, or unrefined petroleum products and liquid products of natural gas, not less than 10 percent of which distil below 347°F (175°C), and not less than 95 percent of which distil below 464°F (240°C) when subjected to distillation in accordance with the Standard Method of Test for Distillation of Gasoline, Naphtha, Kerosine, and Similar Petroleum Products (ASTM D 86).

Note: The naphthas used for specific purposes such as cleaning, manufacture of rubber, manufacture of paints and varnishes, etc., are made to conform to specifications which may require products of considerably greater volatility than that set by the limits of this generic definition.

Shipping regulations: Flammable liquid. Red label may be required.*

naphtha, solvent (160° benzol, coal-tar naphtha).

Properties: A mixture of small quantities of benzene and toluene with xylene and higher homologs, from coal-tar. (a) Crude: dark straw-colored liquid, flammable. (b) Refined: water-white liquid; flammable.

Constants: Sp. gr. (a) 0.862-0.892, (b) 0.862-0.872; b. p. (a) about 160°C (80%), (b) about 160°C (90%), flash point (a) and (b) about 25.6°C.

Derivation: From coal-tar by fractional distillation, from illuminating gas by scrubbing and distilling the resulting oil.

Grades: Dark straw; water-white.

Containers: 55-, 110-gal iron drums; 8000-gal tank cars.

Uses: Solvent; xylene; cumene, nitrated solvent naphtha for incorporation in dynamite compositions.

Fire hazard: Dangerous.

Shipping regulations: Flammable liquid. Red label.*

naphtha, solvent, crude heavy. See naphtha, heavy.

naphtha, V. M. & P. See naphtha, painters'. The initials mean Varnish Makers' and Painters'.

naphthenes. Cycloparaffin hydrocarbons, generally derivatives of cyclopentane (C_5H_{10}) or cyclohexane (C_6H_{12}) occurring in mixture of petroleum products of various origins.

naphthenic acids. A class of acids derived from petroleum, particularly that of a non-paraffinic character.

It is stated that these acids are produced in part by oxidation of certain readily oxidized cycloparaffins (naphthenes) during

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

distillation or other petroleum-refining operations. The acids dissolve in the aqueous caustic solutions used in refining, and are recovered by reacidification and purification from admixed oil, which is usually reduced to 1% or less.

Individual naphthenic acids are isolated with difficulty. The known members of this group are apparently colorless or faintly colored oily liquids, volatile with steam, and boil without appreciable decomposition in the range 200 to 300°C. The most common are derivatives of cyclopentane such as C_5H_9COOH . Similar derivatives of cyclohexane and cycloheptane are also common, and a great variety of homologs and higher molecular weight analogs has been noted. The materials are slightly soluble in water, but freely soluble in hydrocarbons and organic solvents.

Commercial naphthenic acid is a mixture, usually dark colored, and corrosive to metals; malodorous. The acids present have molecular weights in the range 180 to 350.

Uses: Production of sodium, calcium, aluminum, chromium, cobalt, copper, manganese, zinc and lead naphthenates. Their principal uses are as paint driers, wood preservatives; limited use in extreme pressure lubricants. See under separate entries. The free naphthenic acids have been proposed as suitable solvents for vulcanized rubber, various resins and gums such as copal, dammar, sandarac, and mastic and for aniline dyes, for reduction of viscosity of colloidal solutions, clarifying agents for mineral oils, production of detergents and wetting agents, insecticides, additive to wood oil to permit drying without cracking.

naphthionic acid (1-aminonaphthalene-4-sulfonic acid, 1-naphthylamine-4-sulfonic acid; 4-amino-1-naphthalenesulfonic acid) $C_{10}H_6(NH_2)SO_3H$.

Properties: White crystals or powder. Soluble in alcohol and ether.

Derivation: By baking a mixture of equal molecules of alpha-naphthylamine and sulfuric acid with which about 3% of oxalic acid is incorporated.

Method of purification: Crystallization.

Grade: Technical.

Containers: Wooden barrels.

Use: Dye intermediate.

Shipping regulations: None.*

1-naphthol. See alpha-naphthol.

2-naphthol. See beta-naphthol.

alpha-naphthol (1-naphthol, 1-hydroxynaphthalene) $C_{10}H_7OH$.

Properties: Colorless or yellow prisms or powder, disagreeable taste. Soluble in benzene, alcohol and ether, slightly soluble in water. Sp. gr. 1.224 (4°C), 1.0954 (95/4°C); m. p. 96°C; b. p. 278°C; volatile in steam, sublimes; refractive index 1.6206 (98.7°C).

Derivation: By fusing sodium alpha-naphtha-

lene sulfonate and caustic soda. The melt is decomposed with hydrochloric acid and distilled.

Method of purification: Redistillation.

Impurities: Beta-naphthol.

Grades: Technical; pure.

Containers: 55-gal drums.

Uses: Dyes; organic syntheses; synthetic perfumes.

Shipping regulations: None.*

beta-naphthol (2-naphthol; 2-hydroxynaphthalene) $C_{10}H_7OH$.

Properties: White, lustrous, bulky leaflets, or white powder; darkens with age; faint phenol-like odor, stable in air but darkens on exposure to sunlight; sp. gr. 1.217; m. p. 121.6°C; b. p. 285°C, flash point (closed cup) 310°F. Soluble in alcohol, ether, chloroform, glycerol, oils and alkaline solutions, slightly soluble in water.

Derivation: By fusing sodium beta-naphthalene sulfonate with caustic soda. The product is distilled in vacuo.

Method of purification: Sublimation.

Grades: Technical, sublimed; resublimed; N. F. XI.

Containers: 1-lb cartons, 250-, 300-, 350-lb wooded barrels or fiber drums.

Uses: Dyes, pigments, anti-oxidants for rubber, fats, oils, insecticide, synthesis of fungicides, pharmaceuticals, perfumes.

Shipping regulations: None.*

naphthol AS. See beta-hydroxynaphthoic anilide.

beta-naphthol benzoate. See benzonaphthol.

3-naphthol-2-carboxylic acid. See 3-hydroxy-2-naphthoic acid.

1-naphthol-3,6-disulfonic acid $C_{10}H_5(SO_3H)_2OH$.

Derivation: Fusion of sodium naphthalene-1,3,6-trisulfonate with caustic soda, or by diazotization of 1-naphthylamine-3,6-disulfonic acid and treatment with sulfuric acid

Use: Dye intermediate.

1-naphthol-4,8-disulfonic acid (Schoelkopf's acid) $C_{10}H_5OH(SO_3H)_2$.

Properties: Colorless crystals.

Derivation: Decomposition of 1-naphthylamine-4,8-disulfonic acid by diazotization and acidifying with heat.

Use: Dye intermediate.

2-naphthol-3,6-disulfonic acid (R acid, beta-naphtholdisulfonic acid) $C_{10}H_5(OH)(SO_3H)_2$.

Properties: Deliquescent, colorless, silky needles, soluble in water, alcohol and ether.

Derivation: By heating beta-naphthol with sulfuric acid (98%), dissolving the melt in water and adding salt.

Method of purification: Crystallization or through the hard, soluble calcium-sodium salt.

Grades: Technical, with varying amounts of 2-naphthol-6-sulfonic acid. The common article of trade is the disodium salt, an odorless, gray, dry, ground powder.

Containers: Wooden barrels; multiwall paper sacks.

Use: Manufacturing azo dyes for textiles, lakes and foods.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

2-naphthol-6,8-disulfonic acid, potassium salt (G salt) $C_{10}H_6OH(SO_3K)_2$.

Properties: Very small white needles, dry or in paste. Very soluble in water.

Derivation: Sulfonating beta-naphthol in oleum, diluting in water and salting out with potassium sulfate.

Method of purification: Recrystallization.

Grades: Technical; not more than 1.0% R and Schaeffer salts.

Containers: Wooden barrels; fiber drums.

Use: Azo dyes for textiles and lakes.

Shipping regulations: None.*

beta-naphthol methyl ether. See beta-naphthyl methyl ether.

beta-naphthol sodium. See sodium beta-naphtholate.

1-naphthol-4-sulfonic acid (N W acid; Neville acid and Winther's acid; alpha-naphtholsulfonic acid) $C_{10}H_6(OH)SO_3H$.

Properties: Transparent plates. Soluble in water. M.p. 170°C.

Derivation: From the sodium salt of naphthionic acid by hydrolyzing the amino group.

Grades: Technical. Also commonly handled as the sodium salt, an odorless cream to light tan, dry ground powder.

Containers: Wooden barrels, fiber drums.

Use: Dyes.

Shipping regulations: None.*

1-naphthol-5-sulfonic acid (L acid, alpha-naphtholsulfonic acid) $C_{10}H_6(OH)SO_3H$.

Properties: White solid. Soluble in water.

Derivation: (a) From naphthalene-1,5-disulfonic acid by fusion with caustic soda.

(b) From 1-naphthylamine-5-sulfonic acid by diazotizing and boiling the diazo solution with dilute sulfuric acid.

Method of purification: Recrystallization from hot water.

Grades: Technical. See also 1-naphthol-5-sulfonic acid, sodium salt.

Containers: Wooden barrels, fiber drums.

Use: Dyes.

Shipping regulations: None.*

2-naphthol-1-sulfonic acid $C_{10}H_6(OH)SO_3H$.

Properties: White crystalline solid, soluble in water.

Derivation: By sulfonating beta-naphthol with 2 to 2.5 parts of 90 to 92% sulfuric acid at about 40°C.

Method of purification: Recrystallization from water.

Grade: Technical.

Containers: Wooden barrels, fiber drums.

Use: Intermediate for Tobias acid.

Shipping regulations: None.*

2-naphthol-6-sulfonic acid (Schaeffer's acid; beta-naphtholsulfonic acid) $C_{10}H_6(OH)SO_3H$.

Properties: White leaflets; soluble in water and alcohol. M.p. 122°C.

Derivation: By sulfonation of beta-naphthol and separation from the croceine acid formed simultaneously.

Method of purification: Recrystallization from water.

Grades: Technical. Also commonly sold as the sodium salt, a cream to light tan, dry ground powder with faint naphthol odor.

Containers: Wooden barrels; fiber drums.

Use: Dyes.

Shipping regulations: None.*

2-naphthol-7-sulfonic acid (Cassella's acid; mono-sulfonic acid F; F acid; mono acid F; beta-naphtholsulfonic acid) $C_{10}H_6(OH)(SO_3H)$.

Properties: White crystals; soluble in water and alcohol; m.p. 89°C.

Derivation: By fusion of naphthalene-2,7-disulfonic acid with caustic soda or by heating the acid with an aqueous solution of caustic soda in an autoclave.

Grade: Technical.

Containers: Wooden barrels; fiber drums.

Use: Dyes.

Shipping regulations: None.*

2-naphthol-8-sulfonic acid. See croceine acid.

alpha-naphtholsulfonic acids. See 1-naphthol-4-sulfonic acid and 1-naphthol-5-sulfonic acid.

beta-naphtholsulfonic acids. See 2-naphthol-6-sulfonic acid and 2-naphthol-7-sulfonic acid.

1-naphthol-5-sulfonic acid, sodium salt (L-acid salt) $C_{10}H_6(OH)(SO_3Na)$.

Properties: Gray to light tan dry powder.

Odorless.

Purity: 70% min, inorganic content 23% max.

Containers: 175 lb fiber drums.

1,4-naphthoquinone (alpha-naphthoquinone)
 $CHCHCHCHCCOCHCHCO$.

Properties: Greenish yellow powder; odor like benzoquinone, m.p. 123-126°C; begins to sublime below 100°C, very slightly soluble in water, soluble in ethyl alcohol, ethyl ether, chloroform, benzene, and acetic acid.

Uses: Polymerization regulator for rubber and polyester resins, synthesis of dyes and pharmaceuticals, fungicide; algicide.

alpha-naphthoquinone. See 1,4-naphthoquinone.

naphthoquinoneoxime. See nitrosonaphthol.

1,2-naphthoquinone-4-sulfonic acid (beta-naphthoquinone-4-sulfonic acid)

$C_{10}H_6(O)_2SO_3H$.

Derivation: Oxidation with nitric acid of 2-amino-1-naphthol-4-sulfonic acid or 1-amino-2-naphthol-4-sulfonic acid.

Uses: Dye intermediate; identification of sulfonamide derivatives.

beta-naphthoquinone-4-sulfonic acid. See 1,2-naphthoquinone-4-sulfonic acid.

naphthoresorcinol. See 1,3-dihydroxynaphthalene.

"Naphthosol." ⁵⁷ Trademark for a series of dyestuffs and intermediates.

1,8-naphthosultam-2,4-disulfonic acid (sultam acid) $C_{10}H_4(SO_3H)_2NHSO_2$. (The $-NHSO_2-$ group forms a third ring by attachment at the 1,8 positions.)

Properties: White solid, soluble in water;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

slightly soluble in alcohol.

Derivation: Oleum sulfonation of 1-naphthylamine-8-sulfonic acid or 1-naphthylamine-4,8-disulfonic acid.

Grade: Technical.

Containers: Not sold as such.

Use: Intermediate for Chicago acid.

Shipping regulations: None.*

beta-naphthoxyacetic acid (2-naphthoxyacetic acid) $C_{10}H_7OCH_2COOH$. A plant hormone.

Properties: Crystals; m.p. 156°C. Soluble in water, alcohol, acetic acid.

1-naphthylacetic acid. See naphthaleneacetic acid.

alpha-naphthylamine $C_{10}H_7NH_2$.

Properties: White crystals becoming red on exposure to air. Soluble in alcohol and ether; slightly soluble in water. Sp. gr. 1.13; m.p. 50°C; b.p. 301°C.

Derivation: By the reduction of alpha-nitro-naphthalene with iron and hydrochloric acid. The mass is then mixed with milk of lime and distilled.

Method of purification: Crystallization.

Grade: Technical.

Containers: 225-, 300-, 350-lb wooden barrels; multiwall paper sacks.

Warning: Harmful dust and vapor. Repeated absorption may result in bladder tumors. MCA warning label.

Shipping regulations: None.*

beta-naphthylamine $C_{10}H_7NH_2$.

Properties: White to reddish lustrous leaflets. Soluble in hot water, alcohol, ether, and benzene. Commercial: f.p. 109.5°C, sp. gr. 1.061 (98/4°C); b.p. 306°C.

Derivation: From beta-naphthol by heating in an autoclave with ammonium sulfite and ammonia.

Method of purification: Distillation.

Grade: Technical.

Containers: Wooden barrels, fiber drums, multiwall paper sacks.

Use: Dyes.

Warning: Harmful dust and vapor. Repeated absorption may result in bladder tumors. MCA warning label.

Shipping regulations: None.*

1-naphthylamine-3,8-disulfonic acid (epsilon acid) $C_{10}H_5(NH_2)(SO_3H)_2$.

Properties: White crystalline scales; soluble in hot water.

Derivation: Naphthalene-1,5- and 1,6-disulfonic acids are nitrated and reduced, resulting in 1-naphthylamine-3,8- and 4,8-disulfonic acids. The separation is effected by crystallizing out the acid sodium salt of 1-naphthylamine-3,8-disulfonic acid.

Grade: Technical.

Containers: Wooden barrels; fiber drums.

Use: Dyes.

Shipping regulations: None.*

2-naphthylamine-3,6-disulfonic acid (amino R acid) $C_{10}H_5(NH_2)(SO_3H)_2$.

Properties: Light brown to tan granular paste. Characteristic odor.

Purity: 50% min.

2-naphthylamine-4,8-disulfonic acid (C acid; Cassella acid; 3-amino-1,5-naphthalenedisulfonic acid) $C_{10}H_5(NH_2)(SO_3H)_2$.

Properties: White crystalline solid; soluble in water (slightly).

Derivation: Reduction of 2-nitronaphthylamine-4,8-disulfonic acid.

Method of purification: Recrystallization of sodium salt from water.

Use: Dyestuffs.

2-naphthylamine-5,7-disulfonic acid (amino-J acid; 6-amino-1,3-naphthalenedisulfonic acid) $C_{10}H_5(NH_2)(SO_3H)_2$.

Properties: Crystallizes in white lustrous leaflets from water and in long needles from hydrochloric acid solutions.

Derivation: By sulfonation of either 2-naphthylamine-5-sulfonic acid or 2-naphthylamine-7-sulfonic acid.

Grade: Technical.

Containers: Wooden barrels, fiber drums.

Use: Dyes.

Shipping regulations: None.*

2-naphthylamine-6,8-disulfonic acid (amino-G acid; 7-amino-1,3-naphthalenedisulfonic acid) $C_{10}H_5(NH_2)(SO_3H)_2$.

Properties: White crystalline solid, soluble in water.

Derivation: (a) From G acid by heating sodium salt with ammonia and sodium bisulfite solution in an autoclave under pressure. (b) Sulfonation of beta-naphthylamine.

Method of purification: Recrystallization from water.

Grade: Technical.

Containers: Wooden barrels, fiber drums.

Use: Dyes.

Shipping regulations: None.*

2-naphthylamine-1,5-disulfonic acid, sodium salt. See D salt.

alpha-naphthylamine hydrochloride

$C_{10}H_7NH_2 \cdot HCl$.

Properties: White to gray, crystalline powder, soluble in water, alcohol, and ether.

Derivation: By the action of hydrochloric acid on alpha-naphthylamine.

Method of purification: Crystallization.

Grades: Technical, C. P.

Containers: 1-lb bottles; wooden kegs; fiber drums.

Uses: Dyes; organic synthesis.

Shipping regulations: None.*

1-naphthylamine-4-sulfonic acid. See naphthylonic acid.

1-naphthylamine-5-sulfonic acid (Laurent's acid; L acid; 5-amino-1-naphthalenesulfonic acid) $C_{10}H_6NH_2(SO_3H)$.

Properties: Anhydrous, white or pinkish crystalline needles; greenish fluorescence in dilute aqueous solution. Soluble in water.

Derivation: (a) From alpha-naphthylamine by sulfonation with oleum. (b) From alpha-naphthalenesulfonic acid by nitration, reduction and separation from 1-naphthylamine-8-sulfonic acid also formed.

Method of purification: Crystallization.

Grades: Technical (not more than 2% 1,8 acid).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: Wooden barrels; fiber drums.

Use: Azo dyes.

Shipping regulations: None. *

1-naphthylamine-6 and 7-sulfonic acid (Cleve's acid; 5- and 8-amino-2-naphthalenesulfonic acids) $C_{10}H_6NH_2SO_3H$.

Properties: Colorless needles; not very soluble in water.

Derivation: Sulfonation, nitration, reduction and either separation of the combined 1, 6 and 1, 7 acids or separating by different concentrations and salting out.

Method of purification: Recrystallization.

Grades: Technical; either mixture of 1, 6 plus 1, 7 acids or each separate.

Containers: Wooden barrels; fiber drums.

Uses: Azo and diazo dyes.

Shipping regulations: None. *

1-naphthylamine-8-sulfonic acid (peri acid; S acid; Schoelkopf's acid; 8-amino-1-naphthalenesulfonic acid) $C_{10}H_6NH_2SO_3H$.

Properties: White needles, slightly soluble in water.

Derivation: Together with 1-naphthylamine-5-sulfonic acid by sulfonating naphthalene, nitrating, reducing and separating the combined precipitated acids with soda ash. The insoluble 1, 8 sodium salt is filtered off from the 1, 5 sodium salt solution and transposed into free acid with muriatic acid.

Grades: Technical, with less than 1% 1, 5 acid.

Containers: Wooden barrels; fiber drums.

Use: Mostly as phenyl-1-naphthylamine-8-sulfonic acid for azo dyes.

Shipping regulations: None. *

2-naphthylamine-1-sulfonic acid (Tobias acid; 2-amino-1-naphthalenesulfonic acid) $C_{10}H_6(NH_2)(SO_3H)$.

Properties: Crystallizes in white needles. Soluble in hot water.

Derivation: Sodium 2-naphthol-1-sulfonate (from beta-naphthol and sulfuric acid at 40°C) is heated with ammonium hydrogen sulfite and ammonia in an autoclave at from 100 to 150°C.

Method of purification: Precipitation from dilute solution of sodium salt.

Grade: Technical.

Containers: Wooden barrels; fiber drums.

Use: Dyes.

Shipping regulations: None. *

2-naphthylamine-6-sulfonic acid (Broenner's acid; 6-amino-2-naphthalenesulfonic acid) $C_{10}H_6(NH_2)SO_3H$.

Properties: Colorless needles; soluble in boiling water.

Derivation: By heating sodium 2-naphthol-6-sulfonate with concentrated ammonia in an autoclave at 180°C.

Grades: Technical. Also commonly sold in the form of the sodium salt, an odorless, light gray to pink powder.

Containers: Barrels; kegs; fiber drums.

Use: Dyes.

Shipping regulations: None. *

2-naphthylamine-7-sulfonic acid (Cassella's acid F; Bayer's acid; F acid; delta acid)

$C_{10}H_6(NH_2)SO_3H$.

Properties: Colorless crystals; soluble in water, alcohol, and ether.

Derivation: (Cassella's acid F.) By heating sodium 2-naphthol-7-sulfonate with aqueous ammonia and ammonium acid sulfite in an autoclave.

Grade: Technical.

Containers: Wooden barrels; kegs; fiber drums.

Use: Dyes.

Shipping regulations: None. *

2-naphthylamine-8-sulfonic acid (Badische acid). Similar to other naphthylamine-sulfonic acids.

1-naphthylamine-3, 6, 8-trisulfonic acid (Koch's acid; 8-amino-1, 3, 6-naphthalenetrisulfonic acid) $C_{10}H_4(NH_2)(SO_3H)_3$.

Properties: White solid; soluble in water (slightly).

Derivation: Naphthalene is sulfonated to naphthalene-1, 3, 6-trisulfonic acid using oleum; and this trisulfonic acid is nitrated cold and then reduced with iron.

Method of purification: Recrystallization from water.

Grades: Technical.

Containers: Wooden barrels, fiber drums.

Use: Dyes.

Shipping regulations: None. *

naphthyl benzoate. See benzonaphthol.

naphthylenediamine (diaminonaphthalene; naphthalenediamine) $C_{10}H_6(NH_2)_2$. There are eight isomers. The following properties are those of the 1, 5 isomer.

Properties: Colorless crystals; m. p. 190°C; b. p., sublimes. Soluble in alcohol and hot water, very sparingly soluble in cold water.

Derivation: (a) By the reduction of alpha-dinitronaphthalene. (b) By heating dihydroxynaphthalene with aqueous ammonia.

Method of purification: Crystallization.

Grades: Technical.

Containers: Wooden kegs; fiber drums.

Use: Organic synthesis.

Shipping regulations: None. *

naphthyleneethylene. See acenaphthene.

N-alpha-naphthylethylenediamine dihydrochloride $C_{10}H_7NHCH_2CH_2NH_2 \cdot 2HCl$. Colorless crystals; soluble in water. Used as reagent for the quantitative determination of sulfadriugs.

beta-naphthyl ethyl ether (bromelia; nerolin II; nerolin; 2-ethoxynaphthalene) $C_{10}H_7OC_2H_5$.

Properties: White crystals, orange-blossom odor; congealing pt. 35°C; soluble in 5 parts of 95% alcohol.

Derivation: By the interaction of beta-naphthol and ethyl alcohol in presence of sulfuric acid.

Method of purification. Crystallization.

Grades: Technical.

Containers: Tins.

Uses: Perfumes; soaps.

Shipping regulations: None. *

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

1-naphthyl N-methylcarbamate $C_{10}H_7OOCNHCH_3$.

Derivation: Synthesized directly from 1-naphthol and methyl isocyanate or from naphthyl chloroformate (1-naphthol and phosgene) plus methylamine.

Use: Insecticide.

beta-naphthyl methyl ether (yara-yara; beta-naphthol methyl ether; 2-methoxynaphthalene; methyl naphthyl ether; methyl beta-naphtholate) $C_{10}H_7OCH_3$.

Properties: White, crystalline scales; soluble in alcohol and ether; insoluble in water. M. p. 72°C; b. p. 274°C.

Derivation: (a) By heating beta-naphthol and methyl alcohol in presence of sulfuric acid. (b) By methylating beta-naphthol with dimethyl sulfate.

Method of purification: Crystallization.

Grades: Technical.

Containers: Tins.

Use: Perfumery (soaps).

Shipping regulations: None.*

alpha-naphthylphenyloxazole (NPO, ANPO, 2-(1-naphthyl)-5-phenyloxazole) $C_{19}H_{15}NO$.

Properties: Solid; m. p. 104-106°C.

Grade: Scintillation.

Containers: 100-g bottles.

Use: Scintillation counter or wave length shifter in solution scintillators.

alpha-naphthyl salicylate $HOC_6H_4COOC_{10}H_7$.

Properties: White, crystalline powder, incompatible with alkalis and ferric compounds. Soluble in alcohol, ether, and fixed oils; insoluble in water. M. p. 83°C.

Derivation: By the action of salicylic acid upon alpha-naphthol.

Use: Medicine.

Shipping regulations: None.*

beta-naphthyl salicylate (salicylic naphthyl ester) $C_6H_4OHCOO(C_{10}H_7)$.

Properties: White, shining crystals, odorless, tasteless; decomposed by the alkaline pancreatic fluid; undecomposed by cold acids or alkalis. Soluble in hot alcohol, ether, benzene; soluble with difficulty in cold alcohol; insoluble in water. M. p. 95°C.

Derivation: By the action of salicylic acid on beta-naphthol.

Containers: Glass bottles; fiber cans.

Use: Medicine.

Shipping regulations: None.*

alpha-naphthylthiourea (ANTU) $C_{10}H_7NHCSNH_2$.

Properties: Odorless gray powder; m. p. 198°C. Insoluble in water and only very slightly soluble in most organic solvents.

Derivation: From alpha-naphthylthiocarbamide and alkali or ammonium thiocyanate.

Containers: Fiber cans.

Use: Rodenticide.

Warning: Poisonous if inhaled or swallowed. MCA warning label.

Naples yellow. See lead antimonate.

narceine $C_{23}H_{27}O_9N \cdot 3H_2O$.

Properties: White, silky crystals; bitter

taste; odorless. Crystallizes from water at 60°C with 2 molecules of water, loses these at 100°C and a further molecule at 140°C. The fused residue is a mixture of bases. Soluble in alcohol and boiling water; less soluble in cold water; insoluble in ether. M. p. 150-160°C (commercial), 170-171°C (pure base).

Derivation: Occurs in opium. May be obtained from narcotine.

Use: Medicine.

Shipping regulations: None.*

narcissus oil. See jonquil oil.

narcosine. See noscapine.

l-alpha-narcotine. See noscapine.

naringenin-7-rhamnoglucoside. See naringin.

naringenin-7-rutinoside. See naringin.

naringin (naringenin-7-rhamnoglucoside; naringenin-7-rutinoside; aurantiin) $C_{27}H_{32}O_{14}$.

Properties: A bioflavonoid. Crystals; m. p. 171°C; bitter taste. Soluble in acetone, alcohol, warm acetic acid.

Source: Extracted from flowers and rind of grapefruit and immature fruit.

Uses: Beverages; medicine; food supplement.

"Narlene." ²³³ Trademark for organophosphorus compounds.

native paraffin. See ozocerite.

"Natox." ¹⁷² Brand name for sodium oxalate. $Na_2C_2O_4$.

Properties: Grayish, crystalline powder.

Minimum of 88% $Na_2C_2O_4$.

Containers: 100-lb paper bags.

Uses: Insolubilizer in the manufacture of wallboard cement and insulating materials; tanning of kid skin, fireworks.

natrium. The Latin name for sodium; hence the symbol Na in chemical nomenclature.

natroalunite. See alunite.

natrolite $Na_2Al_2Si_3O_{10} \cdot 2H_2O$. A mineral of the zeolite group. See zeolites.

Properties: Colorless or white to gray, yellow, greenish or red; sp. gr. 2.2-2.25; hardness 5-5.5.

"Natrosol 250." ²⁶⁶ Trademark for a nonionic, water-soluble cellulose ether.

Properties: White powder; readily soluble in hot or cold water.

Uses: Thickener; binder; protective colloid; suspending agent in latex paints and emulsion polymerization.

"Natsyn." ²⁶⁵ Trademark for a series of cis-1,4-polyisoprene synthetic rubbers essentially duplicating the chemical structure of natural rubber.

Natta catalysts. A particular type of stereospecific catalyst (q. v.) made from titanium chloride and aluminum alkyl or similar materials by a special process which includes grinding the materials together to produce an active catalyst surface. Also used to designate stereospecific catalysts in general.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

natural cement. A hydraulic cement produced by pulverizing and then heating naturally occurring rock (cement rock) containing appropriate proportions of limestone, clay, magnesia and iron. Ignition temperatures are usually lower than for Portland cement. Final pulverizing is necessary as with Portland cement.

natural gas. A mixture of the low molecular weight paraffin series hydrocarbons methane, ethane, propane and butane with small amounts of higher hydrocarbons, also frequently containing small or large proportions of nitrogen, carbon dioxide, hydrogen sulfide and occasionally small proportions of helium. Methane is almost always the major constituent. Natural gas accompanying petroleum always contains appreciable quantities of ethane, propane, butane, as well as some pentane and hexane vapors and is known as "wet" gas. "Dry" gas contains little of these higher hydrocarbons. See also sour gas.

The exact composition of natural gas varies with locality. The heating value of natural gas is usually over 1000 Btu/cu ft unless nitrogen or carbon dioxide are important components of the gas.

Uses: Natural gas is used directly as a fuel and the higher hydrocarbons in it are also recovered for blending in motor fuel, and for use as liquefied fuel gases. Manufacture of carbon black is a major use, as is the use as a starting material for chemical synthesis of ammonia, acetylene, vinyl chloride, methanol, formaldehyde, ethanol, acetaldehyde. The most recently developed use is for production of synthesis gas from which liquid fuels and oxygenated aliphatic organic compounds are produced.

Containers: Limited amounts are shipped in high pressure cylinders.

Shipping regulations: Flammable compressed gas. Red gas label.*

"Naturetin," ⁴¹² Trademark for bendroflumethiazide (q. v.).

"Naugapol," ²⁴⁸ Trademark for a series of butadiene-styrene copolymers which have received special processing for minimum water soluble salts and low ash content. Included are "Naugapol K" series which are masterbatches of high styrene resin ("Kralac" A - EP) and "Naugapol" elastomers. Uses for "Naugapol" include wire and cable insulation, mechanical goods, adhesives and cements. The "K" series are used for shoe soles, floor tile and wire and cable insulation.

"Naugatex," ²⁴⁸ Trademark for a series of synthetic latices. The 2000 and 2100 types are hot and cold polymerized SBR types respectively. The 2600 series are nitrile latices. The 2700 series are high styrene or resin latices. These latices have a wide range of properties and uses, such as textile applications, paper saturation, and beater addition; tire cord; rug backing, paints; chewing gum and foam sponge.

"Naugawhite," ²⁴⁸ Trademark for an alkylated phenol antioxidant.

Properties: A slightly viscous clear amber liquid; sp. gr. 0.96; soluble in acetone, ethylene dichloride, benzol and gasoline; insoluble in water. Also available as "Naugawhite Powder", sp. gr. 1.19.

Uses: A nondiscoloring, nonstaining, general purpose antioxidant for rubber and latex in foam sponge, tire carcass, refrigerator gaskets, footwear, proofing, wire insulation and sundries. Used in all types of natural and synthetic rubbers.

naval stores. Historically, the pitch and rosin used on wooden ships. The term now includes all the modern products from pine wood and stumps, including rosin, turpentine and pine oils, from either gum or wood, and also tall oil and its derivatives.

"Navee '42," ³³ Trade name for an emulsifiable degreasing compound consisting of high kauri-butanol solvents and emulsifying agents. Flash point 150°F min. Used for marine and industrial degreasing and light duty carbon removal. Also available as "Navee 427," a variation non-corrosive to aluminum, especially designed for the aircraft industry.

"Naxol," ²⁴³ Trade name for cyclohexanol.

Nb. Symbol for niobium.

NBA. Abbreviation for N-bromoacetamide.

NBC. ²⁸ Sun or ozone cracking inhibitor.

Nickel dibutylidithiocarbamate.

$[(C_4H_9)_2NC(S)]_2Ni$.

Properties: Green powder or flakes; sp. gr. 1.26; m. p. 86°C or higher.

Containers: 250-lb drums.

Uses: To prevent cracking due to ozone of SBR (styrene butadiene rubber) stocks; to improve heat resistance and retard discoloration of neoprene compounds.

NBR. Nitrile-butadiene rubber. See acrylonitrile rubber.

NBS. Abbreviation for N-bromosuccinimide.

NC. Abbreviation for nitrocellulose.

"NCF Paste," ³²⁸ Brand name for a water-soluble urea-formaldehyde resin, used in the textile industry to produce a durable crease-proof, dimensional stabilizing finish. It is snow-white, with a faint odor of formaldehyde.

NCS. Abbreviation for N-chlorosuccinimide.

Nd. Symbol for neodymium.

NDGA. Abbreviation for nordihydroguaiaretic acid.

Ne. Symbol for neon.

"Neantine," ²²⁷ Trademark for diethyl phthalate (phthalol, ethyl phthalate) $C_6H_4(COOC_2H_5)_2$, 99% pure.

Properties: Colorless liquid, when purified, is completely odorless; otherwise develops a very faint and slightly sweet odor; stable;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

will not discolor. Sp. gr. (25/25°C) 1.115-1.118; refractive index 1.499-1.502. Clearly soluble in 5 parts of 60% alcohol.

Uses: Employed as solvent for synthetic musks and other solid aromatic substances; also a denaturant for perfumery alcohol.

"Neatex." ¹⁵² Trade name for neat's foot oil; produced in seven grades of different cold tests for various uses such as belt and leather dressings, lubricating oils and greases, sulfonated oils, silk soaking, tanning oils, textile tapes, veterinarian supplies.

neatsfoot oil (bubulum oil; hoof oil).

Properties: A fixed, pale yellow oil with a peculiar odor. Soluble in alcohol, ether, chloroform, and kerosene. Sp. gr. 0.916; saponification value 194-199; iodine value 70.

Derivation: By boiling in water the shinbones and feet (deprived of hoofs) of cattle and separating the oil from the fat obtained.

Adulterants: Rape, cotton-seed, fish and mineral oils.

Grades: 15°; 20°; 30°, 40°F cold test, being the temperature in degrees F at which stearin separates.

Containers: Tins, drums.

Uses: Leather industry for "fat-liquoring"; waterproofing and softening leather; lubricant; oiling wool.

Shipping regulations: None.*

"Nebony." ²¹ Brand name for hydrocarbon, dark-colored thermoplastic resins of good odor available in grades from tacky medium-hard to glossy, brittle solid. Soluble in ketones, esters, terpenes, naphthenes, aromatic and chlorinated solvents and partially soluble in aliphatic and ether-alcohol solvents. Used in phonograph records, sound deadening compounds, rubber compounding, electrical insulating compounds, plastics, floor tile, adhesives, wax compounds, pipe coating oils, and paper impregnants.

"Nebula." ⁵¹ Trademark for multi-purpose grease having ability to serve under heavy loads at high speeds and under extremes of temperatures.

neburon. See 1-n-butyl-3-(3,4-dichlorophenyl)-1-methylurea.

"Nectadon." ¹²³ Trademark for noscapine.

"Neellum." Quaternary alloy of bismuth, tellurium, selenium, antimony. Possible semiconductor for thermoelectric cooling.

"Neellum." ⁴¹ Trade name for a synthetic rubber coating of the neoprene type which can be applied in films up to 20 mils in thickness.

"Neetol." ²⁴⁴ Trademark for a series of alkaline oils, based primarily on neatsfoot oil.

Containers: Non-returnable steel drums averaging 400-425 lbs net.

Uses: Used by the leather industry and referred to as mayonnaise type fat-liquor.

"Negamine 142A." ⁸³ Trademark for a textile finishing agent consisting of the amino esters of long chain fatty acids.

"Negatan." ¹⁰⁰ Trademark for negatol (q. v.).

negatol ("Negatan"). A condensation product of meta-cresol-sulfonic acid with formaldehyde. A polymerized dihydroxydimethyldi-phenylmethane-disulfonic acid. It is dispersible in water forming colloidal solutions which are very acidic. The pH of a 5% dispersion is about 1.0.

Use: Medicine.

"Neguvon." ¹⁸¹ Parasiticide and anthelmintic for domestic animals, containing O,O-di-methyl 2,2,2-trichloro-1-hydroxyethyl phosphonate (q. v.).

"Nekal." ³⁰⁷ Trademark for a series of wetting and dispersing agents.

"Nekal" BA-75: Sodium alkyl-naphthalenesulfonate; 65% active; anionic.

Properties: Powder; density 0.73.

Uses: Dyeing and leveling agent in leather processing; wetting, dispersing and penetrating agent in textile processing; wetting agent in agricultural chemicals; dispersing agent in plastics and synthetic latices; stabilizer in latex formulations.

"Nekal" BX-78: Sodium alkyl-naphthalenesulfonate, approximately 20% sodium sulfate. Properties: Powder; density 0.55-0.70.

Uses: Wetting, penetrating, pasting agent in textile processing; wetting and dispersing agent in leather processing; wetting agent in paper manufacture; wetting agent for dry-color pigments; extender for paper-coating formulations, surfactant for latex polymerization and emulsification.

"Nekal" NF: Sodium alkyl-naphthalenesulfonate; anionic.

Properties: Liquid, water-soluble and stable to acids, alkalis and hard water; sp. gr. 1.04.

Uses: Dispersant for solids in oils; wetting and penetrating agent for padding and long-liquor drying with vat, naphthol, sulfur and direct colors.

"Nekal" NS: Sulfonated aliphatic polyester; approximately 22% active.

Properties: Liquid, sp. gr. 1.04; low foaming. Uses: Wetting and penetrating agent in textile processing; rewetting agent for "Sanforizing."

"Nekal" WS-21: Sulfonated aliphatic polyester; 18-20% active.

Properties: Clear, colorless liquid; soluble in water, stable in hard and soft water; moderately stable in acid and alkaline liquors.

Uses: Wetting and rewetting agent for use in both hot and cold solutions; wetting and penetrating agent in various phases of textile processing; surfactant in polyvinyl acetate emulsion paint formulations.

"Nekal" WS-25: Sulfonated aliphatic polyester; 55-60% active.

Properties: More concentrated solution of "Nekal WS-21."

Uses: See "Nekal WS-21."

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Nello" Dipentene. ²⁹⁶ Brand name for commercial cut of terpene hydrocarbons possessing a boiling range similar to that of the chemical compound *d*-limonene. Used in paints for wetting and dispersing properties; in rubber reclaiming as a swelling and penetrating agent; in resin manufacturing.

"Nello" Gum Rosin. ²⁹⁶ Brand name for a proprietary product. A relatively new type of rosin which is absolutely clean, being clear and free from dirt and sand. Refined in aluminum stills under chemical control, and embodying absolute uniformity. Available in grades WW to H. "Nello" gum rosin is processed to the following specifications: Acid number 161-168 (mg KOH); saponification number 170-180 (mg KOH), softening point by ring and ball method; (Grades X, WW, WG) 168-176°F, (Grades N and below) 171-176°F; ash max. 0.04%; unsaponifiable 5-9%; turpentine content 0.2-0.6%.

"Nello" Gum Spirits Turpentine. ²⁹⁶ Brand name for a proprietary product, a pure gum spirits of turpentine.

"Nello" Alpha-Pinene. ²⁹⁶ Brand name for a proprietary product. Typical purity of 98% as alpha-pinene.

"Nello" Refined Sulfate Wood Turpentine. ²⁹⁶ Brand name for a proprietary product, the by-product of the sulfate pulping operations located predominately in southern U. S.; similar to gum turpentine.

"Nello" Resin. ²⁹⁶ Brand name for a proprietary product, a liquid rosin for use in the manufacture of paints, varnishes, and enamels, available in pale and medium grades containing 80% "Nello" Gum Rosin and 20% turpentine.

"Nello" Terpeneol. ²⁹⁶ Brand name for a proprietary product, a water-white viscous liquid with a characteristic woody lilac odor. Contains a minimum alcohol content as terpeneol of 97% consisting principally of the alpha isomer. Used primarily in the preparation of essential oils and industrial and soap perfumes.

Nelson cell. A diaphragm-type electrolytic cell (see diaphragm cell) for the production of chlorine and caustic soda. The Nelson cell, once widely used but now largely replaced by Vorce and Hooker cells, is of rectangular design. A steel outer tank collects the caustic and hydrogen. A row of carbon anodes is suspended from the lid and a U-shaped cathode of perforated sheet steel is located between the anodes and the tank. The cathode is lined with a diaphragm of asbestos paper, which separates the brine in the anode compartment from the caustic in the outer cathode chamber.

"Nemafume." ⁸⁸ Trademark for 1,2-dibromo-3-chloropropane; 99% purity.

"Nemagon." ¹²⁵ Trademark for a soil fumigant containing 97% of 1,2-dibromo-3-chloro-

propane and 3% of other active compounds. Properties: Pungent, brown liquid; b. p. approx. 195°C; setting point 7°C; slightly soluble in water; soluble in most common organic solvents.

Containers: 30-gal unlined metal drums (505 lb net).

Warning: (technical product and formulations 20% and over): Harmful liquid and vapor; (liquid) combustible, keep away from heat and open flame.

Caution: (formulations less than 20%): May cause irritation of skin, eyes, nose and throat.

nematocide. An agent which is destructive to nematodes (roundworms or threadworms).

"Nembutal." ³ Trademark for pentobarbital sodium.

"Nemex." ⁴⁰¹ Trade name for a mixture of chloropicrin (50%) and chlorinated C₃ hydrocarbons, including 1,3-dichloropropene, 1,2-dichloropropane.

Uses: Soil fumigant for nematodes and fungi.

Warning: Poisonous liquid and vapor. Do not breathe vapor. Do not get in eyes, on skin or clothes.

neo-

1. A prefix meaning new and designating a compound related in some way to an older one.
2. A prefix indicating a hydrocarbon in which at least one carbon atom is connected directly to four other carbon atoms; as, neopentane.

"Neo-Antergan." ¹⁷³ Trademark for pyrilamine.

"Neo-Aristocort." ⁵⁷ Trademark for neomycin-triamcinolone acetate.

neoarsphenamine. Consists chiefly of sodium 3,3'-diamino-4,4'-dihydroxyarsenobenzene-N-methanol sulfoxylate:

Properties: Yellow powder, containing not less than 19% arsenic. Odorless or slight odor. Poisonous! Soluble in water and glycerol; slightly soluble in alcohol; almost insoluble in acetone, chloroform, ether.

Containers: Ampules.

Use: Medicine (the same as arsphenamine).

Shipping regulations: None.*

"Neobiotic." ²⁹⁹ Trademark for neomycin sulfate.

"Neobon." ²⁹⁹ Trademark for a preparation containing vitamins, minerals, and other factors. Used in medicine.

"Neobon." ⁴¹ Trade name for a synthetic rubber membrane and coating of the neoprene type for protecting concrete and steel tanks from corrosives.

"Neochel." ²⁸⁸ Trademark for chemical additives to electroplating baths. Liquid formulation for use in all cyanide copper and bronze plating solutions which replaces Rochelle salt or proprietary materials in these baths.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

neocinchophen (6-methyl-2-phenylquinoline-4-carboxylic ethyl ester) $C_{19}H_{17}NO_2$.

Properties: White to pale-yellow, crystalline powder; odorless and tasteless; permanent in air; affected by light. M. p. 75-76°C. Nearly insoluble in water; soluble in hot alcohol and strong acids; very soluble in chloroform and ether.

Derivation: Synthetic.

Method of purification: Crystallization.

Grades: N. F. XI.

Containers: Glass bottles; tin cans; paper-lined barrels; well closed, light-resistant containers.

Use: Medicine.

Shipping regulations: None.*

"NeoCoat." ²⁰⁴ Trademark for a self curing liquid neoprene maintenance coating for steel, concrete, and wood surfaces. Resistant to corrosive atmospheric conditions, splash and spill of chemicals, and to abrasion. Shipped in 1-gal and 5-gal cans.

neodymia. Neodymium oxide. See neodymium salts. See also rare earths.

neodymium Nd. Element having atomic number 60; group III of the periodic table, one of the rare-earth elements of the cerium subgroup.

Properties: Yellowish metal, tarnishes easily; sp. gr. 7.004; m. p. 1024°C, b. p. about 3150°C; ignites to oxide (200-400°C), liberates hydrogen from water; soluble in dilute acids. Color of salts rose-red.

Derivation: For source and isolation see rare earth minerals; metal produced by reduction of the chloride or fluoride with calcium powder.

Containers: Boxes.

Uses: Neodymium salts, electronics; alloys, in colored glass, to increase heat resistance of magnesium in aircraft and missiles.

Shipping regulations: None.*

See also didymium.

neodymium salts.

neodymium acetate $Nd(C_2H_3O_2)_3 \cdot xH_2O$. Pink powder, soluble in water.

neodymium ammonium nitrate

$Nd(NO_3)_3 \cdot 2NH_4NO_3 \cdot 4H_2O$. Pink crystals, soluble in water. Technical grade contains 75% neodymium salt. Principal impurities praseodymium and samarium.

neodymium carbonate $Nd(CO_3)_3 \cdot xH_2O$.

Pink powder, insoluble in water, soluble in acids. Grades 75%, 95%, and 99% neodymium salt.

neodymium chloride $NdCl_3 \cdot xH_2O$. Pink lumps, soluble in water and acids. Grades 75%, 95%, 99%, and 99.9% neodymium salt. Used as source of anhydrous chloride for preparation of the metal.

neodymium fluoride. Pink powder, insoluble in water. Grades 65%, 75%, 99%, and 99.9% neodymium salt.

neodymium nitrate $Nd(NO_3)_3 \cdot 6H_2O$. Pink crystals, very soluble in water. Grades 75%, 95%, 99%, and 99.9% neodymium salt.

Shipping regulations: Oxidizing material. Yellow label.*

neodymium oxalate $Nd_2(C_2O_4)_3 \cdot xH_2O$. Pink powder insoluble in water, slightly soluble in acids. Grades 75%, 95%, and 99% neodymium salt.

neodymium oxide (neodymia) Nd_2O_3 .

Pure product a blue-gray powder. Technical grade a brown powder. Grades 65%, 75%, 85%, 95%, 99% and 99.9% oxide.

Insoluble in water, soluble in acids. Hygroscopic, absorbs carbon dioxide from the air. Used in ceramic capacitors, coloring glass; catalysts.

neodymium sulfate $Nd_2(SO_4)_3 \cdot 8H_2O$. Pink crystals, soluble in cold water; sparingly soluble in hot water. Grades 75%, 99%, and 99.9% neodymium salt.

Containers: Bottles, fiber and steel drums.

Uses: Decolorizing glass; coloring glass used in glass blowers' and welders' goggles, tableware, etc.

"Neo-Fat" Products. ¹⁵ Trademark for a series of fatty acids produced by fractional crystallization and distillation processes.

Containers: Lined bung drums; lined open head drums, or 50-lb paper bags, all also in aluminum tank cars.

Various products are available:

"Neo-Fat" 8. Proprietary name for caprylic acid.

Properties: Acid value 390; iodine value 0.8, titer 15°C, color Lovibond (5 1/4) 1.0R-20Y; unsap. 0.2%, moisture 0.2% approx. 7.5 lbs/gal.

Uses: Chemical raw material, fatty alcohols, metal salts, detergents, flotation; paper coating.

"Neo-Fat" 10. Proprietary name for capric acid.

Properties: Acid value 326, iodine value 0.8; titer 30°C; color Lovibond (5 1/4) 3.0R-10Y, color stab. Lovibond (5 1/4) 3.0R-35Y; unsap. 0.2%, moisture 0.2%; approx. 7.5 lbs/gal.

Uses: Chemical raw material, perfumes, flavors; alkylolamides; flotation; paper coating.

"Neo-Fat" 12. Proprietary name for lauric acid.

Properties: Acid value 280, iodine value 0.8, titer 42.5°C, color Lovibond (5 1/4) 0.8R-8Y; color stab. Lovibond (5 1/4) 2.0R-20Y; unsap. 0.1%, moisture 0.2%; approx 7.5 lbs/gal.

Uses: Alkyd resins, wetting agents, soaps; cosmetics; insecticides, metallic soaps; chemical raw material.

"Neo-Fat" 14. Proprietary name for myristic acid.

Properties: Acid value 246, iodine value 0.8; titer 50°C, color Lovibond (5 1/4) 0.8R-8Y; color stab. Lovibond (5 1/4) 2.5R-25Y; unsap. 0.1%, moisture 0.2%, approx 7.5 lbs/gal, odor, bland and characteristic.

Uses: Alkyd resins; wetting agents; soaps; cosmetics; insecticides; metallic soaps; chemical raw material, specialty lubricating greases.

"Neo-Fat" 16. Proprietary name for palmitic acid.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

- Properties: Acid value 218; iodine value 1.0; titer 57.5°C; color Lovibond (5 1/4) 0.8R-8Y; color stab. Lovibond (5 1/4) 2.0R-20Y; unsap. 0.2%; moisture 0.2%; approx 7.5 lbs/gal.
- Uses: Chemical raw material; esters; plasticizers; metallic soaps; greases; detergents; cosmetics; shaving cream; fatty alcohols; sulfonic acids; paper coating.
- "Neo-Fat" 16-54. Proprietary name for eutectic palmitic-stearic acid.
- Properties: Acid value 212; iodine value 1.0; titer 54°C; color Lovibond (5 1/4) 1.5R-15Y; unsap. 0.3%; moisture 0.3%; approx 7.5 lbs/gal; appearance, hard waxy amorphous.
- Uses: Chemical raw material; esters; plasticizers; metallic soaps; greases; detergents; cosmetics; shaving cream; fatty alcohols; sulfonic acids; paper coating.
- "Neo-Fat" 18. Proprietary name for stearic acid.
- Properties: Acid value 179; iodine value 1.5; titer 67.5°C; color Lovibond (5 1/4) 1.0R-10Y; unsap. 0.3%; moisture 0.3%; approx 7.5 lbs/gal.
- Uses: Chemical raw material; esters; plasticizers; metallic soaps; greases; detergents; cosmetics; shaving cream; fatty alcohols; sulfonic acid.
- "Neo-Fat" 18-53. Proprietary name for single pressed stearic acid.
- Properties: Acid value 209; iodine value 12; titer 53.0°C; color Lovibond (1") 1.5R-15Y, unsap. 0.4%; moisture 0.2%; approx 7.5 lbs/gal.
- Uses: Buffing compounds; polishes; rubber compounding.
- "Neo-Fat" 18-54. Proprietary name for double pressed stearic acid.
- Properties: Acid value 209; iodine value 6; titer 54.1°C; color Lovibond (5 1/4) 0.5R-2Y; Gardner color after heating 1 hr at 150°C, 2; unsap. 0.6%; moisture 0.2%; approx 7.5 lbs/gal; peroxide index 0.1; buffing stick test, must paste; odor bland.
- Uses: Paper coating, recording cylinders; cosmetics, candles, buffing compounds; esters; plasticizers.
- "Neo-Fat" 18-55. Proprietary name for triple pressed stearic acid.
- Properties: Acid value 207.5; iodine value 1.5, titer 55.0°C; color Lovibond (5 1/4) 0.5R-2Y; unsap. 0.4%, moisture 0.2%, approx 7.5 lbs/gal; odor bland.
- Uses: Paper coating; recording cylinders, cosmetics, candles; buffing compounds; esters; plasticizers; shaving cream.
- "Neo-Fat" 18-59. Proprietary name for rubber grade stearic acid.
- Properties: Acid value 198; iodine value 8, titer 56°C; color Lovibond (1") 4.0R-20Y; unsap. 1.5%; moisture 0.3%; approx 7.5 lbs/gal.
- Uses: Rubber compounding; buffing compounds; recording cylinders; water proofing cement.
- "Neo-Fat" 18-61. Proprietary name for mixture of stearic - palmitic acids.
- Properties: Acid value 202; iodine value 2; titer 62°C; color Lovibond (5 1/4) 1.0R-10Y; unsap. 0.4%; moisture 0.2%; approx 7.5 lbs/gal.
- Uses: Chemical raw material; polishes; buffing compounds; water proofing cement.
- "Neo-Fat" 55. Proprietary name for distilled palm fatty acid.
- Properties: Acid value 207; iodine value 50; titer 45°C; color Lovibond (5 1/4) 1.0R-10Y; unsap. 0.5%; moisture 0.5%; approx 7.5 lbs/gal.
- Uses: Chemical raw material; chemical specialties; soaps; polishes.
- "Neo-Fat" 65. Proprietary name for distilled animal fatty acids.
- Properties: Acid value 202; iodine value 60; titer 41°C; color Lovibond (1") 2R-20Y; unsap. 1.5%; moisture 0.5%; approx 7.5 lbs/gal.
- Uses: Chemical raw material; lubricating greases; soaps; chemical specialties.
- "Neo-Fat" 92-04. Proprietary name for low titer crystallized distilled white oleic acid.
- Properties: Acid value 199; iodine value 93; titer 3°C; color Lovibond (5 1/4) 1R-10Y; unsap. 1.0%; moisture 0.3%; approx 7.5 lbs/gal.
- Uses: Chemical raw material; self-polishing wax compounds; esters; plasticizers; soaps.
- "Neo-Fat" 94-04. Proprietary name for low titer crystallized red oil.
- Properties: Acid value 199; iodine value 93; titer 9°C; color Lovibond (1") 2R-15Y; unsap. 1.0%; moisture 0.3%; approx 7.5 lbs/gal.
- Uses: Chemical raw material; self-polishing wax compounds, esters; plasticizers; ore flotation; soaps.
- "Neo-Fat" 94-10. Proprietary name for 8-11 titer crystallized red oil.
- Properties: Acid value 198, iodine value 93; titer 9°C; color Lovibond (1") 2R-15Y; unsap. 1.0%; moisture 0.3%; approx 7.5 lbs/gal.
- Uses: Chemical raw materials; self-polishing wax compounds, esters; plasticizers; ore flotation; soaps.
- "Neo-Fat" 255. Proprietary name for stripped coco fatty acids.
- Properties: Acid value 255, iodine value 12; titer 28°C; color Lovibond (5 1/4) 1.5R-10Y, unsap. 1.0%; moisture 0.5%; approx 7.5 lbs/gal.
- Uses: Soaps, shampoos; cosmetics; esters; plasticizers.
- "Neo-Fat" 263. Proprietary name for mixture of lauric and myristic acids, 50-50 blend.
- Properties: Acid value 262; iodine value 1.0; titer 35°C; color Lovibond (5 1/4) 1R-10Y; unsap. 0.2%; moisture 0.2%; approx 7.5 lbs/gal.
- Uses: Alkyd resins; wetting agents; soaps; cosmetics; insecticides; metallic soaps; chemical raw material; specialty lubricating greases.
- "Neo-Fat" 265. Proprietary name for distilled coco fatty acids.
- Properties: Acid value 265; iodine value 11; titer 24°C; color Lovibond (5 1/4) 2.0R-15Y; unsap. 0.5%, moisture 0.3%; approx 7.5 lbs/gal.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Uses: Alkyd resins; soaps; shampoos; esters.

"Neo-Fat" 270. Proprietary name for a mixture of lauric and myristic acids, 70-30 blend.

Properties: Acid value 270; iodine value 1.0; titer 33°C; color Lovibond (5¼) 1R-5Y; color stab. Lovibond (5¼) 3.5R-35Y; unsap. 0.2%; moisture 0.2%, approx 7.5 lbs/gal.

Uses: Alkyd resins; wetting agents, soaps; cosmetics; insecticides; metallic soaps; chemical raw material; specialty lubricating greases.

"Neo-Fat" 280. Proprietary name for a mixture of capric-myristic fatty acids.

Properties: Acid value 278, iodine value 1.0; titer 35°C; color Lovibond (5¼) 1.0R-10Y, color stab. Lovibond (5¼) 3.5R-35Y; unsap. 0.2%, moisture 0.2%; approx. 7.5 lbs/gal; Gardner 1.

Uses: Alkyd resins; wetting agents; cosmetics; insecticides; metallic soaps, chemical raw material; specialty lubricating greases.

"Neo-Fat" 360. Proprietary name for mixture of caprylic-capric acids.

Properties: Acid value 361; iodine value 1, titer 5°C; color Lovibond (5¼) 2R-20Y; unsap. 0.5%; moisture 0.5%; approx 7.5 lbs/gal.

Uses: Chemical raw material; perfumes; flavors; alkylolamides; flotation, paper coating; metal salts; detergents, fatty alcohols.

"Neofinish." 159 Trade name for a non-ionic compound dispersible in hot water. Used as a softener for all textile fibers.

"Neofollone." 227 Trademark for methyl 2-nonenolate. $\text{CH}_3(\text{CH}_2)_5\text{CH}:\text{CHCOOCH}_3$, 98.5% pure.

Properties: Colorless to slightly yellow liquid; stable; will not discolor. Sp. gr. (25/25°C) 0.893-0.898, refractive index (20°C) 1.440-1.444; clearly soluble in 4 parts of 70% alcohol.

Uses: In high class perfumes, in small quantities, where it will create a violet-leaf character.

"Neo-Germ-I-Tol." 430 Trade name for a high-alkyl dimethyl benzyl ammonium chloride. Used in the preparation of sanitary maintenance products; effective in hard water.

neohexane (2, 2-dimethylbutane) C_6H_{14} or $\text{C}_2\text{H}_5\text{C}(\text{CH}_3)_3$.

Properties: Colorless volatile liquid; b. p. 49.7°C; refractive index 1.3659 (25°C); sp. gr. 0.6570 (25°C); freezing point -99.7°C; flash point -32°C; characterized by a very high octane rating in internal-combustion engines.

Derivation: By the thermal or catalytic union (alkylation) of ethylene and isobutane, each of which is recovered from refinery gases resulting from the cracking of petroleum.

Grades: 95%, 99%, research.

Containers: Bottles; drums.

Use: As a component of motor and aviation fuels with very high octane ratings.

Shipping regulations: Flammable liquid. Red label. *

"Neo-Iopax." 321 Brand name for sodium iodomethamate.

"NeoLine." 204 Trademark for a liquid neoprene, externally catalyzed, for coating immersed surfaces of steel and concrete. Applied by brush, spray or roller for heat curing or air curing. Resists alkalies, moderate concentrations of acids, except oxidizing agents, and many solvents up to 220°F. Shipped in 1-gal and 5-gal cans.

"Neolith." 434 Brand name for litharge in a ceramic grade. Reddish-brown pellets; relatively dust-free; free flowing; 5% max on 20 mesh, 5% max through 250 mesh. Poison!

Containers: 50-, 100-lb bags; 700-lb drums; railroad hopper cars.

Uses: Ceramics; glass, allied industries.

"Neolyn." 266 Trademark for a series of soft or medium hard modifying resins. For use in adhesives, lacquers, organo-sols, plastisols, and floor tile.

"Neomerpin." 28 Trademark for a line of surface active agents based on aromatic sulfonic acid.

Properties: Yellow, translucent liquid.

Use: As a wetting, scouring, and emulsifying assistant for the textile and leather industries.

neomycin. An antibiotic, a metabolic product of *Streptomyces fradiae*. It consists of a family of at least four related compounds, neomycins A, B, and C, and fradycin. However the marketed form (as the sulfate) appears to be a single compound. The chemical structure is believed to be similar to that of streptomycin. Neomycin is active against gram-positive, acid-fast and gram-negative bacteria. It is most widely used for treating certain types of skin infections. It is stable and active in alkaline solution.

Use: Medicine (as the sulfate salt).

neomycin sulfate. The sulfate salt of neomycin (q. v.).

Properties: White to slightly yellow crystals or powder, odorless or practically odorless; hygroscopic. Solutions are dextrorotatory. Very soluble in water, very slightly soluble in alcohol and insoluble in acetone, chloroform and ether.

Grades: U. S. P. XVI; commercial.

Use: Medicine (antibiotic); cosmetic, textile, paper industries.

neon Ne.

Properties: Colorless wholly inert gas; does not combine chemically with any element. An element of atomic number 10, group 0 of the periodic system. Liquefies at -245.92°C.

Derivation: By fractional distillation of liquid air. It constitutes 0.0012% of normal air.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Grades: Technical; highest purity.
Containers: Technical, steel cylinders;
H. P., hermetically sealed glass flasks.
Use: Filling luminescent electric tubes and
photoelectric bulbs.
Shipping regulations: Nonflammable gas.
Green label.*

neonicotine. See anabasine.

neopentane (2,2-dimethylpropane; tetramethyl-
methane) C_5H_{12} or $C(CH_3)_4$. Present in
small amounts in natural gas.

Properties: Colorless gas or very volatile
liquid; b. p. $9.5^\circ C$; sp. gr. 0.613 ($0/0^\circ C$);
m. p. $-20^\circ C$; soluble in alcohol; insoluble
in water.

Grades: Technical 95%, pure 99%, research
99.9%.

Containers: Cylinders under low pressure.

Shipping regulations: Flammable liquid.

Red label.*

neopentyl glycol $HOCH_2C(CH_3)_2CH_2OH$.

Properties: White, crystalline solid; boiling
range, 95% between $204-208^\circ C$ (760 mm);
m. p. $120-130^\circ C$.

Containers: Fiber drums.

Use: Polyester foams.

"Neopones." ⁴⁴⁹ Trademark for a series of
nonionic surface active agents useful as
wetting agents, foaming agents, dye retard-
ants and detergents for automatic laundry
machines.

neoprene. A type of elastomers based on
polymers of 2-chlorobutadiene-1,3.

Properties: Creamy white or amber chips,
or dark brown putty-like solids; sp. gr.
1.23.

Containers: 50-lb bags.

Uses: In oil-, solvent-, heat-, and weather-
resistant resilient products; for quick-
setting, high-strength adhesive cements;
paints and putties, for lining tanks and
chemical equipment, crepe soles for shoes;
binder for rocket fuels.

neoprene latices. Water emulsions of poly-
merized 2-chlorobutadiene-1,3. White
milky liquids, with solid content running
from 34 to 60%. Sp. gr. 1.06-1.15.

Containers: Drums; tank cars; tank trucks.

Uses: See under neoprene.

"NeoPrime A, B, C." ²⁰⁴ Trademark for
chlorinated rubber base primers, used
with liquid neoprene coatings to bond the
neoprene coating to the underlying surface.

"Neoprontosil." ¹⁶² Trademark for azosulf-
amide.

neopyrithiamine. See pyriithiamine.

"Neo-Silvol." ³³⁰ Trademark for colloidal
silver iodide.

"Neosol" Solvent. ¹²⁵ Trademark for ethyl
alcohol proprietary solvent based on a
formulation approved by the Bureau of
Internal Revenue.

Authorized composition: Specially denatured
alcohol No. 1 (190 Proof), 100 parts by
volume; methyl isobutyl ketone, 1 part by

volume; ethyl acetate, 1 part by volume;
aviation gasoline, 1 part by volume.

Typical properties: Reid vapor pressure
(psi at $100^\circ F$), 1.7; residual odor, none;
lbs/U. S. gal at $60^\circ F$, 6.78; flash point
 $45^\circ F$.

Containers: 55-gal non-returnable drums;
6000-, 10,000-gal tank cars; tank trucks.

Uses: Solvent for shellac and other spirit
varnishes; latent solvent in nitrocellulose
lacquers; solvent for adhesives and coating
compounds, inks, and spot remover formu-
lations.

Warning: Flammable. Poisonous if swal-
lowed. Avoid contact with skin. Protect
eyes against splashes and maintain vapor
concentrations at comfort levels.

Shipping regulations: Flammable liquid.

Red label.*

"Neo Spectra." ¹³³ Trademark for a series
of jet impingement carbon blacks for
automotive enamels and all types of appli-
cations requiring high jetness. Available
as:

"Neo Spectra Mark I." For specialty appli-
cations requiring very high jetness in
powder form only.

Container: 25-lb bags.

"Neo Spectra Mark II." Standard black for
top quality enamels and lacquers. High
gloss and blackness, fast dispersion vehicle
seeking.

Containers: 25-lb bags (powder form) and
5-lb bags (bead form).

"Neo Spectra III." Medium high color, com-
bines excellent quality and economy for
enamels, lacquers, synthetic fibers and
plastics.

Container: 10-lb bag (powder form only).

neostigmine bromide (3-dimethylcarbamoxy-
phenyltrimethylammonium bromide)
 $(CH_3)_2NCOOC_6H_4N(CH_3)_3Br$.

Properties: White, crystalline powder; odor-
less and of bitter taste; m. p. $167^\circ C$ (dec);
very soluble in water; soluble in alcohol;
practically insoluble in ether.

Grades: U. S. P. XVI.

Use: Medicine.

neostigmine methylsulfate

$(CH_3)_2NCOOC_6H_4N(CH_3)_3SO_4CH_3$.

Properties: White crystalline powder; odor-
less; bitter taste; soluble in water and less
in alcohol, m. p. $142-145^\circ C$.

Grades: U. S. P. XVI.

Use: Medicine.

"Neo-Synephrine" Hydrochloride. ¹⁶² Trade-
mark for phenylephrine hydrochloride.

"Neotex." ¹³³ Trademark for furnace carbon
blacks used in rubber, printing inks and
protective coatings. Characterized by low
structure and low oil absorption. Available
in three grades, "Neotex" 100, "Neotex"
130, and "Neotex" 150.

Containers: 25- and 50-lb bags; hopper cars.

"Neothane." ²⁶⁵ Trademark for a series of
solid polyurethane elastomers.

Uses: Solid tires; shoe soles and heels;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

industrial rolls, gears, bearings, belts, bumpers, gaskets, seals, mounts, pedals, etc.

"Neo-Tone Sour." ²⁴⁴ Proprietary product consisting chiefly of fluorine compounds and complex phosphates.
Properties: White granular material; soluble in water; neutralizing value, 21.3 oz sodium bicarbonate per lb.
Containers: 150-lb and 300-lb net fiber drums.
Uses: Laundry sour of the iron-removing type.

"Neotran." ²³³ Trademark for insecticidal preparations with bis(p-chlorophenoxy)-methane as active ingredient.

"Neowet." ¹⁵⁹ Trade name for a slightly yellowish somewhat viscous liquid surface active agent having a faint color and containing 33.3% active ingredients. It is a complex polyethylene ether and is non-ionic.
Uses: For use with enzymatic desizing agents and for general wetting purposes.

"Neowet X." ¹⁵⁹ Trade name for organic ether sulfonate.
Properties: Water-white, slightly viscous liquid with slight ethereal odor. Water soluble and contains 20% active ingredients.
Uses: Detergent; surface active agent.

"Neozone." ²⁸ Trademark for a line of rubber antioxidants.

"Neozone" A. Phenyl-alpha-naphthylamine, $C_{10}H_7NHC_6H_5$. Yellow pellets which turn dark purple on exposure to air or light; sp. gr. 1.22; f. p. not lower than 50°C.

"Neozone" D. Phenyl-beta-naphthylamine, $C_{10}H_7NHC_6H_5$. Fine light gray powder; sp. gr. 1.24; f. p. not lower than 106°C.
Containers: (A) 250-lb, (D) 160-lb drums.
Uses: For natural and synthetic rubbers; (D) stabilizer in manufacture of SBR.

"Neozyme." ¹⁵⁹ Trademark for a combination of proteolytic and amylolytic enzymes, together with a small proportion of a fat-splitting enzyme.
Uses: Desizing fabrics sized with starch or gelatin or a combination of both.

nepheline. See nephelite.

nepheline syenite. An igneous rock composed mainly of feldspar and nephelite, being high in alumina and quartz-free. Magnetite and mica are sometimes present.
Occurrence: Ontario, less important amounts in Arkansas, New Jersey.
Uses: Extensively used in glass manufacture; pottery; porcelain; roofing; enamels.

nephelite (nepheline) $(Na,K)(Al,Si)_2O_4$. Essentially a silicate of sodium, found in silica-poor igneous rocks.
Properties: Colorless, white, yellowish; luster vitreous to greasy; hardness 5.5-6, sp. gr. 2.55-2.65. Eleolite is a massive variety with a greasy luster.
Occurrence: U. S. S. R.; Ontario; Norway; South Africa; Maine, Arkansas, New Jersey.

Uses: Ceramic and glass manufacture; enamels; source of potash.

nephrite. See jade.

"Nepoxide." ⁴¹ Trade name for a synthetic resin coating of the epoxy type which exhibits excellent adhesive properties and resistance to general chemicals and solvents. Can be deposited in high film thickness.

"Neptazane." ³¹⁵ Trademark for methazolamide (q. v.).

neptunium Np. A synthetic element, having atomic number 93, first formed by bombarding uranium with high-speed deuterons. Several isotopes have since been prepared ranging in half-lives from 7.3 minutes to about 2 million years and in mass numbers from 231 to 241. Neptunium 237, the longest-lived isotope, has been found naturally in extremely small amounts in uranium ores. It is not believed to be primeval but to be formed by the action of stray neutrons on uranium. Neptunium 237 is produced in weighable amounts as a by-product in the production of plutonium 239.

Metallic neptunium is obtained by first preparing neptunium trifluoride, which is reduced with barium vapor at 1200°C. It is a silvery white metal; m. p. 640°C; sp. gr. 17.7. Neptunium is similar chemically to uranium, forming analogous compounds such as NpF_3 , NpF_6 , NpF_4 , NpO_2 , Np_2O_5 , etc.

neptunium decay series. The series of short lived and little known elements produced as successive intermediate products when the elements uranium 237 and plutonium 241 undergo radioactive disintegration through neptunium 237 and finally into bismuth 209. The latter is not radioactive and thus is the end element of the series.

"Neran." ²⁰⁶ Brand name for a peptized casein product used for seasoning light leathers.

nerol $C_{10}H_{17}OH$. The trans isomer of geraniol.
Properties: Colorless liquid; rose-neroli odor.
Derivation: Iodization of geraniol with hydriodic acid, followed by treatment with alcoholic soda.
Containers: Glass bottles; drums.
Use: Perfumery.
Shipping regulations: None.*

nerolidol $C_{15}H_{24}O$. A sesquiterpene alcohol.
Properties: Straw-colored liquid with an odor similar to rose and apple. Sp. gr. 0.878; refractive index 1.480-1.482; stable in air; soluble in alcohol.
Occurrence: Found in cabreuva oil, balsam Peru, and oils of orange flower, neroli, sweet orange, and ylang ylang.
Use: Perfumery.

nerolin. See beta-naphthyl ethyl ether.

nerolin II. See beta-naphthyl ethyl ether.

neroli oil. See orange flower oil.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Nerolon." ¹⁹ Brand name for beta-naphthyl methyl ketone, an aromatic chemical used primarily in soap.

"Nerone." ²²⁷ Trademark for a synthetic neroli ketone.

Properties: Yellow liquid, having a fresh leafy odor, recalling petitgrain oil; sp. gr. 0.910-0.915 (25/25°C), refractive index (n_D²⁰) 1.4650-1.4750; flash point TCC above 212°F. Soluble in 9 parts of 70% alcohol, 2 parts of 80% alcohol.

Occurrence: Not found in nature.

Uses: In formulating mimosa, new mown hay, and similar types; also in intensifying castoreum and oakmoss effects.

"Nerosol." ³⁴² Trademark for a blend of sesquiterpene alcohols used in perfumery for peppery note.

nerve gases (nerve poisons). Highly toxic chemical warfare agents developed in Germany during World War II. Structurally, they are organic derivatives of phosphoric acid (principally, alkyl phosphates, fluorophosphates, and thiophosphates). Like the insecticides diisopropyl fluorophosphate, OMPA, parathion, and tetraethyl pyrophosphate, they inhibit the enzyme cholinesterase and cause acetylcholine poisoning and the resulting cessation of nerve transmission. The nerve gases are colorless, odorless, tasteless liquids of low volatility. They are absorbed rapidly through the eyes, lungs, or skin and are approximately 10 to 100 times as toxic to man as hydrogen cyanide. Atropine sulfate is used in the treatment of nerve gas poisoning. The principal German nerve gases were Sarin, Soman, and Tabun (q. v.). Many recent pesticides have the same general structure.

nerve poisons. See nerve gases.

nerve root. See cyripedium.

Nessler's reagent. Solution of mercuric iodide in potassium iodide, used in detecting the presence of ammonia, particularly in very small amounts.

Neuberg blue. A mixture of copper blue (powdered azurite) and an iron blue (Prussian blue). It can be more easily ground in oil than pure copper blue.

"Neubrite." ⁴²⁸ Trademark for ammonium and zinc silicofluorides containing optical brightener and an antichlor.

Properties: Yellow, free-flowing, dustless granules.

Uses: As neutralizer and whitener in laundering.

"Neufume DMX." ³²⁸ Brand name for a cationic dispersion of an aromatic amine, used in the textile industry as an acetate fume-proofing agent, substantive and durable in liquid or paste form.

neurine $\text{CH}_2\text{CHN}(\text{CH}_3)_3\text{OH}$ (trimethylvinylammonium hydroxide). A poisonous ptomaine formed during putrefaction by the

dehydration of choline.

Properties: Syrupy liquid; fishy odor; absorbs carbon dioxide from the air; soluble in water and alcohol; very poisonous!

Use: Biochemical research.

"Neusol." ⁴²⁸ Trademark for ammonium and zinc silicofluorides, containing antichlor.

Properties: Light blue, granular, dustless and non-caking.

Uses: To mothproof and neutralize fabrics in laundering.

"Neutral 50." ²⁴⁴ A proprietary product consisting of synthetic detergents, complex phosphates, and silicates.

Properties: A light buff powder; soluble in water. Total alkali as Na_2O , 13.6%; active Na_2O , 3.1%.

Containers: 275-lb fiber drums; 100-lb fiber drums; 5-lb cans, 6 to a case; 20-lb galv. steel pail.

Uses: For dairy, dishes, and general hand cleaning where a mildly alkaline non-abrasive cleaner is used.

Fire hazard: None.

Shipping regulations: None. *

"Neutralite." ¹⁸⁴ A granular calcite employed for increasing the pH of water.

neutralization. In everyday language the chemical reaction between an acid and a base in which they are changed into a salt and water. In farming, soil acids are treated with hydrated lime (calcium hydroxide, a base). The formic acid of certain insect bites is neutralized with ammonia, a base.

A more precise definition of neutralization is that it is the reaction between hydrogen ion from an acid and hydroxyl ion from a base to produce water.

See acid, base.

neutral oils. Lubricating oil of medium or low viscosity obtained by distillation and dewaxing of crude petroleum or its cracking products.

neutral red (toluylene red)

$(\text{CH}_3)_2\text{NC}_6\text{H}_3\text{N}_2\text{C}_6\text{H}_4\text{CH}_2\text{NH}_2 \cdot \text{HCl}$ (tricyclic).

Properties: Green powder, dissolves in water or alcohol to give red color.

Use: Acid-base indicator in the range pH 6.8-8.0 (red in acid, yellow brown in alkali). See indicators.

neutral soap. See soap, hard.

neutral sodas. See sodas, modified.

neutral spirits. A name for ethyl alcohol.

"Neu-Tri." ²³³ Trademark for trichloroethylene (q. v.).

"Neutrigan." ³⁰⁷ 100% proprietary compound.

Properties: Fine, nearly white powder; density 1.25, soluble in water.

Uses: Neutralizing agent for chrome tanned leather. Permits fuller yields with acid and direct colors and better absorption of fat liquor by the leather.

neutrino. A subnuclear particle whose existence was first hypothesized to satisfy the laws of

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

conservation of energy and momentum in nuclear transformations involving electrons. Its existence has since been proven by direct observation. The neutrino has no charge and probably no rest mass and thus shows almost no interaction with matter, making any direct experimental observation of the particle extremely difficult.

See fundamental particle.

"Neutrol." ²¹⁷ Brand name of acid activated clay used as decolorizing adsorbent for vegetable and animal fats and oils.
See also "Filtrol."

"Neutrolene." ²⁴⁴ Trademark for a series of non-ionic, moisture free, fatty oils. Containers: Non-returnable steel drums averaging 400-425 lbs net.

Uses: As a fatliquor in the leather industry. Also may be used as an emulsifier for raw oils.

"Neutroleum." ¹⁸⁸ Trademark for an all-purpose deodorizing agent. Claim is made that if properly used it will completely and permanently deodorize liquid insecticides, waxes, polishes, glues, linoleums, ink, paints, varnishes, cleaner's naphtha, para blocks, naphthalene, turpentine substitutes, solvents, and diluents, including lacquer diluents, petroleum, and solvents.

"Neutrolox." ²⁰⁴ Trademark for a very high grade ammonium chloride prepared for use in textile finishing plants.

Properties: Fine white powdery material; extremely soluble in water and solutions containing customary concentrations, pH 6-7.

Use: To neutralize textiles containing caustic soda from mercerizing, scouring, or bleaching operations, giving the textiles so treated a pH of 6-7 after drying.

neutron. A subnuclear particle having very nearly the same mass and size as the proton, but without an electric charge. Free neutrons are unstable and undergo radioactive decay to protons. Neutrons appear to be stable, however, when bound in atomic nuclei, and the latter are now thought to be composed exclusively of protons and neutrons, stable assemblages when the total number of particles and the neutron/proton ratio lies within certain limits. Neutrons interact with almost all nuclei and are absorbed. Since the neutron has no charge and therefore experiences no repulsive forces by atomic or nuclear charges it is readily transmitted through and absorbed by matter. A nuclear reactor is a copious source of neutrons. Depending on the kinetic energy that they may have they are classed as fast, epithermal, and thermal, or slow.

See fundamental particle.

"Neutronyx." ³²⁸ A series of compounds which are proprietary surface-active non-ionic agents, used as emulsifying, wetting, dispersing agents and detergents. The 300

series are fatty acid esters of polyethylene glycol and the 600 series are polyoxyethylated alkyl phenols.

"Neutronyx" 834: Oil-soluble emulsifying agent.

"Neutronyx" 330: Water-soluble, coupling and auxiliary emulsifier.

"Neutronyx" 331: Water-soluble, coupling and auxiliary emulsifier.

"Neutronyx" 332: Water-dispersible, thickening agent.

"Neutronyx" 333: Water-soluble, foaming agent.

"Neutronyx" 600: Oil- and water-soluble emulsifier; detergent.

"Neutronyx" 611: Water-soluble, low foam; low cloud; detergent.

"Neutronyx" 640: Water-soluble; extremely high cloud point.

"Neutroscents." ¹⁸⁸ Trademark for a series of perfumes designed particularly to cover objectionable odors; available in water-soluble form for sprays, air-conditioning apparatus, and other dispersion devices. Also available in a highly concentrated form for incorporation into technical products.

"Nevillac." ²¹ Brand name for a series of (alkyl) hydroxy resins. Used in adhesives, lacquers, paper coatings, special inks and varnishes.

Neville and Winther's acid. See 1-naphthol-4-sulfonic acid.

"Nevillite." ²¹ Trademark for water-white cycloparaffin resin.

Uses: Pressure-sensitive adhesives, white rubber products, special paper coatings, polyethylene modifier.

"Nevindene." ²¹ Brand name for high melting coumarone-indene resins of extreme hardness used for dental compounds, fast-drying varnishes, rotogravure inks, aluminum paints and insulating compounds.

"Nevinol." ²¹ Brand name for a plasticizing and solvent oil used as a stable plasticizer for resins and gums; also used in fly paper, adhesives, inks, aluminum pastes, water-proofing compounds, and rubber-resin finishes.

new green. See copper acetoarsenite.

Newport "S." ⁷⁹ Trade name for a pale terpene resin.

Properties: Color X-WG; m. p. (capillary tube) 100°C; m. p. (ball and ring) 118°C; sp. gr. (25°C) 1.03. Petroleum soluble type.

Containers: Non-returnable, light gauge metal drum containing approx 500 lbs net.

Uses: Adhesives, stiffening agent for textiles.

Newport "V40." ⁷⁹ Trade name for a pale terpene resin.

Properties: Color X-WG; m. p. (capillary tube) 100°C; m. p. (ball and ring) 118°C; sp. gr. (25°C) 1.05. Alcohol soluble type.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: Non-returnable, light gauge metal drums containing approx 500 lbs net.
Uses: Paper coatings; floor coatings, in half-second butyrate coatings; etc.

"Newport White" Pine Oil. ⁷⁹

Properties: Color, white; sp. gr. (15.5°C) 0.934; refractive index (20°C) 1.4820; polymerized residue 0.4%; flash point (open cup) 173°F; Engler distillation 5%, 204°C; 50%, 213°C;

Containers: 55-gal drums; tank cars.

Uses: Mining-flotation; textile dyeing and cleaning; laundries; disinfectants; insecticides; deodorants; cleaning compounds, coated paper; paint and varnish, paint (casein); pharmaceuticals.

new silver. See German silver.

Newtonian flow. A term used in rheology to describe a type of flow occurring in a liquid system where the rate of shear is directly proportional to the shearing force. It can occur, ideally, under the influence of an infinitesimally small force. Mineral oils, at low rates of shear, exhibit Newtonian flow. When rate of shear is not directly proportional to the shearing force, flow is described as non-Newtonian. In general, Newtonian flow is exhibited by relatively stiff, plastic-like materials.

Newton's alloy. See table under fusible alloys.

N. F. Abbreviation for National Formulary, an official list of drugs published by the American Pharmaceutical Association. The latest edition at the time this dictionary was written was the 11th, noted as N. F. XI.

"N-Glo-5," "N-Glo-5-Y." ⁷⁹ Trade names for two gloss oils, i. e., solutions of linseed rosin in mineral spirits.

Properties:

	"N-Glo-5"	"N-Glo-5-Y"
Acid value (on solution)	44	46
Concentration (total solids)	61%	64%
Viscosity (Gardner-Holdt)	K	Y
Color (Hellige)	8-9	8-9
Per cent lime	5%	5%

Containers: 55-gal drums; tank cars.

Uses: Paint and varnish; sizing varnish.

Ni. Symbol for nickel.

"Niacet." ²¹⁴ Trademark for vinyl acetate and various metallic acetate salts, including aluminum formoacetate, copper acetate, potassium acetate, sodium acetate, sodium diacetate, zinc acetate and "Niaproof" aluminum acetate.

"Niocide." ⁵⁵ Trademark for fungicidal products containing dimethyl dithiocarbamates used mainly for scab control.

niacin. See nicotinic acid.

niacinamide. See nicotinamide.

"Niagaramite." ⁵⁵ Trademark for miticide containing 15% aramite (q. v.).

nialamide $C_5H_4NCO(NH)_2(CH_2)_2CONHCH_2C_6H_5$.

Designated chemically as 1-(2-(benzylcarbamyl) ethyl)-2-isonicotinoylhydrazine. It is a white, crystalline powder of low solubility in water and good solubility in slightly acid solutions. It is stable in crystalline form, suspension and solution. Used in medicine as an amine oxidase inhibitor.

"Niamid." ²⁹⁹ Trademark for nialamide.

"Niaproof." ²¹⁴ Trademark for a water-repellent compound. Substantially a soluble basic aluminum acetate salt.

Properties: Fine white powder readily soluble in water. Aluminum oxide (Al_2O_3) value 35.5-37%, sulfates, chlorides, trace; insoluble 0.2% (max), pH in water solutions 4.7-4.8.

Grades: Technical.

Containers: 25-lb non-returnable Fiberpaks; 200-lb non-returnable Leverpaks.

Uses: Source of aluminum ion for water-repellent finishes for textile, paper, and leather products, particularly in processes using wax or soap emulsions.

"Niatex." ²¹⁴ Trademark for antistatic agents. (Antistatic Agent AG-2).

Properties: Viscous, light-colored liquid; 20% active aqueous solution; gives a durable antistatic finish to synthetic fibers and fabrics.

"Niattox." ⁵⁵ Trademark for a line of DDT sprays and dusts.

"Niax." ²¹⁴ Trademark for a series of polymeric propylene oxide polyols having molecular weights from 300 to 6000 and hydroxyl groups varying from 2 to 6 and for a series of catalysts for polyurethane foams and resins.

"Niax" PPG diols 425, 1025, 2025, 3025, 4025. Adducts of propylene oxide to dipropylene glycol; colorless liquids; 425 is water soluble; 1025 through 4025 are water insoluble. The numbers are the average molecular weights.

"Niax" triols LHT-240, LHT-112, LHT-67, LHT-42, LHT-34, LHT-28. Adducts of propylene oxide to 1,2,6-hexanetriol. Colorless liquids, water insoluble. The numbers are the average hydroxyl number.

"Niax" triols LG-168, LG-56, LM-52.

Adducts of propylene oxide to glycerine. Colorless liquids, water insoluble, numbers are the average hydroxyl number.

Containers: 1-, 5-, 55-gal drums (8, 40 and 460 lbs), tank cars up to 10,000 gal.

Uses: Intermediates for flexible, semi-rigid and rigid polyurethane foams; polyurethane elastomers, and coating resins.

"Niax" catalyst D-22. Dibutyl tin dilaurate (q. v.).

"Ni-Bral." ²⁸³ Trademark for a nickel aluminum bronze containing approximately 5% nickel, 9.5% aluminum, 3-4% iron, 1.5-3.0% manganese, balance copper.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

This alloy provides tensile strengths over 90,000 psi and yield strengths over 45,000 psi and about 18% elongation. Because of its superior resistance to corrosion-erosion in sea water it is preferred for heavy duty ship propellers and sea water pumps, valves, etc.

"Nibrite." ¹³⁴ Trademark for brightener for nickel plating solutions.

"Nicarb." ¹²³ Trademark for nicarbazin for use as a coccidiostat. Nicarbazin is an equimolar complex of 4,4'-dinitrocarbanilide and 2-hydroxy-4,6-dimethylpyrimidine. It forms crystals, decomposes at 265-275°C; insoluble in water.

nicarbazin. See "Nicarb."

niccolite (arsenical nickel) NiAs. Arsenic replaced to some extent by antimony or sulfur, and nickel by iron or cobalt.

Properties: Pale copper-red mineral with dark tarnish, metallic luster. Contains 43.9% nickel, soluble in concentrated nitric acid. Sp. gr. 7.3-7.67; hardness 5-5.5.

Occurrence: United States (Nevada, Connecticut, Michigan); Canada (Ontario, Newfoundland); Argentina, Germany; Portugal. Use: Nickel ore.

"Nichrome." ³⁵⁰ Trademark for an alloy containing 60% nickel, 24% iron, 16% chromium, 0.1% carbon. It is used principally for electric resistance purposes. "Nichrome" castings, which contain 60% nickel, 25% iron, 15% chromium and 0.7% carbon, are resistant to cold sulfuric acid in all concentrations and to hot (not boiling) sulfuric acid in all strengths except concentrated (95%). It also offers good resistance to mine and sea waters and moist sulfurous atmospheres.

nickel Ni. An element of atomic number 28 in group VIII of the periodic system.

Properties: Hard silvery metal, takes a high polish; sp. gr. 8.908, m. p. 1455°C, good resistance to corrosion, attacked only very slowly by hydrochloric and sulfuric acids, more readily by nitric acid; very resistant to strong alkalis.

Occurrence: Chiefly as pentlandite at Sudbury, Ontario and garnierite in New Caledonia; Cuba; Norway, recent discoveries in U. S. S. R. and in the Northwest Territory of Canada.

Derivation: The sulfide ore is refined by flotation and roasting to sintered nickel oxide, and either marketed as such or reduced to metal which is cast into anodes and refined electrolytically or by the carbonyl process. (See Mond process.) Nickel is extracted from the Cuban iron ores by ammonia leaching.

Grades: Electrolytic; ingot, pellets; shot, sponge; powder.

Uses: Construction material, mainly in the form of alloys such as wrought and cast low-alloy steels, stainless steels, "Monel," and "Inconel" because of its strength and resistance to corrosion, magnetic alloys,

electroplating; used in the alkaline (Edison) storage battery; finely divided nickel as a catalyst in organic syntheses.

Shipping regulations: Catalyst, spent, activated forms: Flammable solid. Yellow label. *

"330" Nickel. ²⁸³ Trademark for a wrought alloy containing at least 99% nickel.

Use: An anode material for vacuum tubes and other electronic components.

nickel acetate $\text{Ni}(\text{OOCCH}_3)_2 \cdot 4\text{H}_2\text{O}$.

Properties: Green, monoclinic crystals. Effloresces somewhat in air. Sp. gr. 1.74; decomposes on heating. Soluble in water and alcohol.

Derivation: (a) By heating nickel hydroxide with acetic acid in the presence of metallic nickel. (b) Interaction of nickel sulfate and lead acetate.

Grade: Technical.

Containers: Glass bottles; fiber cans; barrels.

Uses: Textiles (mordant); nickel plating.

nickel acetylacetonate $\text{Ni}[\text{OC}(\text{CH}_3)_2\text{CHCOCH}_3]_3$.

Properties: Green crystals, m. p. 228°C.

Derivation: Reaction of nickel chloride with acetylacetone and ammonia.

nickel alloys See iron-nickel alloys, also

"Alumel," "Balco," "Chlorimets," "Chromel," "Chromel P," "Copel," "Cupron," "D" Nickel, "Duranickel," "Durco," "Evanohm," "Hastelloy," "Illium," "Inconel," "Inconel X," "K Monel," Lukens Monel-Clad Steel, Lukens Inconel-Clad Steel, Lukens Nickel-Clad Steel, "Monel," "Nichrome," "Ni-Span," "R Monel," "S Monel," and "Tophet A, C, and D."

nickel aluminide A cermet which can be flame-sprayed.

nickel-ammonium chloride (ammonium-nickel chloride) (a) $\text{NiCl}_2 \cdot \text{NH}_4\text{Cl}$,

(b) $\text{NiCl}_2 \cdot \text{NH}_4\text{Cl} \cdot 6\text{H}_2\text{O}$.

Properties: (a) Yellow powder, (b) green crystals; sp. gr. 1.65. Soluble in water, deliquescent.

Grade: Technical.

Containers: Glass bottles, fiber cans.

Uses: Electroplating; dyeing (mordant).

nickel-ammonium sulfate (nickel salts, double, ammonium-nickel sulfate)

$\text{NiSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$.

Properties: Green crystals, decomposed by heat. Soluble in water, less in ammonium sulfate solution; insoluble in alcohol. Sp. gr. 1.929.

Derivation: An aqueous solution of nickel sulfate is acidified with sulfuric acid; then an aqueous solution of ammonium sulfate is added. On concentrating, crystals of the double sulfate separate out.

Method of purification: Recrystallization.

Grades: Technical; C. P.

Containers: Barrels; kegs; boxes, fiber drums.

Use: Nickel electrolyte for electroplating.

Shipping regulations: None. *

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

nickel arsenate (nickelous arsenate)

Properties: Yellow-green powder; soluble in acids; insoluble in water. Sp. gr. 4.98.

Grade: Technical.

Containers: Fiber cans.

Use: Catalyst (hardening fats used in preparing soap).

Shipping regulations: Poison, class B. Poison label.*

nickel black. See nickelic oxide.**nickel bromide** (nickelous bromide)

Properties: (a) Brownish-yellow solid or yellow, lustrous scales. (b) Deliquescent, greenish scales. Soluble in water, alcohol, ether, and ammonium hydroxide. Sp. gr.

(a) 4.64; m. p. (b) loses water of crystallization at about 200°C.

Derivation: By the action of hydrobromic acid on nickel oxide.

nickel carbonate NiCO_3

Properties: Light-green crystals; insoluble in water; soluble in acids; m. p., decomposes.

Derivation: By the addition of sodium carbonate to a solution of nickel sulfate.

Containers: Barrels.

nickel carbonate, basic. Uncertain composition, represented variously as

Properties: Light green crystals or brown powder. Sp. gr. 2.6. Insoluble in water, soluble in ammonia and dilute acids.

Derivation: By the addition of soda ash to a solution of nickel sulfate.

Grade: Technical.

Containers: 100-lb drums; 400-lb barrels.

Uses: Electroplating; preparation of nickel catalysts, ingredient of ceramic colors and glazes.

Shipping regulations: None.*

nickel carbonyl (nickel tetracarbonyl) $\text{Ni}(\text{CO})_4$

Properties: Colorless, or yellow volatile liquid; flammable, poisonous! Dangerous to inhale! Soluble in alcohol and concentrated nitric acid; insoluble in water. Sp. gr. 1.3185; m. p. -25°C; b. p. 43°C; vapor decomposes at 60°C.

Derivation: By passing carbon monoxide gas over finely divided nickel.

Grades: Technical.

Containers: Iron cylinders.

Use: For production of metallic nickel by Mond process; gas plating.

Fire hazard: Dangerous!

Shipping regulations: Flammable liquid. Red label (by freight; not accepted by express).*

nickel chloride (a) NiCl_2 (b) $\text{NiCl}_2 \cdot 6\text{H}_2\text{O}$

Properties: (a) Brown scales; deliquescent in moist air. (b) Green scales; deliquescent in moist air. Soluble in water and ammonium hydroxide. Sp. gr. (a) 2.56; m. p., sublimes.

Derivation: By the action of hydrochloric

acid on nickel oxides.

Method of purification: Crystallization.

Grades: Technical; C. P.

Containers: 1-, 5-lb bottles; 275-lb barrels; 100-, 50-lb kegs; 25-lb boxes; fiber drums; multiwall paper sacks.

Uses: Nickel-plating cast zinc; manufacture of sympathetic ink, antiseptic; absorbent for ammonia gas in military and industrial gas masks.

Shipping regulations: None.*

nickel-chromium steels. A series of low-alloy and high-alloy steels, containing both nickel and chromium, characterized by hardness and toughness.

Typical low-alloy compositions: Ni 1.10-1.40, Cr 0.55-0.90%. Nickel is usually about twice the chromium content. High-alloy members are usually stainless steels.

See under steel.

nickel-cobalt sulfate (cobalto-nickelous sulfate).

Properties: Reddish-brown, crystalline mass. Soluble in water.

Grades: Technical.

Containers: Glass bottles; fiber cans.

Uses: Blackening brass, zinc; dyeing, printing (mordant).

Shipping regulations: None.*

nickel cyanide $\text{Ni}(\text{CN})_2 \cdot 4\text{H}_2\text{O}$

Properties: Apple-green plates or powder; poisonous! Soluble in ammonium hydroxide and potassium cyanide solution; insoluble in water and acids. M. p., loses $4\text{H}_2\text{O}$ at 200°C; b. p., decomposes.

Derivation: By adding potassium cyanide to a solution of a nickel salt.

Grade: Technical.

Containers: Wooden kegs; glass bottles; fiber drums; multiwall paper sacks.

Uses: Metallurgy; electroplating; galvanoplastic work.

Shipping regulations: Class B poison. Poison label.*

nickel dibutylldithiocarbamate $\text{Ni}[\text{SC}(\text{S})\text{N}(\text{C}_4\text{H}_9)_2]_2$

Use: Rubber compounding.

See zinc dibutylldithiocarbamate.

nickel formate $(\text{HCOO})_2\text{Ni} \cdot 2\text{H}_2\text{O}$

Properties: Green crystals; sp. gr. 2.15; soluble in water.

Grades: Technical.

Containers: Barrels; kegs; fiber drums.

Use: Production of nickel catalyst for hydrogenation.

nickel hydroxide (a) Nickelous $4\text{Ni}(\text{OH})_2 \cdot \text{H}_2\text{O}$ 

Properties: (a) Pale green powder; (b) black powder, (a) soluble in acids, ammonium hydroxide; insoluble in water and alkalis. Sp. gr. (a) 4.36, m. p. (a) decomposes; (b) decomposes.

Derivation: (a) By adding caustic soda to a solution of nickelous salt. (b) By adding a hypochlorite to a solution of a nickel salt.

Grades: Technical; C. P.

Containers: Wooden kegs; glass bottles; fiber drums.

Use: Nickel salts.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

nickelic oxide (nickel peroxide; nickel sesquioxide; black nickel oxide; black nickel) Ni_2O_3 .

Properties: Gray-black powder; soluble in acids; insoluble in water. Sp. gr. 4.84; m. p., is reduced to NiO at 600°C .

Derivation: By gentle heating of the nitrate or chlorate.

Grades: Technical; C. P.

Containers: 1-lb bottles; tins; barrels.

Use: Storage batteries.

nickel iodide (nickelous iodide) NiI_2 or $\text{NiI}_2 \cdot 6\text{H}_2\text{O}$ (loses water at 43°C).

Properties: Black, crystalline powder or blue-green crystals. Hygroscopic. Sublimes at 797°C without melting. Soluble in alcohol, water; sp. gr. 5.834.

nickel-iron alloys. See iron-nickel alloys.

"Nickel-Lume." ⁷² Trade name for organic bright nickel process; prepared from nickel sulfate, nickel chloride, boric acid and organic addition agents.

nickel matte. See matte.

nickel nitrate $\text{Ni}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$.

Properties: Green, deliquescent crystals.

Keep well stoppered. Soluble in water and alcohol.

Constants: Sp. gr. 2.065; m. p. 56.7°C ; b. p. 136.7°C .

Derivation: By the action of nitric acid on nickel oxide.

Method of purification: Crystallization.

Grades: Technical; reagent.

Containers: Glass bottles; drums.

Uses: Nickel plating; preparation of nickel catalysts; manufacture of brown ceramic colors.

Fire hazard: Dangerous.

Shipping regulations: Oxidizing material.

Yellow label. *

nickel nitrate ammoniated (nickel nitrate tetrammine) $\text{Ni}(\text{NO}_3)_2 \cdot 4\text{NH}_3 \cdot 2\text{H}_2\text{O}$.

Properties: Green crystals. Soluble in water; insoluble in alcohol; decomposes in air.

Derivation: By adding ammonium hydroxide to a nitric acid solution of nickel nitrate, with subsequent crystallization.

Method of purification: Recrystallization.

Grade: Technical.

Containers: Glass bottles; wooden kegs; fiber drums.

Use: Nickel plating.

Fire hazard: Dangerous.

Shipping regulations: Oxidizing material.

Yellow label. *

nickel nitrate tetrammine. See nickel nitrate ammoniated.

nickelous arsenate. See nickel arsenate.

nickelous bromide. See nickel bromide.

nickelous chloride. See nickel chloride.

nickelous iodide. See nickel iodide.

nickelous oxide. See nickel oxide.

nickelous phosphate. See nickel phosphate.

nickelous phosphate, tertiary. See nickel phosphate.

nickel oxide (nickelous oxide; nickel protoxide; green nickel oxide) NiO .

Properties: Green powder, becoming yellow; is found in nature as the mineral hansenite. Soluble in acids and ammonium hydroxide; insoluble in water.

Constants: Sp. gr. 6.6-6.8; absorbs oxygen at 400°C forming Ni_2O_3 which is reduced to NiO at 600°C .

Derivation: By heating nickel hydroxide or nitrate.

Grades: Technical; C. P.

Containers: Wooden kegs; glass bottles; fiber drums; barrels.

Uses: Nickel salts; porcelain painting.

Shipping regulations: None. *

nickel oxide, black. See nickelic oxide.

nickel oxide, green. See nickel oxide.

nickel peroxide. See nickelic oxide.

nickel phosphate (nickelous phosphate; tri-nickelous orthophosphate; tertiary nickelous phosphate) $\text{Ni}_3(\text{PO}_4)_2 \cdot 7\text{H}_2\text{O}$.

Properties: Light-green powder. Soluble in acids, ammonium hydroxide; insoluble in water.

Grade: Technical.

Uses: Electroplating; making "nickel yellow."

nickel plating. An electrolysis process in which nickel is deposited onto another metal or other material by electrolysis of a nickel salt solution. Usually the solution contains both the chloride and sulfate. The plate is soft or hard, dull or shiny, etc., according to the pH and other conditions and according to what additives are present. Common additives are a wetting agent such as lauryl sulfate, which prevents pitting, and brightening agents which may be sulfonates or other organic compounds. Impure nickel ingots are also sometimes converted to pure nickel by a similar process during which nickel is dissolved from the ingot (which is made the anode), while deposition of pure metal takes place on a cathode.

It is estimated that over one-half billion square feet of surface are nickel plated per year. Chromium plating is almost always preceded by a layer of nickel plate. The layer of nickel ranges from 0.0001 to 0.06 inches depending upon the application.

Applications are for automobiles, appliances, furniture, tools, machine parts, hardware, plumbing fixtures, bicycles, scales, cameras, wire products, business machines, ornaments, utensils, musical instruments, radios, all types of electrical and electronic equipment, electrotype, jewelry, clocks, stoves. Electroforming is also used. Sometimes nickel alloys with cobalt or tungsten are plated.

nickel-potassium sulfate (potassium-nickel sulfate) $\text{NiSO}_4 \cdot \text{K}_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$.

Properties: Blue-green crystals. Soluble in water. Sp. gr. 2.124.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

nickel protoxide. See nickel oxide.

nickel-rhodium. Alloys containing nickel and from 25-80% of rhodium; but sometimes also some platinum, iridium, palladium, molybdenum, tungsten, copper, iron, or cobalt.

Uses: Electrodes; chemical apparatus; reflectors; pen points.

nickel salts, double. See nickel ammonium sulfate.

nickel salts, single. See nickel sulfate.

nickel sesquioxide. See nickelic oxide.

nickel silvers. Non-ferrous alloys of the following compositions: (a) Nickel silver 18% A contains 65% copper, 18% nickel and 17% zinc. It offers good resistance to cold dilute sulfuric and hydrochloric acids and to hot dilute sulfuric acids under certain conditions of operation. It is resistant to cold acetic acid in all concentrations and to hot (not boiling) acetic acid up to 10%, to sodium hydroxide under all conditions and to sea water and moist sulfurous atmospheres. (b) Nickel silver 18% B contains 55% copper, 18% nickel and 27% zinc. It offers approximately the same resistance to corrosion as the 18% A alloy.

nickel stannate $\text{NiSnO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: Light colored crystalline powder; approx. temperature of dehydration 120°C .

Uses: Additive in ceramic capacitors.

nickel steel. When nickel is introduced in amounts up to approximately 5% the effect is to increase strength and hardness without a comparative decrease in ductility. Nickel steels are particularly suitable for case-hardening. Nickel markedly improves corrosion resistance. Along with aluminum it imparts age-hardening characteristics to iron. (1) Nickel strengthens unquenched or annealed steels, (2) toughens pearlite-ferritic (medium carbon) steels, especially at low temperatures, (3) renders high chromium-iron alloys austenitic.

See also iron-nickel alloys; steel.

nickel sulfate (nickel salts, single, blue salt) (a) NiSO_4 ; (b) $\text{NiSO}_4 \cdot 6\text{H}_2\text{O}$; (c) $\text{NiSO}_4 \cdot 7\text{H}_2\text{O}$.

Properties: (a) Yellow-green crystals; (b) blue or emerald green crystals, (c) green crystals. All the sulfates are soluble in water, (b) and (c) are soluble in alcohol; (a) is insoluble in alcohol and ether. Constants: Sp. gr. (a) 3.418, (b) 2.031, (c) 1.98, m. p. (a) loses SO_3 at 840°C , (b) loses $6\text{H}_2\text{O}$ at 280°C , (c) $98-100^\circ\text{C}$.

Derivation: By the action of sulfuric acid on nickel oxide.

Grades: Technical; C. P.

Containers: Bags; 300-, 400-lb barrels; 100-lb kegs; 25-lb boxes; fiber drums; carloads.

Uses: Manufacture of nickel-ammonium sulfate; nickel catalysts; nickel plating; mordant in dyeing and printing textiles;

blackening zinc and brass; paints and varnishes; ceramics.

Shipping regulations: None. *

nickel tetracarbonyl. See nickel carbonyl.

nickel-titanium.

Composition: Nickel, titanium, aluminum, iron, silicon.

Properties: M. p. 2700°F .

Uses: Titanium source for nickel base alloys.

nicometh. See methyl nicotinate.

"Nicon." ¹⁶⁹ Trademark for diethyldithiocarbamate used in the colorimetric determination of nickel.

"Niconyl." ³³⁰ Trademark for isonicotinic acid hydrazide (isoniazid U. S. P.).

nicotinamide (niacinamide; nicotinic acid amide) $\text{C}_5\text{H}_4\text{NCONH}_2$. Same biological function as nicotinic acid (q. v.).

Properties: Colorless needles; m. p. 129°C ; stability as for nicotinic acid; soluble in ethyl alcohol and water; bitter taste.

Sources: Synthetic made by conversion of nicotinic acid to the amide.

Grades: U. S. P. XVI.

Containers: Bottles; fiber drums.

Uses: Medicine; nutrition. *

Also commercially available as nicotinamide hydrochloride.

nicotinamide adenine dinucleotide. Name recommended by the International Union of Biochemistry and IUPAC. (NAD; diphosphopyridine nucleotide, DPN; cozymase; coenzyme I; Co I; codehydrogenase I). $\text{C}_6\text{H}_6\text{N}_2\text{O} \cdot \text{C}_5\text{H}_8\text{O}_3 \cdot \text{PO}_3 \cdot \text{O} \cdot \text{HPO}_3 \cdot \text{C}_5\text{H}_8\text{O}_3 \cdot \text{C}_5\text{H}_4\text{N}_5$. A co-enzyme necessary for the alcoholic fermentation of glucose, and the oxidative dehydrogenation of other substrates.

Properties: A white hygroscopic powder; soluble in water; stable for about a week in aqueous solutions.

Source: Yeast. Commercially, is isolated from yeast and purified by ion-exchange chromatography.

Grades: 75% and 85% level of purity.

Use: Biochemical research; chromatography.

nicotinamide adenine dinucleotide phosphate.

Name recommended by the International Union of Biochemistry and IUPAC. (NADP; triphosphopyridine nucleotide; TPN; phosphocozymase; codehydrogenase II; coenzyme II; Co II) $\text{C}_{21}\text{H}_{29}\text{N}_7\text{O}_{17}\text{P}_3$. The coenzyme of apozymase, necessary for the alcoholic fermentation of glucose, and the oxidative dehydrogenation of other substrates.

Derivation: From yeast. NADP is prepared by enzymes from NAD and purified by ion exchange chromatography.

Use: Biochemical research.

* Commercially available as the sodium salt of the oxidized form.

nicotine $\text{C}_{10}\text{H}_{14}\text{N}_2$ or $\text{C}_5\text{H}_4\text{NC}_4\text{H}_7\text{NCH}_3$. (beta-Pyridyl-alpha-N-methylpyrrolidine).

Properties: Alkaloid from tobacco; thick

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

water-white levorotatory oil, turning brown on exposure to the air; poisonous! Hygroscopic, soluble in alcohol, chloroform, ether, kerosene, water, and oils. B. p. 247°C (dec); sp. gr. 1.00924.

Derivation: By distilling tobacco with milk of lime and extracting with ether.

Grades: Technical.

Containers: Glass bottles; tins.

Uses: Medicine, insecticide (horticultural purposes), tanning.

Shipping regulations: Poison, class B. Poison label. *

nicotine dusts.

Caution: Harmful if inhaled or swallowed. Avoid excessive exposure to dust, avoid contact with skin and eyes, wash thoroughly after handling. Store away from feed and foodstuffs. The percentage and form of nicotine present may call for poison labeling under various state laws. MCA warning label.

nicotine salts.

(a) Hydrochloride: $C_{10}H_{14}N_2 \cdot 2HCl$.

(b) Salicylate: $C_{10}H_{14}N_2 \cdot C_7H_5O_3$.

(c) Sulfate: $(C_{10}H_{14}N_2)_2 \cdot H_2SO_4$.

(d) Tartrate: $C_{10}H_{14}N_2 \cdot 2C_4O_6H_6 \cdot 2H_2O$.

Properties: (a) Colorless oil, poisonous! (b) White crystals; poisonous! (c) White crystals, poisonous! (d) White plates, poisonous! All the salts are soluble in water, alcohol and ether. M. p. (b) 117.5°C.

Derivation: By the action of the respective acid on the alkaloid.

Method of purification: Crystallization.

Grades: Technical (sulfate, 40% grade).

Containers: Glass bottles, for crystals; fiber cans; for liquid non-returnable tins.

Uses: Medicine, insecticide (horticultural and general purposes).

Danger: Poisonous if swallowed, absorbed through skin. MCA warning label.

Shipping regulations: Poison, class B. Poison label. *

nicotinic acid (niacin, pyridine-3-carboxylic acid) C_5H_4NCOOH . The antipellagra vitamin, essential to many animals for growth and health. In man, nicotinic acid is believed necessary along with other vitamins for the prevention and cure of pellagra. It functions in protein and carbohydrate metabolism. As a component of two important enzymes, coenzyme I and coenzyme II, it functions in glycolysis and tissue respiration.

Properties: Colorless needles, odorless, m. p. 236°C; sublimes above melting point, sour taste; soluble in water and alcohol, insoluble in most lipid solvents, quite stable to heat and oxidation.

Units: Amounts of nicotinic acid are expressed in milligrams.

Sources: Food sources: meat, fish, milk, whole grains, yeast. Commercial sources: synthetic nicotinic acid is made by oxidation of nicotine, quinoline, or 2-methyl-5-ethylpyridine (from ammonia and formaldehyde or acetaldehyde).

Containers: Glass vials, bottles, fiber cans and drums.

Grades: U. S. P. XVI; 50 and 80% USP, blended with soy flour (animal feeds).

Uses: Medicine; nutrition; feeds; enriched flours.

See also nicotinamide.

nicotinic acid amide. See nicotinamide.

niello. The black metallic-like mixture of the sulfides of copper, silver and lead that has been used since the 11th century to inlay ornamental designs engraved in metal, usually silver. In earlier periods silver sulfide seems to have been used as the niello material.

nifuroxime (anti-5-nitro-2-furaldehyde) oxime $C_4O_2H_3NO_2CHNOH$.

Properties: White to pale yellow powder; becomes tan on standing; slightly soluble in water; fairly soluble in alcohol; very soluble in dimethylformamide.

Grade: N. F. XI.

Use: Medicine.

nigre. The dark-colored layer, containing some soap as well as salts and impurities, formed in soap manufacture as an intermediate layer between the layers of soap proper and lye.

nigrosine. A class of blue or black dyes, some soluble in water, some in alcohol and some in oil, used in manufacture of ink and shoe-polish and in dyeing leather, wood, textiles, etc.

"Ni-Hard." ²⁸³ Trademark for abrasion-resistant martensitic white cast irons containing approximately 4.5% nickel and 1.5% chromium. Hardnesses of 550 to 700 BHN are available. Used in service wherever abrasion resistance under mild impact is desired.

nikethamide (N,N-diethylnicotinamide, pyridine-3-carboxylic acid, diethylamide) $C_5H_4NCON(C_2H_5)_2$.

Properties: Clear, colorless to pale yellowish, somewhat viscous liquid, which crystallizes on standing in the cold and melts again as the temperature rises; faint, characteristic, aromatic odor and peculiar, bitter taste. Solutions are clear and nearly colorless and have no more than a faint odor of diethylamine. Miscible with water, alcohol, and ether; sp. gr. 1.058-1.066; congealing range, 22-24°C; refractive index (25°C) 1.522-1.524, pH (1 in 4 solution) 6.5-7.5.

Grades: N. F. XI; technical.

Containers: Carboys.

Use: Medicine.

nil alba. See zinc oxide.

"Nile." ³⁰⁷ Bright basic blue for discharge printing.

"Nilevar." ⁷⁰ Trademark for brand of norethandrolone, 17 alpha-ethyl-17-hydroxynorandrostenone. Used in medicine.

"Nilite." ²⁸ Trademark for a series of nitro-carbonitrate blasting agents.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Nilofoam." ³⁰⁶ Trade name for a silicone defoaming agent.

"Nilstain." ¹⁵⁵ Trademark for a line of stainless steel alloys.

niobe oil. See methyl benzoate.

niobic acid $\text{Nb}_2\text{O}_5 \cdot \text{nH}_2\text{O}$. The term includes all hydrated forms of Nb_2O_5 . Niobic acid forms as a white insoluble precipitate when a potassium hydrogen sulfate fusion of a niobium compound is leached with hot water or when niobium fluoride solutions are treated with ammonium hydroxide. It is soluble in concentrated sulfuric acid, concentrated hydrochloric acid, hydrofluoric acid, and in bases. The formation of niobic acid is important in the analytical determination of niobium.

niobite. See columbite.

niobium Nb (formerly columbium, Cb).

Element of atomic number 41, group V of the periodic system. It is a comparatively plentiful metal.

Properties: Gray or silver-white, hard metal, not readily tarnished, sp. gr. 8.57, m. p. $2415 \pm 15^\circ\text{C}$. Reacts with oxygen and the halogens only when heated. Insoluble in acids except mixed nitric and hydrofluoric, attacked by fused alkalis.

Occurrence: In columbite.

Derivation: (a) Reduction of the complex alkali fluoride with sodium, or of the oxide with calcium, aluminum, or hydrogen. (b) Heating niobium oxide and niobium carbide together in a vacuum to produce the pure metal. Large single crystals are produced by arc-fusion. High purity alloys are prepared by electron beam melting processes.

Uses: In chromium steel, "getter" in vacuum techniques, nuclear energy equipment, cermets (carbide), alloys in jet engines, missiles, rockets, as rotor at liquid helium temperatures in gyroscopes.

niobium carbide NbC .

Properties. Lavender-gray powder, insoluble in water and in all acids except a mixture of nitric and hydrofluoric acids. M. p. about 3500°C , hardness 2400 kg/sq. mm, sp. gr. 7.82.

Derivation: By direct combination of niobium with carbon or by the reduction of niobium oxide with lampblack.

Uses. Cemented carbide tipped tools, certain special steels, preparation of niobium metal.

niobium chloride (niobium pentachloride)

NbCl_5 .

Properties: Yellow crystalline solid, soluble in alcohol, ether, carbon tetrachloride, hydrochloric acid, conc. sulfuric acid. M. p. 194°C , b. p. 241°C , sp. gr. 2.75. Deliquescent, decomposes in moist air with evolution of hydrogen chloride fumes. Caution! Keep well stoppered.

Derivation: Direct combination of niobium and chlorine, chlorination of niobium oxide in the presence of carbon.

Containers: Available in commercial quantities.

Uses: Preparation of pure niobium; intermediate.

niobium oxide (niobium pentoxide) Nb_2O_5 .

Properties: White powder; insoluble in acids except hydrofluoric, soluble in fused potassium hydrogen sulfate, or carbonates or hydroxides of the alkali metals. Sp. gr. 4.5-5.0.

Derivation: Strong ignition of niobic acid.

Uses: Intermediate, in electronics.

niobium pentachloride. See niobium chloride.

niobium pentoxide. See niobium oxide.

niobium-potassium oxyfluoride (potassium-niobium oxyfluoride; potassium oxyfluoroniobate) $\text{K}_2\text{NbOF}_5 \cdot \text{H}_2\text{O}$.

Properties: White lustrous leaflets. Greasy to touch. Soluble in water.

Uses: Separation of niobium from tantalum; electrolytic preparation of niobium metal.

niobium-tin Nb_3Sn . Used for special wire for superconducting magnets to obtain high magnetic fields for use in communication, and containment of thermonuclear fusion plasmas.

niobium-uranium alloys. Niobium alloyed with 20% uranium yields a nuclear fuel which maintains tensile strength and hardness at 1600°F . The fuel is used in nuclear reactors such as gas-cooled units.

"Ni-O-Nel." ²⁸³ Trademark for an alloy containing approximately 42% nickel, 22% chromium, 30% iron and 3% molybdenum. Has outstanding corrosion resistance, particularly toward sulfuric and phosphoric acids.

"Ni-Plex." ⁷² Trade name for a blend of mildly alkaline organic chemicals used to remove nickel deposits from any base metal.

"Niran" Insecticide. ⁵⁸ Trademark for parathion (q.v.).

"Ni-Resist." ²⁸³ Trademark for a series of corrosion resisting austenitic nickel cast irons containing from 17 to 35% nickel. Most types contain chromium between 2 and 4%. These irons are used for resistance to heat and corrosion and for selected thermal expansivities.

"Nirus AOL." ⁸³ Trademark for a cationic, oil soluble, neutral, single compound used as a corrosion inhibitor in the petroleum industry. Low viscosity, tan fluid.

Containers: 400-lb steel drums.

"Nisentil" Hydrochloride. ¹⁹⁰ Trademark for a brand of alphaprodine hydrochloride (q.v.).

"Ni-Span-C." ²⁸³ Trademark for a wrought age-hardenable nickel-iron alloy containing about 42% nickel, which has high tensile strength and a substantially constant modulus of elasticity over the temperature range of minus 50°F to plus 150°F . Widely used for Bourdon tubes and hair springs.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

niter (saltpeter) KNO_3 . A natural potassium nitrate. Color, white, gray, or colorless; streak, white; vitreous luster. Contains 46.5% K_2O , 53.5% N_2O_5 . Found as white crusts, needle-like crystals and silky tufts in limestone caverns or as incrustations upon the earth's surface or on rocks. Also found in hot, dry countries as an efflorescence in soils containing human or animal excrement. In such countries advantage has been taken of this and soil, plant ashes and decomposing organic matter (manure) are built into mounds, moistened periodically and the niter finally extracted with water.

Constants: Sp. gr. 2.09-2.27; hardness 2.

Occurrence: United States (Kentucky, Wyoming), India, Egypt, Algeria, Iran, Spain, France, Germany.

Uses: See potassium nitrate.

Shipping regulations: Oxidizing material. Yellow label. *

niter cake. See sodium bisulfate.

niter, Chile. See caliche.

niton. See radon.

nitralloy. See nitriding steel.

"Nitramex" No. 2-H.²⁸ Trademark for a high density blasting agent of "Nitramon" type.

nitramine. See tetryl.

"Nitramite".²⁸ Trademark for a low density blasting agent of "Nitramon" type.

"Nitramon".²⁸ Trademark for an ammonium nitrate base blasting agent which is not detonated by impacts from rifle bullets, sledge hammers, or even by the heat from blow torches. Is detonated by specially constructed primers.

Use: Various modifications serve for large and small drill hole blasting, and for seismic prospecting on land and at sea.

nitranilic acid (2,5-dihydroxy-3,6-dinitroquinone) $\text{C}_6\text{O}_2(\text{NO}_2)_2(\text{OH})_2$.

Properties: Flat yellow crystals; loses water at 100°C; decomposes explosively at 170°C; soluble in water and alcohol, insoluble in ether.

ortho-nitraniline orange. Ortho-nitraniline orange is produced from the intermediates ortho-nitraniline and beta-naphthol. It is a very bright, light shade organic orange having good light fastness when used by itself in enamels. It is used for awning paints, and since it has comparatively good alkali fastness it is used in the manufacture of casein paints. One disadvantage is that ortho-nitraniline orange bleeds badly in oils and lacquer solvents.

nitranilines. See nitroanilines.

nitrating acid. See mixed acid.

nitre. See niter (saltpeter).

nitre cake. See sodium bisulfate.

nitre, Chile. See caliche.

"Nitrelmang."²⁵⁰ Trademark for a high purity nitrided grade of "Electromanganese" (q. v.).

"Nitretamin Phosphate."⁴¹² Trademark for trolnitrate phosphate (q. v.).

"Nitrex."²⁴⁸ Trademark for synthetic rubber latices of the butadiene-acrylonitrile type; used for paper saturation, leather finishing, and as a plasticizer for resin latices.

nitric acid (aqua fortis; engraver's acid; azotic acid) HNO_3 .

Properties: Transparent, colorless or yellowish, fuming, suffocating, caustic and corrosive liquid. Miscible with water.

Constants: B. p. (decomposes) 83°C; m. p. -41.59°C; sp. gr. 1.504 (25/4°C); vapor pressure 62 mm (25°C); refractive index 1.3970 (n_D 24/D); viscosity 0.761 cp (25°C).

Derivation: (a) Oxidation of ammonia by air in the presence of a platinum catalyst. The product is approximately 60% nitric acid, 40% water. Concentration is achieved by distillation with sulfuric acid, or by extractive distillation with magnesium nitrate. See also the Fauser process. (b) Formerly from Chile saltpeter by action of sulfuric acid.

Grades: Technical; pure. See also nitric acid, fuming.

Strength of solutions: 36, 38, 40, 42°Bé; 58-63.5%; 95%.

Containers: Bottles; carboys (carloads); tank cars.

Uses: Primary use is manufacture of ammonium nitrate for fertilizer and explosives.

Lesser but important uses are organic synthesis (dyes, drugs, explosives, cellulose nitrate, nitrate salts); also in metallurgy, photoengraving; etching steel, ore flotation; medicine.

Danger! Causes severe burns, vapor extremely hazardous. May cause nitrous gas poisoning. Spillage may cause fire or liberate dangerous gas. MCA warning label.

Shipping regulations: Corrosive liquid. White label. *

nitric acid, fuming.

1. White fuming nitric acid (WFNA) contains more than 97.5% nitric acid, less than 2% water, and less than 0.5% oxides of nitrogen. It is a colorless or pale yellow liquid which fumes strongly. It is decomposed by light or elevated temperatures, becoming red in color from nitrogen tetroxide.

2. Red fuming nitric acid (RFNA) contains more than 86% nitric acid, approximately 6-15% oxides of nitrogen (as nitrogen tetroxide) and less than 5% water.

Derivation: From dilute nitric acid, nitrogen tetroxide, and oxygen by the Fauser process.

Grades: Technical.

Containers: Stainless steel or aluminum drums.

Uses: Preparation of nitro-compounds; oxidizer in liquid rocket propellants.

Danger! Causes severe burns; vapor extremely hazardous; may cause nitrous gas poisoning. Spillage may cause fire or liberate

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

dangerous gas. MCA warning label.
Shipping regulations: Corrosive liquid.
White label.*

nitric oxide NO. See also nitrogen dioxide.

Properties: A colorless gas (readily reacts with oxygen at room temperature to form nitrogen dioxide, NO₂, a reddish-brown gas). B. p. -150.0°C, m. p. -161.0°C; sp. gr. at b. p. 1.27, slightly soluble in water.

Grades: Pure (99%).

Containers: Cylinders.

Uses: An important intermediate stage in the manufacture of nitric acid from ammonia. Also formed from atmospheric oxygen and nitrogen in the electric-arc process for fixation of nitrogen.

Shipping regulations: Poison, class A. Poison gas label. Not accepted by express.

nitriding. A process of case hardening in which a ferrous alloy, usually of special composition, is heated in an atmosphere of ammonia or in contact with nitrogenous material to produce surface hardening by absorption of the nitrogen without quenching.

nitriding steel (nitralloy). The alloys used for nitriding are known as nitralloy. They contain aluminum as an alloying constituent. Several types of nitralloy are available with ranges of composition as follows: aluminum 0.85-1.2%, carbon 0.20-0.45%, chromium none to 1.8%; molybdenum 0.15-1.00%, manganese 0.4-0.7%, silicon 0.2-0.4%.

Nickel nitriding steels are also sometimes used, and stainless steel and others not containing aluminum are also nitrided, although the case is not nearly as hard as nitralloys.

nitrile. An organic compound containing the -CN grouping, for example, acrylonitrile CH₂=CHCN.

nitrile-butadiene rubber. See acrylonitrile rubber.

nitrile rubber. See acrylonitrile rubber.

nitrile-silicone rubber (NSR). Combines the characteristic properties of silicones with the oil resistance of nitrile rubber. Resistant to jet fuels, solvents and hot oils.

nitrilomalonamide. See cyanoacetamide.

nitrilotriacetic acid. See triglycollamic acid.

para-nitroacetanilide NO₂C₆H₄NHCOCH₃.

Properties: White crystals; soluble in alcohol and ether; very slightly soluble in cold water. Soluble in hot water, in potassium hydroxide solution. M. p. 214-216°C.

Derivation: By acetylating aniline, then nitrating.

Method of purification: Crystallization.

Grades: Technical.

Containers: 300-, 325-, 375-lb barrels.

Use: Manufacture of para-nitraniline.

meta-nitroacetophenone C₆H₄NO₂COCH₃.

Light yellow amorphous solid.

para-nitro-ortho-aminophenol C₆H₃OHNH₂NO₂.

Properties: Yellow-brown leaflets containing water of crystallization melting at 80 to 90°C; anhydrous melts at 154°C. Soluble in acid.

Derivation: From dinitrophenol.

Method of purification: Recrystallization from hydrochloric acid.

Grades: Technical.

Containers: Wooden barrels; fiber drums.

Use: Dyes.

Shipping regulations: None.*

meta-nitroaniline (meta-nitraniline)

NO₂C₆H₄NH₂.

Properties: Yellow needles; sp. gr. 1.43;

m. p. 111.8°C, b. p. 285°C; soluble in alcohol and ether; very slightly soluble in water.

Derivation: From aniline by nitration after acetylation, with subsequent removal of the acetyl group by hydrolysis.

Method of purification: Crystallization.

Grades: Technical (crystals; paste).

Containers: Drums.

Uses: Color test for pine wood; dye intermediate.

Danger! Hazardous solid and vapor. Rapidly absorbed through skin. MCA warning label.

ortho-nitroaniline (ortho-nitraniline)

NO₂C₆H₄NH₂.

Properties: Orange-red needles; sp. gr.

1.443; m. p. 69.7°C. Soluble in alcohol and ether; very slightly soluble in water.

Derivation: From aniline by nitration after acetylation, with subsequent removal of the acetyl group by hydrolysis.

Method of purification: Crystallization.

Grades: Technical (flaked).

Containers: Drums.

Uses: Dye intermediate.

Danger! Hazardous solid and vapor. Rapidly absorbed through skin. MCA warning label.

para-nitroaniline (para-nitraniline)

NO₂C₆H₄NH₂.

Properties: Yellow needles; sp. gr. 1.437; m. p. 148°C, soluble in alcohol and ether; very slightly soluble in water.

Derivation: From aniline by nitration after acetylation, with subsequent removal of the acetyl group by hydrolysis.

Method of purification: Crystallization.

Grades: Technical.

Containers: Drums.

Uses: Dye intermediate, especially para-nitraniline red.

Danger: Hazardous solid and vapor. Rapidly absorbed through skin. MCA warning label.

Shipping regulations: Poison, class B.

Poison label.*

ortho-nitroanisole C₆H₄OCH₃NO₂.

Properties: Light reddish or amber liquid.

Soluble in alcohol and ether; insoluble in water; sp. gr. 1.255 (20/20°C); crystallizing point 9.6°C; boiling range 268-271°C.

Derivation: From ortho-nitrophenol by methylation or from ortho-nitrochlorobenzene by action of methanol (methyl alcohol) and caustic soda.

Method of purification: Distillation.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Grades: Technical.

Containers: Galvanized drums; tank cars.

Uses: Organic synthesis; manufacture of intermediates for dyes and pharmaceuticals.

Shipping regulations: None.*

para-nitroanisole (1-methoxy-4-nitrobenzene)
 $\text{NO}_2\text{C}_6\text{H}_4\text{OCH}_3$.

Properties: Colored monoclinic crystals; m. p. 54°C, b. p. 260°C. Insoluble in water; soluble in alcohol, ether.

Use: Intermediate.

5-nitrobarbituric acid (dilituric acid)
 $\text{O}_2\text{NHCCONHCNHCOCO}$.

Properties: Prisms and leaflets from water, m. p. 176°C (dec), slightly soluble in water, soluble in alcohol and sodium hydroxide solution; insoluble in ether.

Grades: Reagent; technical.

Use: Microreagent for potassium.

3-nitrobenzaldehyde (meta-nitrobenzaldehyde)
 $\text{NO}_2\text{C}_6\text{H}_4\text{CHO}$.

Properties: Yellowish, crystalline powder, m. p. 58°C, b. p. (23 mm) 164°C, almost insoluble in water; soluble in alcohol, chloroform, ether.

Grades: Technical.

Uses: Synthesis of dyes, pharmaceuticals, surface active agents, vapor phase corrosion inhibitor, antioxidant for chlorophyll, mosquito repellent.

nitrobenzene (oil of mirbane, essence of mirbane, essence of myrbane) $\text{C}_6\text{H}_5\text{NO}_2$.

Properties: Bright yellow crystals or yellow, oily liquid, poisonous! Soluble in alcohol, benzene, and ether; very slightly soluble in water. Sp. gr. 1.19867; m. p. 5.70°C, b. p. 210.85°C.

Derivation: From benzene by nitrating with nitric acid.

Method of purification: By washing and distilling with steam, then redistilling.

Impurities: Unconverted benzene.

Grades: Technical.

Containers: Glass bottles, various tins, 500-, 1000-lb iron drums. Carloads, tank cars.

Uses: Major use is manufacture of aniline; also used to produce pyroxylin insulating compounds; solvent for cellulose ethers, modifying esterification of cellulose acetate, ingredient of metal polishes and shoe polishes, raw material for manufacture of benzidine, quinoline, azobenzene, etc.

Danger: Hazardous liquid and vapor, rapidly absorbed through skin. MCA warning label.

Shipping regulations: Class B poison. Poison label.*

para-nitrobenzeneazoresorcinol
 $\text{NO}_2\text{C}_6\text{H}_4\text{N}_2\text{C}_6\text{H}_3(\text{OH})_2$.

Properties: Red crystals. Slightly soluble in water; soluble in nitrobenzene. M. p. 198°C.

Derivation: Diazotized para-nitroaniline is coupled with resorcinol.

Method of purification: Recrystallization.

Grades: Analytical.

Containers: Glass bottles.

Use: Determination of magnesium.

Shipping regulations: None.*

para-nitrobenzene azosalicylate sodium salt
 See alizarin yellow R.

nitrobenzoic acid $\text{C}_6\text{H}_4(\text{NO}_2)\text{COOH}$. (a) meta-, (b) ortho-, (c) para-(nitrodracrylic acid).

Properties: Yellowish-white crystals. (a) Soluble in alcohol and ether; slightly soluble in water; (b) Soluble in water, alcohol and ether; (c) Soluble in alcohol; sparingly soluble in water.

Constants: (a) Sp. gr. 1.494; m. p. 140-141°C; (b) Sp. gr. 1.575; m. p. 147.7°C; (c) Sp. gr. 1.5497; m. p. 238°C.

Derivation: (a and b) By the nitration of benzoic acid, (c) By the oxidation of para-nitrotoluene by hot chromic acid mixture.

Method of purification: Crystallization.

Grades: Technical.

Containers: Fiber drums; car loads.

Uses: (a and b) Organic synthesis; (c) preparation of anesthetics and as intermediate in the manufacture of dyes and sun screening agents.

Shipping regulations: None.*

meta-nitrobenzotrifluoride (3-nitrobenzotrifluoride, meta-nitrotrifluoromethylbenzene; meta-nitro-alpha, alpha, alpha-trifluorotoluene) $\text{NO}_2\text{C}_6\text{H}_4\text{CF}_3$.

Properties: Pale straw, thin oily liquid, aromatic odor; distillation range 200.5-208.5°C, f. p. -5.0°C; sp. gr. (15.5°C) 1.437, b. p. 203°C; flash point (open cup) 101°C, fire point (open cup) 102°C, wt/gal 11.98 lbs (15.5°C), viscosity 2.35 cps (100°F), soluble in organic solvents; insoluble in water.

meta-nitrobenzoyl chloride $\text{NO}_2\text{C}_6\text{H}_4\text{COCl}$.

Properties: Yellow to brown liquid; partially crystallized at room temperature, m. p. 34°C (approx), b. p. 278°C, soluble in ether, decomposes in water and alcohol.

Use: Manufacture of dyes for fabrics and color photography, intermediate in preparation of pharmaceuticals.

para-nitrobenzoyl chloride $\text{NO}_2\text{C}_6\text{H}_4\text{COCl}$.

Properties: Yellow crystalline solid; m. p. 72°C, b. p. 154°C (15 mm), decomposes in water and alcohol, soluble in ether.

Use: Intermediate for procaine hydrochloride, dyestuffs.

para-nitrobenzyl cyanide (para-nitro-alpha-tolunitrile) $\text{NO}_2\text{C}_6\text{H}_4\text{CH}_2\text{CN}$.

Properties: Crystals, m. p. 116-118°C. Insoluble in water; soluble in alcohol and ether.

Derivation: Action of concentrated nitric acid on benzyl cyanide.

Uses: Intermediate for dyestuffs, pharmaceuticals, penicillin precursors, local anesthetics; preparation of para-nitro-phenylacetic acid.

ortho-nitrobiphenyl (ONB, ortho-nitrodiphenyl)
 $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{NO}_2$.

Properties: Light-yellow to reddish

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

crystalline solid or liquid; sp. gr. 1.203 (25/25°C); 10 lbs/gal; crystallizing pt. 34.5°C (min); refractive index 1.613 approx (25°C); b. p. 330°C approx. Soluble in carbon tetrachloride, mineral spirits, pine oil, turpentine, benzene, acetone, glacial acetic acid, and perchlorethylene.

Derivation: By controlled nitration of biphenyl.

Uses: Plasticizer; imparts fungicidal properties to textiles, dye intermediate.

Warning! This material can cause serious damage to respiratory passages and liver.

nitrobromoform. See bromopicrin.

"Nitro BT." ⁶⁵ Trademark for tetrazolum salt (q. v.).

2-nitro-1-butanol $\text{CH}_3\text{CH}_2\text{CHNO}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid; solubility in water 20 g/100 cc (20°C); sp. gr. 1.133 (20/20°C), b. p. 105°C (10 mm), m. p. -48 to -47°C; wt/gal 9.44 lbs (20°C), refractive index 1.4390 (20°C), pH of 0.1 M solution 4.51.

Containers: 5- and 55-gal drums, 1-gal cans.

nitrocalcite. See calcium nitrate.

nitrocarbonitrate ("Nilite"). A blasting agent consisting of ammonium nitrate sensitized with diesel oil.

Shipping regulations: Oxidizing material. Yellow label.*

nitrocellulose (cellulose nitrate, cotton solution, nitrocotton, guncotton, collodion cotton). A cotton-like or pulp-like material of variable composition obtained by treating cellulose (in the form of linters, cotton waste, cotton wool, tissue paper or wood pulp) with a mixture of concentrated nitric and sulfuric acids, the excess of which is removed by washing, digesting and boiling procedures. The name cellulose nitrate is technically correct although nitrocellulose is more commonly used. By varying the strength of the acids, the temperature, the time of nitration and the proportion of acids to cellulose, products of widely different properties are obtained. These are classified according to percentage of nitrogen, which usually ranges from 10 to 14. The latter corresponds approximately to the empirical formula $\text{C}_6\text{H}_7\text{O}_5(\text{NO}_2)_3$. Nitrocellulose of approximately 12.5 to 13.5% nitrogen is used for explosives such as guncotton and some dynamites. This high-nitrogen form is soluble in acetone, but insoluble in ether-alcohol mixtures. When nitrogen content is in the range 10.5 to 12.2%, the material is referred to as soluble nitrocellulose because it is soluble in ether-alcohol mixtures and is used for preparation of collodion, "Celluloid," plastics, and fastdrying lacquers. The name pyroxylin (q. v.) has sometimes been applied to cellulose nitrate, its solutions, and products. It is an official U. S. P. XVI grade. The most recently developed major use is as the basic material in solid mono-propellants, including

those for rockets.

Fire hazard: Dangerous.

Shipping regulations: Various, according to whether dry or wet, and to solvent used.

High explosive, red or yellow labels.*

nitrochloro derivatives. See under the corresponding chloronitro derivative.

nitrochloroform. See chloropicrin.

nitrocobalamin. Vitamin B_{12}C . See vitamin B_{12} .

"Nitrocols." ²²³ Proprietary products consisting of pigments dispersed in nitrocellulose and plasticizer. Available in two forms, chip and paste.

Grades and Uses:

Super 1A. A high-color carbon black dispersed in $\frac{1}{2}$ sec. nitrocellulose and dibutyl phthalate. Used in high-grade jet black lacquer finishes.

No. 250. A medium-color carbon black dispersed in $\frac{1}{2}$ sec. nitrocellulose and dibutyl phthalate, with a high pigment concentration. Used in industrial-type lacquers.

No. 9. Titanium dioxide (anatase) dispersed in $\frac{1}{2}$ sec. nitrocellulose and dibutyl phthalate. Used in high-gloss white lacquer enamels.

No. 73. Titanium dioxide dispersed in 5-6 sec. nitrocellulose and dibutyl phthalate. Used in high-gloss white lacquer enamels.

No. 90. Titanium dioxide (rutile) dispersed in $\frac{1}{2}$ sec. nitrocellulose and dibutyl phthalate. Used in high-gloss white lacquer enamels.

nitrocotton. See nitrocellulose.

2-nitro-para-cresol (4-methyl-2-nitrophenol) $\text{NO}_2(\text{CH}_3)\text{C}_6\text{H}_3\text{OH}$.

Properties: Yellow crystals, density 1.24 g/ml (38/4°C), m. p. about 35°C, b. p. 125°C (25 mm); slightly soluble in water; soluble in alcohol, ether.

Use: Intermediate.

nitrodichloro derivatives. See the corresponding dichloronitro derivative.

ortho-nitrodiphenyl. See ortho-nitrobiphenyl.

ortho-nitrodiphenylamine $\text{C}_6\text{H}_5\text{NHC}_6\text{H}_4\text{NO}_2$.

Properties: Red-brown crystalline powder; m. p. 75-76°C.

Containers: Fiber kegs.

Use: Intermediate.

nitrodraconic acid. See para-nitrobenzoic acid.

nitro dyes. Dyes whose molecules contain the NO_2 chromophore group in their structure, and whose Colour Index is from 10,300-10,999.

nitroerythrite. See erythrityl tetranitrate.

nitroethane $\text{CH}_3\text{CH}_2\text{NO}_2$.

Properties: Colorless liquid. Solubility in water 4.5 cc/100 cc (20°C), solubility of water in nitroethane 0.9 cc/100 cc (20°C).

Constants: Sp. gr. 1.052 (20/20°C), freezing point -90°C; b. p. 114°C (760 mm); vapor pressure (15.6 mm) (20°C); flash point 106°F (Tag open cup), wt/gal 8.75 lbs (68°F); refractive index 1.3917 (20°C).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: By reaction of ethane with oxides of nitrogen or nitric acid under pressure.
Containers: 5- and 55-gal drums; tank cars.
Uses: Solvent for nitrocellulose, cellulose acetate, cellulose acetopropionate, cellulose acetobutyrate, vinyl, alkyd, and many other resins, waxes, fats and dyestuffs; chemical synthesis.

Shipping regulations: None. *

2-nitro-2-ethyl-1,3-propanediol

$\text{CH}_2\text{OH}(\text{C}_2\text{H}_5)_2\text{NO}_2\text{CH}_2\text{OH}$.

Properties: White, crystalline solid, m. p. 56-57°C; b. p. decomposes (10 mm); pH 0.1 M aqueous solution 5.48, soluble in organic solvents, very soluble in water.

Containers: Fiberpak boxes.

Shipping regulations: None. *

5-nitro-2-furaldehyde semicarbazone. See nitrofurazone.

nitrofurantoin $\text{C}_8\text{H}_6\text{N}_4\text{O}_5$, N-(5-nitro-2-furylidene)-1-aminohydantoin.

Properties: Yellow, bitter powder with slight odor. M. p. (dec) 270-272°C. Very slightly soluble in alcohol and practically insoluble in ether and water.

Grade: U. S. P. XVI.

Use: Medicine (antibacterial agent).

nitrofurazone (5-nitro-2-furaldehyde semicarbazone) $\text{C}_6\text{H}_6\text{N}_4\text{O}_4$.

Properties: Odorless, lemon-yellow, crystalline powder which turns brownish black on heating and decomposes between 236 and 240°. Nearly tasteless but develops bitter aftertaste. Fairly soluble in alcohol and propylene glycol. Slightly soluble in water and polyethylene glycol mixtures. Practically insoluble in chloroform or ether.

Derivation: By simultaneous acetylation and nitration of furfural, followed by reaction with semicarbazide and sulfuric acid.

Grades: N. F. XI.

Use: Medicine (antibacterial agent).

"Nitrogation." ¹²⁵ Trademark for anhydrous ammonia specifically intended for direct injection into the irrigation stream for purpose of soil fertilization.

nitrogen N. Element of atomic number 7, of group V of the periodic system.

Properties: Colorless, odorless, tasteless diatomic gas constituting about four-fifths of the air, colorless liquid, chemically rather inert; sp. gr. (gas) 0.96737, referred to air; (liquid) 0.804, (solid) 1.0265, m. p. -210°C, b. p. -195.5°C. Soluble in water, slightly soluble in alcohol.

Derivation: From liquid air by fractional distillation.

Impurities: Argon and other "rare gases", oxygen.

Grades: U. S. P. XVI; prepurified 99.966% min; extra dry 99.7% min; water pumped 99.6% min.

Containers: Steel cylinders.

Uses: Production of ammonia, acrylonitrile, cyanamide, cyanides, nitrides, inert gas

for purging, blanketing, and exerting pressure; for freezing out gaseous impurities in electronic manufacturing operations; for chilling in aluminum foundries; for bright annealing of steel; for cooling agent in low temperature processes; as an inert pressuring and blanketing gas in missiles.

nitrogenase. Enzyme which fixes nitrogen and can be isolated from soil bacteria, namely, *Clostridium pasteurianum*. It is possible to synthesize ammonia from nitrogen and hydrogen without high temperatures and pressures by means of nitrogenase. Pyruvic acid is an adjunct of the reaction that occurs.

nitrogen chloride. See nitrogen trichloride.

nitrogen dioxide (nitrogen peroxide) NO_2 .

Properties: A red-brown gas which exists in varying equilibrium with other oxides of nitrogen as the temperature is varied. When heated, it becomes less brown, then yellow, and finally colorless at 150°C because the NO_2 gradually dissociates into colorless NO (nitric oxide) and oxygen gas. When cooled, nitrogen dioxide condenses at 21.15°C to a yellow-brown liquid (sp. gr. 1.45 at 20°C), and freezes at -11.2°C to a colorless solid. This color change marks the gradual conversion of the brown NO_2 gas to colorless N_2O_4 (nitrogen tetroxide). Under most circumstances samples of nitrogen dioxide consist of an equilibrium mixture of NO_2 and N_2O_4 . Either of these oxides will dissolve in water to form nitric acid.

Containers: 125-, 150-, 2000-lb cylinders, tank cars.

Grades: Pure, 99.5% min.

Uses: Intermediate in production of nitric acid, nitrating agent; oxidizing agent; catalyst, oxidizer for rocket fuels.

Danger! Extremely dangerous liquid and gas. Inhalation may cause fatal lung injury.

MCA warning label.

Shipping regulations: Poison, class A, poison gas label by freight, not accepted by express. Nitrogen dioxide is the legal label name for shipping regulation purposes. *

nitrogen fixation. The conversion of the nitrogen of the air into a useful compound. This is accomplished naturally through the action of the bacteria that exist on the roots of leguminous plants (recently duplicated in the laboratory) and also by the action of lightning in causing combination of nitrogen and oxygen of the air.

The direct combination of nitrogen and hydrogen (see ammonia synthesis) is by far the most important and widely used industrial procedure. The union of calcium carbide and nitrogen to form calcium cyanamide is a little used process. The direct combination of nitrogen and oxygen (arc process) has been used but has not been continued. Various other reactions can be caused to take place but have not been used successfully on a large scale.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

nitrogen fluorine compounds. Among these are nitrogen trifluoride (q. v.), dinitrogen tetrafluoride, dinitrogen difluoride, and difluoramine. These materials are powerful oxidizers for both liquid and solid propellants for rocket propulsion.

nitrogen monoxide. See nitrous oxide.

nitrogen mustards. A class of compounds with fishy odor and lachrymatory properties, and of importance in cancer treatment and research. They are named from their similarity in structure to mustard gas (dichlorodiethyl sulfide). The sulfur of the mustard gas is replaced by an amino nitrogen, so that the typical nitrogen mustards are halogenated alkylamines, such as methyl bis(2-chloroethyl)amine, $(\text{CH}_2\text{ClCH}_2)_2\text{NCH}_3$ (see mechlorethamine hydrochloride). Other examples are triethylene melamine, and triethylene thiophosphoramide (q. v.), and triethylene phosphoramide. The drug "Myleran" or 1,4-dimethylsulfonyloxybutane, $(-\text{CH}_2\text{CH}_2\text{OSO}_2\text{CH}_3)_2$, is somewhat similar in structure.

nitrogen oxides. See nitrous oxide, nitric oxide, and nitrogen dioxide. Nitrogen tetroxide is described under nitrogen dioxide.

nitrogen peroxide. See nitrogen dioxide.

nitrogen solution. Mixture of 60 parts of ammonium nitrate and 40 parts of 50% aqua ammonia for neutralizing superphosphate in making fertilizer.

Containers: Tank cars.

nitrogen tetroxide N_2O_4 . See nitrogen dioxide.

nitrogen trichloride (nitrogen chloride) NCl_3 .

Properties: Yellow oil or rhombic crystals, sp. gr. 1.653, explodes at 95°C , b. p. less than 71°C ; m. p. less than -40°C ; insoluble in cold water, decomposes in hot water, soluble in chloroform, phosphorus trichloride, and carbon disulfide, formerly used in bleaching and aging of flour. Poisonous.

nitrogen trifluoride NF_3 . Colorless gas, colorless mobile liquid. Useful as oxidizer for high energy fuels; also used in synthesis.

nitroglycerin (explosive oil; glyceryl trinitrate; glonoin oil; trinitroglycerin) $\text{CH}_2\text{NO}_3\text{CHNO}_3\text{CH}_2\text{NO}_3$.

Properties: Pale yellow, thick, flammable, explosive liquid. Soluble in alcohol and ether; slightly soluble in water.

Constants: Sp. gr. 1.6009; freezing point 13.1°C ; explosion point 260°C .

Derivation: By dropping glycerol through cooled, mixed acid and stirring, followed by repeated washing with water.

Grades: Technical.

Containers: Tin cans.

Uses: Explosive; production of dynamite and other explosives; medicine; explosive plasticizer in solid rocket propellants; possible liquid rocket propellant.

Fire hazard: Dangerous.

Shipping regulations: Cannot be shipped by common carrier. *

nitroguanidine $\text{H}_2\text{NC(NH)NHNO}_2$.

Properties: Yellow solid, m. p. 246°C ; soluble in alcohol.

Derivation: Made by dissolving guanidine nitrate in concentrated sulfuric acid and then diluting.

Uses: Explosives and smokeless powders; anti-muzzle-flash agent for solid propellants.

Containers: Fiber drums.

Shipping regulations: Class A explosive.

High explosive label. Not accepted by express. *

nitrohydrochloric acid. See aqua regia.

3-nitro-2-hydroxybenzoic acid. See meta-nitrosalicylic acid.

4-nitro-3-hydroxymercuri-ortho-cresol anhydride. See nitromersol.

"Nitrojection Ammonia." ¹²⁵ Trademark for anhydrous ammonia specifically intended for direct injection into the soil by tractor equipment for purposes of soil fertilization.

nitromannite. See mannitol hexanitrate.

nitromannitol. See mannitol hexanitrate.

nitromersol (4-nitro-3-hydroxymercuri-ortho-cresol anhydride) $\text{C}_6\text{H}_2(\text{CH}_3)(\text{NO}_2)(\text{OHg})$.

Properties: Brownish yellow or yellow granules or powder. Odorless and tasteless.

Insoluble in water; insoluble in alcohol, acetone, ether; soluble in solutions of alkalis, ammonia by opening the anhydride ring and salt formation.

Grade: N. F. XI.

Use: Medicine.

nitromethane CH_3NO_2 .

Properties: Colorless liquid. Solubility in water 9.5 cc/100 cc (20°C); solubility of water in nitromethane 2.2 cc/100 cc (20°C).

Constants: Sp. gr. 1.139 ($20/20^\circ\text{C}$), b. p. 101°C (760 mm), vapor pressure 27.8 mm (20°C), flash point 112°F (Tag open cup), wt./gal 9.5 lbs (68°F), refractive index 1.3817 (20°C); freezing point -29°C .

Derivation: By reaction of methane with oxides of nitrogen or nitric acid under pressure.

Containers: 5-, and 55-gal drums and 1-gal cans.

Uses: Solvent for nitrocellulose, cellulose acetate, cellulose acetopropionate; cellulose acetobutyrate, vinyl, alkyd, and many other resins, waxes, fats and dyestuffs; chemical synthesis; rocket fuel.

Shipping regulations: None. *

2-nitro-2-methyl-1,3-propanediol

$\text{CH}_2\text{OHC}(\text{CH}_3)\text{NO}_2\text{CH}_2\text{OH}$.

Properties: White, crystalline solid. Solubility in water 80 g/100 cc (20°C).

Constants: M. p. $147-149^\circ\text{C}$; b. p. decomposes (10 mm); pH 0.1 M solution 5.42.

Containers: Fiberpak boxes.

nitromuriatic acid. See aqua regia.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

nitron (1,4-diphenyl-3,5-endo-anilino-4,5-dihydro-1,2,4-triazole) $C_{20}H_{16}N_4$.

Properties: Lemon-yellow, fine crystalline needles. Soluble in chloroform, acetone, and acetic acid ester; slightly soluble in ether and alcohol.

Derivation: Triphenylaminoguanidine (prepared from thiocarbanilide and phenylhydrazine), is heated with formic acid, the product diluted with much water, filtered, and precipitated with ammonium hydroxide. The product is dissolved in chloroform, the solution concentrated and allowed to crystallize.

Grades: Reagent; technical.

Containers: Glass bottles.

Use: Reagent for the detection of the nitrate ion (NO_3^-) in very dilute solutions.

Shipping regulations: None.*

"Nitron." ⁵⁸ Trademark for cellulose nitrate sheeting.

alpha-nitronaphthalene $C_{10}H_7NO_2$.

Properties: Yellow crystals. Soluble in alcohol and ether; insoluble in water.

Constants: Sp. gr. 1.331; m. p. 61°C; b. p. 304°C.

Derivation: By the action of a mixture of nitric and sulfuric acids on finely ground naphthalene.

Method of purification: Crystallization.

Grades: Technical.

Containers: Wooden barrels, kegs, fiber drums.

Uses: Dyes; naphthylamine; is added to mineral oils to mask their fluorescence.

Shipping regulations: None.*

1-nitronaphthalene-5-sulfonic acid.

(Laurent's alpha acid) $C_{10}H_6(NO_2)(SO_3H)$.

Properties: Pale yellow needles. Soluble in water, alcohol, and ether.

Derivation: By sulfonating nitronaphthalene with a mixture of chlorohydrin and sulfuric acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Wooden barrels; fiber drums.

Uses: Dyes.

Shipping regulations: None.*

nitronium perchlorate NO_2ClO_4 .

Properties: White crystalline solid; m. p. 120-140°C; hygroscopic, noncorrosive; soluble in water to form nitric and perchloric acids; highly reactive.

Derivation: From ozone, nitrogen dioxide, chlorine dioxide.

Use: Suggested as propellant oxidizer.

nitroparaffins. Organic compounds derived from paraffin hydrocarbons by replacement of one or more hydrogen atoms by a nitro (NO_2) group. Examples are nitromethane (CH_3NO_2) and nitroethane ($C_2H_5NO_2$). Useful as solvents and raw materials for synthesis.

para-nitrophenetole $NO_2C_6H_4OC_2H_5$.

Properties: Crystallizes in prisms. Soluble in alcohol and ether.

Constants: M. p. 58°C; b. p. 283°C.

Derivation: This is prepared by ethylation of para-nitrophenol with ethyl chloride.

Method of purification: May be recrystallized from alcohol.

Grades: Technical.

Containers: Drums.

Uses: Dyes and other intermediates.

Shipping regulations: None.*

nitrophenide [bis(3-nitrophenyl) disulfide] $(NO_2C_6H_4)_2S$.

Properties: Yellow, rhomboid crystals;

m. p. 83°C, insoluble in water; soluble in ether; slightly soluble in alcohol.

Derivation: Reduction of meta-nitrobenzenesulfonyl chloride with hydriodic acid.

Use: Veterinary medicine and pharmaceutical intermediate.

meta-nitrophenol $NO_2C_6H_4OH$.

Properties: Pale yellow crystals; sp. gr.

1.485 (20°C); m. p. 96-97°C; b. p. 194°C (70 mm).

Derivation: Diazotized meta-nitroaniline is boiled with water and sulfuric acid.

Use: As an indicator.

ortho-nitrophenol $NO_2C_6H_4OH$.

Properties: Yellow crystals; sp. gr. 1.295

(45°C), 1.657 (20°C); m. p. 44-45°C; b. p. 214°C; soluble in hot water, alcohol, ether.

Derivation: Action of dilute nitric acid on phenol at low temperature, para-nitrophenol formed at same time. They are separated by steam distillation.

Containers: Glass bottles; fiber cans, drums.

Uses: Intermediate in organic synthesis; indicator.

Warning! Hazardous solid. Absorbed through skin. MCA warning label.

Shipping regulations: None.*

para-nitrophenol $NO_2C_6H_4OH$.

Properties: Yellowish monoclinic prismatic crystals, sp. gr. 1.479-1.495 (20°C), m. p. 111.4-114°C (sublimes); b. p. 273°C (dec), soluble in hot water, alcohol, ether.

Derivation: See ortho-nitrophenol.

Containers: Glass bottles; fiber cans; drums.

Uses: Intermediate in organic synthesis; indicator.

Warning! Hazardous solid. Absorbed through skin. MCA warning label.

Shipping regulations: None.*

para-nitrophenylacetic acid (para-nitro-alpha-toluic acid) $NO_2C_6H_4CH_2COOH$.

Properties: Colored needles. M. p. 152-3°C.

Slightly soluble in cold water; soluble in alcohol and chloroform.

Derivation: Hydrolysis of para-nitrobenzyl cyanide with 50% sulfuric acid.

Uses: Intermediate for dyestuffs, pharmaceuticals, penicillin precursors, local anesthetics.

4-nitrophenylarsonic acid $NO_2C_6H_4AsO(OH)_2$.

Properties: Crystalline solid.

Derivation: Nitration of phenylarsonic acid.

Uses: Veterinary medicine.

"Nitrophoska." ⁴⁴⁰ Trademark for a series of highly concentrated fertilizers. Available

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

as (N:P:K ratios shown):

"Nitrophoska" Red 13:13:20;
 "Nitrophoska" Green 15:15:15;
 "Nitrophoska" Grey 10:8:18;
 "Nitrophoska" Blue 12:12:19;
 "Nitrophoska" Yellow 15:15:6 + 4% magnesium oxide;
 "Nitrophoska" Blue Special 12:12:17 + 2% magnesium oxide plus (in 100 kg) about 880 g borax, 270 g manganese sulfate, 150 g copper sulfate, 2.5 g cobalt sulfate, 90 g zinc sulfate;
 Bor-"Nitrophoska" Red 13:13:20 + 2% borax.

The nitrogen in these fertilizers is about half in the form of quick-acting nitrate nitrogen and the remainder in the form of long-lasting ammonia nitrogen. The phosphoric acid is all available to the plants; one third as quick-acting (water-soluble) and two thirds as long-lasting (citrate-soluble) phosphoric acid. The potash is completely water-soluble. In "Nitrophoska" Red, Green, and Grey the potash originates from potassium chloride, whereas in "Nitrophoska" Blue and Yellow the potash originates from potassium sulfate. The magnesia in "Nitrophoska" Yellow originates from magnesium sulfate.

nitrophosphate. A nitrogen-phosphorus fertilizer produced by the action of nitric acid or a mixture of nitric and sulfuric or phosphoric acids on phosphate rock. Potassium salts usually are added to produce complete fertilizers.

Typical analysis: Available nitrogen 15%, available P_2O_5 15%, available K_2O 15%.

Containers: Bags, bulk, carloads.

Use: Fertilizer.

See also superphosphate; triple superphosphate.

1-nitropropane $CH_3CH_2CH_2NO_2$.

Properties: Colorless liquid. Solubility in water 9.5 cc/100 cc (20°C), solubility of water in 1-nitropropane 0.5 cc/100 cc (20°C).

Constants: Sp. gr. 1.003 (20/20°C), b. p. 132°C (760 mm), vapor pressure 7.5 mm (20°C), flash point 120°F (Tag open cup), wt/gal 8.4 lbs (68°F), refractive index 1.4015 (20°C), freezing point -108°C.

Derivation: By reaction of propane with nitrogen oxides or nitric acid under pressure.

Containers: 5-, 55-gal drums and 1-gal cans; tank cars.

Uses: Solvent for many resins, waxes, fats and dyestuffs; chemical synthesis.

Shipping regulations: None.*

2-nitropropane $CH_3CHNO_2CH_3$.

Properties: Colorless liquid. Solubility in water 1.7 cc/100 cc (20°C); solubility of water in 2-nitropropane 0.6 cc/100 cc (20°C).

Constants: Sp. gr. 0.992 (20/20°C), b. p. 120°C (760 mm); vapor pressure 12.9 mm (20°C); flash point 103°F (Tag open cup); wt/gal 8.3 lbs (68°F); refractive index 1.3941 (20°C); freezing point -93°C.

Derivation: By reaction of propane with nitrogen oxides or nitric acid under pressure.
 Containers: 5-, 55-gal drums, 1-gal cans; tank cars.

Uses: Solvent for many resins, waxes, fats and dyestuffs; chemical synthesis; used as wetting agent in grinding pigments.

Shipping regulations: None.*

meta-nitrosalicylic acid (3-nitro-2-hydroxybenzoic acid) $C_6H_3COOH(OH)NO_2$.

Properties: Yellowish crystals. Soluble in water and in alcohol. M. p. 144°C.

Derivation: By the nitration of salicylic acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Tins; kegs, fiber drums.

Uses: Intermediate, azo dyes.

Shipping regulations: None.*

meta-nitrosalicylic acid, methyl ester

$C_6H_3(OH)(NO_2)COOCH_3$.

Properties: M. p. 130°C, insoluble in water, soluble in organic solvents.

"Nitrosan." ²⁸ Trademark for a nitrogen-releasing chemical blowing agent containing 70% N,N'-dimethyl-N,N'-dinitroterephthalamide (NTA) and 30% white mineral oil by weight.

Properties: Nonhygroscopic crystalline powder, sp. gr. 1.2 g/cc; slightly to moderately soluble in common organic solvents. A smooth and rapid evolution of nitrogen gas is obtained when heated at 100°C. Medium and strong bases cause it to react violently and give off toxic diazomethane gas. Exposure to sunlight causes color change from yellow to green.

Containers: Nine 5-lb fiberpaks per cardboard carton.

Uses: For preparing open- and closed-cell chloride foam. Also used in expanding elastomers where milling temperatures do not exceed 50°C.

Hazards: Flammable solid. Keep away from open flame.

Shipping regulations: Flammable solid. Yellow label.*

para-nitrosodimethylaniline

$NOC_6H_4N(CH_3)_2$.

Properties: Green leaflets. Soluble in alcohol and ether; insoluble in water; m. p. 93°C.

Derivation: By action of nitrous acid on N-dimethylaniline.

Method of purification: Crystallization.

Grades: Technical.

Containers: 120-lb barrels; fiber drums.
